The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed. Portable means for adding a lock to the switch or circuit breaker shall not be permitted.

Panel Statement: See panel action and statement on Proposal 12-9.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

Comment on Affirmative:

QUAVE, D.: Comment on Affirmative for Proposal 12-9.

12-79 Log #403 NEC-P12 **Final Action: Reject**
(625.25)

Submitter: Sam Marcovici, NY City Buildings Dept.

Recommendation: Revise text to read as follows:

625.25 Loss of Primary Source.

Means shall be provided such that, upon loss of voltage from the utility or other electric systems(s), energy cannot be back fed ~~through~~ from the electric vehicle ~~and~~ through the supply equipment to the premises wiring system unless permitted by 625.26.

Substantiation: When in charging mode, the EV is the last link (the load) of power string. The power flows from the premises wiring system, through the supply equipment, and into the EV.

In the event of loss of primary power, the reverse happens and the EV becomes the first link (the source) of the power string. In that case, the power will flow from the EV, through the supply equipment, and to the wiring system.

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided any definitive technical substantiation that a problem exists with the present wording of Section 625.25. Section 625.25 clearly expresses the intent in the present wording, and the proposed wording would be of no value in clarifying the intent of the requirement.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10 Negative: 1

Explanation of Negative:

QUAVE, D.: I agree with the submitter and the substantiation is correct. The correct terminology should be used. This does add clarity, because power cannot be fed through the source but is fed from the source.

12-80 Log #917 NEC-P12 **Final Action: Reject**
(625.28)

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Delete.

Substantiation: 90.3 indicates Chapter 5 already applies. There is no specific requirement for wet locations, for example, therefore, it is assumed general requirements for such locations apply.

Panel Meeting Action: Reject

Panel Statement: Article 90.3 states that Chapter 5, 6, and 7 apply to special occupancies, special equipment, or other special conditions. These latter Chapters (5, 6, and 7) modify the general rules (Chapters 1, 2, 3, and 4). There is no statement that Chapter 5 modifies or applies to Chapter 6.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

12-81 Log #1650 NEC-P12 **Final Action: Accept in Principle**
(626 (New))

TCC Action: The Technical Correlating Committee advises that Article placement, titles and scope statements are the responsibility of the Technical Correlating Committee and, based on the current content of the Article, the Technical Correlating Committee directs that the Title and Scope be rewritten to read as follows:

"Article 626 Electrified Truck Parking Spaces

626.1 Scope. The provisions of this article cover the electrical conductors and equipment external to the truck or transport refrigerated unit that connect trucks or transport refrigerated units to a supply of electricity, and the installation of equipment and devices related to electrical installations within an electrified truck parking space."

The Technical Correlating Committee directs the Code-Making Panel 12 Chair to instruct the Code-Making Panel 12 Task Group to rewrite the Article for clarity, in accordance with the NEC Style Manual, and for consistency of terminology and submit the rewrite as a Public Comment.

This action will be considered by the Panel as a Public Comment.

Submitter: Juan C. Menendez, Southern California Edison Company

Recommendation: Revise as follows:

ARTICLE XXX Electrified Parking Space Equipment

I. General

xxx.1. Scope. The provisions of this article cover the electrical conductors and equipment that connect trucks and transport refrigerated units to a supply of electricity, and the installation of equipment and devices related to electrical installations within an electrified parking space.

xxx.2. Definitions. (See Article 100 for additional definitions.)

Air-Conditioning or Comfort-Cooling Equipment. All of that equipment intended or installed for the purpose of processing the treatment of air so as to control simultaneously its temperature, humidity, cleanliness, and distribution to meet the requirements of the conditioned space.

Appliance, Portable. An appliance that is actually moved or can easily be moved from one place to another in normal use.

FPN: For the purpose of this article, the following major appliances, other than built-in, are considered portable if cord connected: refrigerators, cook tops, range, television, or other similar appliances.

Connector. A device that, by insertion into a truck inlet, establishes an electrical connection to the truck for the purpose of providing power for the on-board electric loads and may provide a means for information exchange. This device is part of the truck coupler.

Converter. A device that changes electrical energy from one form to another, as from alternating current to direct current.

Disconnecting Means. The necessary equipment usually consisting of a circuit breaker or switch and fuses, and their accessories, located near the point of entrance of supply conductors in a truck and intended to constitute the means of cutoff for the supply to that truck.

Electrified Parking Space. A truck parking space that has been provided with an electrical system that allows truckers to "plug in" their vehicles while stopped, and use off-board power sources in order to operate on-board systems such as air conditioning, heating and appliances, without any engine idling.

Electrified Parking Space Supply Equipment, also known as Truck Stop Electrification Equipment. The conductors, including the ungrounded, grounded and equipment grounding conductors, and the connectors, attachment plugs and all other fittings, devices, power outlets, circuit breakers, switches and fuses and their accessories, located near the point of entrance of supply conductors to a electrified parking space, installed specifically for the purpose of delivering energy from the electrified parking space wiring system to the truck service equipment within the truck and intended to constitute the disconnecting means for the supply to the truck.

FPN: The electrified parking space supply equipment may be configured in three basic styles (i.e., pedestal, overhead gantry, and raised concrete pad design) for use at different electrified parking spaces in different climatic zones and for different parking configurations, see XXX.18 (A).

Electrified Parking Space Wiring Systems. All of the electrical wiring, equipment, and appurtenances related to electrical installations within an electrified parking space including the electrified parking space supply equipment.

Frame. Chassis rail and any welded addition thereto of metal thickness of 1.35 mm (0.053 in.) or greater.

Low Voltage. An electromotive force rated 24 volts, nominal, or less, supplied from a transformer, converter, or battery.

Separable Power Supply Cable Assembly. A flexible cord or cable, including ungrounded, grounded, and equipment grounding conductors, provided with a female connector, a attachment plug and all other fittings, grommets, or devices installed for the purpose of delivering energy from the source of electrical supply to the inlet installed within the truck.

Transformer. A device that, when used, raises or lowers the voltage of alternating current of the original source.

Transport Refrigerated Unit (TRU), also known as Refrigerated Transport Units (RTU). A trailer with an integrated heating or cooling device for the purpose of maintaining the desired environment of temperature-sensitive goods or products (being transported in trucks, trailers, etc).

Truck. A heavy-duty vehicular-type unit primarily designed for commercial transportation of goods and equipment, which has its own motive power. It is built on a permanent chassis, typically designed with but not required to include a sleeper berth and without a permanent foundation where connected to the required utilities and that may include heating, air-conditioning, and electric systems contained therein.

Truck Coupler. A mating truck inlet and connector set.

Truck Inlet. The device(s) on the truck into which the connector(s) is inserted for providing electric energy. It may also be used for the exchange of information. This device is part of the truck coupler. For the purposes of this Code, the truck inlet is considered to be part of the truck and not part of the electrified parking space supply equipment.

Truck Parking Space. An area within a vehicle park set aside and identified for the accommodation of a truck on a temporary basis.

Truck Service Equipment, The on-board equipment attached to or connected to the truck, containing the disconnecting means, overcurrent protective devices, and inlets or other means for connecting the truck to the electrified parking space supply equipment.

Truck Stop. A plot of land upon which two or more truck parking sites are located, established, or maintained for occupancy by trucks for resting purposes.

FPN: An electrified parking space may also include dedicated parking areas for heavy duty trucks at travel plazas, warehouses, shipper and consignee yards, depot facilities, border crossings, etc. It does not include areas such as the shoulders of on and off highway ramps and access roads, camping and recreational vehicle sites, residential and commercial parking areas used for automotive parking or other areas where ac power is provided solely for the purpose of connecting automotive and other light electrical loads, such as engine block heaters, and at private residences.

Truck Stop Electrification. An electrical system that allows truckers to "plug in" their vehicles while stopped, and use off-board power sources in order to operate on-board systems such as air conditioning, heating and appliances, without any engine idling.

Truck Stop Feeder Circuit Conductors. The conductors from the electrified parking space service equipment to the electrified parking space supply equipment.

xxx.3. General Requirements

A. Systems. This article covers 120-, 120/208-, or 120/240-volts, nominal, single-or three-phase, 3 or 4-wire ac power supply systems respectively, with ground. Where a different voltage is required by either design or available power supply system, adjustment shall be made in accordance with other articles and sections for the voltage used.

B. Not Covered. The provisions of this article do not apply to that portion of other equipment in residential, commercial or industrial facilities that require electric power for devices used to load and unload cargo and equipment, operate conveyors, and other devices on the site or truck.

C. Connection to Wiring System. The provisions of this article shall apply to the electrified parking space supply equipment intended for connection to a wiring system as defined in xxx.3(A).

D. Listed or Labeled. All electrical materials, devices, appliances, fittings, and other equipment shall be listed or labeled by a qualified testing agency and shall be connected in an approved manner when installed.

xxx.4. Reserved

II. Electrified Parking Space Electrical Wiring System

xxx.5. Primary Distribution System

A. Voltages. Unless other voltages are specified, the nominal ac system voltages of 120, 120/240, 208Y/120, 240, 480Y/277, and 480 volts shall be used to supply equipment covered by this article.

xxx.6. Other Articles. Whenever the requirements of other articles of this Code and Article xxx differ, the requirements of Article xxx apply.

xxx.7. Secondary Distribution System. The electrified parking space secondary electrical distribution system to electrified parking space supply equipment shall be single-phase derived from 120/208 volt three-phase, four-wire or 120/240 volt split single-phase.

Exception: Existing electrified parking space equipment may also be provided with a 120-volt distribution system for use by legacy vehicles.

xxx.8. Underground Service, Feeder, Branch-Circuit, and Electrified Parking Space Feeder-Circuit Conductors.

A. General. All direct-burial conductors, including the equipment grounding conductor if of aluminum, shall be insulated and identified for the use. All conductors shall be continuous from equipment to equipment. All splices and taps shall be made in approved junction boxes or by use of material listed and identified for the purpose.

B. Protection Against Physical Damage. Direct-buried conductors and cables entering or leaving a trench shall be protected by rigid metal conduit, intermediate metal conduit, electrical metallic tubing with supplementary corrosion protection, rigid nonmetallic conduit, liquidtight flexible nonmetallic conduit, liquidtight flexible metal conduit, or other approved raceways or enclosures. Where subject to physical damage, the conductors or cables shall be protected by rigid metal conduit, intermediate metal conduit, or Schedule 80 rigid nonmetallic conduit. All such protection shall extend at least 450 mm (18 in.) into the trench from finished grade.

FPN: See 300.5 and Article 340 for conductors or Type UF cable used underground or in direct burial in earth.

xxx.9. Feeder and Service Load Calculations.

A. General. The calculated load of a feeder or service shall not be less than the sum of the loads on the branch circuits supplied, as determined by Part II of this article, after any applicable demand factors permitted have been applied.

FPN: See Examples D1(A) through D10 in Annex D.

xxx.10. Demand Factors. Electrified parking space electrical wiring systems are based upon the climatic zone in which the equipment is installed.

xxx.11. Calculations. Electrical service and feeders shall be calculated on the basis of not less than 11000 volt-amperes per truck parking space. The demand factors set forth in Table xxx.10 shall be the minimum allowable demand factors that shall be permitted in calculating load for service and feeders.

Where the electrical supply for a truck parking space has more than one receptacle, the calculated load shall be calculated for all receptacles. Where the electrical supply is in a location that serves two or more trucks, the equipment for each site must comply with xxx.10 and the calculated load shall be computed on the basis of each parking site. No demand factor shall be allowed for any other load, except as provided in this Code.

Table xxx.10 Demand Factors for Services and Feeders

Climatic Temperature Zone	Demand Factor (percent)
1	70%
2a	67%
2b	62%
3a	59%
3b	57%
4a	55%
4b	51%
5a	47%
5b	43%
6a	39%
6b	34%
7a	29%
7b	24%
8a	21%
8b	20%
9a	20%
9b	20%
10a	21%
10b	23%
11	24%

A. Branch Capacity. Truck site branch circuit conductors shall have a capacity not less than the loads supplied and shall be rated at not less than 30 amperes.

xxx.12. Overcurrent Protection. Overcurrent protection shall be provided in accordance with Article 240.

xxx.13. Grounding. All electrical equipment and installations in truck parks shall be grounded as required by Article 250.

xxx.14. Reserved

III. Electrified Parking Space SupplyEquipment (Off-board)

xxx.15. Grounding.

A. Exposed Non-Current-Carrying Metal Parts. Exposed non-current-carrying metal parts of fixed equipment, metal boxes, cabinets, and fittings that are not electrically connected to grounded equipment shall be grounded by a continuous equipment grounding conductor run with the circuit conductors from the service equipment or from the transformer of a secondary distribution system. Equipment grounding conductors shall be sized in accordance with 250.122 and shall be permitted to be spliced by listed means.

The arrangement of equipment grounding connections shall be such that the disconnection or removal of a receptacle or other device will not interfere with, or interrupt, the grounding continuity.

B. Secondary Distribution System. Each secondary distribution system shall be grounded at the transformer.

C. Neutral Conductor Not to Be Used as an Equipment Ground. The neutral conductor shall not be used as an equipment ground for trucks or equipment within the truck park.

D. No Connection on the Load Side. No connection to a grounding electrode shall be made to the neutral conductor on the load side of the service disconnecting means except as covered in 250.30(A) for separately derived systems and 250.32(B)(2) for separate buildings.

xxx.16. Clearance for Overhead Conductors. Open conductors of not over 600 volts, nominal, shall have a vertical clearance of not less than 5.5 m (18 ft.) measured from the surface of the parking lot and a horizontal clearance of not less than 900 mm (3 ft.) in all areas subject to truck movement. In all other areas, clearances shall conform to 225.18 and 225.19.

FPN: For clearances of conductors over 600 volts, nominal, see 225.60 and 225.61.

xxx.17. Wiring Methods and Installation

A. Electrified Parking Space Supply Equipment Type. The electrified parking space supply equipment shall be provided in one of the following forms:

(1) Pedestal.

(2) Overhead Gantry.

(3) Raised Concrete Pad.

B. Mounting Height. Pedestal and raised concrete pad types of electrified parking space supply equipment shall be not less than 600 mm (2 ft.) above ground or the height of the flood plain level, whichever is greater.

C. Access. All electrified parking space supply equipment shall be accessible by an unobstructed entrance or passageway not less than 600 mm (2 ft.) wide and not more than 2.0 m (6 ft. 6 in.) high.

D. Working Space. Sufficient space shall be provided and maintained about all electrical equipment to permit ready and safe operation, in accordance with 110.26.

E. Facility Disconnecting Means. A disconnecting switch or circuit breaker shall be provided to disconnect one or more electrified parking space supply equipment sites from a remote location in the site supply equipment for disconnecting the power supply to a section of the truck stop. The facility disconnecting means shall be provided and installed in a readily visible and accessible location and shall be capable of being locked in the open position.

xxx.18. Overhead Gantry or Cable Management System

Electrified parking space equipment provided from either overhead gantry or cable management systems may be provided with a permanently attached power supply cable. It may also include or be separate from optional hybrid data, communications, optical fiber cables, shielding, etc. The cable or cables terminate in an electrified parking space supply equipment module that contains receptacles as described in xxx.20 (B). The power supply cable shall be connected directly to the terminals of the panelboard or conductors within a junction box in the equipment and provided with a means to prevent strain from being transmitted to the terminals.

The power supply cable shall be provided with a means to de-energize the cable conductors and power service delivery device upon exposure to strain that could result in either cable rapture or separation of the cable from the power service delivery device and exposure of live parts.

xxx.19. Protection of Outdoor Equipment

A. Wet Locations. All switches, circuit breakers, receptacles, control equipment, and metering devices located in wet locations or outside of a building shall be weatherproof equipment. (See section 100-1.)

B. Meters. If secondary meters are installed, meter sockets without meters installed shall be blanked off with an approved blanking plate.

xxx.20. Means for Connecting to Electrified Parking Space Supply Equipment

A. General. Trucks shall be supplied from electrified parking space supply equipment through not more than two suitable extra hard service cables or cords. Each connection to the equipment shall be by a single separable power supply cable assembly.

B. Type Receptacles Provided. All receptacles shall be of the grounding type. A maximum of three receptacles shall be provided. Every truck parking space with electrical supply shall be equipped with:

(1) Two 20-ampere, 125-volt single receptacles, NEMA type 5-20R, and

FPN: Complete details of the 15-or 20-ampere plug and receptacle configuration can be found in the National ElectricalManufacturersAssociationStandardforDimensionsofAttachmentPlugsandReceptacles,ANSI/NEMAWD6-2002, Figure 520.

(2) One 30-ampere, 120/208-volt, 3-pole, 4-wire receptacle.

FPN: Complete details of the 30-ampere plug and receptacle configuration can be found in the Standard for Pin and Sleeve Configurations, UL 1686, Configurations section, Parts C2.10 or C3.

FPN: See Figure xxx.21 for details regarding receptacle types.

Exception: Where electrified parking space supply equipment provides the air-conditioning and comfort cooling function without requiring a direct electrical connection at the truck, only the two receptacles identified in xxx.21(B)(1) need be provided.

Additional receptacles shall be permitted for the connection of electrical equipment outside the truck within the electrified parking space.

For Transport Refrigerated Units (TRU), see Part VI.

C. Disconnecting Means. The electrified parking space supply equipment shall be provided with a disconnecting switch or circuit breaker for disconnecting the power supply to the individual truck service equipment.

D. Switch-Rated or Interlocked Receptacles. Each receptacle provided by the electrified parking space supply equipment shall be either a switch rated receptacle-plug combination, include an interlocked receptacle with an associated switching device of an interlocking type, or provided with an equivalent means to prevent connection or disconnection under load. The switching device shall be rated to close-into and withstand short circuit fault currents of at least 35kA.

The switch rated receptacle-plug combination, the interlocked plug and receptacle combination, or other means provided shall ensure that the user has no access to live parts.

E. Ground-Fault Circuit Interrupters (GFCI). The electrified parking space equipment shall be designed and constructed such that all receptacle outlets are provided with GFCI protection**.**

xxx.21. Separable Power-Supply Cable Assembly. Where a separable power-supply cable assembly consisting of a cord with a female connector and attachment plug is provided, the vehicle shall be equipped with a permanently mounted, flanged surface inlet in accordance with xxx.21(G)(1), wired directly to the panelboard by an approved wiring method. The attachment plug shall be of a listed type. The power-supply cable assembly or assemblies shall be OEM (factory) supplied or OEM or factory approved, and be of one of the following types and rating specified herein.

Cords with adapters and pigtail ends, extension cords, and similar items shall not be attached to, provided or shipped with a truck.

A. Rating.

(1) Twenty-Ampere Power-Supply Assembly. Trucks wired a 20-ampere, 125-volt truck inlet, in accordance with xxx.21(F)(1), shall use a listed 20-ampere power-supply assembly.

Exception: A listed separable power supply cable assembly, either hard-service or extra hard service and rated 15amperes, 125 volts may be provided for connection to an engine block heater for legacy vehicles.

(2) Thirty-Ampere Power-Supply Assembly. Trucks wired a 30-ampere, 120/208-volt truck inlet, in accordance with xxx.21(F)(2) shall use a listed 30-ampere main power-supply assembly.

B. Conductors. The cord shall be a listed type with three or four conductors, for single phase connection, one of which shall be identified by a continuous green color for use as the grounding conductor.

Exception: A separate listed three conductor separable power supply cable assembly, having one conductor identified by a continuous green color for use as the grounding conductor, and rated 15 amperes, 125-volts may be provided for connection to an engine block heater for legacy vehicles.

C. Cord. Extra-hard usage flexible cords and cables rated not less than 194°F (90°C), 600 volts; listed for both wet locations and sunlight resistance; and having an outer jacket rated to be resistant to temperature extremes, oil, gasoline, ozone, abrasion, acids, and chemicals shall be permitted where flexibility is necessary between the electrified parking space supply equipment and the panelboard and inlet(s) on the truck.

Exception: Cords for the separable power supply cable assembly for 15 and 20 A connections may be a hard-service type.

D. Attachment Plug. Where a flexible cord is provided with an equipment grounding conductor and equipped with an attachment plug, the attachment plug shall comply with 250.138(A) and 250.138(B).

(1) Connection to a 20-Ampere Receptacle. A separable power supply cable assembly for connection to a truck having a 20-ampere inlet shall have an attachment plug that shall be 2-pole, 3-wire, grounding type, rated 20 amperes, 125 volts and intended for use with the 20-ampere, 125-volt receptacle, conforming to the configuration shown in Figure xxx.21(e).

Exception: A separable power supply cable assembly, rated 15A, provided for the connection of an engine block heater only, shall have an attachment plug that shall be 2-pole, 3-wire, grounding type, rated 15 amperes, 125 volts, conforming to the configuration shown in Figure xxx.21(d).

FPN: Complete details of the 15-or 20-ampere plug and receptacle configuration can be found in the National Electrical Manufacturers Association Standard for Dimensions of Attachment Plugs and Receptacles, ANSI/NEMA WD 6 -2002, Figure 515 or 5-20.

(2) Connection to a 30-Ampere Receptacle. A separable power supply cable assembly for connection to a truck having a 30-ampere inlet shall have an attachment plug that shall be 3-pole, 4-wire, grounding type, either:

(a) rated 30 amperes, 120/208 volts and intended for use with the 30-ampere, 120/208-volt receptacle, conforming to the configuration shown in Figure xxx.21(g) and intended for use with 120/208-volt switched receptacle configuration conforming to the configuration shown in Figure xxx.21(c), or

(b) rated 30 amperes, 125/250 volts and intended for use with the 30-ampere, 125/250-volt receptacle, conforming to the configuration shown in Figure xxx.21(f) and intended for use with 125/250-volt receptacle configuration conforming to the configuration shown in Figure xxx.21(b).

FPN: Complete details of the 30-ampere plug and receptacle configuration can be found in the Standard for Pin and Sleeve Configurations, UL 1686, Configurations section, Parts C2.10 or C3.

The attachment plug(s) shall be listed, by itself or as part of a cord set, for the purpose and shall be molded to or installed on the flexible cord so that it is secured tightly to the cord at the point where the cord enters the attachment plug. If a right-angle cap is used, the configuration shall be oriented so that the grounding member is farthest from the cord.

E. Connector

(1) The connector for a separable power supply cable assembly, as specified in xxx.21(A)(1), shall be a 2-pole, 3-wire grounding type, rated 20 amperes, 125 volts.

Exception: The connector for a separable power supply cable assembly, rated 15A, provided for the connection of an engine block heater only, shall have an attachment plug that shall be 2-pole, 3-wire, grounding type, NEMA 5-15R configuration, rated 15 amperes, 125 volts.

(2) The connector for a separable power supply cable assembly, as specified in xxx.21(A)(2), shall be a 3-pole, 4-wire grounding type, either:

(a) rated 30 amperes, 120/208 volts, switched inlet-connector type, conforming to the configuration shown in Figure xxx.21(c) and intended for use with 120/208-volt switched inlet, conforming to the configuration shown in Figure xxx.21(g), or

(b) rated 30 amperes, 125/250 volts, conforming to the configuration shown in Figure xxx.21(b) and intended for use with 125/250-volt inlet, conforming to the configuration shown in Figure xxx.21(f).

FPN: Complete details of the 30-ampere plug and receptacle configuration can be found in the Standard for Pin and Sleeve Configurations, UL 1686, Configurations section, Parts C2.10 or C3.

FPN: The connector in xxx.21(E)(2)(b) may be used on a 120/208-volt, single-phase circuit.

F. Switch-Rated or Interlocked Truck Coupler. Each connector provided by the separable power-supply assembly for use with the electrified parking space supply equipment shall be a part of either a switch rated connector-inlet combination, be used with an interlocked connector-inlet combination with an associated switching device of an interlocking type, or provided with an equivalent means to prevent connection or disconnection under load. The switching device shall be rated to close-into and withstand short circuit fault currents of at least 35kA.

The switch rated connector-inlet combination, the interlocked connector and inlet combination, or other means provided shall ensure that the user has no access to live parts.

G. Truck Coupler.

(1) Truck Inlet. Each truck shall be provided with not more than two inlets corresponding to the type and rating of connector of the power-supply cable assemblies provided and the rating of the receptacle in the electrified parking space supply equipment to which it is intended to be connected. See xxx.21(A).

(2) Construction and Installation. The truck coupler shall be constructed in accordance with xxx.21(F) and be installed so as to guard against inadvertent contact by persons with parts made live from the electrified parking space supply equipment or truck.

(3) Grounding Pole. The truck coupler shall be provided with a grounding pole, unless part of a system identified and listed as suitable for the purpose in accordance with Article 250.

(4) Grounding Pole Requirements. The truck coupler shall be so designed that the grounding pole connection is the first to make and the last to break contact.

H. Overall Length. The exposed cord length shall be measured from the face of the attachment plug to the point of entrance to the truck or the face of the flanged surface inlet or to the point where the cord enters the truck. The overall length of the cable shall not exceed 7.5 m (25 ft) unless equipped with a cable management system that is listed as suitable for the purpose.

I. Point of Entrance. The point of entrance of the separable power supply cable assembly to the truck or location of the truck inlet shall be in the exterior wall, either in front of or behind the driver door located at a height of not less than 600 mm (24 in.) and not more than 1.6 m (5.2 ft) above the parking surface.

J. Protection Against Corrosion and Mechanical Damage. Permanent provisions shall be made for the protection of the inlet and truck distribution panel, attachment plug of the power-supply cord and any connector cord assembly or receptacle against corrosion and mechanical damage if such devices are in an exterior location while the truck is in transit.

xxx.22. Loss of Primary Source. Means shall be provided such that, upon loss of voltage from the utility or other electric system(s), energy cannot be back fed through the truck and the truck supply equipment to the electrified parking space wiring system unless permitted by xxx.23.

xxx.23. Interactive Systems. Electrified parking space supply equipment and other parts of a system, either on-board or off-board the vehicle, that are identified for and intended to be interconnected to a vehicle and also serve as an optional standby system or an electric power production source or provide for bi-directional power feed shall be listed as suitable for that purpose. When used as an optional standby system, the requirements of Article 702 shall apply, and when used as an electric power production source, the requirements of Article 705 shall apply.

xxx.24. Reserved

IV. Transport Refrigerated Units (TRU)

xxx.25. Transport Refrigerated Units. A number of electrified parking spaces with electrical supply may each be equipped with additional ac grid power capacity to provide for operation of the heating/refrigeration units. For electrified parking space equipment covered by Parts I – III, a separate receptacle shall be provided for Transport Refrigerated Units. This receptacle would be used in addition to the three receptacles mentioned in xxx.21(B).

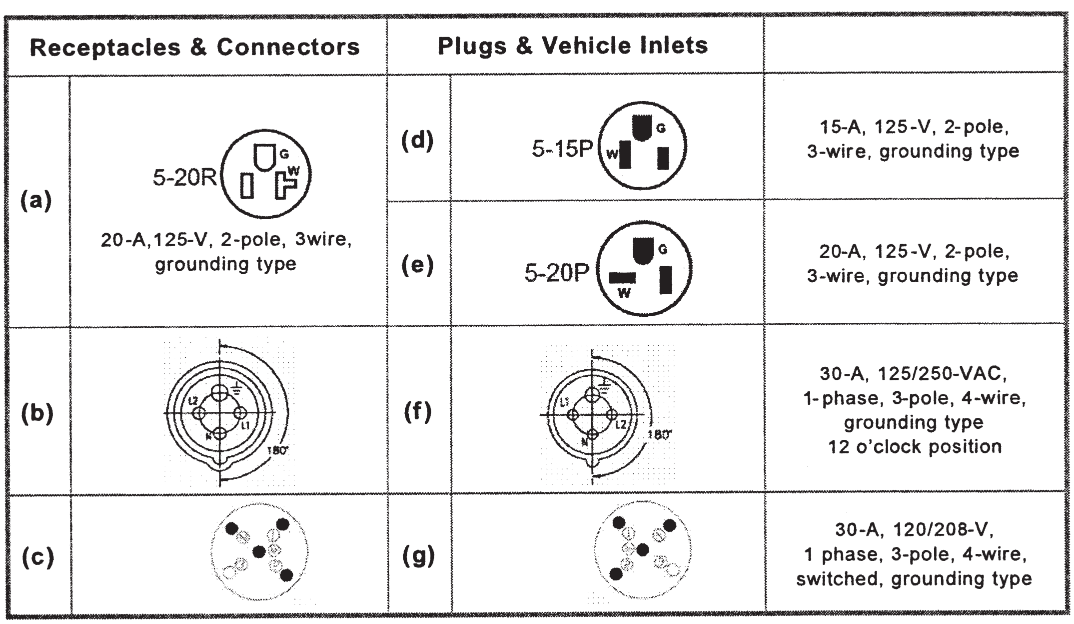

Figure xxx.21 -Receptacle, Connector, Attachment Plug and Inlet Configurations, 2-Pole,3-Wire and 3-Pole, 4-Wire Grounding-Types, Used for Electrified Parking Space SupplyEquipment, Separable Power Supply Cable Assemblies and Truck Inlets.

xxx.26. General Requirements

A. Systems. This part covers 120/208-, 277/480-volts, three-phase, 3 or 4-wire ac power supply systems respectively, with ground. Where different voltage is required by either design or available power supply system, adjustment shall be made in accordance with other articles and sections for the voltage used.

B. Electrified Parking Space Supply Equipment. The electrified parking space supply equipment, or portion thereof, providing electrical power for the operation of transport refrigerated units shall comply with Part VI.

xxx.27. Reserved.

xxx.28. Disconnecting Means and Branch-Circuit Protective Equipment

A. Disconnecting Means. Disconnecting means shall be provided to isolate each refrigerated unit from its supply connection.

B. Type. The disconnecting means shall be permitted to consist of a circuit breaker, motor circuit switch, or both, and shall be properly identified as to which receptacle it controls.

C. Location. The disconnecting means shall be readily accessible, located not more than 762 mm (30 in.) from the receptacle it controls, and shall be located in the supply circuit ahead of the receptacle. Circuit breakers or switches located in power outlets complying with this section shall be permitted as the disconnecting means.

D. Switch-Rated or Interlocked Receptacles. Each receptacle provided by the electrified parking space supply equipment shall be either a switch rated receptacle-plug combination, include an interlocked receptacle with an associated switching device of an interlocking type, or provided with an equivalent means to prevent connection or disconnection under load. The switching device shall be rated to close-into and withstand short circuit fault currents of at least 35kA.

The switch rated receptacle-plug combination, the interlocked plug & receptacle combination, or other means provided shall ensure that the user has no access to live parts.

E. Type Receptacles Provided. All receptacles shall be of the grounding type. Every electrified parking space intended to provide an electrical supply for transport refrigerated units shall be equipped with either a:

(1) 30 ampere, 480-volt, 3-phase receptacle, or

(2) 60 ampere, 208-volt, 3-phase receptacle.

These electrical supplies shall be permitted to include additional receptacles that have configurations in accordance with xxx.21(B).

xxx.29. Power Supply Cable Assembly. Where a power supply cable assembly, consisting of a cord with an attachment plug is provided, it shall be wired directly to the panelboard by an approved wiring method. The attachment plug shall be of a listed type. The power supply cable assembly or assemblies shall be OEM (factory) supplied or OEM or factory approved, and be of one of the following types and rating specified herein.

Cords with adapters and pigtail ends, extension cords, and similar items shall not be attached to, provided or shipped with a truck.

A. Rating. The power supply cable assembly shall be listed and rated:

(1) 30 ampere, 480-volt, three phase, or

(2) 60 ampere, 208-volt, three phase.

B. Conductors. The cord shall be a listed type with four conductors, for three phase connection, one of which shall be identified by a continuous green color for use as the grounding conductor.

C. Cord. Extra-hard usage cables rated not less than 194°F (90°C), 600 volts; listed for both wet locations and sunlight resistance; and having an outer jacket rated to be resistant to temperature extremes, oil, gasoline, ozone, abrasion, acids, and chemicals shall be permitted where flexibility is necessary between the electrified parking space supply equipment and the panelboard and inlet(s) on the truck.

D. Attachment Plug. Where a flexible cord is provided with an equipment grounding conductor and equipped with an attachment plug, the attachment plug shall comply with 250.138(A) and 250.138(B).

An attachment plug for the connection of a truck or trailer shall be either:

(1) rated 30 ampere, 480-volt, three phase and intended for use with a 480-volt, three phase receptacle, or

(2) rated 60 ampere, 208-volt, three-phase and intended for use with the 60-ampere, 208-volt, three phase receptacle and intended for use with 208-volt, three phase receptacle.

FPN: Complete details of the 30-ampere and 60-ampere plug configurations can be found in the Standard for Pin and Sleeve Configurations, UL 1686, Configurations section, Part C2 and Part C3.

The attachment plug(s) shall be listed, by itself or as part of the power supply cable assembly, for the purpose and shall be molded to or installed on the flexible cord so that it is secured tightly to the cord at the point where the cord enters the attachment plug. If a right-angle cap is used, the configuration shall be oriented so that the grounding member is farthest from the cord.

E. Point of Entrance. The point of entrance of the power supply cable assembly to the truck or location of the transport refrigerated unit inlet shall be located at a height of not less than 600 m (24 in.) above the parking surface.

F. Protection Against Corrosion and Mechanical Damage. Permanent provisions shall be made for the protection of the power supply cable assembly, attachment plug and any other exposed portions of the transport refrigeration unit distribution system against corrosion and mechanical damage if such devices are in an exterior location while the truck or trailer is in transit.

xxx.30. Reserved.

Substantiation: By way of introduction to the members of CMP # xx, this code proposal was developed by the Truck Stop Electrification (TSE) Committee of the National Electric Transportation Infrastructure Working Council (IWC), sponsored by the Electric Power Research Institute (EPRI). The TSE Committee is a multi-industry group of professional volunteers, involving truck manufacturers, TSE designers and implementers, component manufacturers, utilities, and members of the National Association of Truck Stop Operators, Society of Automotive Engineers (SAE), Environmental Protection Agency, Department of Energy, Department of Defense, IEEE, EPRI, and others, working together to develop the TSE infrastructure. For most on-road, heavy-duty fleets, idling can account for more than 50 percent of total trip time. The amount of diesel fuel burned, the emissions produced, and the maintenance impacts

trucks owners are significant. Consider the following:

- A class 8 truck typically idles 10-12 hours per night, 300 nights per year (3,000 hours peryear).
- There are approximately 1.4 million heavy-duty long haul trucks on the road.
- Each year a truck emits over 0.3 tons of nitrogen oxides and 21 tons of carbon dioxide.
- Excessive idling has resulted in higher fuel consumption; a typical diesel vehicle burns one to 1.3 gallons of fuel for every hour of idling.
- Idling trucks collectively burn away more than 1.2 billion gallons of diesel fuel annually at a cost of more than one trillion dollars to the industry.
- A truck idling for one hour suffers wear and tear equivalent to being driven seven miles.
- Operating life of engine oil is reduced by 75 percent due to prolonged idling – from 600 engine hours to 150 engine hours.
- Drivers are constantly exposed to exhaust fumes from the idling trucks.

Over the past several years, the attention of regulatory agencies and environmental groups has focused on reducing truck idling. Developing a standardized, safe and efficient means of reducing fuel consumption and emissions has been the goal.

More than twenty states and cities have already adopted legislation to reduce the number of hours a truck idles. There are two topics of importance to fleet and independent operators and governmental regulators -- reducing fuel consumption and emissions. Both of these subjects are intertwined; if done properly both fuel consumption and emissions can be reduced, with the added benefit of lower maintenance costs as well.

One of the most effective opportunities to reduce both fuel consumption and truck emissions is to reduce unnecessary idling. Idling is most extensive when trucks are parked at truck stops or other roadside rest areas, during the required rest times for the driver to sleep.

Alternative technologies are available that provide cab heating, cooling, and/or electrical supply while consuming far less energy. These include:

An auxiliary power unit (APU) mounted externally on the truck cab can provide electric power.

Auxiliary power units (APU) are viable for certain operators, but weight, cost and maintenance issues make them less than an ideal solution for others.

Truck Stop Electrification or “shore power” will provide electric power that which allows drivers to plug trucks into power outlets to run cab amenities (hotel loads) and the heating, ventilation and air conditioning systems necessary for heating and cooling. Variations of TSE systems also allow the HVAC systems to be supplied externally, without a direct electrical connection to the truck, and with the heated or cooled air ducted into the truck via a console fitted through the cab window. The console also provides outlets for various appliances and other amenities carried by the truck driver. The same basic issues relating to engine idling reduction include dealing with cabs of long-haul trucks (TSE) and Transport Refrigerated Units (TRU).

When available, electricity provided at an Electrified Parking Space is the cheapest form of energy for running a truck’s on-board electrical systems, reducing emissions and fuel consumption.

Many large truck stops are located on the edge of metropolitan areas, often within the boundaries of an ozone nonattainment area. Thus, idling at these truck stops can contribute significantly to a region's air quality problems. Idling is also a source of noise.

Fleets and operators would like to be able to find truck stops where drivers could shut down, plug in the trucks and power everything from HV/AC systems to microwave ovens, televisions and computers. The technology is available today to dramatically reduce engine idling. What is missing are places to plug in.

Today, approximately 500,000 truck parking sites exist in the United States, with an additional 200,000 sites in non-dedicated parking areas and loading sites around the country. Less than one percent of these sites now provide any electrified parking space equipment. These include both gantry-mounted and pedestal mounted equipment that provides AC power. Each parking space has outlets for connection to an ac source of power. Some provide optional hookups for television and the Internet.

Article xxx Electrified Parking Space Equipment has been developed to identify the infrastructure needs for systems where electrified parking space equipment may be installed for both heavy duty trucks and transport refrigerated units.

1. General

xxx.1. Scope.

xxx.2. Definitions

The additions and changes to this section are primarily editorial and provide consistency with the accepted definitions commonly used by truck stop operators, regulatory agencies, and the trucking and transportation industries.

xxx.3. General Requirements.

xxx.3.A. Systems.

A 120/208 VAC, three-phase, 4 wire system will offer the most economical single-phase system that is both easily balanced and flexible for future three-phase loads. Other voltage systems may be used for different installations. See Appendix A ("Truck Stop Electrification Voltage Specifications: The Appropriate Design of the Power Distribution Infrastructure," EPRI, Palo Alto, CA:
2005: 1010572").

xxx.3.B. Not Covered.

This provision excludes other electric powered equipment on some sites used for cargo handling, loading and unloading, etc. that are not a part of the electrified parking space equipment.

xxx.3.D. Listed or Labeled.

This requirement will insure that Electrified Parking Space Equipment, its related components and interconnection cables comply with accepted requirements for safety.

II. Electrified Parking Space Electrical Wiring System

xxx.7. Secondary Distribution System.

This code article is intended to apply to new installations that have the capability of providing for hotel loads, HVAC, etc. Existing installations for block heater use today have been exempted.

xx.10. Demand Factors.

The method for calculating demand factors for electrified parking spaces differs greatly from the approach used for mobile homes and recreational vehicles for several reasons. Unlike mobile homes and RVs which are plugged in perhaps several dozen times a year, trucks are plugged in almost daily, totaling approximately 300 days a year on average. Moreover, mobile homes remain plugged in for relatively long periods of time, whereas trucks typically plug in for only 10-12 hours at a time.

Another important distinction from mobile homes and RV parks is that most truck stops with electrified parking spaces are filled to capacity or near capacity during the evening rest hours and are virtually empty during the day. For these reasons, a demand factor based on the available number of physical spaces does not accurately reflect the expected demand during the resting times. An electrified parking space facility would have to be designed based on 100% occupancy, hence the demand factor table in Article 551 is not appropriate.

Data was obtained from approximately 24 truck stops nationwide with electrified parking spaces wherein occupancy status, power, energy consumption, outdoor temperature and wind speed, HVAC temperature, and other parameters were monitored continuously. The data, representing over 5 million hours of service, showed that although demand may be affected by occupancy, time of day, and other factors, the single most significant parameter affecting demand is the outside air temperature. The data indicates that the HVAC has the highest power requirement in cold climates, with the heating demand representing the greatest load, which in turn is dependent on outside temperature. In very warm climates, where no heating load is necessary, the cooling load increases as the outdoor temperature rises.

The model used for the proposed demand factors was developed to correlate power and energy with ambient weather conditions. First, it was necessary to categorize different areas across the country according to temperature zones. The US Department of Agriculture (USDA) has developed a commonly used Plant Hardiness Zone map that is publicly available (see Figure 1). The map was created by USDA using an archive of average annual minimum temperature data from about 8,000 stations throughout North America. The map divides the country into 11 major zones based on the average annual minimum temperature. The zones and their respective temperature ranges are also shown in Table 1 below.

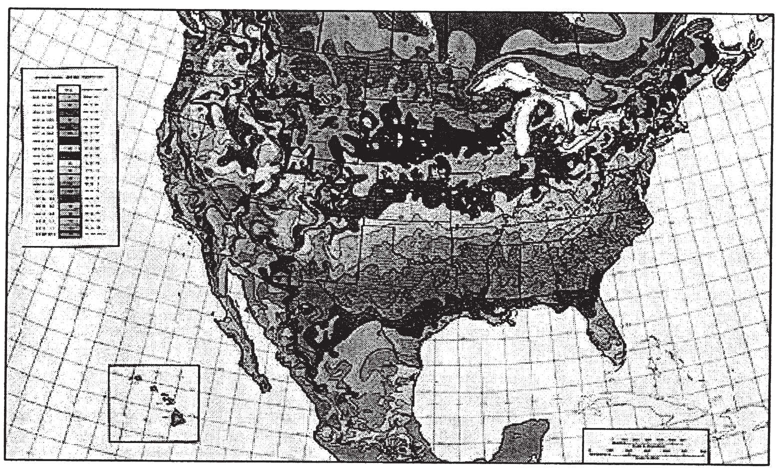

Figure 1 US Department of Agriculture Plant Hardiness Zone Map

Table 1 - USDA Hardiness Zones and Average Annual Minimum Temperature Range

Zone	Fahrenheit	Celsius	Example Cities
1	Below -50 F	Below -45.6 C	Fairbanks, Alaska; Resolute, Northwest Territories (Canada)
2a	-50 to -45 F	-42.8 to -45.5 C	Prudhoe Bay, Alaska; Flin Flon, Manitoba (Canada)
[illegible]	-45 to -40 F	-40.0 to -42.7 C	Unalakleet, Alaska; Pinecreek, Minnesota
3a	-40 to -35 F	-37.3 to -39.9 C	International Falls, Minnesota; St. Michael, Alaska
[illegible]	-35 to -30 F	-34.5 to -37.2 C	Tomahawk, Wisconsin; Sidney, Montana
4a	-30 to -25 F	-31.7 to -34.4 C	Minneapolis/St.Paul, Minnesota; Lewistown, Montana
[illegible]	-25 to -20 F	-28.9 to -31.6 C	Northwood, Iowa; Nebraska
5a	-20 to -15 F	-26.2 to -28.8 C	Des Moines, Iowa; Illinois
[illegible]	-15 to -10 F	-23.4 to -26.1 C	Columbia, Missouri; Mansfield, Pennsylvania
6a	-10 to -5 F	-20.6 to -23.3 C	St. Louis, Missouri; Lebanon, Pennsylvania
6b	-5 to 0 F	-17.8 to -20.5 C	McMinnville, Tennessee; Branson, Missouri
7a	0 to 5 F	-15.0 to -17.7 C	Oklahoma City, Oklahoma; South Boston, Virginia
7b	5 to 10 F	-12.3 to -14.9 C	Little Rock, Arkansas; Griffin, Georgia
8a	10 to 15 F	-9.5 to -12.2 C	Tifton, Georgia; Dallas, Texas
[illegible]	15 to 20 F	-6.7 to -9.4 C	Austin, Texas; Gainesville, Florida
9a	20 to 25 F	-3.9 to -6.6 C	Houston, Texas; St. Augustine, Florida
9b	25 to 30 F	-1.2 to -3.8 C	Brownsville, Texas; Fort Pierce, Florida
10a	30 to 35 F	1.6 to -1.1 C	Naples, Florida; Victorville, California
10b	35 to 40 F	4.4 to 1.7 C	Miami, Florida; Coral Gables, Florida
11	above 40 F	above 4.5 C	Honolulu, Hawaii; Mazatlan, Mexico

Load data from the electrified parking spaces at different geographical locations was recorded for the coldest month (January). The data, in average measured kW per occupied parking space, was correlated with the USDA zones as shown in Figure 2. A baseline load for small appliances, block heater and other amenity loads was then established to reflect the variations in the recorded load attributed to the daily temperature differences during the month. These values were then increased by a margin of approximately 20%. This margin is based on the expected demands of additional devices identified as likely to be used in the truck in the future and anticipates the increased accessory loads as electrified parking spaces become more available. Figure 2 illustrates the high power demand per occupied space in the coldest zones (e.g., zones 1 and 2 to the right of the graph) resulting from load needed to heat the interior cab space. The graph also shows the decrease in load in the warmer zones. However, as the average temperatures increase in the hottest zones (e.g., zones 10 and 11), the load requirements begin to increase reflecting the air conditioning loads.

As seen in the graph, there is a baseline load of about 2.2 kW per occupied space, at the several of the temperate climate zones, with an increasing load as temperatures decrease in colder zones and increase in hotter zones.

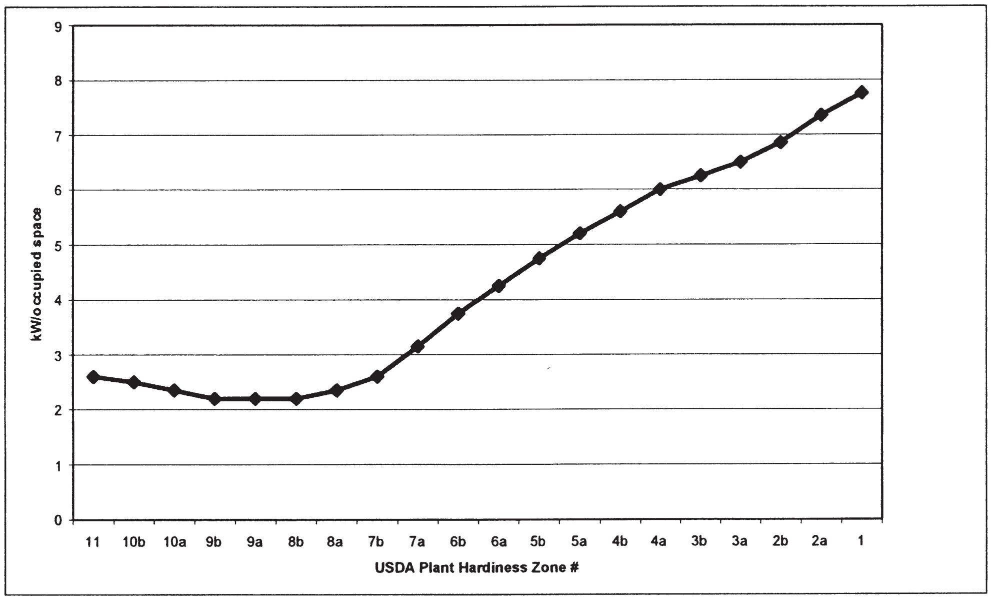

Figure 2 - Distribution Graph of Connected Load Value Based on Climate Zones

Table 2 shows data from five specific truck stops located in different cities in warm, temperate, and colder climates. The fourth column gives the actual average measured kW load per occupied space during the coldest month of January. The fifth column identifies the USDA zone based on the map, and the last column shows the recommended kW per space for that zone. Assuming 100% occupancy, the table confirms that the recommended load capacity per space provides a reasonable margin of safety.

TABLE 2 - Data Summary for Truck Stops in Different Geographical Regions and Climate Zones

Site	State	Number of Occupied Parking Spaces	Average measured kW load per space *	Zone	Recommended kW per space based on zone
Syracuse	NY	20	3.76	4b	5.6
Paulsboro	NJ	80	2.46	6b	3.75
Knoxville	TN	93	1.89	7a	3.15
Atlanta	GA	63	1.73	7b	2.6
Houston	TX	51	1.12	9a	2.2
* Data from the coldest month (January)					

The two 20-ampere and one 30-ampere service receptacles on the electrified parking space supply equipment corresponds to 11 kW of available power. Converting the recommended kW per space to a percentage of the available power results in the demand factor table shown below (Table3), which is the basis for Table xxx.10.

Table 3 - Demand Factors for Services and Feeders

Climate Zone	KW per Space	% of Total (11 kW)
1	7.75	70%
2a	7.35	67%
2b	6.85	62%
3a	6.5	59%
3b	6.25	57%
4a	6	55%
4b	5.6	51%
5a	5.2	47%
5b	4.75	43%
6a	4.25	39%
6b	3.75	34%
7a	3.15	29%
7b	2.6	24%
8a	2.35	21%
8b	2.2	20%
9a	2.2	20%
9b	2.2	20%
10a	2.35	21%
10b	2.5	23%
11	2.6	24%

Additional data from the various truck stops, where electrified parking space equipment has been installed, continues to be collected and would be available for further review. **xxx.11. Calculations.**

Loads for other amenities such as, but not limited to, service buildings, restaurants, and refueling stations shall be sized separately and then be added to the value calculated for the truck stop where they are all supplied by one service.

III. Electrified Parking Space Supply Equipment (Off-board).

xxx.15. Grounding.

xxx.16. Clearance for Overhead Conductors.

Article 225.18 identifies clearances from ground for overhead conductors and cables. These clearances are broken down into four types of installations. For the purposes of this code proposal, the clearances for equipment on public streets, alleys, etc. (Article 225.18(4)) was selected as appropriate for truck stops.

xxx.17. Wiring Methods and Installation.

xxx.17(A). Electrified Parking Space Supply Equipment Type.

There are four generic types of installations that could be provided: pedestal, overhead gantry, raised concrete pad, and speed bump design. The speed bump design was not recommended due to experiences where such a design was used in truck parking sites and proved to be easily damaged by snow removal equipment as well as water and flooding.

xxx.17(B). Mounting Height.

The minimum restriction for the height of the equipment also includes provision for areas where the parking site is located on land in a known flood plain.

xxx.17(E) Facility Disconnecting Means

This requirement provides for a disconnecting means that can shut off and isolate the Electrified Parking Space Supply Equipment in a row, section or area of the truck stop if required. It can be locked in the “Off” position. It shall be provided in addition to the disconnecting means in the electrified parking space equipment located at each parking space.

xxx.18. Overhead Gantry or Cable Management System.

This section covers systems where the means of providing power to the truck are attached to an equipment module that is permanently wired to an overhead electrical system. A provision has been made for a breakaway-type of strain relief mechanism such that there are neither live parts nor damage to the cable.

xxx.19. Protection of Outdoor Equipment.

The electrified parking space equipment and trucks using this equipment will be connected at times when there are adverse environmental conditions, such as snow, rain, wind-blown dust, exposure to very cold temperatures, etc. The use of suitably rated enclosures, components, and other electrical devices is recommended.

xxx.20. Means for Connecting to Electrified Parking Space Supply Equipment

xxx.20(B). Type Receptacles Provided.

Truck OEMs and implementers have recommended that a combination of receptacle outlets be provided to allow connection of the truck to the electrified parking space supply equipment. This section identifies standard receptacles of both general purpose and industrial types. It limits the number of cables permitted to reduce the likelihood of damage to the cable assemblies and other risks associated with the use of multiple cables for connection. An exception allows for legacy type connections for block heaters on existing trucks. It offers the opportunity to connect via a single cable and includes future anticipated loads using a 120/208Y, single-phase supply source.

These receptacles, their mating attachment plugs, connectors, and inlets have been identified so as to limit the use of multiple adapters, user-assembled cables and connector assemblies, or other available configurations such as might be found in RV applications.

xxx.20(D). Switch-Rated or Interlocked Receptacles.

Trucks will be connected and disconnected in adverse weather conditions. Experience shows that the truck operators will not always shut off power at the electrified parking space equipment before disconnecting either the attachment plug or connector. Additionally, standard NEMA receptacles, plugs, connectors and inlets have not been rated for make and break under load and may be damaged as a result of repeated connection or disconnection under load.

The use of an interlock mechanism or a switch rated receptacle or will prevent an arcover, electrical damage to the connection devices and ensure that no live parts are exposed to contact during connection or disconnection.

xxx.20(E). Ground-Fault Circuit Interrupters (GFCI).

Section xxx.20(E) requires GFCI Protection be provided as an integral part of all Electrified Parking Space Supply Equipment. This equipment will be installed in many existing truck stops and used outdoors in many different environment conditions where it can be contacted by persons. This requirement will ensure that people coming in contact with Electrified Parking Space Supply Equipment will be provided with suitable personnel protection that functions to deenergize the equipment within an established period of time when a current to ground exceeds an established predetermined value that may result in a shock hazard and is less than required to operate the overcurrent protective device of the supply circuit.

For trucks parking at residential or commercial locations or at sites not designated as truck parking spaces, the most common locations being commercial and retail parking lots, residential driveways, garages, carports, or streets adjacent these locations, the availability of GFCI protection cannot be assured. It has been recommended that SAE J2698 require GFCI Protection be provided onboard the truck. This would assure that such protection will be available regardless of parking site used.

xxx.21. Separable Power-Supply Assembly.

xxx.21(C). Cord.

Section xxx.21(C) requires that the flexible cord used for the purpose of connecting the truck to the Electrified Parking Space Supply Equipment be of an extra hard usage type, as designated in Table 400-4. The separable power supply cord assembly used will typically be used one or more times daily, and will be subjected to a high level of abuse by being walked on, driven over, coiled up and stored in a truck compartment with other tools, road chains and related equipment. It should also be listed type suitable for use outdoors, in damp and wet conditions, and at cold temperatures found in the northern climates of the USA during winter months. Additionally, the flexible cord shall also be resistant to normal automotive fluids and fuels, notably gasoline and diesel oil.

xxx.21(F). Switch-Rated or Interlocked Truck Coupler.

As indicated in xxx.20(D), trucks will be connected and disconnected in adverse weather conditions. Experience shows that the truck operators will frequently disconnect the attachment plug or the connector before shutting off power at the electrified parking space equipment. Additionally, standard NEMA receptacles, plugs, connectors and inlets have not been rated for make and break under load and may be damaged as a result of repeated connection or disconnection under load. The use of an interlock mechanism at the inlet connection or a switch rated connector-inlet or will prevent an arcover, electrical damage to the connection devices and ensure that no live parts are exposed to contact during connection or disconnection.

xxx.21(G). Truck Coupler.

Presently, the SAE J2698 Truck and Bus Electrical Systems Subcommittee is developing a Recommended Practice that is intended to describe the assembly design of single phase nominal 120 VAC wiring distribution systems and circuits that provide power to truck sleeper cabs for ‘hotel’ loads, other battery charging and cold weather starting aids on heavy duty on-highway trucks.

The present J2698 draft, dated August 12, 2005, (see Appendix A for details), identifies a minimum of two NEMA (5-15 and 5-20) 125 volt connections at the interface between the truck and connector on the separable power-supply cable assembly used to connect the truck to the electrified parking space equipment. Some truck OEMs have suggested that more than two connection points be used to provide additional electrical capacity.

xxx.21(G) limits these connections to no more than two, and permits the alternative of connecting via a 30-ampere, 120/208 volt, single phase connector-inlet combination. By limiting the number of connection points, the volt-ampere load of the equipment can be defined and the opportunity for a fault or hazard occurring from the use of multiple cord sets reduced. The on-board systems being developed today do not anticipate any control circuits or other means to deenergize all of the line connected circuits should one of the connection points at the truck be disconnected. Minor repairs or adjustments are made by the truck operator or local service person at a truck stop. In the event that these involve a line connected electrical circuit, and not all of the ac power connections are disconnected, the risk of contact with a live part can be minimized by limiting the number of connection points to the truck. It also reduces the likelihood of tripping hazards, and injury to persons walking thru the parking spaces, physical damage to the power supply cable assemblies themselves or to the equipment.

The use of an alternative 30-ampere, 120/208Y-volt connection, as requested by some manufacturers of both electrified parking space equipment and heavy duty road equipment, offers greater capacity and the possibility of using a single connection point at the vehicle and an internal (on-board) distribution system for all of the electrical power needs.

xxx.21(H). Overall Length.

Based on a study of truck and trailer sizes, configurations, parking lot design, equipment placement, and the connection point(s) on the truck being located at or near the driver side door, an overall length of 25 feet is adequate for the purpose. This limits the risk of increased damage to the cord set if longer cords were used, decreases the weight carried on-board the truck, reduces voltage drop and lowers the cost of such cord sets. For truck stops where existing parking space configurations, such as back-in sites, have been established that do not permit placement of the electrified parking space equipment in an optimal position to minimize the cord length, the use of longer cord lengths and a cable management system, will minimize the potential damage to the cord or cable.

xxx.21(I). Point of Entrance.

Based on discussions with truck OEMs and recommendations contained in the SAE J2698 draft document, the connection point(s) at the truck will be located on the driver's side of the vehicle, at or near the driver's side door. By identifying this position, the length of the separable power supply cable assembly can be identified. The references to minimum and maximum heights address concerns with ease of connection or disconnection and possible damage caused by flooding or other vehicle operation through standing water.

xxx.22. Loss of Primary Source.

In the event of loss of AC power while connected, power from an APU or other source should not backfeed into the TSE equipment or its wiring systems.

xxx.23. Interactive Systems.

Trucks presently carry alternative on-board power sources, such as batteries, generators and auxiliary power units, to perform various functions during vehicle operation or when stopped.

Future electrical supply needs may utilize these sources of power or on-board generation capabilities as either a standby power source or as a source of power production operating in parallel with a primary source(s) of electricity, in addition to its normal function of charging the truck batteries or operating other on-board equipment. The use of such vehicle or vehicle related equipment for this purpose should comply with all related installation practices and safety regulations in place for similar types of equipment, as well as the requirements of IEEE p1547.

IV. Transport Refrigerated Units (TRU)

xxx.25. Transport Refrigerated Units

Mechanical refrigeration units transport a huge variety of food, household and commercial products that must be chilled, frozen, heated or kept at some specified temperature en route. These TRUs or transport refrigerated units (also known as reefers) are diesel operated and produce exhaust emissions. In some areas, such as California and New York, there are concerns about getting TRUs to shut down their engines when the truck or trailer is standing still. The California Air Resources Board has begun offering pollution-abatement credits to facilities that install and use electric outlets to power reefers.

Reefer manufacturers are getting more inquiries from West Coast customers about standby electric units, which operate on 208-230- or 277/480-volt power. The equipment includes a large motor that runs the compressor so the diesel engine can be shut off. The switchover from diesel to standby electric power is automatic. When the stand-by cord is plugged in, the reefer's microprocessor controls automatically shut off the diesel and its centrifugal clutch disengages, allowing the motor to run the compressor through a belt drive. Unplugging the standby reverses the switchover.

Electric standby equipment is not new. It is widely used in Western Europe, where noise is an issue at distribution centers that have been surrounded by cities. Also, trucks using ferries to cross the English Channel, Baltic Sea and other bodies of water must shut down all engines, including those on reefers, while aboard ferries. The distribution centers and ferry parking decks are provided with plugins.

To our knowledge, there are currently no TRUs that plug in at truck stops. However, at least one TRU manufacturer is planning to have plug- in capabilities in the near future. As lawmakers interested in promoting idle reduction shift their focus to TRUs, other TRU manufacturers may develop the capability to utilize electrified parking spaces for their trailer units. This portion of the proposed Code addresses basic requirements that could be expanded further in future code cycles as the need arises.

xxx.28 Disconnecting Means and Branch-Circuit Protective Equipment.

This section provides some general guidelines and identifies practices similar to those used for heavy duty trucks parked at truck stops. In this case, a transport refrigerated unit (TRU) will be connected to a separate and additional supply source to operate on-board equipment necessary to maintain a perishable cargo. Based on a survey of present TRU equipment and the heating or cooling capacities utilized, two ratings have been recommended at the operating voltage levels most common today.

xxx.29 Power-Supply Cable Assembly.

This section identifies the basic ratings for the flexible cord or cable used in terms of the environmental conditions, exposures to materials, fluids and other contaminants, and physical damage that may occur as a result of daily usage at a truck stop.

It also relates the electrical rating of the power supply cable assembly and attachment plug to the corresponding ratings of the receptacle outlets provided as a part of the electrified parking space equipment.

Appendix A

SAE J2698 Recommended Practice for Primary Single Phase Nominal 120 VAC Wiring Distribution Assembly Design is under development by SAE's Truck and Bus Electrical Systems Subcommittee. It is intended to address the design and application of on-board 120 VAC wiring distribution systems used in trucks to provide power to 'sleeper" cab loads and other vehicle performance functions, such as battery charging, block heater and other cold weather related starting loads when the truck is parked and not idling.

The present draft, in addition to its Scope, Definitions and References, addresses such topics as Insulated Cable, Terminal and Connection Function, Supply Connections, Receptacles, Overcurrent Protection, Switches and Controls, Grounding and Bonding requirements. It also includes recommendations for the manufacturer's factory testing, including a high voltage dielectric test, other tests and visual inspections to ensure proper polarity and continuity, and to verify correct operation of protective devices such as GFCI's and overcurrent protection. Lastly, it addresses Wire Installation and Protection, Markings, Instruction Manual, and Separation of Circuits.

Both the SAE J2698 committee, its members and the Truck Stop Electrification (TSE) Committee have met on several occasions to work together to implement requirements for the offboard Electrified Parking Space Supply Equipment and the on-board truck wiring and distribution systems so that the two are fully functional and compatible.

The Truck Stop Electrification (TSE) Committee has made several suggestions to the SAE J2698 committee for improvements to further align the SAE J2698 Recommended Practice and this code proposal. These comments were related to several of the basic practices and wiring methods identified in the National Electrical Code, and the addition of specific references to Article numbers in the NEC to aid the vehicle designer in better understanding these basic rules. They included improvements to the existing definitions, additional definitions, general references to require all line voltage components and systems to be Listed or Labeled and used in the approved manner when installed, changes to include details relating both external connections and wiring and internal wiring, protection of exposed external wiring and alternative wiring methods, references to the proper use of flexible cord and identification of the types suitable for the application, the use of metallic and/or nonmetallic wiring systems and components, generic dimensional information as a point of reference to locate the position of the inlet(s) on the truck, the need for additional references to other SAE Recommended Practices that define test methods or procedures to evaluate the effects of shock and vibration on the components, identification of bonding requirements, bonding conductor sizing and protection, additional details to better define methods for grounding, to provide grounding continuity, the need to address backfeed from electrical sources on the truck, and so forth.

While the document is still under development, both SAE J2698 committee and the Truck Manufacturers Association (TMA) recognize the need to complete the J2698 document in a timely fashion. It is anticipated that with the support of TMA, the J2698 document can be completed in approximately 12 months and published prior to the adoption of the requirements for Electrified Parking Space Equipment in the National Electrical Code.

Further information regarding SAE J2698 Recommended Practice for Primary Single Phase Nominal 120 VAC Wiring Distribution Assembly Design can be obtained from SAE International, World Headquarters, 400 Commonwealth Drive, Warrendale, PA 15096 or SAE International, Automotive Headquarters, 755 West Big Beaver Road, Suite 1600, Troy, MI 48084.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle

ARTICLE 626

Electrified Truck Parking Space Equipment

626.1 Scope. The provisions of this article cover the electrical conductors and equipment that connect trucks and transport refrigerated units to a supply of electricity, and the installation of equipment and devices related to electrical installations within an electrified truck parking space.

626.2. Definitions. ~~(See Article 100 for additional definitions.)~~

Cable management system An apparatus designed to control and organize unused lengths of cable or cord at electrified truck parking spaces.

Connector. A device that, by insertion into a truck inlet, establishes an electrical connection to the truck for the purpose of providing power for the on-board electric loads and may provide a means for information exchange. This device is part of the truck coupler.

~~Converter. A device that changes electrical energy from one form to another, as from alternating current to direct current.~~

Electrified Truck Parking Space. A truck parking space that has been provided with an electrical system that allows truckers to "plug in" their vehicles while stopped, and use off-board power sources in order to operate on-board systems such as air conditioning, heating and appliances, without any engine idling.

FPN: An electrified truck parking space may also include dedicated parking areas for heavy duty trucks at travel plazas, warehouses, shipper and consignee yards, depot facilities, border crossings, etc. It does not include areas such as the shoulders of on and off highway ramps and access roads, camping and recreational vehicle sites, residential and commercial parking areas used for automotive parking or other areas where ac power is provided solely for the purpose of connecting automotive and other light electrical loads, such as engine block heaters, and at private residences.

~~Electrified~~ Truck ~~Parking Space Supply Equipment, also known as Truck Stop Electrification Equipment. The conductors, including the ungrounded, grounded and equipment grounding conductors, and the connectors, attachment plugs, and all other fittings, devices,~~ interlocking mechanisms, ~~power outlets, circuit breakers, switches, and fuses, and their~~ related ~~accessories, installed specifically for the purpose of delivering energy from the electrified~~ truck ~~parking space wiring system to the truck service equipment~~ .that is ~~intended to constitute the disconnecting means for the supply to the truck.~~

Electrified Truck Parking Space Wiring Systems. All of the electrical wiring, equipment, and appurtenances related to electrical installations within an electrified truck parking space including the electrified parking space supply equipment.

~~Frame. Chassis rail and any welded addition thereto metal thickness of 1.35 mm (0. 053 in.) or greater.~~

Overhead Gantry A structure consisting of horizontal framework supported by vertical columns spanning above electrified truck parking spaces that supports equipment, appliances, raceway and other necessary components for the purpose of supplying electrical, HVAC, internet, communications and other services to the spaces.

Separable Power Supply Cable Assembly. A flexible cord or cable, including ungrounded, grounded, and equipment grounding conductors, provided with a female connector, an attachment plug and all other fittings, grommets, or devices installed for the purpose of delivering energy from the source of electrical supply to the inlet installed within the truck.

Transport Refrigerated Unit (TRU), also known as Refrigerated Transport Units (RTU). A trailer with integrated heating and/or cooling for the purpose of maintaining the desired environment of temperature-sensitive goods or products.

Truck. ~~A heavy-duty vehicular-type unit primarily designed for commercial transportation of goods and equipment, which has its own motive power. It is built on a permanent chassis, typically designed with but not required to include a sleeper berth and without a permanent foundation where connected to the required utilities and that may include heating, air-conditioning, and electric systems contained therein.~~
Motor vehicle primarily designed for the transportation of goods and equipment.

Truck Coupler. A mating truck inlet and connector set.

Truck Flanged Surface Inlet. The device(s) on the truck into which the connector(s) is inserted for providing electric energy. It may also be used for the exchange of information. This device is part of the truck coupler. For the purposes of this Code, the truck flanged surface inlet is considered to be part of the truck and not part of the electrified truck parking space supply equipment.

~~Truck Parking Space. An area within a truck stop set aside and identified for the accommodation of a truck on a temporary basis.~~

Truck Service Equipment~~,~~. The on-board equipment ~~attached to or connected to~~ of the truck containing the disconnecting means, overcurrent protective devices, and flanged surface inlets or other means for connecting the truck to the electrified truck parking space supply equipment.

~~Truck Stop. A plot of land upon which two or more truck parking sites are located,established, or maintained for occupancy by trucks for resting purposes.~~

626.3 Other Articles. Wherever the requirements of other articles of this Code and Article 626 differ, the requirements of Article 626 shall apply.

626.4 General Requirements
(A) Not Covered. The provisions of this article do not apply to that portion of other equipment in residential, commercial or industrial facilities that require electric power for devices used to load and unload cargo and equipment, operate conveyors, and other devices on the site or truck.
(B) Systems. This article covers 120-, 120/208-, or 120/240-volts, nominal, single- or three-phase, 3 or 4-wire ac power supply systems respectively, with ground. Where a different voltage is required by either design or available power supply system, adjustment shall be made in accordance with other articles and sections for the voltage used.
(C) Connection to Wiring System. The provisions of this article shall apply to the electrified truck parking space supply equipment intended for connection to a wiring system as defined in 626.3(A).
(D) Illumination. Illumination shall be required to facilitate safe use of electrified truck parking spaces.

~~5.5 Listed or Labeled. All electrical materials, devices, appliances, fittings, and other equipment shall be listed or labeled by a qualified testing agency and shall be connected in an approved manner when installed.~~

~~**xxx.1. Reserved**~~
I. Electrified Truck Parking Space Electrical Wiring Systems

~~**6.6 Primary**~~ **Distribution Systems**
(B) Distribution System Voltages. Unless other voltages are specified, the nominal ac system voltages of 120, 120/240, 208Y/120, 240, and 480Y/277, ~~and 480 volts~~ shall be used to supply equipment covered by this article.

~~**4.4 Other Articles**. Whenever the requirements of other articles of this Code and Article xxx differ, the requirements of Article xxx apply.~~

~~**(C) Secondary Distribution**~~ **Parking Space Supply System**. The electrified truck parking space secondary electrical distribution system to electrified truck parking space supply equipment shall be single-phase derived from 208Y/120 ~~120/208~~ volt three-phase, four-wire system or 120/240 volt split single-phase system.

Exception: Existing electrified truck parking space equipment may also be provided with a 120-volt distribution system for use by legacy vehicles.

~~**626.8 Underground Service, Feeder, Branch-Circuit, and Electrified Parking Space Feeder-Circuit Conductors**.~~
~~(A) General. All direct-burial conductors, including the equipment grounding conductor if of aluminum, shall be insulated and identified for the use. All conductors shall be continuous from equipment to equipment. All splices and taps shall be made in approved junction boxes or by use of material listed and identified for the purpose.~~
~~(B) Protection Against Physical Damage. Direct-buried conductors and cables entering or leaving a trench shall be protected by rigid metal conduit, intermediate metal conduit, electrical metallic tubing with supplementary corrosion protection, rigid nonmetallic conduit, liquidtight flexible nonmetallic conduit, liquidtight flexible metal conduit, or other approved raceways or enclosures. Where subject to physical damage, the conductors or cables shall be protected by rigid metal conduit, intermediate metal conduit, or Schedule 80 rigid nonmetallic conduit. All such protection shall extend at least 450 mm (18 in.) into the trench from finished grade.~~
~~FPN: See 300.5 and Article 340 for conductors or Type UF cable used underground or in direct burial in earth.~~

10.10 Feeder and Service Load Calculations.
(A) General. The calculated load of a feeder or service shall not be less than the sum of the loads on the branch circuits supplied, as determined by Part II of this article, after any applicable demand factors permitted have been applied.
~~FPN: See Examples D1(A) through D10 in Annex D.~~
(B) Demand Factors. Electrified truck parking space electrical wiring systems are based upon the climatic zone in which the equipment is installed.

12.12 Calculations.
(A) Parking Space VA Electrical service and feeders shall be calculated on the basis of not less than 11000 volt-amperes per electrified truck parking space.
(B) Demand Factors. The demand factors set forth in Table ~~xxx.10~~ 626.12(B) shall be the minimum allowable demand factors that shall be permitted in calculating load for service and feeders.
~~Where the electrical supply for a truck parking space has more than one receptacle, the calculated load shall be calculated for all receptacles.~~ No demand factor shall be allowed for any other load, except as provided in this Code.

Table ~~xxx.10~~ 626.12(B) Demand Factors for Services and Feeders

Climatic Temperature Zone (Hardiness Zone)	Demand Factor (percent)
1	70%
2a	67%
2b	62%
3a	59%
3b	57%
4a	55%
4b	51%
5a	47%
5b	43%
6a	39%
6b	34%
7a	29%
7b	24%
8a	21%
8b	20%
9a	20%
9b	20%
10a	21%
10b	23%
11	24%

*****Table 1-USDA Hardiness Zones and Average Annual Minimum Temperature Range and Figure 1-US Department of Agriculture Plant Hardiness Zone Map Here*****

(C) Two or More Vehicles. Where the electrical supply is in a location that serves two or more trucks, the equipment for each site must comply with ~~xxx.10~~ 626.12(A) and the calculated load shall be computed on the basis of each parking site. ~~No demand factor shall be allowed for any other load, except as provided in this Code.~~

(C) Branch ~~Capacity~~ Rating. Truck site branch circuit conductors shall have an ~~capacity~~ ampacity not less than the loads supplied and shall be rated at not less than 30 amperes.

14.14 Overcurrent Protection. Overcurrent protection shall be provided in accordance with Article 240.

16.16 Grounding. All electrical equipment and installations in truck parks shall be grounded as required by Article 250.

~~**16.17 Reserved**~~

II. Electrified Truck Parking Space Supply Equipment (Off-board)

16.16 Grounding.

(A) Exposed Non-Current-Carrying Metal Parts. Exposed non-current-carrying metal parts of fixed equipment, metal boxes, cabinets, and fittings that are not electrically connected to grounded equipment shall be grounded by a continuous equipment grounding conductor run with the circuit conductors from the service equipment or from the transformer of a secondary distribution system. Equipment grounding conductors shall be sized in accordance with 250.122 and shall be permitted to be spliced by listed means.

The arrangement of equipment grounding connections shall be such that the disconnection or removal of a receptacle or other device will not interfere with, or interrupt, the grounding continuity.

~~(B)~~ ~~Secondary~~ Distribution System Grounding. Each secondary distribution system shall be grounded at the transformer.

(C) ~~Neutral~~ Grounded Conductor Not to Be Used as ~~an~~ Equipment Grounding Conductor. The ~~neutral~~ grounded conductor shall not be used as an equipment grounding conductor for trucks or equipment within the truck park.

(C) No Bonding Connection To The Grounded Conductor on the Load Side. No connection to a grounding electrode shall be made to the neutral conductor on the load side of the service disconnecting means except as covered in 250.30(A) for separately derived systems and 250.32(B)(2) for separate buildings.

~~20.20~~ ~~Clearance for~~ Overhead Conductors~~s~~ Clearance

(A) Conductors Not Over 600 Volts. Open conductors of not over 600 volts, nominal, shall have a vertical clearance of not less than 5.5 m (18 ft.) measured from the surface of the parking lot and a horizontal clearance of not less than 900 mm (3 ft.) in all areas subject to truck movement. In all other areas, clearances shall conform to 225.18 and 225.19.

(B) Conductors Over 600 Volts.

FPN: For clearances of conductors over 600 volts, nominal, see 225.60 and 225.61.

22.22 Wiring Methods and ~~Installation~~ Materials

(D) Electrified Truck Parking Space Supply Equipment Type. The electrified truck parking space supply equipment shall be provided in one of the following forms:

(1) Pedestal.
(2) Overhead Gantry.
(3) Raised Concrete Pad.

(E) Mounting Height. Pedestal and raised concrete pad types of electrified truck parking space supply equipment shall be not less than 600 mm (2 ft.) above ground. ~~or the height of the flood plain level, whichever is greater.~~

(C) Access and Working Space. All electrified truck parking space supply equipment shall be accessible by an unobstructed entrance or passageway not less than 600 mm (2 ft.) wide and not more than 2.0 m (6 ft. 6 in.) high.~~Working Space.~~ Sufficient space shall be provided and maintained about all electrical equipment to permit ready and safe operation, in accordance with 110.26.

~~(D)~~ ~~Facility~~ Disconnecting Means. A disconnecting switch or circuit breaker shall be provided to disconnect one or more electrified truck parking space supply equipment sites from a remote location in the site supply equipment for disconnecting the power supply to a section of the truck stop. The facility disconnecting means shall be provided and installed in a readily visible and accessible location and shall be capable of being locked in the open position.

24.24 Overhead Gantry or Cable Management System

Electrified truck parking space equipment provided from either overhead gantry or cable management systems may be provided with a permanently attached power supply cable. It may also include or be separate from optional hybrid data, communications, optical fiber cables, shielding, etc. The cable or cables terminate in an electrified truck parking space supply equipment module that contains receptacles as described in 626.28 (B). The power supply cable shall be connected directly to the terminals of the panelboard or conductors within a junction box in the equipment and provided with a means to prevent strain from being transmitted to the terminals.

The power supply cable shall be provided with a means to de-energize the cable conductors and power service delivery device upon exposure to strain that could result in either cable damage ~~rapture~~ or separation of the cable from the power service delivery device and exposure of live parts.

26.26 Enclosure Type for Parking Space Equipment and Meters ~~Protection of Outdoor Equipment Wet Locations~~. All switches, circuit breakers, receptacles, control equipment, and metering devices located in wet locations or outside of a building shall be weatherproof equipment. (See section 100-1.) ~~**Meters.**~~ If secondary meters are installed, meter sockets without meters installed shall be ~~blanked off~~ covered with a means identified for the purpose.~~with an approved blanking plate.~~

28.28 Means for Connecting to Electrified Truck Parking Space Supply Equipment

(D) General. Trucks shall be supplied from electrified truck parking space supply equipment through not more than two suitable extra hard service cables or cords. Each connection to the equipment shall be by a single separable power supply cable assembly.

~~(B)~~ ~~Type~~ Receptacles Provided –NEMA Configurations. All receptacles shall be of the grounding type. A maximum of three receptacles shall be provided. Every truck parking space with electrical supply shall be equipped with:

(1) Two 20-ampere, 125-volt single receptacles, NEMA type 5-20R, and

FPN: Complete details of the 15- or 20-ampere plug and receptacle configuration can be found in the National Electrical Manufacturers Association Standard for Dimensions of Attachment Plugs and Receptacles, ANSI/NEMA WD 6 -2002, Figure 5-20.

(2) One 30-ampere, 120/208-volt, 3-pole, 4-wire receptacle.

FPN 1: Complete details of the 30-ampere plug and receptacle configuration can be found in the Standard for Pin and Sleeve Configurations, UL 1686, Configurations section, Parts C2.10 or C3.

FPN 2: See Figure 626.30 (C) for details regarding receptacle types.

Exception: Where electrified truck parking space supply equipment provides the air-conditioning and comfort cooling function without requiring a direct electrical connection at the truck, only the two receptacles identified in 626.21(B)(1) need be provided.

~~Additional receptacles shall be permitted for the connection of electrical equipment outside the truck within the electrified truck parking space.~~

–FPN: For Transport Refrigerated Units (TRU), see Part V~~I~~

(D) Disconnecting Means. The electrified truck parking space supply equipment shall be provided with a ~~disconnecting~~ switch or circuit breaker for disconnecting the power supply to the individual truck service equipment.

~~(E)~~ ~~Switch-Rated or Interlocked Receptacles.~~ Means to Prevent Connection or Disconnection Under Load Each receptacle provided by the electrified truck parking space supply equipment shall be either a switch rated receptacle-plug combination, include an interlocked receptacle with an associated switching device of an interlocking type, or provided with an equivalent means to prevent connection or disconnection under load. The switching device shall be marked with a short circuit current rating.~~rated to close-into and withstand short circuit fault currents of at least 35kA~~. The switch rated receptacle-plug combination, the interlocked plug and receptacle combination, or other means provided shall ensure that the user has no access to live parts.

(E) Ground-Fault Circuit Interrupters (GFCI). The electrified truck parking space equipment shall be designed and constructed such that all receptacle outlets are provided with GFCI protection.

30.30 Separable Power-Supply Cable Assembly.

Where a separable power-supply cable assembly consisting of a cord with a female connector and attachment plug is provided, the vehicle shall be equipped with a permanently mounted, flanged surface inlet in accordance with **626.32(A),** wired directly to the panelboard by an approved wiring method. The attachment plug shall be of a listed type. The power-supply cable assembly or assemblies shall be identified ~~OEM (factory) supplied or OEM or factory approved~~, and be of one of the following types and rating specified herein. Cords with adapters and pigtail ends, extension cords, and similar items shall not be attached to, provided or shipped with a truck.

A. Rating(s).

(1) Twenty-Ampere Power-Supply Assembly. Trucks wired with a 20-ampere, 125-volt truck inlet, in accordance with 626.21(F)(1), shall use a listed 20-ampere power-supply assembly.

Exception: A listed separable power supply cable assembly, either hard-service or extra hard service and rated 15- amperes, 125 volts may be provided for connection to an engine block heater for legacy vehicles.

(2) Thirty-Ampere Power-Supply Assembly. Trucks wired with a 30-ampere, 120/208-volt truck inlet, in accordance with 626.21(F)(2) shall use a listed 30-ampere main power-supply assembly.

(F) Listed Cord Assemblies

(1) Conductors. The cord shall be a listed type with three or four conductors, for single phase connection, one of which shall be identified by a continuous green color for use as the equipment grounding conductor.

Exception: A separate listed three conductor separable power supply cable assembly, having one conductor identified by a continuous green color for use as the equipment grounding conductor, and rated 15 amperes, 125-volts may be provided for connection to an engine block heater for legacy vehicles.

(2) Cord. Extra-hard usage flexible cords and cables rated not less than 194°F (90°C), 600 volts; listed for both wet locations and sunlight resistance; and having an outer jacket rated to be resistant to temperature extremes, oil, gasoline, ozone, abrasion, acids, and chemicals shall be permitted where flexibility is necessary between the electrified truck parking space supply equipment and the panelboard and inlet(s) on the truck.

Exception: Cords for the separable power supply cable assembly for 15 and 20 A connections may be a hard-service type.

(3) Attachment Plug. The attachment plug(s) shall be listed, by itself or as part of a cord set, for the purpose and shall be molded to or installed on the flexible cord so that it is secured tightly to the cord at the point where the cord enters the attachment plug. If a right-angle cap is used, the configuration shall be oriented so that the grounding member is farthest from the cord. Where a flexible cord is provided with an equipment grounding conductor and equipped with an attachment plug, the attachment plug shall comply with 250.138(A) and 250.138(B).

(3) Connection to a 20-Ampere Receptacle. A separable power supply cable assembly for connection to a truck having a 20-ampere inlet shall have an attachment plug that shall be 2-pole, 3-wire, grounding type, rated 20 amperes, 125 volts and intended for use with the 20-ampere, 125-volt receptacle, conforming to the configuration shown in Figure ~~xxx.21(e).~~ 626.30(c)

Exception: A separable power supply cable assembly, rated 15A, provided for the connection of an engine block heater only, shall have an attachment plug that shall be 2-pole, 3-wire, grounding type, rated 15 amperes, 125 volts, conforming to the configuration shown in Figure 626.30(c)~~xxx.21(d)~~.

FPN: Complete details of the 15- or 20-ampere plug and receptacle configuration can be found in the National Electrical Manufacturers Association Standard for Dimensions of Attachment Plugs and Receptacles, ANSI/NEMA WD 6 -2002, Figure 5-15 or 5-20.

(4) Connection to a 30-Ampere Receptacle. A separable power supply cable assembly for connection to a truck having a 30-ampere inlet shall have an attachment plug that shall be 3-pole, 4-wire, grounding type, either:

(a) rated 30 amperes, 120/208 volts and intended for use with the 30-ampere, 120/208-volt receptacle, conforming to the configuration shown in Figure 626.30 and intended for use with 120/208-volt switched receptacle configuration conforming to the configuration shown in Figure 626.30, or

(b) rated 30 amperes, 125/250 volts and intended for use with the 30-ampere, 125/250-volt receptacle, conforming to the configuration shown in Figure 626.30 and intended for use with 125/250-volt receptacle configuration conforming to the configuration shown in Figure 626.30.

FPN: Complete details of the 30-ampere plug and receptacle configuration can be found in the Standard for Pin and Sleeve Configurations, UL 1686, Configurations section, Parts C2.10 or C3.

(MOVE TO 626.30(B))~~The attachment plug(s) shall be listed, by itself or as part of a cord set, for the purpose and shall be molded to or installed on the flexible cord so that it is secured tightly to the cord at the point where the cord enters the attachment plug. If a right-angle cap is used, the configuration shall be oriented so that the grounding member is farthest from the cord.~~

Figure ~~xxx.21~~626.30(c) - Receptacle, Connector, Attachment Plug and Inlet Configurations, 2-Pole,
3-Wire and 3-Pole, 4-Wire Grounding-Types, Used for Electrified Truck Parking Space Supply Equipment, Separable Power Supply Cable Assemblies and Truck Inlets.

~~Connector~~

~~**(1)** The connector for a separable power supply cable assembly, as specified in xxx.21(A)(1), shall be a 2-pole, 3-wire grounding type, rated 20 amperes, 125 volts.~~

~~Exception: The connector for a separable power supply cable assembly, rated 15A, provided for the connection of an engine block heater only, shall have an attachment plug that shall be 2-pole, 3-wire, grounding type, NEMA 5-15R configuration, rated 15 amperes, 125 volts.~~

~~**(2)** The connector for a separable power supply cable assembly, as specified in xxx.21(A)(2), shall be a 3-pole, 4-wire grounding type, either:~~

~~**(c)** rated 30 amperes, 120/208 volts, switched inlet-connector type, conforming to the configuration shown in Figure xxx.21(c) and intended for use with 120/208-volt switched inlet, conforming to the configuration shown in Figure xxx.21(g), or~~

~~**(d)** rated 30 amperes, 125/250 volts, conforming to the configuration shown in Figure xxx.21(b) and intended for use with 125/250-volt inlet, conforming to the configuration shown in Figure xxx.21(f).~~

~~FPN: Complete details of the 30-ampere plug and receptacle configuration can be found in the Standard for Pin and Sleeve Configurations, UL 1686, Configurations section, Parts C2.10 or C3.~~

~~FPN: The connector in xxx.21(E)(2)(b) may be used on a 120/208-volt, single-phase circuit.~~

–(5) Switch-Rated or Interlocked Truck Coupler. Each connector provided by the separable power-supply assembly for use with the electrified truck parking space supply equipment shall be a part of either a switch rated connector-inlet combination, be used with an interlocked connector-inlet combination with an associated switching device of an interlocking type, or provided with an equivalent means to prevent connection or disconnection under load. The switching device shall be marked with a short circuit current rating.~~rated to close-into and withstand short circuit fault currents of at least 35kA.~~

The switch rated connector-inlet combination, the interlocked connector and inlet combination, or other means provided shall ensure that the user has no access to live parts.

32.32 Truck/Vehicle Coupler.

(A) Inlet Rating and Configuration.~~Truck Inlet~~.

(1) Each truck shall be provided with not more than two inlets corresponding to the type and rating of connector of the power-supply cable

Receptacles & Connectors		Plugs & Vehicle Inlets		
(a)	 20-A,125-V, 2-pole, 3wire, grounding type	(d)		15-A, 125-V, 2-pole, 3-wire, grounding type
		(e)		20-A, 125-V, 2-pole, 3-wire, grounding type
(b)		(f)		30-A, 125/250-VAC, 1-phase, 3-pole, 4-wire, grounding type 12 o’clock position
(c)		(g)		30-A, 120/208-V, 1 phase, 3-pole, 4-wire, switched, grounding type

assemblies provided and the rating of the receptacle in the electrified truck parking space supply equipment to which it is intended to be connected. See 626.30(C)

~~(2) Construction and Installation.~~ The truck coupler shall be constructed in accordance with 626.30(C) and be installed so as to guard against inadvertent contact by persons with parts made live from the electrified truck parking space supply equipment or truck. ~~Grounding Pole.~~ The truck coupler shall be provided with a grounding pole, unless part of a system identified and listed as suitable for the purpose in accordance with Article 250. ~~Grounding Pole Requirements.~~ The truck coupler shall be so designed that the grounding pole connection is the first to make and the last to break contact.

(B) Cord ~~Overall~~ Length. The exposed cord length shall be measured from the face of the attachment plug to the point of entrance to the truck or the face of the flanged surface inlet or to the point where the cord enters the truck. The overall length of the cable shall not exceed 7.5 m (25 ft) unless equipped with a cable management system that is listed as suitable for the purpose.

(C) ~~Point of Entrance.~~ Truck/Vehicle Inlet Location The point of entrance of the separable power supply cable assembly to the truck or location of the truck inlet shall be in the exterior wall, either in front of or behind the driver door located at a height of not less than 600 mm (24 in.) and not more than 1.6 m (5.2 ft) above the parking surface.

~~(D) Protection Against~~ Corrosion and Mechanical Damage. Permanent provisions shall be made for the protection of the inlet and truck distribution panel, attachment plug of the power-supply cord and any connector cord assembly or receptacle against corrosion and mechanical damage if such devices are in an exterior location while the truck is in transit.

34.34 Loss of Primary Power ~~Source~~. Means shall be provided such that, upon loss of voltage from the utility or other electric system(s), energy cannot be back fed through the truck and the truck supply equipment to the electrified truck parking space wiring system unless permitted by 626.36.

36.36 Interactive Systems. Electrified truck parking space supply equipment and other parts of a system, either on-board or off-board the vehicle, that are identified for and intended to be interconnected to a vehicle and also serve as an optional standby system or an electric power production source or provide for bi-directional power feed shall be listed as suitable for that purpose. When used as an optional standby system, the requirements of Article 702 shall apply, and when used as an electric power production source, the requirements of Article 705 shall apply.

~~**Reserved**~~

III. Transportation Refrigerated Units (TRU)

38.38 Transport Refrigerated Units. A number of electrified truck parking spaces with electrical supply may each be equipped with additional ac grid power capacity to provide for operation of the heating/refrigeration units. For electrified truck parking space equipment covered by Parts I – III, a separate receptacle shall be provided for Transport Refrigerated Units. This receptacle would be used in addition to the three receptacles mentioned in 626.30(C).

(A) General Requirements ~~Systems.~~ This part covers 208Y/120 ~~120/208~~, 480Y/277 ~~277/480~~-volts, three-phase, 3 or 4-wire ac power supply systems respectively, with ground. Where different voltage is required by either design or available power supply system, adjustment shall be made in accordance with other articles and sections for the voltage used.

(B) Electrified Truck Parking Space Supply Equipment. The electrified truck parking space supply equipment, or portion thereof, providing electrical power for the operation of transport refrigerated units shall comply with Part VI.

~~**(E) Reserved.**~~

40.40 Disconnecting Means and Branch-Circuit Protective Equipment

(A) Disconnecting Means. Disconnecting means shall be provided to isolate each refrigerated unit from its supply connection.

(B) Permitted Disconnect Types. The disconnecting means shall be permitted to consist of a circuit breaker, motor circuit switch, or both, and shall be properly identified as to which receptacle it controls.

(C) Disconnect Location. The disconnecting means shall be readily accessible, located not more than 762 mm (30 in.) from the receptacle it controls, and shall be located in the supply circuit ahead of the receptacle. Circuit breakers or switches located in power outlets complying with this section shall be permitted as the disconnecting means.

(D) Means to Prevent Connection or Disconnection Under Load ~~Switch-Rated or Interlocked Receptacles.~~ Each receptacle provided by the electrified truck parking space supply equipment shall be either a switch rated receptacle-plug combination, include an interlocked receptacle with an associated switching device of an interlocking type, or provided with an equivalent means to prevent connection or disconnection under load. The switching device shall be marked with a short circuit current rating.~~rated to close-into and withstand short circuit fault currents of at least 35kA.~~The switch rated receptacle-plug combination, the interlocked plug & receptacle combination, or other means provided shall ensure that the user has no access to live parts.

(E) NEMA Configuration Receptacle Requirements. ~~Type Receptacles Provided.~~ All receptacles shall be of the grounding type. Every electrified truck parking space intended to provide an electrical supply for transport refrigerated units shall be equipped with either a:

(1) 30 ampere, 480-volt, 3-phase receptacle, or
(2) 60 ampere, 208-volt, 3-phase receptacle.

~~These electrical supplies shall be permitted to include additional receptacles that have configurations in accordance with xxx.21(B).~~

42.42 Power Supply Cable Assembly. Where a power supply cable assembly, consisting of a cord with an attachment plug is provided, it shall be wired directly to the panelboard by an approved wiring method. The attachment plug shall be of a listed type. The power supply cable assembly or assemblies shall be OEM (factory) supplied or OEM or factory approved, and be of one of the following types and rating specified herein. Cords with adapters and pigtail ends, extension cords, and similar items shall not be attached to, provided or shipped with a truck.

(A) Rating(s). The power supply cable assembly shall be listed and rated:
(1) 30 ampere, 480-volt, three phase, or
(2) 60 ampere, 208-volt, three phase.

42.42 Power Supply Cable Assembly ~~Conductors.~~

(A) Listed Cord Assemblies. The cord shall be a listed type with four conductors, for three phase connection, one of which shall be identified by a continuous green color for use as the grounding conductor. ~~Cord.~~ Extra-hard usage cables rated not less than 194°F (90°C), 600 volts; listed for both wet locations and sunlight resistance; and having an outer jacket rated to be resistant to temperature extremes, oil, gasoline, ozone, abrasion, acids, and chemicals shall be permitted where flexibility is necessary between the electrified truck parking space supply equipment and the panelboard and inlet(s) on the truck.

(B) Listed Attachment Plug(s). Where a flexible cord is provided with an equipment grounding conductor and equipped with an attachment plug, the attachment plug shall comply with 250.138(A) and 250.138(B). An attachment plug for the connection of a truck or trailer shall be either:

(1) rated 30 ampere, 480-volt, three phase and intended for use with a 480-volt, three phase receptacle, or

(2) rated 60 ampere, 208-volt, three-phase and intended for use with the 60-ampere, 208-volt, three phase receptacle and intended for use with 208-volt, three phase receptacle.

FPN: Complete details of the 30-ampere and 60-ampere plug configurations can be found in the Standard for Pin and Sleeve Configurations, UL 1686, Configurations section, Part C2 and Part C3.

The attachment plug(s) shall be listed, by itself or as part of the power supply cable assembly, for the purpose and shall be molded to or installed on the flexible cord so that it is secured tightly to the cord at the point where the cord enters the attachment plug. If a right-angle cap is used, the configuration shall be oriented so that the grounding member is farthest from the cord.

(C) Truck/Vehicle ~~Point of~~ Entrance Location. The point of entrance of the power supply cable assembly to the truck or location of the transport refrigerated unit inlet shall be located at a height of not less than 600 m (24 in.) above the parking surface.

~~(D) Protection Against~~ Corrosion and ~~Mechanical~~ Physical Damage. Permanent provisions shall be made for the protection of the power supply cable assembly, attachment plug and any other exposed portions of the transport refrigeration unit distribution system against corrosion and mechanical damage if such devices are in an exterior location while the truck or trailer is in transit.

~~**(E) Reserved.**~~

Panel Statement: The committee agrees with the addition of this new article and has modified its content to follow the NEC style.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 9 Negative: 1

Explanation of Negative:

HEDGES, T.: After doing more research, it appears that with the exception of the definition and use of the coupler between the vehicle and the premises equipment all of the requirements in the proposed article are already a part of the NEC and this new article would only bring them all together in one place for the convenience of the installer and only add cumbersome redundancy to the existing NEC. In addition, this would only help every other special interest group to have their own dedicated section. The designer of these “Electrified Truck Parking Spaces” should have no problem designing an installation to conform with the NEC requirements.

Comment on Affirmative:

LOTTMANN, T.: NEMA is concerned that the 30A 120/208 Volt configuration may be limited to a proprietary configuration of one manufacturer.

ARTICLE 630 — ELECTRIC WELDERS

12-82 Log #2170 NEC-P12 **Final Action: Reject**
(630.11(B))

Submitter: Dann Strube, Strube Consulting
Recommendation: Revise text to read as follows:
"Minimum conductor ampacity shall be permitted to be based...".
Substantiation: The current language requires the use of the demand factors for groups of welders. This restrictive language will now allow the use of larger feeders to provide for future added loads. This requirement is far too restrictive.
Panel Meeting Action: Reject
Panel Statement: The requirement in Section 630.11(B) is for the minimum conductor ampacity. The current language does not require the use of demand factors, it describes the method to be used in order to determine the minimum conductor ampacity. Nothing in this section prohibits the use of larger feeders to provide for future loads; please refer to Section 90.1(B).
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

ARTICLE 640 — AUDIO SIGNAL PROCESSING, AMPLIFICATION, AND REPRODUCTION EQUPMENT

12-83 Log #2360 NEC-P12 **Final Action: Accept in Principle**
(640.2)

Submitter: John H. Schmidt, ABC Television Network
Recommendation: In the definition for Abandoned Audio Distribution Cable, after the words "and not identified for future use with a tag" add the new text "or in a database."
Substantiation: In modern large systems, cables are often identified with a number at each end, and the function of the cable is listed in a database referencing that number. This database should be adequate to identify cables for future use.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 12-94.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
QUAVE, D.: Abandoned cables are widely considered to be products of combustion and should be removed. Any one can install a tag on a cable without ever intending to use it. The term, "or in a database", would be impossible to enforce. Who is responsible for the database and how and where is it to be kept?

12-84 Log #3030 NEC-P12 **Final Action: Accept**
(640.2)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Recommendation: 640.2 Definitions.
Abandoned Audio Distribution Cable. Installed audio distribution cable that is not terminated at equipment and not identified for future use with a tag.
Keep this definition unchanged for consistency.
Substantiation: The definitions of abandoned cable in every article should be identical. The relevant articles are: 640, 645, 725, 760, 770, 800, 820 and 830. The definitions at articles 640 and 725 are already correct as follows:
640.2: Abandoned Audio Distribution Cable. Installed audio distribution cable that is not terminated at equipment and not identified for future use with a tag.
725.2: Abandoned Class 2, Class 3, and PLTC Cable. Installed Class 2, Class 3, and PLTC cable that is not terminated at equipment and not identified for future use with a tag.
The additional wording in this definition causes confusion. Proposals are being made to make changes to the definitions in articles 770, 800, 820 and 830, and to add a general definition into article 645 and into article 100.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
QUAVE, D.: Abandoned cables are widely considered to be products of combustion and should be removed. Anyone can install a tag on a cable without ever intending to use it.

12-85 Log #2685 NEC-P12 **Final Action: Accept in Principle**
(640.2. Abandoned Audio Distribution Equipment Cable)

Submitter: Charles M. Trout, Maron Electric Co. Inc.
Recommendation: Revise 640.2 Abandoned Audio Distribution Cable to read:
Installed audio distribution cable that is not terminated at equipment and not identified for future use with a tag which is of a material impervious to the deleterious effects of temperature and dampness. The tag shall be resistant to the effects of gnawing by rodents. The tag shall contain the following information:
(1) Date tag was installed.
(2) Date of intended use of disconnected cable.
(3) Drawing or file number containing information relating to intended future use of disconnected cable.
The date of intended use of disconnected cable shall not exceed 90 days from date of disconnection.
Substantiation: Abandoned cables are a growing problem in the industry. These cables are left for others to deal with when present users discontinue their operation. Understanding this problem, the removal of abandoned cables, is required by Articles 640, 645, 725, 760, 770, 800, 820 and 830. 640.3(A) requires the removal of abandoned audio distribution cables. Tagging of cables intended for future use without a method of ensuring the intention of future use invites tagging of cables to avoid the responsibility of their proper removal.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 12-94.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
QUAVE, D.: See Explanation of Negative for Proposal 12-84.
WHITE, K.: My vote is negative because of the following restrictions:
● providing a tag that is gnawing rodents resistant
● A cable that is identified for future use is usually not defined when the use will occur and how it will be used.
Comment on Affirmative:
JOHNSON, R.: See my Explanation of Negative Vote on Proposal 12-94.

12-86 Log #2246 NEC-P12 **Final Action: Reject**
(640.3)

Submitter: Keith Campbell, K.B. Campbell & Associates, Inc. DE Camb, Inc. B.E.S.I.
Recommendation: Regarding: Article 640, Section 3, subsection 3 - that: Chapter 5 relating to 600 volt machines, on direct current (DC) mains, linked to school AC systems – freon gases – off: 600 volts machine control centers: On AC.
Substantiation: That, systems linked to neurological equipment/appliances, as per: Article 640, Section 3, subsection (j) of the NEC-2005.
For the National Fire Protection Assoc. (NFPA), that factors ruled by the: U.S. NEC but not in compliance with: subterranean electrical grids, roadways and sidewalks.
Note: Supporting Material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The proposed changes fail to comply with Section 4-3.3 of NFPA Regulations Governing Committee Projects. A clear recommendation fails to exist.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-87 Log #3002 NEC-P12 **Final Action: Accept in Principle**
(640.3)

Submitter: Marcelo M. Hirschler, GBH International
Recommendation: Revise text to read as follows:
640.3 Locations and Other Articles.
Circuits and equipment shall comply with 640.3(A) through 640.3(L), as applicable.
(A) Spread of Fire or Products of Combustion. ~~The accessible portion of abandoned~~ Abandoned audio distribution cables shall be removed. Removal of abandoned cables shall not damage the building structure or finish and shall not compromise the performance of adjacent wiring systems or components. See 300.21.
Substantiation: This comment recommends a change in wording to ensure that abandoned cables are removed and to prevent confusion in future. There have been multiple proposals that would permit some cables to remain in "inaccessible spaces". This is not conducive to safe electrical practice; this the key change is the elimination of the words "the accessible portion of".
If the intent of the code-making panel was to clarify that removal of cable should not be done if such removal would damage the building, which is

obviously not the intent, a second sentence can be added stating that removal of abandoned cables shall not be performed if it would damage the building structure or finish or in any way compromise the functional performance of any other wiring systems or components. This would be accomplished by the optional added sentence.

Consistent wording on removal of abandoned cables is being proposed for sections: 640.3, 725.3, 770.3, 770.154, 800.3, 800.154, 820.3, 820.154 and 830.3.

For information, see the relevant definitions in the NEC.

Accessible (as applied to equipment). Admitting close approach; not guarded by locked doors, elevation, or other effective means.

Accessible (as applied to wiring methods). Capable of being removed or exposed without damaging the building structure or finish or not permanently closed in by the structure or finish of the building.

Accessible, Readily (Readily Accessible). Capable of being reached quickly for operation, renewal, or inspections without requiring those to whom ready access is requisite to climb over or remove obstacles or to resort to portable ladders, and so forth.

Concealed. Rendered inaccessible by the structure or finish of the building. Wires in concealed raceways are considered concealed, even though they may become accessible by withdrawing them.

Isolated (as applied to location). Not readily accessible to persons unless special means for access are used.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Proposal 12-94.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

12-88 Log #3105 NEC-P12 **Final Action: Reject**

(640.3)

Submitter: Donald Hall, Corning Cable Systems

Recommendation: Revise text to read as follows:

640.3 Locations and Other Articles.

Circuits and equipment shall comply with 640.3(A) through 640.3(L) as applicable.

(A) Spread of Fire or Products of Combustion. 300.21 shall apply. ~~The accessible portion of a~~ Abandoned audio distribution cables shall be removed.

Also, add the following FPN to 640.3(A):

<u>FPN: ANSI/NECA/BICSI 568-2001, Standard for Installing Commercial Building Telecommunications Cabling, and other industry standards provide recommended cable installation practices which facilitate the eventual removal of cables as they become abandoned.</u>

Substantiation: Abandoned cable should be removed to reduce unnecessary accumulation of fuel load and promote electrical safety. It is not reasonable or necessary to install cables in a manner that prevents their eventual removal.

The proposed FPN will provide useful information to architects, system designers, and installers to help minimize the cost and inconvenience of removing abandoned cable.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 12-94.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

12-89 Log #2804 NEC-P12 **Final Action: Accept**

(640.3(A))

Submitter: Harold C. Ohde, IBEW #134

Recommendation: Revise text to read as follows:

640.3 Locations and Other Articles. No change

(A) Spread of Fire or Products of Combustion. ~~The accessible portion of abandoned audio distribution cables shall be removed. See~~ 300.21 <u>shall apply.</u>

Substantiation: The requirements for removal of abandoned audio distribution cable would be better suited in appropriate code section within Article 640. I have submitted another proposal that would move the abandoned audio distribution cable requirements to 640.5 - Mechanical Execution of Work. The abandoned audio distribution cable requirements are out of place in 640.3 - Other Articles. The requirements are not part of another Article as they are part of Article 640 and are located within Article 640.

The addition of the words “shall apply” would incorporate language that is consistent with 800.3, 820.3 and 830.3.

Similar proposals have been submitted for 725.3, 760.3, 770.3, 800.3, 820.3, and 830.3 to revise these sections as well.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

12-90 Log #1068 NEC-P12 **Final Action: Reject**

(640.4)

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Delete present text and substitute: Amplifiers, loudspeakers, and other equipment shall be protected where subject to physical damage and shall be identified as suitable for the environment in which they are installed.

Substantiation: Environmental exposure is not identified. Re: exposure type; unless hermetically sealed all equipment is exposed to the environment. Environmental exposure or physical damage that might result in shock, fire, or personal hazard is subjective and cannot be specifically determined.

Panel Meeting Action: Reject

Panel Statement: The current requirement does not require protection from “environmental exposure.” It requires protection against “environmental exposure such as might result in fire, shock, or personal hazard”.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

12-91 Log #887 NEC-P12 **Final Action: Accept in Principle**

(640.6)

Submitter: Noel Williams, Noel Williams Consulting

Recommendation: Revise 640.6 as follows:

“...Cables installed exposed ~~on the surface of ceilings and sidewalks~~ shall be supported in such a manner...The installation shall conform to 300. ~~4~~ (D) and 300.11.” (other portions to remain unchanged.)

Substantiation: Current cable support rules apply only to cables exposed to view (on surfaces). Cables above ceilings are “exposed” as defined, but such cables are only required to be “neat and workmanlike.” All of 300.4 should apply. There is no reason to require physical protection only for cables run parallel to framing.

Panel Meeting Action: Accept in Principle

The panel accepts the deletion of “(D)” from “300. 4” and adds “(A)” after “300.11”

Panel Statement: The panel agrees with the intent and editorially corrected the reference to 300.4. The panel added the condition (A) to “300.11”

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

12-92 Log #1362 NEC-P12 **Final Action: Accept**

(640.6)

Submitter: Mike Holt, Mike Holt Enterprises

Recommendation: Add “Cable Ties” to the list of approved supporting methods

640.6 Mechanical Execution of Work.

Equipment and cables shall be installed in a neat workmanlike manner. Cables installed exposed on the surface of ceilings and sidewalls shall be supported in such a manner that the cables will not be damaged by normal building use. Such cables shall be supported by straps, staples, <u>cable ties,</u> hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall conform to 300.4(D) and 300.11.

Substantiation: This is being proposed in an effort to create uniform language with the chapter three cable wiring method support sections, specifically, 230.30(A), 330.30(A) and 334.30. Similar proposals are also being made to 725.8, 760.8, 770.24, 800.24, 820.24 and 830.24

Panel Meeting Action: Accept

Panel Statement: This change is in addition to the changes made in Proposal 12-94.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

LOTTMANN, T.: NEMA is in agreement with the panel action and offers the following additional comments. UL1565 provides requirements for listed cable ties intended for primary support of flexible conduits and cables in accordance with the NEC. Such cable ties must have a minimum loop tensile strength rating of 23 kg (50 lbs) or greater. Accept the proposed addition in the third sentence, but add the following new fourth sentence. <u>Cable ties that provide primary support for such cables shall have a minimum loop tensile strength of 23 kg (50 lbs).</u>

NEMA also recommends that the Technical Correlating Committee submit a comment to Code Panel 7 suggesting that the following be considered during the ROC stage.

320.30(A) Add new second sentence as follows:

<u>Cable ties that provide primary support for such cables shall have a minimum loop tensile strength of 23 kg (50 lbs.)</u>

330.30(A) Add new second sentence as follows:

<u>Cable ties that provide primary support for such cables shall have a minimum loop tensile strength of 23 kg (50 lbs.)</u>

334.30(A) Add new third sentence as follows:

<u>Cable ties that provide primary support for such cables shall have a minimum loop tensile strength of 23 kg (50 lbs.)</u>

12-93 Log #1859 NEC-P12 **Final Action: Accept in Principle**

(640.6)

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industry Solutions

Recommendation: In the final sentence, delete the reference to 300.11 as follows:

“The installation shall also conform with 300.4(D) ~~and 300.11~~ .”

Substantiation: The requirement added by Panel 12 during the 2005 revision cycle is overly restrictive and inappropriate for audio conductors. The Fine Print Note associated with 640.6 presently directs the reader to the appropriate installation practices for such wiring and cabling. Section 300.11 is directed toward power cable assemblies that are heavier, larger and operate at greater voltage and current levels than audio cables. Deletion of the reference to 300.11 will yield consistency throughout the NEC as Panel 3 did not see fit to adopt this reference in Articles 760 and 725.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Proposal 12-94.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

12-94 Log #3049 NEC-P12 **Final Action: Accept in Principle in Part (640.6)**

TCC Action: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the Panel as a Public Comment.

The Technical Correlating Committee will have a Task Group appointed to review the issues raised in this proposal.

Submitter: Harold C. Ohde, IBEW #134

Recommendation: Revise 640.6 as follows:

640.6 Mechanical Execution of Work

(A) Neat and Workmanlike Manner. Audio signal processing, amplification, and reproduction equipment, cables and circuits shall be installed in a neat and workmanlike manner.

(B) Installation of Audio Distribution Cables . Cables installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the audio distribution cables will not be damaged by normal building use. Such cables shall be secured by listed straps, staples, hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also comply with 300.4(D) and 300.11.

FPN: Accepted industry practices are described in ANSI/NECA/BICSI 568-2001, *Standard for Installing Commercial Building Telecommunications Cabling,* and other ANSI-approved installation standards.

(C) Abandoned Audio Distribution Cables. Abandoned audio distribution cables shall be removed.

FPN: Accepted industry practices are described in ANSI/NECA/BICSI 568-2001, Standard for Installing Commercial Building Telecommunications Cabling, and other ANSI-approved standards which provide cable installation that facilitates the removal of abandoned cables.

Substantiation: This proposal revises this section into a practical working tool which will assist in making 640.6 a clear, usable and enforceable code. Each first level subdivision contains a code rule that requires action and the required action has been presented in clear, usable and enforceable manner.

In the electrical industry, the electrician, contractor and AHJ have been taught the importance and significance of the concept of mechanical execution of work. I am an electrical instructor who teaches this important concept to the people involved. This in one of the basis for 90.1(A) which serves as the purpose of this Code. The Code's purpose is to provide a safe installation from hazards arising from the use of electricity.

The revised text in 640.6(A) will require all audio signal processing, amplification, and reproduction equipment, cables and circuits to be installed in a neat and workmanlike manner.

640.6(B) is an editorial change with additional language to require the means of securing and supporting to be listed for the purpose.

The addition of 640.6(C) would replace the requirement that was in 640.3(A). It makes sense to have the requirements of both the installation of cable and the removal of cable in the same Code section. This would provide the proper guidance to everyone involved. The installer, contractor and the AHJ would gain from this revised section as the rules are centrally located in one Code section. If audio distribution cable is installed properly then the removal of audio distribution cable should be no problem if it is not needed anymore or abandoned. The proposed FPN will provide useful guidance and information to everyone involved regarding correct installation practices which would facilitate the removal of the cable as well.

Similar proposals have been submitted for 725.8, 760.8, 770.24, 800.24, 820.24, and 830.24.

Panel Meeting Action: Accept in Principle in Part

Revise 640.6 to read as follows:

640.6 Mechanical Execution of Work

(A)Neat and Workmanlike Manner. Audio signal processing, amplification, and reproduction equipment, cables, and circuits shall be installed in a neat and workmanlike manner.

(B)Installation of Audio Distribution Cables. Cables installed exposed on the surface of ceilings and sidewalls shall be supported in such a manner that the audio distribution cables will not be damaged by normal building use. Such cables shall be secured by straps, staples, hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also comply with 300.4 and 300.11(A).

(C) Abandoned Audio Distribution Cables. Abandoned audio distribution cables shall be removed.

(D) Installed Audio Distribution Cable Identified for Future Use.

(1) Cables identified for future use shall be marked with a tag in accordance with the following:

(a) Tag is impervious to the effects of temperature and dampness

(b) Tag is resistant to the effects of gnawing by rodents

(2) Cables shall have the following information on the tag or in a database:

(a) Date cable was identified for future use

(b) Date of intended use

(c) Information relating to the intended future use of cable

Panel Statement: This action combines several proposals addressing similar issues about abandoned audio distribution cables.

The pharse "by the building structure" was deleted because the present wording of Section 640.6 does not include these words. During the 2005 NEC revision cycle CMP, 12 deleted this requirement because some AHJs were interpreting this to mean that only the structural building components could be used to support cables, thus eliminating support to materials such as sheetrock.

The reference to Section 300.11 was modified to reflect that subsection (A) and all of 300.4 would apply.

The fine print notes were deleted because numerous standards and installation manuals exist and to only mention one does not adequately inform the public about accepted industry practices. The NEC is not intended to be an instruction manual for untrained persons.

Part (D) was inserted in this section so that all the requirements for "Installed Audio Distribution Cables Identified for Future Use" could be contained in one place.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 9 Negative: 3

Explanation of Negative:

JANIKOWSKI, R.: Tagging of abandoned Audio Distribution cable. What is "resistant to gnawing by rodents"? How do I enforce?

Information on abandoned cables kept in a database. Inspector has no idea which abandoned cables are in the database. Inspector has no access to database and an electronic database can be easily modified.

JOHNSON, R.: Delete the proposed 640.6(D)(1)(6).

~~(b) Tag is resistant to the effects of gnawing by rodents~~ .

The need for this requirement has not been justified. Resistance criteria have not been established. With this change I would support the panel action. I request the correlating committee address the consistency of abandoned cable requirements with other code sections and recent panel actions.

WHITE, K.: My vote is negative because of the following restrictions:

• providing a tag that is gnawing rodents resistant

• A cable that is identified for future use is usually not defined when the use will occur and how it will be used.

Comment on Affirmative:

QUAVE, D.: The panel action to accept in principle in part is proper, however, the panel should have accepted the submitter's proposal that the securing of these cables should be listed straps, staples, hangers, or similar fittings...If these supports are not required to be listed, string fishing line, duct tape and other items would all be acceptable if the present wording is used. Part D should be eliminated. Abandoned cables are widely considered to be products of combustion and should be removed. Anyone can install a tag on a cable without ever intending to use it. The term, "or in a database", would be impossible to enforce. Who is responsible for the database and how and where is it to be kept?

12-95 Log #2885 NEC-P12 **Final Action: Accept in Principle (640.6, FPN)**

Submitter: Ron Alley, ELECTRICO

Recommendation: Delete the following FPN:

~~FPN: Accepted industry practices are described in ANSI/NECA/BICSI 568-2001, Standard for Installing Commercial Building Telecommunications Cabling, and other ANSI approved installation standards.~~

Substantiation: Numerous consensus standards from organizations such as Electronics Industry Association (EIA), Telecommunication Industry Association (TIA), Underwriters Laboratories Inc. (UL), NEMA and IEEE and IEC/ISO could be added as a Fine Print Note throughout the Code to assist the reader of the NEC as the existing FPN notes do. There are just as many publications such as Telecommunications Cabling Installation, Network Cabling, Telecommunications Cable Splicing, Communications Cabling, Telecommunications Internetworking and too many others to mention, that could be listed in a FPN that would benefit the reader. Also, there are safety regulations, pertaining to telecommunication systems such as OSHA 1910 and OSHA 1926 that could be added as a Fine Print Note to assist readers to make their companies and workers safer. Adding a Fine Print Note for the purpose of informing the reader of all related standard and publications would be cumbersome. The NEC should list all prominent standards and publications in a FPN or it should list none.

The particular standard mentioned in the FPN, (ANSI/NECA/BICSI 568-2001 (Installing Commercial Building Telecommunications Cabling) contains only 46 pages. The Standard mentioned in the FPN is very basic. It lists only a small percentage of the terminations used in the industry. Also, only a limited number of communications cables are shown and their limitations are not discussed.

The standard does not contain enough information to be used as a stand alone document without the use of other standards and text books that are not mentioned in the FPN. In my opinion the ANSI standard listed in the FPN should never be used instead of manufacturer's instructions.

Manufacturer's instructions are sometimes required to be included as a condition of listing or labeling of telecommunications equipment and are sent with the listed or labeled products or can be requested from the manufacturer prior to installation. Manufacturers instructions are updated as needed to keep up with product improvements. The FPN in the 2005 Code most likely will not be as up to date as the manufacturer's instructions.

If the committee decides to keep the FPN, please consider modifying the FPN as follows:

ANSI/NECA/BICSI 568-2001 Standard for Installing Commercial Building Telecommunications Cabling is one source of many that can be used along with manufacturer's instructions.

Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 12-94.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-96 Log #1760 NEC-P12 **Final Action: Accept in Principle**
(640.6 Exception)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reported as "Accept in Principle" to correlate with the Panel Actions on Proposals 12-94 and 12-91.
Submitter: Percy E. Pool, Verizon NS
Recommendation: Add the following exception to 640.6:
"Exception: 300.1(C) shall not apply."
Substantiation: 300.11(C) is clearly not applicable to audio cabling. Audio cables are typically lashed together to form a "cable assembly". This frequently occurs during modifications or additions to an existing installation. Audio cables are physically smaller, lighter and carry less voltage and current than power cables. It is overly restrictive to prohibit lashing of audio cables together to form a cable assembly. Audio cables secured in this manner have adequate support (see 300.11(A)), are supported independently of the suspended ceiling grid, and are not likely to collapse in the event the suspended ceiling collapses. Such restriction imposes additional installation costs with no improvement in safety.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposals 12-94 and 12-91.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-97 Log #1062 NEC-P12 **Final Action: Reject**
(640.7(A))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Delete "in accordance with the requirements of Article 250".
Substantiation: Edit. To comply with the Style Manual. Article 250 already applies per 90.3.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 12-15.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-98 Log #921 NEC-P12 **Final Action: Reject**
(640.7(A) and (C))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: In the first sentence of (A) delete "In accordance with the requirements of Article 250".
In (C) delete " in compliance with Article 250."
Substantiation: The Style Manual indicates references should not be made to entire Articles. 90.3 indicates Articled 250 applies unless amended.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 12-15.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-99 Log #1033 NEC-P12 **Final Action: Reject**
(640.8)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:
Insulated conductors of different systems grouped or bundled ~~so as to be in close~~ with physical contact between different systems conductors, or in the same raceway, cable tray, auxiliary gutter , or enclosure, ~~or in portable cords or cables~~ shall comply with 300.3(C)(1).
Substantiation: Edit. A physical contact by definition has to be "close". Cable tray is not a raceway and auxiliary gutters may not be deemed a raceway (see definition of raceway). Portable cables (inferred to be flexible cords) of 640.21 for power supply conductors are not permitted by 640.9(A) and (B).
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any definitive technical substantiation that a problem exists with the present wording. The panel disagrees with the submitter's substantiation that the change is editorial in nature.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-100 Log #1034 NEC-P12 **Final Action: Reject**
(640.9(A)(2)and (3) and (B))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: In (A) change "Article 647" to "647.3".
Revise (3):
OTHER WIRING . All wiring not ~~connected to~~ parts of the premises power wiring system ~~or to a wiring system separately derived from the premises wiring system~~ shall comply with Part I, II, and III of Article 725, as applicable .
In (B) insert "Parts I, II, and III" ahead of "Article 725".
Delete the last sentence.
Substantiation: Edit. References should not be made to entire articles. In (3), unless wiring is supplied from a stand alone power system it will be connected to the premises wiring system whether directly connected or through transformers, rectifiers, etc. (see definition of premises wiring system in Article 100). The last sentence of (B) is covered by 90.3.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any definitive technical substantiation that a problem exists with the present wording. The panel disagrees with the submitter's substantiation that the change is editorial in nature.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-101 Log #31 NEC-P12 **Final Action: Accept in Principle**
(640.11 (New) & 640.3(A))

Submitter: Stanley Kaufman, Cable Safe Inc.
Recommendation: Revise as follows:
640.11. Abandoned Cables. The accessible portion of abandoned audio distribution cables shall be removed.
640.3(A) Spread of Fire or Products of Combustion. T ~~he accessible portion of abandoned audio distribution cables shall be removed~~ . See 300.21.
Substantiation: The title of Section 640.3 is "Locations and Other Articles". The requirement for the removal of abandoned cables is not in another article; it is in Article 640. It is out of place in section 640.3. This proposal will move it to a new section of Article 640.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 12-94.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-102 Log #2647 NEC-P12 **Final Action: Reject**
(640.30)

Submitter: Robert W. Jensen, dbi / Rep. BICSI, A Telecommunications Association
Recommendation: Move to a new section:
640.30 Abandoned Cables. The accessible portion of abandoned audio distribution cables shall be removed.
Remove wording in 640.3(A) "The accessible portion of abandoned audio distribution cables shall be removed."
Substantiation: The title of Section 640.3 is "Other Articles". The requirement for the removal of abandoned cables is not in another article; it is in Article 640. It is out of place in section 640.3. This proposal will move it to a new section of Article 640.
Panel Meeting Action: Reject
Panel Statement: The moving of this portion of 640.3(A) to 640.30 would then only require that cabling for permanent audio systems be removed and allowing portable and temporary installations to remain. It is widely accepted that abandoned cables are combustible materials and should be treated as such, removed, whether deemed permanent or portable. See panel action and statement on Proposal 12-94.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 645 — INFORMATION TECHNOLOGY EQUIPMENT

12-103 Log #2330 NEC-P12 **Final Action: Reject**
(645(D)(5)(d) (New))

Submitter: Ronald Marts, Telcordia Technologies / Rep. Bellsouth, Cincinnati Bell, SBC, Ameritech, PacBell, Qwest, Southern New England Telephone
Recommendation: Add a new 645(D)(5)(d) as follows:
(d) Power supply cord of listed information technology equipment plugged into receptacles under the raised floor when only the portion of the cord required to make the connection occupies the plenum free air space.
Substantiation: The current wording of 645.5(D) is reasonable for long runs of power supply circuits, interconnecting cables and communications cables. It is not appropriate for extremely short connections of cord sets extending only a few inches below the floor in order to plug a single item of information technology (IT) equipment into a receptacle. Although the safety issue seems to be intuitive, I can find no substantiation that such short lengths of cords constitute a safety hazard. A review of NFPA fire reports on data center fires, which are infrequent, does not suggest that cord sets have contributed to the spread of either fire or products of combustion.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 12-114.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
JOHNSON, R.: The panel has refused to prohibit and also refused to allow flexible power cords under raised floors. Submitters have requested resolution of this ambiguous issue for many code cycles. The panel should vote to accept this commonly used practice which has been shown to be safe in practice.
SATO, C.: See Reason for Negative vote on panel action on Proposal 12-114.
Comment on Affirmative:
CROUSHORE, T.: The National Electrical Code does not prohibit power supply cords from listed information technology equipment from being plugged into the receptacles beneath the raised floor.
JONES, R.: This issue of power supply cords of listed information technology equipment has been going on for several years. The IT industry has done a very poor job in addressing the problem of power supply cords being allowed under raised floors. A presentation was made at the ROP meeting and additional information was given to panel members. The ROP meeting is not the proper place to be presenting new information. The IT industry should have requested a Task Group be formed with members of CMP 12, members of NFPA 75, and individuals within the IT industry.

12-104 Log #2648 NEC-P12 **Final Action: Reject**
(645.2)

Submitter: Robert W. Jensen, dbi / Rep. BICSI, A Telecommunications Association
Recommendation: Add new text to read:
645.2 Definitions
Abandoned Audio Distribution Cable. The definition in 640.2 shall apply.
Abandoned Class 2, Class 3, and PLTC Cable. The definition in 725.2 shall apply.
Abandoned Fire Alarm Cable. The definition in 760.2 shall apply.
Abandoned Optical Fiber Cable. The definition in 770.2 shall apply.
Abandoned Communications Cable. The definition in 800.2 shall apply.
Abandoned Coaxial Cable. The definition in 820.2 shall apply.
Abandoned Network-Powered Broadband Communications Cable. The definition in 830.2 shall apply.
Abandoned Type DP Cable. Installed Type DP cable that is not terminated at equipment and not identified for future use with a tag.
Substantiation: Article 645 has a requirement for removal of abandoned cables without a definition of abandoned cables. Sections 640.2, 725.2, 760.2, 770.2, 800.2, 820.2 and 830.2 already have definitions for the types of cables used within their articles. Accordingly, this proposal references the existing abandoned cable definitions and proposes a new definition for “abandoned Type DP cable”. Referencing the existing definitions in other articles of the code will bring about correlation.
Panel Meeting Action: Reject
Panel Statement: With the exception of Type DP cable, these cable types are not referenced in Article 645.
See panel action and statement on Proposal 12-116.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-105 Log #3028 NEC-P12 **Final Action: Accept in Principle**
(645.2)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Recommendation: Add text to read as follows:
645.2 Definitions.
Abandoned Cable. Installed cable that is not terminated at equipment and not identified for future use with a tag.
Substantiation: The definitions of abandoned cable in every article should be identical. The relevant articles are: 640, 645, 725, 760, 770, 800, 820 and 830. The definitions at articles 640 and 725 are already correct as follows:
640.2: Abandoned Audio Distribution Cable. Installed audio distribution cable that is not terminated at equipment and not identified for future use with a tag.
725.2: Abandoned Class 2, Class 3, and PLTC Cable. Installed Class 2, Class 3, and PLTC cable that is not terminated at equipment and not identified for future use with a tag.
The additional wording in the definitions in articles 760, 770, 800, 820 and 830 cause confusion. Proposals are being made to make changes to the definitions in articles 770, 800, 820 and 830, and to add a general definition into article 645 (the present one) and into article 100.
Panel Meeting Action: Accept in Principle
.**Panel Statement:** See panel action and statement on Proposals 12-106 and 12-116.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
QUAVE, D.: See my Explanation of Negative on Proposal 12-84.

12-106 Log #2687 NEC-P12 **Final Action: Accept in Principle in Part**
(645.2. Abandoned Supply Circuits and Interconnecting Cables)

Submitter: Charles M. Trout, Maron Electric Co. Inc.
Recommendation: Add new 645.2 Definitions. Abandoned Supply Circuits and Interconnecting Cables to read:
Installed supply circuits and interconnecting cables that are not terminated at equipment and not identified for future use with a tag which is of a material impervious to the deleterious effects of temperature and dampness. The tag shall be resistant to the effects of gnawing by rodents. The tag shall contain the following information:
(1) Date tag was installed.
(2) Date of intended use of disconnected cable.
(3) Drawing or file number containing information relating to the intended future use of disconnected cable.
The date of intended use of disconnected cable shall not exceed 90 days from date of disconnection.
Substantiation: Abandoned cables are a growing problem in the industry. These cables are left for others to deal with when present users discontinue their operation. Understanding this problem, the removal of abandoned cables, is required by Articles 640, 645, 725, 760, 770, 800, 820, and 830. 645.5(D)(6) requires the removal of abandoned cables but Article 645 does not define abandoned cables. Tagging of cables intended for future use without a method of ensuring the intention of future use invites tagging of cables to avoid the responsibility of their proper removal.
Panel Meeting Action: Accept in Principle in Part
The panel accepts the definition revised to read:
Abandoned Supply Circuits and Interconnecting Cables. Installed supply circuits and interconnecting cables that are not terminated at equipment and not identified for future use with a tag.
The panel rejects the remainder of the proposal.
Panel Statement: The new definition is added to define abandoned cables. See the panel action and statement on Proposal 12-116.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3
Explanation of Negative:
JOHNSON, R.: Delete as shown: “ ~~The tag shall be resistant to the effects of gnawing by rodents~~ .” The need for this requirement has not been justified. Resistance criteria has not been established. With this change I would support the panel action.
QUAVE, D.: See my Explanation of Negative on Proposal 12-84.
WHITE, K.: My vote is negative because of the following restrictions:
- providing a tag that is gnawing rodents resistant
- A cable that is identified for future use is usually not defined when the use will occur and how it will be used.

12-107 Log #2378 NEC-P12 **Final Action: Reject**
(645.4, FPN)

Submitter: Allen C. Weidman, The Society of the Plastics Industry, Inc.
Recommendation: Revise as follows:

~~FPN: For further information on room construction requirements, see~~ NFPA 75 ~~-2003,~~ ~~*Standard for the Protection of Information Technology Equipment* , Chapter 5.~~

FPN: Use of Article 645 is based on the assumption that construction, furnishings, and operation of the information technology equipment (ITE) room complies with NFPA 75, *Standard for the Protection of Information Technology Equipment.* For those ITE rooms constructed, furnished, and operated in accordance with NFPA 75, Article 645 contains electrical installation requirements that are less stringent than the requirements in the first four chapters of the *Code* and Articles 725, 760, 770, 800 and 820 . Application of these provisions is contingent on the ITE room construction and equipment meeting all five provisions specified in 645.4, as well as meeting furnishing and operation requirements of NFPA 75. For example, the provisions for wiring installations in the space beneath the raised floor of an ITE room where that space is also used for environmental air are less stringent than those in Chapters I through 4 and Articles 725, 760, 770, 800 and 820 for that same type of space. The less restrictive provisions in Article 645 cannot be taken advantage of if any one of the conditions specified in 645.4 is absent.

Substantiation: The scope of article 645 is not understood by many users. Some users want the less stringent requirements of this article without meeting **all** the special requirements of 645.4. While the existing fine print note is useful, the explanatory material in the NEC Handbook provides additional useful information and is unequivocal in explaining that dispensations of this article are not available unless all the requirements of 645.4 are met. The Handbook also clearly states the underlying assumption in Article 645- that the room is constructed to comply with NFPA 75 whereas the existing fine print note only states "For further information on room construction requirements, see NFPA 75 -2003.. " NFPA 75 also contains requirements for the furnishing and operations within the ITE room that are necessary in order for the requirements of Article 645 to apply.

The proposed text is based on the NEC Handbook but is not an exact excerpt.

Panel Meeting Action: Reject

Panel Statement: The revised FPN does not add clarity. The first sentence of 645.5 states "This article shall apply, provided all of the following conditions are met." The five conditions are listed. The existing FPN is very clear as written. Also NFPA 75 defines ITE room construction, requirements, and furnishings and operations within the ITE room. The submitter has not presented any definitive technical substantiation supporting a problem with the current text of the FPN.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

12-108 Log #1706 NEC-P12 **Final Action: Accept**
(645.4(6))

TCC Action: The Technical Correlating Committee understands that this new Section follows the existing FPN to 645.4(5). The Technical Correlating Committee directs that the panel add a title to the new section. This action will be considered by the Panel as a Public Comment.

Submitter: Charles M. Trout, Maron Electric Company
Recommendation: Add a new 645.4(6) to read:

Except for lighting and its controls no electrical distribution equipment or wiring, other than that which supplies the information technology equipment and its associated equipment and a dedicated heating/ventilating/air-conditioning (HVAC), shall be installed in the information technology room.

Exception: Communications systems such as telephone, shall be permitted to be installed.

Substantiation: Relaxation of the rules relating to plenum wiring as shown in 300.22 were made based on the limited wiring methods shown in 645.5. The disconnecting means required by 645.10 is based on an emergency condition where all electrical wiring within the ITE room would be easily and conveniently deenergized.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

JOHNSON, R.: The panel should reject this proposal. This prohibits the use of security, fire alarm and similar wiring. It introduces new restrictions not involved with the under floor wiring which are considered acceptable in normal areas. This can make the computer room an impenetrable barrier to any conduit going from one part of the building to another.

12-109 Log #3109 NEC-P12 **Final Action: Reject**
(645.5(C)(6))

Submitter: Donald Hall, Corning Cable Systems
Recommendation: Add the following FPN after 645.5(D)(6):

FPN: ANSI/NECA/BICSI 568-2001, Standard for Installing Commercial Building Telecommunications Cabling, and other industry standards provide recommended cable installation practices which facilitate the eventual removal of cables as they become abandoned.

Substantiation: Abandoned cable should be removed to reduce unnecessary accumulation of fuel load and promote electrical safety. It is not reasonable or necessary to install cables in a manner that prevents their eventual removal.

The proposed FPN will provide useful information to architects, system designers, and installers to help minimize the cost and inconvenience of removing abandoned cable.

Panel Meeting Action: Reject

Panel Statement: Numerous standards and installation manuals exist and to only mention one does not adequately inform the public about accepted industry practices. The NEC is not intended to be an instruction manual for untrained persons. The standard referenced does not contain information about the removal of cables as they become abandoned.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

12-110 Log #2301 NEC-P12 **Final Action: Reject**
(645.5(D) and 645.5(E) New)

Submitter: Gary Stanitis, Daikin America, Inc.
Recommendation: Revise text to read as follows:

Modify 645.5(D), insert new 645.5(E) and renumber existing 645.5(E) to 645.5(F).

645.5(D) Under Raised Floors with Sprinklers or Fire Suppression: Power cables, communications cables, connecting cables, interconnecting cables, and receptacles associated with the information technology equipment shall be permitted under a raised floor that has automatic sprinklers or other fire suppression under the floor, provided the following conditions are met:

[Remainder of 645.5(D) is unchanged]

645.5(E) Under Raised Floors without Sprinklers or Fire Suppression: Power cables, communications cables, connecting cables, interconnecting cables, and receptacles associated with the information technology equipment shall be permitted under a raised floor, provided the following conditions are met:

(1) The raised floor is of suitable construction, and the area under the floor is accessible.

(2) The branch-circuit supply conductors to receptacles or field-wired equipment are in rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, electrical metallic tubing, electrical nonmetallic tubing, metal raceway, nonmetallic raceway, surface metal raceway with metal cover, nonmetallic surface raceway, flexible metal conduit liquidtight flexible metal conduit, or liquidtight flexible nonmetallic conduit, Type MI cable, Type MC cable, or Type AC cable. These supply conductors shall be installed in accordance with the requirements of 300.11.

(3) Ventilation in the underfloor area is used for the information technology equipment room only, except as provided in 645.4(2). The ventilation system shall be so arranged, with approved smoke detection devices, that upon detection of fire or products of combustion in the underfloor space the circulation of air will cease.

(4) Openings in raised floors for cables protect cables against abrasions and minimize the entrance of debris beneath the floor.

(5) Cables, other than those covered in (E)(2) and those complying with (E)(5)(a), (E)(5)(b), or (E)(5)(c), shall be listed as Type DPP cable having adequate fire resistance and smoke producing characteristics suitable for use under raised floors of an information technology equipment room when sprinklers or fire suppression are not installed under the raised floor.

(a) interconnecting cables enclosed in a raceway.

(b) Interconnecting cables listed with equipment manufactured prior to July 1, 1994, being installed with that equipment.

(c) Cable type designations Types CL2P, CL3P, and PLTCP (Article 725; Types NPLFP and FPLP (Article 760); Types OFCP and OFNP (Article 770; Type CMP (Article 800); and Type CATVP (Article 820). Green, or green with one or more yellow stripes, insulated single conductor cables, 4 AWG and larger, marked "for use in cable trays" of "for CT use" shall be permitted for equipment grounding.

FPN: One method of defining a cable that is low smoke-producing cable and fire-resistant cable is that the cable exhibits a maximum peak optical smoke density of 0.5 or less, and an average optical smoke density of 0.15, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262-2002, *Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handlling Spaces.*

Substantiation: Article 645 of the Code is constructed so that it interrelates with NFPA 75, *Standard for the Protection of Information Technology Equipment.* The close, interactive relationship between these two documents can be observed in the Scope statement of Article 645 where there is a FPN specifically referencing NFPA 75, as well as in section 1.6 of NFPA 75 that states "Chapter 10 contains test extracted from NFPA 70, *National Electrical Code* , Article 645.

When these two standards are taken together, it becomes clear that there is a huge discrepancy between how cabling materials are considered, from a fire safety perspective, compared with any other materials, either construction or other wise, within the Information Technology Equipment Room or Area (ITEA). Examples of fire resistance of materials as described by NFPA are:

1. "Structural supporting members for raised floors shall be of **noncombustible** material."

2. "Decking for raised floors shall be one of the following:"

i. **"Noncombustible"**

ii. "Pressure impregnated, fire retardant treated...having a **flame-spread rating of 25 or less** in accordance with NFPA 255...

iii. "Wood or similar core material that is encased on the top and bottom with sheet, cast or extruded metal... that has an assembly **flame-spread rating of 25 or less** in accordance with NFPA 255..."

3. "Small supervisory offices and similar light-hazard occupancies...shall be permitted... **if noncombustible containers are provided for combustible material.** "

4. "Office furniture in the information technology equipment room shall be of **metal construction** "

5. "Only approved **self-extinguishing-type trash receptacles** shall be used in the information technology equipment area.

6. "Paper stock, inks, unused recording media, and other **combustibles...shall be restricted to the absolute minimum necessary** for efficient operation. Any such materials...shall be kept in totally enclosed metal file cases or cabinets..."

7. "Reserve stocks of paper, inks unused recording media, and **other combustibles shall be stored outside** of the information technology equipment room."

8. "Enclosures of floor-standing equipment having external surfaces of combustible materials of such size that they can contribute to the spread of an external fire shall have a **flame-spread rating of 50 or less.** Equipment conforming to the requirement of UL 478...UL 1950...or UL60950...shall be considered as meeting the requirements."

9. "All sound-deadening material...does not **increase the potential of fire damage to the unit** or the **potential of fire propagation from the unit.** "

10. "All **duct insulation** and **linings** , including **vapor barriers** and **coatings** , shall have a **flame spread rating not over 25** without evidence of continued progressive combustion and **a smoke developed rating non higher than 50** ."

When compared with the concern about flame spread, smoke, and combustible loading associated with all non-cabling materials within Information Technology Equipment Areas, the flame-spread, smoke and combustibility requirements associated with cabling used in concealed spaces, such as raised floors, used for environmental air is completely inappropriate and inconsistent. This is particularly true when one considers that the quantity of cable present in a typical ITEA is very large when compared with these other materials. There is no logical reason to treat cables differently than the other materials and equipment present. And, although NFPA 75 lists sprinklers or other fire suppression as an option under raised floors, it is not mandated in all instances, so the performance of cables listed in Article 645 must address concealed spaces that have no fire protection.

Section 800.179 of the *Code* states "...communications plenum cable shall be listed as being suitable for use in ducts, plenums, and other spaces used for environmental air and shall also be listed as having adequate fire-resistance and low smoke-producing characteristics", with a FPN stating "One method of defining a cable that is low smoke-producing cable and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262-2002, *Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces.* Additionally, even if airflow is discontinued under the raised floor or in the ceiling cavity, experience has shown that combustion in horizontal hidden voids is not significantly reduced ["However research has shown that in hidden voids combustion proceeds to the same degree whether under forced or natural convection" *Fire Performance of Communications Cable in Buildings* - IEC TR 6222].

All materials of significance in ITEAs should be consistent in their fire performance requirements. It would be inappropriate to reduce the fire and smoke performance of all non-cabling materials since ITEAs are important to protect the business function, as well as life and safety in many instances. But, if **MINIMUM** fire performance cabling is allowed in Article 645 of the *Code,* then the same must be true for all materials. A better option would be to require cabling to be consistent in fire performance with other materials currently described in Article 645. Cabling should meet the requirements of Section 800.179 of the *Code* (plenum rating), or Section 300.22 of the Code (General Purpose cable installed properly in sealed conduit). If, in addition to these two appropriate cabling methodologies, the Panel wishes to list allowable cable types to be installed within ITEAs that conform to all NFPA 75 requirements, including underfloor or above ceiling sprinklers or fire suppression , then the cable type suitable for this installation methodology should be clearly defined within Section 645. Under floor and ITEA room sprinkler density requirements in NFPA 75 should be consistent with the combustible loading presented by the cable type allowed. Also, it should be clearly identified that these three (i.e. plenum rated cable, cable in conduit, or cable directly protected by sprinklers or fire suppression within ITEAs conforming to all requirements of NFPA 75) cable installation methodologies are distinct , yet suitable for ITEAs.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The provisions of this proposal cannot be enforced. There is not sufficient technical substantiation provided to include new requirements on sprinkler systems. For information, NFPA 75, Section 8.1.1.2, requires sprinklers or gaseous fire suppression in the underfloor areas of ITE (computer) rooms.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

12-111 Log #2218 NEC-P12 **Final Action: Reject**

(645.5(D)(2))

Submitter: Kyle Cope, Prysmian Cables and Systems

Recommendation: Revise as follows:

"... liquidtight flexible metal conduit, or liquidtight flexible nonmetallic conduit, Type MI cable, Type MC cable, Type PA cable , or Type AC cable. These supply...".

Substantiation: Statement of problem: Material technology advancements now allow for cable designs that provide improved mechanical damage protection. i.e., crush and impact, over standard Type MC cable without sacrificing flame performance properties. The characteristics achieved using traditional metallic components can now be realized using polymeric materials. The use of polymeric materials also provides the opportunity for lighter and smaller diameter cables.

Substantiation for Proposal: Type PA has been proposed as a new type (Article 3XX) and should be included in this list (645.5(D)(2)) as it offers enhanced mechanical benefits as an alternate to Type MC cable. See test data provided. A UL Fact-Finding study comparing the subject cable to type MC is ongoing at the time of proposal submittal. This data will be forwarded once the study is complete.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: Type PA cable has not been recognized by the NEC as suitable at this time. No substantiation has been provided that this product has been listed by a qualified testing laboratory. The proposed article relating to this product has not been accepted at this time. Without the requirements necessary for the use of this product being in force, the panel cannot accept its inclusion in Article 645.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

12-112 Log #2379 NEC-P12 **Final Action: Accept**

(645.5(D)(5))

Submitter: Allen C. Weidman, The Society of the Plastics Industry, Inc.

Recommendation:

Revise as follows:

c. Cable type designations shown in Table 645.5 shall be permitted. ~~Type TC (Article 336); Types CL2, CL3, and PLTC (Article 725); Type ITC (Article 727); Types NPLF and FPL (Article 760); Types OFC and OFN (Article 770); Type CM (Article 800); and Type CATV (Article 820). These designations shall be permitted to have an additional letter P or R or G.~~ Green, or green with one or more yellow stripes, insulated single conductor cables, 4 AWG and larger, marked "for use in cable trays" or "for CT use" shall be permitted for equipment grounding.

Table 645.5 Cable Types Permitted Under Raised Floors

Article	Plenum	Riser	General Purpose
336			TC
725	CL2P & CL3P	CL2R & CL3R	CL2, CL3 & PLTC
727			ITC
760	NPLFP & FPLP	NPLFR & FPLR	NPLF & FPL
770	OFNP & OFCP	OFNR & OFCR	OFN & OFC
800	CMP	CMR	CM & CMG
820	CATVP	CATVR	CATV

Substantiation: This is an editorial proposal. The current wording "These designations shall be permitted to have an additional letter P or R or G." requires the user to have an in-depth knowledge of the cable types in the code. It might even lead the user to search for nonexistent cables types such as TCP, TCR, TCG, ITCP, ITCR, ITCG, NPLFG, FPLG, OFNG, OFCG or CATVG. It's easier for the user to have a table to look up the permitted cable types. Acceptance of this proposal will bring about compliance with the NEC Style Manual.

Section 3.3.1 (2) of the 2003 NEC Style Manual states:

"2. Use simple declarative sentence structure, and keep sentences short. Writing rules in long sentences full of commas, dependent clauses, and parenthetical expressions often creates confusion and misunderstanding. The requirement can be written in two or more short sentences, expressed using a list or table, or both."

Panel Meeting Action: Accept

12-113 Log #1418 NEC-P12 **Final Action: Accept**
(645.5(D)(5)(c), FPN)

Submitter: Thomas J. Guida, Underwriters Laboratories Inc.
Recommendation: Revise text to read as follows:

FPN: One method of defining "fire resistance" is by establishing that the cables do not spread fire to the top of the tray in the " UL Flame Exposure , Vertical Tray Flame Test" ~~referenced~~ in ~~ANSI/UL 1581-2001, Standard for Electrical Wires, Cables, and Flexible Cords~~ . UL 1685-2000 Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables. The smoke measurements in the test method are not applicable.

Another method of defining fire resistance is for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing the CSA "Vertical Flame Test - Cables in Cable Trays," as described in CSA C22.2 No. 0.3-M-2001, Test Methods for Electrical Wires and Cables.

Substantiation: The revised wording is an update of the standard references and not a change in the test method. UL 1581 references UL 1685 for the text of the test method.

Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-114 Log #2339 NEC-P12 **Final Action: Reject**
(645.5(D)(5)(d) (New))

Submitter: Stephen McCluer, American Power Conversion Corp
Recommendation: Add a new 645.5(D)(5)(d) as follows:

(d) Power supply cord of listed Information Technology Equipment plugged into receptacles under the raised floor when only the portion of the cord required to make the vertical connection occupies the plenum free air space. Cords shall be protected from damage and shall not be permitted to lie on the subfloor.

Substantiation: The current wording of 645.5(D) is reasonable for long runs of power supply circuits, interconnecting cables and communications cables. It is inappropriate for extremely short connections of cord sets extending only a few inches below the floor in order to plug a single item of information technology (IT) equipment into a receptacle. Although the safety issue seems to be intuitive, no Code Making Panel or floor testimony that I am aware of has presented substantiation that such short lengths of cords actually constitute a safety issue. A review of NFPA fire reports on data center fires, which are infrequent, does not suggest that cord sets have substantially contributed to the spread of fire or products of combustion.

Following is rebuttal to arguments that have been put forward to justify why cord sets must be treated the same as power supply, interconnecting and communication cables that are run throughout the space under a raised floor of an Information Technology Equipment room.

1. "The length of the cord set can be up to 15 ft."

Although a 15-ft cord set is theoretically possible, the language of this proposal stipulates that only the length of cord necessary to make the connection is permitted beneath the floor. It would require excess cord length to be handled in an acceptable manner above the floor. The proposal also requires the cords to be protected from damage, such as sharp edges of a floor cut-out. IT equipments with short cord sets (e.g., only 2-5 ft in length) are readily available.

2. "There is no limitation on the number of pieces of equipment that may be installed in an IT equipment room. One hundred or even more pieces of information technology equipment requiring power supply cords could be located in one ITE room. This equates to a possible 1500 ft or more of power supply cord that may be used under a raised floor."

The underlying premise is flawed. Because raised floors are typically no more than 3 ft high in an IT equipment room, and because the language of this proposal does not permit excess cable under the floor (as described in #1 above), the theoretical amount of materials in the hypothetical example is actually not 1500 ft but only 300 ft. But that begs the issue. It assumes that all 100+ cables will be consumed in fire and will contribute to the fire and smoke. In an electrical fire, IF a piece of IT equipment overloads and the current causes the cord to heat up, AND IF the circuit protective device for that particular circuit simultaneously falls to interrupt the circuit and remove the source of energy, AND IF the under-floor smoke detectors required in 645(D)(3) fall to activate the Disconnecting Means required in 645.10, THEN the length of the cord that is under the floor might contribute some products of combustion. The other 100+ cables in the space would not contribute to the problem. The two or three feet of cord under the floor would represent a very small cord length in a very large volume of space. It would be a very low density of flammable material in the air space. The cords are discontinuous. The multiple short lengths of cords are not a risk for spreading fire from one area to another.

3. "DP cable was not intended to replace the flexible cords of Article 400. DP cable was intended to be used as a power supply cord only if it was intended to be used as a power supply cord under a raised floor in an ITE room. Power supply cables listed as having fire-resistant characteristics can be developed and surely would have been developed in accordance with the demand if the present rules were properly enforced."

No such power cord exists today, despite the existence of these rules and of IT equipment rooms for many years. The reason is that adding flame retardants to the PVC or synthetic rubber compounds used for cable jackets makes the cable prone to damage if used in an exposed area. The flame retardant outer jacket will not be able to spring back after being bent or crushed. The jacket would not resist damage from sharp objects as well as a standard flexible cord.

Basically, the requirements for a cord or cable for exposed use conflict with the requirements for cords and cables that have better flame ratings. If the cord has flame retardants to pass a vertical wire test, it will be too prone to damage to use in an exposed area. If it has the flexibility to allow its use in an exposed area, it will not have as good of a flame rating.

Manufacturers today do not create products specifically for use above or below a floor because they do not know where and how a piece of IT equipment will be used. It is unreasonable to force manufacturers to create twice as many products when there is no substantiated evidence of a problem. Separate above- and below-floor designs would significantly increase the cost of products for little or no perceived benefit. The Code should not mandate the use of technology that does not exist based on the assumption that it might exist some day.

The assertion that the present codes have not been properly enforced is disingenuous. NEC 90.4 specifically allows an AHJ to "permit alternative methods where it is assured that equivalent objectives can be achieved by establishing and maintaining effective safety." Given the excellent safety record in ITE rooms, it is safe to say that cord sets plugging into receptacles under the floor are a safe and effective method.

4. "The receptacles could be installed above the floor with the cables being protected from physical damage as is required for interconnecting cables under 645.5(C)."

This has been tried in a number of data centers. It is extremely cumbersome. It frequently results in cables and receptacle boxes obstructing aisle ways because many equipment rack designs cannot accommodate the equipment. Receptacles above the floor should be fixed in place; if not, they are susceptible to damage. Above floor receptacles are unsightly, unreliable and unsafe. There might not be space in a cabinet for the receptacle box or to allow adequate bend radius for the cord. The ITE PDU cord is often forced to bend at an angle that causes it to break and create a hazardous condition.

5. "The proposal does not enhance or maintain safety. It is a serious degradation of a requirement designed to protect persons and property from the hazards of fire."

This proposal at worst introduces an insignificant degradation in safety. The argument should be made that this proposal actually increases safety. The Code, as written today, actually forces an unreasonable and nearly impossible requirement upon equipment manufacturers and imposes a major financial burden upon users. The benefit does not justify the cost. "Work-arounds" (such as described in #4 above) sometimes introduce new hazards. In reality, there already are tens of thousands of data centers with millions of pieces of IT equipment connected via cord sets to receptacles under the raised floor. This proposal legitimizes a practice that has been industry standard procedure for at least two decades. In the absence of substantiated data that the practice is unsafe, the practice should be permitted.

Panel Meeting Action: Reject
Panel Statement: The wording "when only the portion of the cord required to make the vertical connection occupies the plenum free air space" would require the receptacle to be located directly under the floor penetration. This would require the ITE equipment being supplied to be located directly above the floor penetration to comply with the recommendation that "cords shall not be permitted to lie on the subfloor." This would make unnecessary the requirement shown in 645.5(B)(1) allowing a flexible cord and attachment plug not to exceed 15 feet. The power cords would then be required not to exceed the depth of the underfloor space. The wording in the recommendation "and shall not be permitted to lie on the subfloor" is in direct conflict with 645.5(B)(2).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

SATO, C.: The panel action on this proposal should have been "accept in principle." The following wording should have been accepted as a reasonable compromise.

"(d) Power supply cords of listed information technology equipment plugged into receptacles under the raised floor when only the portion of the cord required to make the ~~vertical~~ connection occupies the ~~plenum free air space~~ area under the raised floor . Cords shall be protected from damage and shall not ~~be permitted to~~ lie on the subfloor."

Listed power supply cords have been installed in the underfloor areas of ITE (computer) Rooms since the 1960s. It remains common practice today. The Special Requirements for ITE Rooms in Section 645.4 - including restricted occupancy, separation from other areas of occupancy by fire-rated constructions, and provision of separate HVAC systems (or common HVAC systems with additional fire/smoke dampers) – serve to limit any potential impact of using Listed power supply cords in these areas and distinguish such areas from other areas covered by Section 300.22 (C). Also, the long history and use of Listed power supply cords in the underfloor areas of ITE Rooms has not demonstrated a history of field incidents supporting the need for more onerous flammability requirements for these cords.

The proposed wording no longer implies a need for a direct vertical drop of the power supply cord from the equipment to the subfloor mounted receptacle and is not in direct conflict with Section 645.5(B)(1). Within an ITE Room environment, 15 feet is not a long distance. The power supply cord needs to be able to be routed without damage from the equipment located on top of the raised floor, though an opening in the raised floor, to a receptacle mounted on the subfloor. UL 60950-1, which is used for Listing ITE, contains the 4.5 m (15 ft) length as a "maximum" requirement, which is a length that may be necessary for above floor ITE Room applications and installation of ITE outside of ITE Rooms. For underfloor applications, the manufacturer may choose to provide a shorter length of flexible power supply cord, as necessary.

Section 645.5(B)(2) currently only addresses above floor installations and is not in conflict with the proposal.

Comment on Affirmative:

CROUSHORE, T.: The National Electrical Code does not prohibit power supply cords from listed information technology equipment from being plugged into the receptacles beneath the raised floor.

JANIKOWSKI, R.: I am in favor of allowing short lengths of power supply cords of listed equipment to make a vertical penetration in the plenum free air space for connection of IT equipment. Current codes force a lot cords and cables to lie on top of the raised floor. Current codes permit receptacle outlets to be installed under raised floors but it's very difficult to provide an approved cord set to use them. Required smoke detection under raised floors will quickly alert personnel if problems are encountered.

JONES, R.: See my comments on Proposal 12-103.

12-115 Log #2380 NEC-P12 **Final Action: Reject**
(645.5(D)(5), FPN 2 (New))

Submitter: Allen C. Weidman, The Society of the Plastics Industry, Inc.
Recommendation: Renumber the existing FPN to No.1 and add a new FPN No. 2:

FPN No. 2: See 8.14.1 of NFPA 13-2002, *Installation of Sprinkler Systems* , for requirements for sprinklers in concealed spaces containing exposed combustibles.

Substantiation: Article 645 of the *Code* is directly correlated with NFPA 75 as identified by the FPN in the Scope Section 645.1 that states "For further information, see NFPA 75-2003, *Standard for the Protection of Information Technology Equipment* ." NFPA 75-2003, Chapter 8 covers fire protection. Section 8.1.1 requires that an ITE room in a sprinklered building have sprinkler protection. Section 8.1.2 requires that the sprinkler system be installed in accordance with NFPA 13, *Standard for the Installation of Sprinkler Systems.* NFPA 13 has requirements for sprinklers in a concealed space that contains a combustible loading.

The following is excerpted from the Automatic Systems Sprinkler Handbook 2002 edition: In the handbook the commentary is printed in blue. Since the proposals are printed in black and white I have changed the handbook commentary to ***bold italics*** . I also underlined the text that refers to computer room raised floors.

As indicated in 8.1.1(1), sprinklers are required throughout the premises. Under certain conditions, however, the omission of sprinklers in certain areas and spaces within a building is permitted. Section 8.14 identifies these spaces and conditions.

8.14.1 Concealed Spaces.

8.14.1.1 Concealed Spaces Requiring Sprinkler Protection. All concealed spaces enclosed wholly or partly by exposed combustible construction shall be protected by sprinklers except in concealed spaces where sprinklers are not required to be installed by 8.14.1.2.1 through 8.14.1.2.15.

Concealed spaces requiring sprinkler protection are covered in 8.14.1.1. Concealed spaces, unless protected, can provide an unabated passage for firespread throughout a building. Paragraph 8.14.1 applies to those portions of a building that have construction or finish materials of a combustible nature, are used for the storage of combustible materials, and can contain combustibles associated with building system features such as computer wiring or large quantities of nonmetallic piping.

Any of these scenarios could be found in a concealed space. It is important to recognize that concealed spaces are not exclusively limited to areas above ceilings but can also be found in walls and in spaces beneath the floor. For example, a raised floor in a computer room is a . concealed space. If none of the three prescribed conditions exists, the space is defined as a concealed, noncombustible space with respect to combustible objects and requires no additional sprinkler protection.

Some minor quantities of combustible materials, such as communication wiring, can be present in some concealed spaces but should not typically be viewed as requiring sprinklers (see 8.14.1.1). The threshold value at which sprinklers become necessary in the concealed space is not defined. For example, the usual amounts of data or telephone wiring found above a ceiling would not typically constitute a threat. If bundles of unsheathed computer wiring are installed above the ceiling or beneath the floor in a manner where tire propagation in all directions is likely, then the concealed space should be treated the same as a combustible space, thereby requiring appropriate sprinkler protection. If some other protection measure is provided, such as a CO, system, then the concealed space is considered to be protected, and sprinklers are not required.

Users of Article 645 and NFPA 75 need to be aware of the requirements of NFPA 13 so they can provide the appropriate fire protection where these is a build-up of combustible cables that constitute a combustible loading, or alternately avoid the buildup of combustible cables that would result in a combustible loading.

Sections 770.154(A), 800.154(A) and 820.154(A) of the 2005 NEC have fine print notes referring to NFPA 13.

Panel Meeting Action: Reject

Panel Statement: The definition for "concealed" in Article 100 in the 2005 NEC does not apply to the proposed fine print note. The area below raised floors are not considered by the NEC to be a concealed space. The definition of concealed does not exist in NFPA 13, but it alludes to the area above a drop ceiling as being concealed, which does not match the definition used in Article 100. The reference to NFPA 13 does not seem appropriate in a new 645.5(D)(5) FPN at this time.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

QUAVE, D.: We agree with the panel action and believe that the panel statement should also reflect the latest NFPA 13 Technical Committee actions. Included in the Submitter's substantiation was the 2002 Section 8.14 which since has been revised. We would like to add that NFPA 13 just completed their balloting process for the 2006 NFPA 13 Standard. The Technical Committee on Sprinkler Installation submitted a Comment on Proposal 13-284.

This comment reworded proposed A.8.14.1.2.1 to read: "Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc...can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1). For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined."

In the NFPA 13 Committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

12-116 Log #2649 NEC-P12 **Final Action: Accept in Principle**
(645.5(F))

TCC Action: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the Panel as a Public Comment.

The Technical Correlating Committee will have a Task Group appointed to review the issues raised in this proposal.

Submitter: Robert W. Jensen, dbi / Rep. BICSI, A Telecommunications Association

Recommendation: Move 645.5(D)(6) to new 645.5(F) Abandoned cables shall be removed unless contained in metal raceways.

Substantiation: The requirement should not just be for under raised floors.

Panel Meeting Action: Accept in Principle

Revise proposal as follows:

645.5(F) **Abandoned Supply Circuits and Interconnecting Cables.** Abandoned supply circuits and interconnecting cables shall be removed unless contained in a metal raceway.

Add:

645.5(G) **Installed Supply Circuits and Interconnecting Cables Identified for Future Use** .

(1) Supply circuits and interconnecting cables identified for future use shall be marked with a tag in accordance with the following:
(a) Tag is impervious to the effects of temperature and dampness
(b) Tag is resistant to the effects of gnawing by rodents
(2) Supply circuits and interconnecting cables shall have the following information on the tag or in a database:
(a) Date identified for future use
(b) Date of intended use
(c) Information relating to the intended future use

Panel Statement: This combines several proposals addressing similar issues about abandoned cables.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 8 Negative: 4
Explanation of Negative:
JANIKOWSKI, R.: Tagging of abandoned Audio Distribution cable. What is "resistant to gnawing by rodents"? How do I enforce?
Information on abandoned cables kept in a database. Inspector has no idea which abandoned cables are in the database. Inspector has no access to database and an electronic database can be easily modified.
JOHNSON, R.: Delete the proposed 645.5(G)(1)(b).
~~(b) Tag is resistant to the effects of gnawing by rodents~~ .
The need for this requirement has not been justified. Resistance criteria have not been established. With this change I would support the panel action. I request the correlating committee address the consistency of abandoned cable requirements with other code sections and recent panel actions.
QUAVE, D.: Part G should be eliminated. Abandoned cables are widely considered to be products of combustion and should be removed. Anyone can install a tag on a cable without ever intending to use it. The term, "or in a database", would be impossible to enforce. Who is responsible for the database and how and where is it to be kept?
WHITE, K.: My vote is negative because of the following restrictions:
• providing a tag that is gnawing rodents resistant
• A cable that is identified for future use is usually not defined when the use will occur and how it will be used.

12-117 Log #2381 NEC-P12 **Final Action: Accept**
(645.6, FPN)

Submitter: Allen C. Weidman, The Society of the Plastics Industry, Inc.
Recommendation: Revise as follows:
FPN: For signaling circuits, refer to Article 725; for optical fiber cables and raceways ~~optic~~ ~~circuits~~ , refer to Article 770; and for communications circuits, refer to Article 800. For fire alarm systems, refer to Article 760.
Substantiation: The terminology used to describe optical fiber cables in this article should correlate with the terminology used in Article 770, Optical fiber Cables and Raceways. There are no circuits in Article 770, only raceways and nonelectrical cables.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-118 Log #2828 NEC-P12 **Final Action: Reject**
(645.7)

Submitter: John Kacpenski, Western Telecommunications Consutling (WTC)
Recommendation: Revise text to read as follows:
645.7 Penetrations.
Penetrations of the fire-resistant room boundary shall be in accordance with 300.21. The accessible portion of abandoned information technology cables shall not be permitted to remain.
Substantiation: This addition will harmonize the text with: 725.3(B), 760.3(A), 770.3(A), 800.3(C), 820.3(A), and 830.3(A).
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 12-116 because the entire abandoned cable is required to be removed not just the accessible portion.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-119 Log #554 NEC-P12 **Final Action: Reject**
(645.10)

Submitter: William Davis, Eastman Kodak Co.
Recommendation: Insert the word "electrical" in the first sentence to read:
A means shall be provided to disconnect power to all electrical and electronic equipment in the information technology equipment room.
OR
Add a fine print note to state:
Feeders or branch circuits not supplying electronic equipment such as panelboards, disconnect switches, luminaries, or other similar utilization equipment are not required to be disconnected by this means.
Substantiation: Feeders or branch circuits that enter an ITE room may terminate in a panelboard, disconnect, or other electrical equipment not considered, "electronic equipment". Some of these feeders, panelboards, disconnects, etc. could be substantial in size. These feeders and branch circuits should be disconnected as well as the electronic equipment in the room. NFPA 75 requires emergency lighting in the ITE room that would take care of lighting in the event the lighting branch circuit is disconnected. I'm unsure of the intent of CMP-12. If they have substantiated that only electronic equipment needs to be powered down, then add the fine print note to clarify other electrical equipment need not be included in the disconnecting requirement.
Panel Meeting Action: Reject
Panel Statement: There is no need to turn off lights, fire alarms, phones, and other critical systems.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-120 Log #1714 NEC-P12 **Final Action: Reject**
(645.10)

Submitter: Stephen McCluer, American Power Conversion Corp
Recommendation: 1) Revise 645.10 as noted.
2) Add new paragraph 645.10(1).
1) Revise 645.10 to add an exception and number the exceptions.
Exception No. 1: Installations qualifying under the provisions of Article 685.
Exception No. 2: Installations qualifying under the provisions of Paragraph 645.10(1).
2) Add new paragraph 645.10(1):
645.10(1) Zone disconnect means. An approved disconnect-means shall be permitted to disconnect power only to an isolated portion of the information technology room when the following conditions are met:
(1) The disconnect-means shall completely remove all power to the isolated portion of the room (which can be one equipment or a common group of equipments) with a single means of disconnect
(2) Manual or automatic disconnect-means shall be permitted
(3) Manual disconnect means shall be accessible in a manner acceptable to the authority having jurisdiction
FPN: The disconnect means may include an approved method to prevent accidental or unauthorized activation
(4) Manual disconnect means shall be clearly identified with signage so that emergency procedure operating points are identified
(5) Method of operation shall be well documented and staff shall be trained
(5) The location of all zoned disconnect-means in the IT room shall be identified in such a manner that they are easily located by emergency responders
(6) All zones with an isolated disconnect-means shall contain an approved method of preventing the spread of smoke and products of combustion beyond the perimeter of the zone
Substantiation: The existing requirement in 645.10 for a disconnect-means that de-energizes all of the equipment in an IT room is an artifact from technology that was in use more than twenty years ago. It is inappropriate for the state of technology and IT room design practices that exist today. The risks of unplanned interruption of mission-critical operations far exceed any benefits to be gained by shutting down an entire information technology center. Whereas 20 years ago IT equipment was primarily for "data," today it has a very large component of "control" and, increasingly, communications. The ramifications of a sudden, unplanned interruption have huge financial consequences and very frequently life and human safety ramifications. 645.10 suffers from the "law of unintended consequences." The history of the past quarter century shows that the room disconnect has rarely been used or needed for its intended purpose, but it has actually been the cause of countless catastrophic events. On its surface the disconnect sounds like a logical and good thing to have, but in practice it is more often a bad thing. Disrupting the operation of hundreds of IT devices when only one has a problem cannot be justified when the means exist to deal adequately with the problem.
This proposal acknowledges the need to shut down the energy to a unit or an area of electrical equipment when it is overheated or when personnel safety is jeopardized. This proposal permits de-energizing only the equipment at risk while allowing other equipment to maintain mission-critical operations. The AHJ can premit "localized" shutdown when certain safety criteria are met. Briefly stared, emergency responders must be able to easily find the appropriate disconnect-means, procedures must be well documented, personnel must be trained, and smoke or other elements of combustion must not be allowed to spread beyond the affected equipment area.
This proposal also permits the use of an automatic disconnect-means, such as automatically de-energizing a piece of affected equipment upon activation of a smoke detection system.
This proposal defaults to the use of a room disconnect when, in the opinion of the AHJ, the alternative method fails to satisfy the intent:
This proposal solves several problems, including:
a) It minimized unintended consequences of IT shutdown. Computers are so integrated into our lives today that any interruption of IT operation can have both personnel safety and business continuity implications. It is seldom easy to identify all of the safety hazards associated with IT equipment shutdown.
b) It eliminates the disconnect-means as a single failure point for the entire IT space. Emergency Power Off (EPO) activation is the single largest cause of unintended shutdown of IT equipment.
c) It reduces the risk of damage to the IT equipment caused by "hard shutdown" and restart.
d) It increases reliability and safety.
Panel Meeting Action: Reject
Panel Statement: The proposal is too complicated and would be difficult to enforce. If desired or required, a single ITE room can be divided into multiple rooms per this and other NFPA standards.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

Comment on Affirmative:

JANIKOWSKI, R.: I am in favor of some sort of exceptions for the basic rule that mandates the disconnect required in IT rooms take everything off line. Current technology has far more critical applications than the 20-year old data-only machines. History has proven that the unplanned interruption of mission-critical operations far exceed any benefits to be gained by shutting down an entire IT center. Today's IT rooms control functions that "MUST" remain on line such as "911" centers, Internet and company Intranet operations. This rule is an artifact of 20-year old technology.

JONES, R.: During the 2002 code cycle I wrote a comment on a similar proposal about the EPO. I even wrote a magazine article about the EPO button for the IAEI. No one from the IT industry has bothered to contact me about problems with this requirement in 645.10. At the ROP meeting, we listened to a very informative presentation about how nearly all EPOs that are activated are done so in error and cause business/financial losses and how no one can document an incident where the EPO was used for its intended purpose. Panel members were given approximately 25 pages of information concerning the EPO activations and resulting damage to data operations. This information was given to panel members prior to the vote on the proposal. When were we supposed to study this information and form an intelligent opinion? As I have stated before, the IT industry needs to request a Task Group to be formed with members of CMP 12, NFPA 75 members, and members of the IT industry.

12-121 Log #1063 NEC-P12 **Final Action: Reject**
(645.15)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Delete "in accordance with the requirements of Article 250".
Substantiation: Edit. To comply with the Style Manual. Article 250 already applies per 90.3.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 12-15.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 647 — SENSITIVE ELECTRONIC EQUIPMENT

12-122 Log #1363 NEC-P12 **Final Action: Reject**
(647)

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Change title of Article 647 to "Technical Power Systems"
Substantiation: This is the current wording in 647.7(A)(2)
(occurrences of "technical power" have been bolded for emphasis)
WARNING — **TECHNICAL POWER**
Do not connect to lighting equipment.
For electronic equipment use only.
60/120 V. 1ac
GFCI protected

(3) A 125-volt, single-phase, 15- or 20-ampere-rated receptacle outlet having one of its current-carrying poles connected to a grounded circuit conductor shall be located within 1.8 m (6 ft) of all permanently installed 15- or 20-ampere-rated 60/120-volt **technical power-system** receptacles.

(4) All 125-volt receptacles used for 60/120-volt **technical power** shall have a unique configuration and be identified for use with this class of system. All 125-volt, single-phase, 15- or 20-ampere-rated receptacle outlets and attachment plugs that are identified for use with grounded circuit conductors shall be permitted in machine rooms, control rooms, equipment rooms, equipment racks, and other similar locations that are restricted to use by qualified personnel.

This proposal brings the title of the article in alignment with the body of the article.
Panel Meeting Action: Reject
Panel Statement: Section 647.1 (Scope) indicates the purpose of this article is not the power aspect, but the installation and wiring of the equipment. The submitter has provided no substantiation that a problem exists with the present wording. The 647.1 scope refers to sensitive electronic equipment. Technical power refers to the voltage limitations relating to sensitive electronic applications.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-123 Log #627 NEC-P12 **Final Action: Accept**
(647.4(C))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read as follows:
(C) ~~Color Coding~~ Conductor Identification . All feeders and branch-circuit conductors installed under this section shall be identified as to system at all splices and terminations by color, marking, tagging, or equally effective means. The means of identification shall be posted at each branch-circuit panelboard and at the disconnecting means for the building.
Substantiation: This section includes other means of identification for conductors in addition to just color coding. The more appropriate title of the subsection is Conductor Identification. No technical changes are proposed to this section.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-124 Log #626 NEC-P12 **Final Action: Accept**
(647.5)

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read as follows:
647.5 Three-Phase Systems. Where 3-phase power is supplied, a separately derived 6-phase "wye" system with 60 volts to ground installed under this article shall be configured as three separately derived 120-volt single-phase systems having a combined total of no more than six ~~main~~ disconnects.
Substantiation: The use of the word "main" in this section is an indication that the disconnects referred to in this section are always "service disconnects". 647.1 indicates that these systems are separately derived systems. These disconnects are for protection of the system conductors and equipment and not the service.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-125 Log #624 NEC-P12 **Final Action: Accept**
(647.7(2))

TCC Action: The Technical Correlating Committee understands that only the word "receptacle" is being added and the remainder of the Section is unchanged.
Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read as follows:
(2) All receptacle outlet strips, adapters, receptacle covers, and faceplates shall be marked with the following words or equivalent:
WARNING - TECHNICAL POWER
Do not connect to lighting equipment
For electronic equipment use only
60/120 V. 1ac
GFCI protected
Substantiation: Outlet is defined in Article 100 as "A point on the wiring system at which current is taken to supply utilization equipment." The use of the word "outlet" is more broad than what appears to be covered by the requirements in this section. Receptacle outlet strips or receptacle strips appears to be more appropriate based on the definition of outlet.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-126 Log #625 NEC-P12 **Final Action: Accept**
(647.7(3))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read as follows:
(3) A 125-volt, single-phase, 15- or 20-ampere-rated receptacle ~~outlet~~ having one of its current-carrying poles connected to a grounded circuit conductor shall be located within 1.8 m (6 ft) of all permanently installed 15- or 20-ampere-rated 60/120-volt technical power-system receptacles.
Substantiation: This section appears to be referring to connections to the receptacle and not the outlet the receptacle is installed in. This change is for clarity in this section.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-127 Log #1364 NEC-P12 **Final Action: Accept**
(647.7(A)(4))

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Delete, or change, reference to standard receptacles
(4) All 125-volt receptacles used for 60/120-volt technical power shall have a unique configuration and be identified for use with this class of system. ~~All 125-volt, single-phase, 15- or 20-ampere-rated receptacle outlets and attachment plugs that are identified for use with grounded circuit conductors shall be permitted in machine rooms, control rooms, equipment rooms, equipment racks, and other similar locations that are restricted to use by qualified personnel.~~
Substantiation: This sentence is either about standard receptacles on standard branch circuits, in which case it doesn't belong in this article, or the sentence is intended to mean that standard receptacles can be used for technical power in these locations. If the latter is the case, the sentence should be re-written as follows:
All 125-volt, single-phase, 15- or 20-ampere-rated receptacle outlets and attachment plugs that are identified for use with grounded circuit conductors shall be permitted to be used for technical power in machine rooms, control rooms, equipment rooms, equipment racks, and other similar locations that are restricted to use by qualified personnel.
Panel Meeting Action: Accept

Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-128 Log #1999 NEC-P12 **Final Action: Reject**
(647.7(B))

Submitter: Robert Schuerger, EYP Mission Critical Facilities, Inc.
Recommendation: Revise as follows:

647.7(B) ~~Isolated~~ Insulated Grounding Receptacles. ~~Isolated~~ Insulated grounding receptacles shall be permitted as described in 250.146(D); however, the branch circuit equipment grounding conductors shall be terminated as required in 647.6(B).

Substantiation: The use of the term "isolated" has caused confusion which has led to improper and unsafe installations in which a separate grounding electrode and grounding system is installed isolated from the rest of the grounding system of the building. Since the separate grounding system is not properly bonded to the grounding system of the building, a hazardous voltage can be developed between the two grounding systems by an electrical fault or lightning strike.

There have been many cases of this type of installation in the past, with data procession equipment, machine tools and other sensitive electronic equipment. The 2005 edition of IEEE Standard 1100, Recommended Practice for Powering and Grounding Electronic Equipment has "insulated ground receptacle" as the recommended terminology and has recommended the "isolated ground" and "isolated ground receptacle" be avoided.

Panel Meeting Action: Reject

Panel Statement: The term "insulated" indicates only that the conductor cannot be bare and is already addressed in 250.146(D). The use of the term "insulated grounding receptacles" will only add more confusion.

The UL Guide Information for Receptacles for Plugs and Attachment Plugs (RTRT) defines an Isolated Ground Receptacle as follows: "Isolated Ground Receptacles — Grounding-type receptacles in which the grounding terminals are purposely insulated from the mounting means of receptacles and associated metal cover plates as permitted by Section 250.146(D) (formerly Exception No. 4 to Section 250-74) of the NEC are so identified by an orange triangle marked on the face of the receptacle." The NEC and UL definitions should correlate.

Number Eligible to Vote: 11
Ballot Results: Affirmative: 11
Comment on Affirmative:

PRICHARD, R.: Looking to Merriam – Webster and NFPA Glossary for guidance on word usage in the NEC, per the NEC style manual; the term 'isolated' refers to the state of being separated or occurring alone, while the term 'insulated' extends the concept of being separate to be separated from other conducting surfaces by a dielectric (including air space) offering a high resistance to the passage of current or to separate from conducting bodies by means of nonconductors so as to prevent transfer of electricity. The level or description of the isolation state is more a function described in an equipment specification or in a design specification.

In the UL Guide Information for Receptacles for Plugs and Attachment Plugs (RTRT);
'Isolated Ground Receptacles' is defined as a Grounding-type receptacles in which the grounding terminals are purposely insulated from the mounting means of receptacles and associated metal cover plates as permitted by Section 250.146(D) (formerly Exception No. 4 to Section 250-74) of the NEC are so identified by an orange triangle marked on the face of the receptacle." UL standards are often an equipment or device specification which in this instance is referring to an equipment definition that correlates with the required use in 647.7(B) Isolated Grounding Receptacles.

The discussion in [IEEE STD 1100 20005 (proposed) "IEEE Recommended Practice for Powering and Grounding Electronic Equipment" (Emerald Book)] 2.2.9 insulated equipment ground, speaks to the application of isolated grounding receptacle device's application within an insulated equipment ground design. This is consistent with the purpose of this IEEE Standard.

The NEC is a safety standard not an equipment specification standard nor a design specification, and is describing an isolated ground receptacle device's required function without specifying the requisite insulation properties; In the NEC article 647 "Sensitive Electronic Equipment", section "647.7(B) Isolated Grounding Receptacles", description is consistent with the stated purpose of the NEC (see 90.1 "Purpose").

As a point of reference an Isolated Grounding Receptacle (device) may or may not be applied to a design that includes insulated ground circuitry (though an isolated grounding receptacle is often applied in an insulated ground design). The use does not change the state of isolation within the device as it stands regardless its application. The ground receptacle is not connected (isolated) internally to the devices mounting means (yoke) or the threads for the faceplate screw, a practice for nominal (typical) grounding receptacle (devices). Isolated grounding receptacle names the device that is required to be used, further text and references define how it is to be applied (used).

12-129 Log #349 NEC-P12 **Final Action: Accept in Principle**
(647.8(A))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read as follows:

647.8 Lighting Equipment. Lighting equipment installed under this article for the purpose of reducing electrical noise originating from lighting equipment shall meet the conditions of 647.8(A) through (C).

(A) Disconnecting Means. All luminaires (lighting fixtures) connected to separately derived systems operating at 60 volts to ground and associated control equipment, if provided, shall have a disconnecting means that simultaneously opens all ungrounded conductors. The disconnecting means shall be located within sight of the luminaire (lighting fixture) or be capable of being locked in the open position. The provisions for locking or adding a lock to the disconnecting means must remain in place at the switch or circuit breaker whether the lock is installed or not. Portable means for adding a lock to the switch or circuit breaker shall not be permitted.

Substantiation: This proposed change in wording is to provide consistency between other similar rules in the NEC that also call for disconnecting means to be capable of being locked in the open position. The phrase "capable of being locked in the open position" is used over 25 times in the NEC and the purpose is the same in every instance. Electrical safety rules for the worker should be consistent and the wording and requirements should be consistent where this phrase is used. The last sentence is being proposed because there are claims that some of the portable units available for snapping on to circuit breakers do remain with the switch or circuit breaker after they are installed on the breakers when the lock is not installed, but they are portable. The actions by CMP 11 in the 2002 cycle in 430.102(B) Exception were fairly clear that the provisions for adding a lock should be more substantial and not portable units.

Panel Meeting Action: Accept in Principle

Revise proposed text to read:

The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed. Portable means for adding a lock to the switch or circuit breaker shall not be permitted.

Panel Statement: See panel action and statement on Proposal 12-9.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11
Comment on Affirmative:

QUAVE, D.: Comment on Affirmative for Proposal 12-9.

12-130 Log #2052 NEC-P12 **Final Action: Accept in Principle**
(647.8(A))

Submitter: James T. Dollard, Jr., IBEW Local 98
Recommendation: Revise text to read as follows:

647.8(A) Disconnecting Means All luminaires (lighting fixtures) connected to separately derived systems operating at 60 volts to ground, and associated control equipment if provided, shall have a disconnecting means that simultaneously opens all ungrounded conductors. The disconnecting means shall be located within sight of the luminaire (lighting fixture) or be capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed.

Substantiation: The problem with the present wording of this section is that the disconnect for lighting equipment in sensitive electronic equipment applications in many cases is a circuit breaker in a panelboard or a switch that is not made with permanent provisions for locking the circuit breaker or switch in the open position.

This requirement for a disconnect is for the safety of the installer/maintainer of the equipment. Permanent provisions for making circuit breakers and switches capable of being locked in the open position are readily available from circuit breaker and switch manufacturers.

This proposal does not represent a large increase in the cost of an installation but will result in a dramatic increase in safety.

Where Article 647 installations occur we know that maintenance will take place, we must ensure that only a lock is needed by an installer/maintainer to work safely.

The practical safeguarding of persons from electrical hazards as detailed in the scope of the NEC must not be permitted to hinge on whether or not an installer just happens to have enough different types of devices and hopefully one that that happens to fit the circuit breaker or switch in an installation.

Note that this language was accepted by CMP-11 and is a present requirement, in the 2002 NEC, when a circuit breaker or switch is used as a disconnecting means not within sight of a motor. Also included in the 2005 NEC is the same language in 422.31 for appliances

The same level of safety is needed for these disconnecting means for lighting equipment in sensitive electronic equipment applications.

Panel Meeting Action: Accept in Principle

Revise proposed text to read:

The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed. Portable means for adding a lock to the switch or circuit breaker shall not be permitted.

Panel Statement: See panel action and statement on Proposal 12-9.

Comment on Affirmative:

QUAVE, D.: Comment on Affirmative for Proposal 12-9.

ARTICLE 660 — X-RAY EQUIPMENT

12-131 Log #2134 NEC-P12 **Final Action: Accept**
(660.3)

Submitter: Russell LeBlanc, Peterson School of Engineering
Recommendation: Replace the word "approved" with the word identified .
Substantiation: To clarify the intent of the requirement based on the definitions in Article 100.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-132 Log #1246 NEC-P12 **Final Action: Reject**
(660.5)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise text: A d ~~isconnecting means~~ switch or circuit breaker that simultaneously disconnects all ungrounded conductors with an ampere rating not less than...(remainder unchanged).
Substantiation: Edit. To conform to many Code sections which specify the type of disconnecting means and to specify simultaneous opening of all ungrounded conductors. The definition of disconnecting means covers a broad spectrum of devices, such as plug/receptacle, links, terminals, wire connectors, etc.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 12-137.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-133 Log #1472 NEC-P12 **Final Action: Reject**
(660.9)

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Rename the term "fixture wires" to "luminaire wires" in 600.9.
Substantiation: With the changing of the term "fixture" to "luminaire" it only makes sense that the term "fixture wires" be changed to "luminaire wires".
For the purposes of correlation, this proposal is also being submitted to the following Articles/Sections/Tables/Annexes: 200.6; 210.19; 210.20; 210.24; 240.4; 240.5; 300.17; 310.1; 314.16; Article 402; 517.74; 660.9; Table 1; Table 5; Annex C.
Panel Meeting Action: Reject
Panel Statement: "Fixtures wires" is the proper term at this time. If the title of Article 402 is changed to "Luminaire wires", then this section can be changed. While the term fixture as relating to lighting fixtures has been changed to luminaire, the term for fixture wires applies to conductors that serve appliances or other devices and not just luminaires.
Number Eligible to Vote: 11

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-136 Log #348 NEC-P12 **Final Action: Accept in Principle**
(665.12)

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read as follows:
665.12 Disconnecting Means. A readily accessible disconnecting means shall be provided to disconnect each heating equipment from its supply circuit. The disconnecting means shall be located within sight from the controller or be capable of being locked in the open position. The provisions for locking or adding a lock to the disconnecting means must remain in place at the switch or circuit breaker whether the lock is installed or not. Portable means for adding a lock to the switch or circuit breaker shall not be permitted. The rating of this disconnecting means shall not be less than the nameplate rating of the heating equipment. Motor-generator equipment shall comply with Article 430, Part IX. The supply circuit disconnecting means shall be permitted to serve as the heating equipment disconnecting means where only one heating equipment is supplied.
Substantiation: This proposed change in wording is to provide consistency between other similar rules in the NEC that also call for disconnecting means to be capable of being locked in the open position. The phrase "capable of being locked in the open position" is used over 25 times in the NEC and the purpose is the same in every instance. Electrical safety rules for the worker should be consistent and the wording and requirements should be consistent where this phrase is used. The last sentence is being proposed because there are claims that some of the portable units available for snapping on to circuit breakers do remain with the switch or circuit breaker after they are installed on the breakers when the lock is not installed, but they are portable. The actions by CMP 11 in the 2002 cycle in 430.102(B) Exception were fairly clear that the provisions for adding a lock should be more substantial and not portable units.
Panel Meeting Action: Accept in Principle
Revise proposed text to read:
The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed. Portable means for adding a lock to the switch or circuit breaker shall not be permitted.

QUAVE, D.: Comment on Affirmative for Proposal 12-9.

12-137 Log #1245 NEC-P12 **Final Action: Reject**
(665.12)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise text: A readily accessible ~~disconnecting means~~ switch or circuit breaker that simultaneously disconnects all ungrounded conductors shall be...(remainder unchanged).
Substantiation: Edit. To provide a specific type disconnecting means as is done in many sections. The definition of disconnecting means includes many devices other than switches and circuit breakers.
Panel Meeting Action: Reject
Panel Statement: The proposal unduly restricts the disconnecting means to a switch or circuit breaker with no technical substantiation for such restriction. Other types of disconnecting means are permitted.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-138 Log #2053 NEC-P12 **Final Action: Accept in Principle**
(665.12)

Submitter: James T. Dollard, Jr., IBEW Local 98
Recommendation: Revise text to read as follows:
665.12 Disconnecting Means
A readily accessible disconnecting means shall be provided to disconnect each heating equipment from its supply circuit. The disconnecting means shall be located within sight from the controller or be capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed. The rating of this disconnecting means shall not be less than the nameplate rating of the heating equipment. Motor-generator equipment shall comply with Article 430, Part IX. The supply circuit disconnecting means shall be permitted to serve as the heating equipment disconnecting means where only one heating equipment is supplied.
Substantiation: The problem with the present wording of this section is that the disconnect in many installations of induction and dielectric heating equipment applications is a circuit breaker in a panelboard or a switch that is not made with permanent provisions for locking the circuit breaker or switch in the open position.

This requirement for a disconnect is for the safety of the installer/maintainer of the equipment. Permanent provisions for making circuit breakers and switches capable of being locked in the open position are readily available from circuit breaker and switch manufacturers.

This proposal does not represent a large increase in the cost of an installation but will result in a dramatic increase in safety.

Where induction and dielectric heating equipment are involved we know that maintenance will take place, we must ensure that only a lock is needed by an installer/maintainer to work safely.

The practical safeguarding of persons from electrical hazards as detailed in the scope of the NEC must not be permitted to hinge on whether or not an installer just happens to have enough different types of devices and hopefully one that that happens to fit the circuit breaker or switch in an installation.

Note that this language was accepted by CMP-11 and is a present requirement, in the 2002 NEC, when a circuit breaker or switch is used as a disconnecting means not within sight of a motor. Also included in the 2005 NEC is the same language in 422.31 for appliances

The same level of safety is needed for these disconnecting means for induction and dielectric heating equipment.

Panel Meeting Action: Accept in Principle

Revise proposed text to read:

<u>The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed. Portable means for adding a lock to the switch or circuit breaker shall not be permitted.</u>

Panel Statement: See panel action and statement on Proposal 12-9.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

QUAVE, D.: Comment on Affirmative for Proposal 12-9.

12-139 Log #2054 NEC-P12 **Final Action: Accept in Principle**

(665.22)

Submitter: James T. Dollard, Jr., IBEW Local 98

Recommendation: Revise text to read as follows:

665.22 Access to Internal Equipment

Access doors or detachable access panels shall be employed for internal access to heating equipment. Access doors to internal compartments containing equipment employing voltages from 150 volts to 1000 volts ac or dc shall be capable of being locked closed or shall be interlocked to prevent the supply circuit from being energized while the door(s) is open. <u>The provision for locking or adding a lock to the access doors or detachable access panels shall be installed on or at the access door or access panel and shall remain in place with or without the lock installed.</u> Access doors to internal compartments containing equipment employing voltages exceeding 1000 volts ac or dc shall be provided with a disconnecting means equipped with mechanical lockouts to prevent access while the heating equipment is energized, or the access doors shall be capable of being locked closed and interlocked to prevent the supply circuit from being energized while the door(s) is open. Detachable panels not normally used for access to such parts shall be fastened in a manner that makes them inconvenient to remove.

Substantiation: The problem with the present wording of this section is that the means of lockout may be considered to be a portable device not directly associated with the equipment.

This existing requirement for providing a lock is for the safety of the installer/maintainer of the equipment. This proposal does not represent a large increase in the cost of an installation but will result in a dramatic increase in safety.

Where induction and dielectric heating equipment are involved we know that maintenance will take place, we must ensure that only a lock is needed by an installer/maintainer to work safely.

The practical safeguarding of persons from electrical hazards as detailed in the scope of the NEC must not be permitted to hinge on whether or not an installer just happens to have enough different types of devices and hopefully one that happens to the access door or access panel in an installation.

Note that this language was accepted by CMP-11 and is a present requirement, in the 2002 NEC, when a circuit breaker or switch is used as a disconnecting means not within sight of a motor. Also included in the 2005 NEC is the same language in 422.31 for appliances

The same level of safety is needed for these disconnecting means for induction and dielectric heating equipment.

Panel Meeting Action: Accept in Principle

Revise proposed text to read:

<u>The provision for locking or adding a lock to the access doors shall be installed on or at the access door and shall remain in place with or without the lock installed.</u>

Panel Statement: The panel agrees with the intent, but disagrees that detachable access panels need to be locked. Detachable panels not normally used for access to such parts shall be fastened in a manner that makes them inconvenient to remove.

QUAVE, D.: Comment on Affirmative for Proposal 12-9.

ARTICLE 668 — ELECTROLYTIC CELLS

12-140 Log #1025 NEC-P12 **Final Action: Reject**

(668.3(B))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Insert the word "directly" between "not" and "electrically".

Substantiation: Edit. Primary and secondary windings are connected (electromagnetic).

Panel Meeting Action: Reject

Panel Statement: The term "electrically connected" is defined in 668.2, and adding the term "directly" does not clarify 668.3(B).

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

12-141 Log #995 NEC-P12 **Final Action: Reject**

(668.3(C)(3))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Revise text to read as follows:

Equipment located or used within the electrolytic cell line working zone or associated with the cell line dc power circuits shall not be required to <u>be grounded</u> ~~comply with the provisions of Article 250~~ <u>except as provided in 668.11(B).</u>

Substantiation: Edit. Presumption is that only the provisions REQUIRING grounding are intended, since other provisions such as in 668.11(C) are required.

Panel Meeting Action: Reject

Panel Statement: The submitter has not presented any definitive technical substantiation supporting a problem with the current text.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

12-142 Log #1023 NEC-P12 **Final Action: Reject**

(668.15)

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Revise as follows:

For equipment, apparatus, and structural components that are ~~required~~ to be grounded ~~by provisions of Article 668, the provisions of Article 250 shall apply except a water pipe electrode shall not be required to be used.~~ any electrode or combination of electrodes described in 250.52 shall be <u>used</u> . ~~permitted~~ .

Substantiation: Edit. Reference should not be made to an entire article. It appears the only grounding requirements are in 668.11(B) and inferred in 668.3(B). The last sentence of this section makes the reference to a water pipe electrode superfluous. The word "permitted" does not REQUIRE any of the electrodes in 250.52.

Panel Meeting Action: Reject

Panel Statement: The change suggested by the submitter does not add clarity to the requirement. The panel disagrees with the submitter's substantiation that the proposal is editorial.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

12-143 Log #933 NEC-P12 **Final Action: Reject**

(668.21(A))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Revise second, third, and fourth sentences:

Power for these circuits shall be supplied through isolating transformers with <u>an ungrounded secondary.</u> Primaries of such transformers shall operate at not more than 600 volts, <u>nominal</u> , between conductors and shall be provided with proper overcurrent protection. The secondary of such transformers shall not exceed 300 volts, <u>nominal</u> , between conductors and all secondary circuits shall be ungrounded and have an approved overcurrent device of proper rating in each conductor.

Substantiation: Edit. Unless specified to have an ungrounded secondary, an isolating transformer may have a grounded secondary and supply ungrounded circuits, such as a 120/240 volt grounded secondary supplying 240 volt ungrounded circuits. The isolating transformer of (B) is specified to have an ungrounded secondary but that requirement is not a definition for wherever the term "isolating transformer' is used.

Panel Meeting Action: Reject

Panel Statement: The previous sentence in this section specifies that the

circuits be ungrounded. The last sentence also specifies the secondary of the transformer be ungrounded: “The secondary voltages of such transformers… from such secondaries shall be ungrounded….”
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-144 Log #991 NEC-P12 **Final Action: Reject**
(668.30(D))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Insert “overcurrent” between “circuit” and “protection”.
Substantiation: Edit. The type of protection (physical, overcurrent, overload), is not specified but has to be assumed.
Panel Meeting Action: Reject
Panel Statement: The submitter has not presented any definitive technical substantiation supporting a problem with the current text.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-145 Log #899 NEC-P12 **Final Action: Reject**
(668.43(E)(3))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
The provisions of a solid copper bonding jumper, insulated, covered, or bare, not smaller than 8 AWG ~~solid~~ .
Substantiation: Edit. This section doesn’t literally require a solid conductor, only one that is not smaller than 8 AWG solid; a 6 AWG stranded copper conductor literally complies.
Panel Meeting Action: Reject
Panel Statement: The section referred to does not exist.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 669 — ELECTROPLATING

12-145a Log #CP1202 NEC-P12 **Final Action: Accept**
(669.5)

Submitter: Code-Making Panel 12,
Recommendation:
Change the reference in the last sentence of 669.5 from “366.10” to “366.23”
Substantiation:
To reflect the correct location of the information.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 670 — INDUSTRIAL MACHINERY

12-146 Log #142 NEC-P12 **Final Action: Accept**
(670.1, FPN 1 (New))

TCC Action: The Technical Correlating Committee understands that the Panel Action on this Proposal adds FPN No. 1 with the text recommended in the Proposal and that FPN No. 2 will contain only the first sentence in the existing FPN; the second sentence will be deleted.
Submitter: Jay Tamblingson, Rockwell Automation
Recommendation: Add fine print note:
FPN No. 1: For further information, see NFPA 79-2002, Electrical Standard for Industrial Machinery. Change existing FPN to FPN No. 2.
Substantiation: This proposal restores an important FPN information reference to NFPA 79 which, prior to 2005, had existed in Article 670 since 1968. The 2005 version changed this reference to be more restrictive, indicating only that NFPA 79-2002 should be sought for information on workspace requirements. By restoring the previous FPN text, users of the NEC will be properly guided to NFPA 79 for further information on the many important details of safe electrical design for industrial machinery.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

12-147 Log #2171 NEC-P12 **Final Action: Accept**
(670.2)

TCC Action: The Technical Correlating Committee directs that this Proposal be referred to the NFPA Committee on Electrical Equipment of Industrial Machinery for information.
Submitter: Dann Strube, Strube Consulting
Recommendation: Delete the definition of “Industrial Manufacturing System”.
Substantiation: This definition must be a carry over from earlier code, but the term is not used in the NEC today.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

12-148 Log #402 NEC-P12 **Final Action: Reject**
(670.3)

Submitter: Sam Marcovici, NY City Buildings Dept.
Recommendation: Revise text to read as follows:
670.3 Machine Nameplate Data.
(A) Permanent Nameplate. A permanent nameplate shall be attached to the control equipment enclosure or machine and shall be plainly visible after installation. The nameplate shall include the following information:
(1) Supply voltage, phase, frequency, and full-load current
(2) Maximum ampere rating of the short-circuit and ground-fault protective device
(3) Ampere rating of largest motor, from the motor nameplate, or load
(4) Short circuit current rating of the machine industrial control panel based on one of the following:
a. Short circuit current rating of a listed and labeled machine control enclosure or assembly
b. Short circuit current rating established utilizing an approved method
FPN: UL 508A-2001, Supplement SB, is an example of an approved method.
(5) Electrical diagram number(s) or the number of the index to the electrical drawings
The full-load current shown on the nameplate shall not be less than the sum of the full-load currents required for all motors and other equipment that may be in operation at the same time under normal conditions of use. Where unusual type loads, duty cycles, and so forth require oversized conductors or permit reduced-size conductors, the required capacity shall be included in the marked “full-load current.” Where more than one incoming supply circuit is to be provided, the nameplate shall state the preceding information for each circuit.
Both OEM and refurbished machines shall have a permanent nameplate.
FPN: See 430.22(E) and 430.26 for duty cycle requirements.
(B) Overcurrent Protection. Where overcurrent protection is provided in accordance with 670.4(B), the machine shall be marked “overcurrent protection provided at machine supply terminals.”
Substantiation: When industrial equipment usually get refurbished, the replacement motor is sometimes larger than the original one, thus increasing the full-load current of the machine. Accordingly, the refurbishing companies should comply with the nameplate requirement just as the OEMs are.
Panel Meeting Action: Reject
Panel Statement: The proposed revision to 670.3 is already covered by the existing text which requires a nameplate for all machines. Refurbished machines are required to have accurate data on the nameplate.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

12-149 Log #647 NEC-P12 **Final Action: Accept**
(670.3(A)(1))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Revise text to read as follows:
670.3(A)(1):
(A) Permanent Nameplate. A permanent nameplate shall be attached to the control equipment enclosure or machine and shall be plainly visible after installation. The nameplate shall include the following information:
(1) Supply voltage, number of phase s , frequency, and full-load current.
Substantiation: Clarification of existing text.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

12-150 Log #2835 NEC-P12 **Final Action: Reject**
(670.4 Exception (New))

Submitter: Russell A. Tiffany, York International Corp.
Recommendation: Where one or more of the motors of the group are powered from an equipment mounted variable frequency drive, the ampere rating of the drive and/or drives shall be permitted in the summation of the full-load current ratings of the group.
Substantiation: UL allows the equipment wiring lugs to be sized per the nameplate ampacity on equipment based on the ampacity of the drive/drives, but 430.24 only considers the motors, but does not consider the drives. By allowing the smaller conductors, you allow the designer to increase the impedance of the circuit, now reducing the available fault current and helping reduce the risk of injury if a fault occurs.
Panel Meeting Action: Reject
Panel Statement: The change proposed by the submitter would create a conflict with the requirements in 430.122(A) and UL 508C without sufficient technical substantiation to mandate a different method of sizing.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

12-151 Log #1644 NEC-P12 **Final Action: Reject**
(670.4(C))

Submitter: Francois Tanguay, Pyradia, Inc
Recommendation: Add new text as follows:
Branch circuits and branch circuit protection for all electrical circuits in the furnace heating system shall be provided in accordance with NFPA 70 or with NFPA 79. The requirements for resistance heaters larger than 48 amperes to be broken down into subdivided circuits not to exceed 48 amperes shall not apply to industrial ovens and furnaces.
Substantiation: My problematic comes with the fact that CSA INTERNATIONAL which does our equipment certification for the US market are telling us that all our control panels for our ovens and furnaces shall have branch circuit for resistance heating elements divided in 48 A load, which is impossible to do on many ovens and furnaces. The company I work for, PYRADIA, manufactures industrial ovens and furnaces; some of which have heating power as high as 2.2 MW (2200 kW). It is impossible to design that kind of equipment with subdivided heating load of 48 A.
Certification agencies uses UL 499 Electrical Heating Appliances (at article 17.6) and UL 508A Industrial Control Panels (at 31.6), both of which have branch circuit requirements based on 422.11(F) and 424.22(B) of NFPA 70. In mind they both do not apply to industrial ovens and furnaces. Overcurrent protection for resistance heating elements as per 422.11(F) is for appliances.
NFPA 70 defines appliance as “Utilization equipment, generally other than industrial, that is normally built in standardized sizes or types and is installed or connected as a unit to perform one or more functions such as clothes washing, air conditioning, food mixing, deep frying, and so forth”. Which would exclude industrial ovens and furnaces.
Overcurrent protection for resistance heating elements as per article 424.22(B) is for fixed electric space-heating equipment. Which would exclude industrial ovens and furnaces.
670.4(C), which covers Industrial Machinery, does not specify limitation for overcurrent protection.
In NFPA 86 version 2003, Standard for Ovens and Furnaces;
It is written at the article 7-18.1.3 that:
“Branch circuits and branch circuit protection for all electrical circuits in the furnace heating system shall be provided in accordance with NFPA 70, National Electrical Code, and with NFPA 79, Electrical Standard for Industrial Machinery.
Exception: The requirements for resistance heaters larger than 48 amperes to be broken down into subdivided circuits not to exceed 48 amperes shall not apply to industrial ovens and furnaces.”
Even though NFPA 86 at article 7.18.1.3 specify that the 48A breakdown is not required for industrial ovens and furnaces, the certification agencies (UL or CSA) do not base their certification of that NFPA code, which is a problem for us. And, it seems UL standards 499 and 508A can only be modified if NFPA 70 is modified to permit that exception.
Panel Meeting Action: Reject
Panel Statement: Although the concern with compatibility with modern industrial equipment designs and NFPA 86 has merit, the proposal does not contain specific requirements for equipment that cannot be subdivided into 48A loads.
In a shortcircuit, large amounts of energy are released in the form of both heat and magnetic energy. As stated in the commentary for the NEC Handbook for Section 424.22 (B), the existing subdivision size was selected to use a maximum size fuse holder of 60 amps or a 60-ampere circuit breaker, since each 48-ampere load would be protected at 125% X 48 amps or 60 amps. An example of the amount of energy that may be generated in a shortcircuit involving one of these boilers or ovens can be seen by using the formula I2t where I2 is the current squared times the time the energy is permitted to exist in the fault.
The following is the example used in the 2005 NEC Handbook. “By using the UL Electrical Construction Equipment Directory (Green Book), the energy let-through of a 350-ampere fuse can be compared to the energy let-through of a 60-ampere fuse. In the fuse section (JCQR), the let-through energy, approximated by the current squared and then multiplied by the time, or I2t, is provided for various fuse classes (UL). A 600-volt, 60-ampere Class T fuse could have a let-through, I2t, as high as 30,000 ampere squared seconds. But a 600-volt, 350-ampere Class T fuse could have a let-through, I2t, as high as 1,100,000 ampere squared seconds. That means the 350-ampere fuse could let through 36.67 times as much damaging energy as the 60-ampere fuse during a short circuit.”
As can be seen by this example, by increasing the size of the fuse or circuit breaker from the 60 ampere subdivided heating element to a 350 ampere fuse protecting a much larger set of heating elements, the energy let through and the potential for damage is much greater. If an exception is to be made to the general protection rule, the proposal should contain alternative overcurrent protection sizing limits and accompanying rationale for those limits.
Higher limits were previously accepted for certain fixed electric space-heating equipment (boiler constructions) as described in Section 424.22(B) and 424.72(A), as both UL 499 (Electric Heating Appliances) and UL 197 (Commercial Electric Cooking Appliances) allow larger circuits involving resistance heating elements that cannot be subdivided into 48A loads, but limit the circuits to those not exceeding 120 A and protected at not more than 150A. Similarly, Section 7.2.11.2 of NFPA 79 and subclause 31.6 of UL 508A contain alternate provisions for heater circuits that cannot be subdivided into 48A loads.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

ARTICLE 675 — ELECTRICALLY DRIVEN OR CONTROLLED IRRIGATION MACHINES

19-137 Log #2046 NEC-P19 **Final Action: Accept**
(675.8(B))

Submitter: James T. Dollard, Jr., IBEW Local 98
Recommendation: Revise text to read as follows:
675.8(B) Main Disconnecting Means The main disconnecting means for the machine shall provide overcurrent protection, shall be at the point of connection of electrical power to the machine or shall be visible and not more than 15 m (50 ft) from the machine, and shall be readily accessible and capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed. This disconnecting means shall have a horsepower and current rating not less than required for the main controller.
Substantiation: The problem with the present wording of this section is that the disconnect in many installations of electrically driven or controlled irrigation machines is a circuit breaker in a panelboard or a switch that is not made with permanent provisions for locking the circuit breaker or switch in the open position.
This requirement for a disconnect is for the safety of the installer/maintainer of the equipment. Permanent provisions for making circuit breakers and switches capable of being locked in the open position are readily available from circuit breaker and switch manufacturers.
This proposal does not represent a large increase in the cost of an installation but will result in a dramatic increase in safety.
Where electrically driven or controlled irrigation machines are involved we know that maintenance will take place, we must ensure that only a lock is needed by an installer/maintainer to work safely.
The practical safeguarding of persons from electrical hazards as detailed in the scope of the NEC must not be permitted to hinge on whether or not an installer just happens to have enough different types of devices and hopefully one that that happens to fit the circuit breaker or switch in an installation.
Note that this language was accepted by CMP-11 and is a present requirement, in the 2002 NEC, when a circuit breaker or switch is used as a disconnecting means not within sight of a motor. Also included in the 2005 NEC is the same language in 422.31 for appliances
The same level of safety is needed for these disconnecting means for electrically driven or controlled irrigation machines.
Panel Meeting Action: Accept
Number Eligible to Vote: 7
Ballot Results: Affirmative: 7
Comment on Affirmative:
BERNSON, J.: There should be consistency between similar rules in the NEC that call for the disconnecting means to be capable of being locked in the open position. New language accepted by Panel 12 should also be adopted here to clarify that portable units are unacceptable. A new sentence should be added before the last sentence as follows: “Portable means for adding a lock to the disconnecting means shall not be permitted.” See language accepted by Panel 12 (Proposal 12-136) for this same purpose.

19-138 Log #3419 NEC-P19 **Final Action: Accept**
(675.8(B) Exception No. 2)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Delete the word “fusible”.
Substantiation: There is no apparent reason for the fusible requirement in a disconnecting means that must do that and nothing more, that is, disconnect the motor. For any other motor, 430.109(A)(3) does not require a molded case switch to be fusible, and no substantiation was submitted on this point when the proposal was presented.
Panel Meeting Action: Accept
Number Eligible to Vote: 7
Ballot Results: Affirmative: 7

19-139 Log #980 NEC-P19 **Final Action: Reject**
(675.8(C))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise text:
“A ~~disconnecting means~~ switch or circuit breaker shall be provided to disconnect all ungrounded conductors for each motor and its controller and shall be...” (remainder unchanged)

Substantiation: Edit. The type of disconnecting means is not specified; a disconnecting means per definition in Article 100 includes many devices such as plug/receptacle, wire connectors, lugs, relays, links (669.8(B)) etc.
Panel Meeting Action: Reject
Panel Statement: Requirements are given in 675.8(A) and 675.8(B) for the main controller and the main disconnecting means. No evidence is presented to indicate that the supplementary disconnecting means for individual motors needs to be a switch or circuit breaker. Each motor is not required by 675.8(A) to have its own controller.
Number Eligible to Vote: 7
Ballot Results: Affirmative: 7

ARTICLE 680 — SWIMMING POOLS, FOUNTAINS, AND SIMILAR INSTALLATIONS

17-58 Log #3636 NEC-P17 **Final Action: Reject**
(680)

Submitter: Donald W. Zipse, Zipse Electrical Engineering, Inc.
Recommendation: Revise text:

Article 680 Swimming Pools

The grounding, equipotential planes, bonding, wiring and other items need drastic review and re-thinking, as many of the ideas are incorrect.

Therefore, it is strongly suggested that an Ad Hoc Committee be formed to completely revised the Article eliminating the equipotential planes, incorrect voltage gradient statement along with new simplified ground / bonding requirements.

Substantiation: See D. W. Zipse's other proposals.

The problem is that the Underwater Luminaries are "grounded" and there is electrical connections directly back to the high voltage primary side of the pole mounted or pad mounted or underground transformer. The details of this connection will be described later. This electrical connection from the underwater luminaries is a path for the continuously flowing stray current emanating from the utility companies multigrounded neutral electrical distribution systems that has the neutral connected to earth at least 4 times per mile. It is this current that enters the swimming pool to complete the electrical circuit. Bear in mind that the current may be flowing in the opposite direction. The direction is arbitrary.

In addition to the above multigrounded neutral electrical distribution system earthing, there is a second electrical circuit. The second circuit is the bastardized electrical connection between the high voltage primary neutral and the secondary neutral allowing primary high voltage electricity to flow directly into the residence, commercial or industrial facility using the secondary neutral which is bonded to the green equipment grounding conductor. Now this green color equipment grounding conductor is connected to the underwater luminaries metal frame allowing stray continuous flowing dangerous and hazardous current to complete the circuit.

What the above bastardize electrical connection does is allow the direct electrical connection of any lightning strike to nearby distribution system to flow directly into your own home and destroy the sensitive electrical equipment, which is not an act of God or Mother Nature, but directly attributable to the utility since 1932.

With the approval of Code Making Panel # 5's acceptance of the dangerous and hazardous multigrounded neutral distribution system, stray current has been measured flowing within swimming pools, hot tubs, showers, etc.

The Electric Power Research Institute (EPRI) an organization of utilities companies states that 40 to 60 percent of the return neutral current from the high voltage electrical circuit returns over or through the earth. We have measured as high as eighty-eight (88) percent of the neutral current returning over the earth and thus through dairies, back yards of homes through hot tubs, swimming pools, etc.

Ohm's Law states that **Voltage = Current X Resistance**

It is impossible to eliminate voltage gradients, except in your imagination as long as current is flowing continuously through the concrete and re-bar, which is happening in the real world.

Unless the buried in concrete metal mesh is at or near absolute zero temperature, the equipotential bonding will have some resistance. The concrete is semi-conductive being wet and especially since the concrete had a metallic mesh within it. Any current flowing over and through the equipotential bonding will produce a voltage per Ohm's Law. This has been proven by testing as will be described below.

It must be noted that the human body has approximately the same internal resistance as a cow. The electrical principle is the same for equipotential planes and equipotential bonding. The following will show conclusively that there is high voltage electric current flowing in the earth. In one court case, there were 18.5 amperes on the high voltage phase conductor and only 3.5 amperes on the multigrounded neutral electrical distribution system. Simple math shows that 15 amperes of return current in that case was flowing uncontrolled over the earth.

In another case, an engineering firm measured 5 amperes returning to the substation flowing over the earth shocking persons.

What happens is the swimming pool with its water soaked concrete is such a good, efficient low impedance contact with the earth that the equipotential plane acts as a "sink" for the majority of the stray neutral current flowing through earth in the vicinity. It becomes a magnet for collecting the stray current. With the underwater luminaries connected to the equipment grounding conductor which is connected to the neutral service entrance conductor which, is connected to the utility power company's transformer which has the secondary neutral connected to the high voltage primary neutral thus completing the connection to the primary electrical circuit back to the substation completing the circuit.

Thus, in order to eliminate this dangerous and hazardous electrical connection the underwater luminaries must be completely removed.

There must be no electrical connection from the water in the pool back to the high voltage primary electrical system. The metallic frame of the pump motor need to be connected to the equipment grounding conductor and system in order to provide a low impedance path back to the service panel in order to trip the protective device, circuit breaker or fuse.

As the electrical load increases more and more stray current will enter the earth resulting in more and more shocking incidents. It is opined that as the electrical load increases to a critical level that may last for only an hour or a day, in any one multigrounded neutral electrical distribution system, someone will be electrocuted or drown because the persons muscles froze and they sank to the bottom of the pool and drowned. It may have already occurred.
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide a recommendation for consideration in accordance with the Regulations Governing Committee Projects, Section 4-3.3(c).

17-59 Log #3201 NEC-P17 **Final Action: Reject**
(680.1)

TCC Action: The Technical Correlating Committee advises that Article Scope statements and Titles are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.
Submitter: Donald Cook, Shelby County Development Services
Recommendation: 680.1 Scope. The provisions of this article apply to the construction and installation of electrical wiring for and equipment in or adjacent to all swimming, wading, therapeutic, and decorative pools; hot tubs; spas; <u>baptisteries;</u> and hydromassage bathtubs, whether permanently installed or storable, and to metallic auxiliary equipment such as pumps, filters, and similar equipment. Second sentence not changed.
Substantiation: Baptisteries are not currently covered by this article or any other special equipment requirements of the NEC. Many involve immersion of the user and the same electrical hazards as pools, hot tubs, spas, hydromassages, and other vessels included in Article 680. Currently, nothing in the NEC requires bonding of metal parts, GFCI protection of equipment, separation of electrical and electronic devices from the vessel. This and companion proposals address that lack of coverage. The attached newspaper article related to the death of a user is submitted for substantiation that requirements are needed.

- Based on NEC 90.2(A) and (B), the distribution system is within the scope of the NEC.
- The service point, which is defined in Article 100 is the line of demarcation and separates the "utility system" from the "premises wiring". See definitions for service point and premises wiring. The combination of those definitions and the information in 90.2 clearly places this installation within the scope of the NEC.
- The value of the Fine Print Notes (FPN) to the enforcement of the installation can be determined by reading NEC 90.5(C).
- Based on 90.2(C), the authority having jurisdiction (Shelby County) may grant exceptions to the requirements found in the NEC for outdoor distribution work.
- Little or none of the equipment utilized in distribution installations has been evaluated by any NRTL.
- Although the NEC has some rules for installations over 600 volts, it was not developed to evaluate overhead distribution systems.
- After discussing this type installation with respected inspection agencies all over the US, with respected NEC experts all over the country, with NFPA staff, we have agreed to provide that exception based on the owner providing a third party evaluation of the equipment and the installation.
- We also provided an option of transferring ownership of the distribution system back to Alabama Power. If that choice was made, the service point would be re-located to each well site and the NEC would be much easier to use.
- We can not use the NESC. That document has not been adopted in this jurisdiction. We can accept an evaluation from an acceptable third party agency. Since the approval of any installation is the responsibility of the AHJ, it is the responsibility of Shelby County to determine what third party agency we will approve.

90.2 Scope.

(A) Covered. This Code covers the installation of electrical conductors, equipment, and raceways; signaling and communications conductors, equipment, and raceways; and optical fiber cables and raceways for the following:

(1) Public and private premises, including buildings, structures, mobile homes, recreational vehicles, and floating buildings

(2) Yards, lots, parking lots, carnivals, and industrial substations

FPN to (2): For additional information concerning such installations in an industrial or multibuilding complex, see ANSI C2-2002, National Electrical Safety Code.

(3) Installations of conductors and equipment that connect to the supply of electricity

(4) Installations used by the electric utility, such as office buildings, warehouses, garages, machine shops, and recreational buildings, that are not an integral part of a generating plant, substation, or control center.

(C) Special Permission. The authority having jurisdiction for enforcing this Code may grant exception for the installation of conductors and equipment that are not under the exclusive control of the electric utilities and are used to connect the electric utility supply system to the service-entrance conductors of the premises served, provided such installations are outside a building or terminate immediately inside a building wall.

90.5 Mandatory Rules, Permissive Rules, and Explanatory Material.

(A) Mandatory Rules. Mandatory rules of this Code are those that identify actions that are specifically required or prohibited and are characterized by the use of the terms shall or shall not.

(B) Permissive Rules. Permissive rules of this Code are those that identify actions that are allowed but not required, are normally used to describe options or alternative methods, and are characterized by the use of the terms shall be permitted or shall not be required.

(C) Explanatory Material. Explanatory material, such as references to other standards, references to related sections of this Code, or information related to a Code rule, is included in this Code in the form of fine print notes (FPNs). **Fine print notes are informational only and are not enforceable as requirements of this Code.**

ARTICLE 100 Definitions

Approved. Acceptable to the authority having jurisdiction.

Premises Wiring (System). That interior and exterior wiring, including power, lighting, control, and signal circuit wiring together with all their associated hardware, fittings, and wiring devices, both permanently and temporarily installed, that extends from the service point or source of power, such as a battery, a solar photovoltaic system, or a generator, transformer, or converter windings, to the outlet(s). Such wiring does not include wiring internal to appliances, luminaires (fixtures), motors, controllers, motor control centers, and similar equipment.

Service Point. The point of connection between the facilities of the serving utility and the premises wiring.

110.2 Approval. The conductors and equipment required or permitted by this Code shall be acceptable only if approved.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: A change to the scope is not required.

● After discussing this type installation with respected inspection agencies all over the US, with respected NEC experts all over the country, with NFPA staff, we have agreed to provide that exception based on the owner providing a third party evaluation of the equipment and the installation.

● We also provided an option of transferring ownership of the distribution system back to Alabama Power. If that choice was made, the service point would be re-located to each well site and the NEC would be much easier to use.

● We can not use the NESC. That document has not been adopted in this jurisdiction. We can accept an evaluation from an acceptable third party agency. Since the approval of any installation is the responsibility of the AHJ, it is the responsibility of Shelby County to determine what third party agency we will approve.

90.2 Scope.

(A) Covered. This Code covers the installation of electrical conductors, equipment, and raceways; signaling and communications conductors, equipment, and raceways; and optical fiber cables and raceways for the following:

(1) Public and private premises, including buildings, structures, mobile homes, recreational vehicles, and floating buildings

(2) Yards, lots, parking lots, carnivals, and industrial substations

FPN to (2): For additional information concerning such installations in an industrial or multibuilding complex, see ANSI C2-2002, National Electrical Safety Code.

(3) Installations of conductors and equipment that connect to the supply of electricity

(4) Installations used by the electric utility, such as office buildings, warehouses, garages, machine shops, and recreational buildings, that are not an integral part of a generating plant, substation, or control center.

(C) Special Permission. The authority having jurisdiction for enforcing this Code may grant exception for the installation of conductors and equipment that are not under the exclusive control of the electric utilities and are used to connect the electric utility supply system to the service-entrance conductors of the premises served, provided such installations are outside a building or terminate immediately inside a building wall.

90.5 Mandatory Rules, Permissive Rules, and Explanatory Material.

(A) Mandatory Rules. Mandatory rules of this Code are those that identify actions that are specifically required or prohibited and are characterized by the use of the terms shall or shall not.

(B) Permissive Rules. Permissive rules of this Code are those that identify actions that are allowed but not required, are normally used to describe options or alternative methods, and are characterized by the use of the terms shall be permitted or shall not be required.

(C) Explanatory Material. Explanatory material, such as references to other standards, references to related sections of this Code, or information related to a Code rule, is included in this Code in the form of fine print notes (FPNs). **Fine print notes are informational only and are not enforceable as requirements of this Code.**

ARTICLE 100 Definitions

Approved. Acceptable to the authority having jurisdiction.

Premises Wiring (System). That interior and exterior wiring, including power, lighting, control, and signal circuit wiring together with all their associated hardware, fittings, and wiring devices, both permanently and temporarily installed, that extends from the service point or source of power, such as a battery, a solar photovoltaic system, or a generator, transformer, or converter windings, to the outlet(s). Such wiring does not include wiring internal to appliances, luminaires (fixtures), motors, controllers, motor control centers, and similar equipment.

Service Point. The point of connection between the facilities of the serving utility and the premises wiring.

110.2 Approval. The conductors and equipment required or permitted by this Code shall be acceptable only if approved.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle

Change three (3) definitions in 680.2 as follows:

Permanently Installed Swimming, Wading, Immersion, and Therapeutic Pools. Those that are constructed in the ground or partially in the ground, and all others capable of holding water in a depth greater than 1.0 m (42 in.), and all pools installed inside of a building, regardless of water depth, whether or not served by electrical circuits of any nature.

Pool. Manufactured or field-constructed equipment designed to contain water on a permanent or semipermanent basis and used for swimming, wading, immersion, or other purposes.

Storable Swimming, Wading or Immersion Pool. Those that are constructed on or above the ground and are capable of holding water to a maximum depth of 1.0 m (42 in.), or a pool with nonmetallic, molded polymeric walls or inflatable fabric walls regardless of dimension.

Panel Statement: A separate definition of b aptistery is not required. The panel revised three (3) definitions in 680.2; these changes meet the submitter’s intent.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-61 Log #1305 NEC-P17 **Final Action: Reject**
(680.2.Fountain)

Submitter: Jim Davis, Electrical Education Services, LLC
Recommendation: Revise text as follows:
Fountain. ~~Fountains, ornamental pools, display pools, and reflection pools.~~ A mechanically assisted discharge of liquid to serve any one or more of a variety of purposes, usually containing a basin or pool. The definition does not include drinking fountains.
Substantiation: This proposed change intends to resolve a conflict with the NEC Style Manual as well as to provide a more complete description of the many various constructed forms that are currently found in contemporary fountains. In section 2.2.2 of the 2003 edition of the NEC Style Manual, the rule is that definitions **shall not** contain the term that is being defined. The present text also contains a disagreement in number as the "Fountain" is singular, and the items used to define it are plural (fountain s , ornamental pool s , display pool s , and reflection pool s). Revision of this definition will help clarify appropriate application of the NEC.
Panel Meeting Action: Reject
Panel Statement: The proposed definition is too vague and does not add clarity to the text.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-62 Log #3421 NEC-P17 **Final Action: Reject**
(680.2.Maximum Water Level.)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Revise to read as follows:
Maximum Water Level. The highest water level that water can reach based on the design of the water circulation and drainage system for the contained body of water.
Substantiation: The extra few inches provided by a definition based on spill over height add essentially nothing to safety since water at the spillover level would be an extremely transient condition. This definition had very thin substantiation to begin with, and it raises hob with many settled rules in Article 680. Consider for example 680.24(A)(2)(a). With the maximum water level now effectively equal to the deck height in most instances, the allowance for a reduction in height for the swimming pool junction box to 4 inches above the deck is now meaningless, and the boxes must be raised to 8 inches above the deck. When this change was made (allowing 4 inches above the deck), it was done to make a box position under a diving board feasible, so the box wouldn't be needlessly disturbed. Remember that swimming pool junction box covers must be lifted some distance vertically in order to gain access to the box interior.
Panel Meeting Action: Reject
Panel Statement: If the water circulation fails, the water can rise to the point where it spills out.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-63 Log #1935 NEC-P17 **Final Action: Reject**
(Table 680.3)

TCC Action: The Technical Correlating Committee directs that the Panel reconsider and correlate with the Panel Action on Proposals 8-53 and 8-78. This action will be considered by the Panel as a Public Comment.
Submitter: William Wagner, Certification Solutions
Recommendation: Revise Table 680.3 as follows:

Table 680.3 Other Articles

Topic	Section or Article
Wiring	Chapters 1 – 4
Junction box support	314.23
Rigid nonmetallic conduit	315.12, 353.12, 355.12
Audio Equipment	Article 640, Parts I and II
Adjacent to pools fountains	640.10
Underwater speakers*	

*Underwater loudspeakers shall be installed in accordance with 680.27(A)

Substantiation: This is a companion proposal for the new definition of Rigid Nonmetallic Conduit in Article 100 and the revised Article 352 for Type PVC Conduit and the new Article 355 for RTRC. It clarifies that broad designation of rigid nonmetallic conduit (Type RNC) includes PVC, HDPE and RTRC, each of which will now have a separate Article, and includes references to the respective Articles.
Panel Meeting Action: Reject
Panel Statement: These articles are nonexistent; as such, the panel cannot determine the appropriateness of these materials.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-64 Log #2718 NEC-P17 **Final Action: Reject**
(680.6)

Submitter: Steven D. Holmes, Underwriters Laboratories Inc.
Recommendation: Revise as follows:
680.6 Grounding. Electrical equipment shall be grounded in accordance with Parts V, VI, and VII of Article 250 and connected by wiring methods of Chapter 3, except as modified in this article. The following equipment shall be grounded:
(1) Through-wall lighting assemblies and underwater luminaires (lighting fixtures), other than those ~~low-voltage~~ systems listed for the application without a grounding conductor.
(remainder of 680.6 unchanged)
Substantiation: Problem. Item (1) of the list of equipment in 680.6 provides for through-wall lighting assemblies and underwater luminaires to not have a grounding conductor and to not be grounded only if they are low voltage. This requirement unnecessarily prevents development and use of 120 V through-wall lighting assemblies and underwater luminaires that do not have a grounding conductor, even if they do not have non-current-carrying metal parts requiring grounding. The unnecessary low voltage limitations of item (1) of 680.6 prevents luminaire manufacturers, pool builders, owners, and users from gaining the benefits of 120 V luminaires that do not require or have provision for grounding.
Substantiation: During the evaluation for the required listing [Section 680.23(A)(8) and 680.33] of through-wall lighting assemblies and underwater luminaires, it can be determined if a 120 volt lighting assembly or underwater luminaire without a grounding conductor limits the risks of electric shock as is required for (a) low-voltage designs without a grounding conductor and (b) 120 V designs with a grounding conductor.
The 120 V designs without a grounding conductor can be designed so "that, where the luminaire (fixture) is properly installed without a ground-fault circuit-interrupter, there is no shock hazard with any likely combination of fault conditions during normal use (not relamping)" 1 . Test techniques for determining compliance with this NEC requirement are well developed and are effective for evaluating 120 V designs without a grounding conductor just as they are for designs permitted by 680.6 120 V designs without grounding and that limit the risks of electric shock can both be practical and comply with all safety requirements, including the limit for escape current conducting into the swimming pool water under damaged lens or gasket conditions and other applicable fault conditions required in the UL Standard for Underwater Luminaires and Junction Boxes, UL 676
Footnote
[1] Quoted text is from 680.23(A)(1), Underwater Luminaires (Lighting Fixtures); General; Luminaire (Fixture) Design, Normal Operation.
Panel Meeting Action: Reject
Panel Statement: See the panel action on Proposal 17-65.
The term "low voltage" is retained for safety considerations.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
BLEWITT, T.: Proposal should have been Accepted in Part. The Submitter did not make it clear that a system of double insulation was required in the absence of a grounding conductor.
UL 676, the Standard for Underwater Luminaires, specifies construction and performance requirements for line-voltage double-insulated luminaires. Therefore the low voltage restriction for luminaires not requiring grounding is no longer necessary.
Revised text of 680.6(1) should be amended as follows:
(1) Through-wall lighting assemblies and underwater luminaires (lighting fixtures), other than those ~~low-voltage~~ systems listed for the application with an approved system of double insulation ~~without a grounding conductor~~ .
Comment on Affirmative:
HIRSCH, B.: The NEC should encourage new technology and not be so restrictive as to discourage industry changes. Only through testing, however, can we validate the safety of new devices. UL needs to supply compelling substantiation including test requirements and test results that verify the ability of 120 volt pool luminaires and double insulated pool equipment to meet all safety requirements.

17-65 Log #2720 NEC-P17 **Final Action: Accept**
(680.6)

Submitter: Steven D. Holmes, Underwriters Laboratories Inc.
Recommendation: Revise as follows:
680.6 Grounding. Electrical equipment shall be grounded in accordance with Parts V, VI, and VII of Article 250 and connected by wiring methods of Chapter 3, except as modified in this article. The following equipment shall be grounded:
(1) Through-wall lighting assemblies and underwater luminaires (~~lighting fixtures~~), other than those low-voltage ~~systems~~ lighting products listed for the application without a grounding conductor.
(remainder of 680.6 unchanged).

Substantiation: A low-voltage through-wall lighting assembly or underwater luminaire is often a single object, permanently connected to a 15 V supply circuit. In this form, it is not part of a "system" of field-assembled discrete parts or products from the lighting product manufacturer. The only product is the discrete low-voltage through-wall lighting assembly or underwater luminaire. The use of the term "system" sometimes leads readers to unnecessarily expect other nonexistent and not required separate parts or products from the manufacturer of the low-voltage through-wall lighting assembly or underwater luminaire. For these discrete low-voltage lighting assemblies and underwater luminaires, a listed swimming pool and spa transformer (required by 680.23(A)(2)) of any transformer manufacturer can be field acquired and installed for the supply circuit for the low voltage lighting assembly or luminaire. While both the transformer and the supplied lighting assembly or luminaire are listed, they are not listed as a "system".
The term "lighting products" are proposed to replace the term "system". A lighting product is more likely to be understood by the reader to refer to either a discreet single product or a system of parts or products.

In those situations where the lighting product consists of multiple field-assembled separate parts from the manufacturer that need to be used together as a system, the listing can require the multiple parts to be marked to identify that they need to be used together (as a system).

Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-66 Log #987 NEC-P17 **Final Action: Reject**
(680.7)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Add:

"and attachment plug" after "flexible cord".

Substantiation: Edit. To be consistent with the heading. Present literal wording does not permit an underwater lighting fixture to be cord connected.
Panel Meeting Action: Reject
Panel Statement: This requirement is already included in 680.7(B).

The panel does not agree with the submitter's substantiation.

Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-67 Log #1302 NEC-P17 **Final Action: Accept**
(680.7)

Submitter: Jim Davis, Electrical Education Services, LLC
Recommendation: Revise text as follows:

Fixed or stationary equipment, other than underwater luminaire s (~~lighting fixture~~ s) , for a permanently installed pool shall be permitted to be connected with a flexible cord to facilitate the removal or disconnection for maintenance or repair.

Substantiation: This proposed change intends to resolve a conflict with the 2003 NEC Style Manual as well as to provide increased sentence flow and clarity. By adding two commas, one after the word EQUIPMENT and another after the word FIXTURE (in parenthesis), this parenthetical element "other than underwater luminaire (lighting fixture)" is set off more clearly and distinctly as being not covered by the rules of 680.7. Also, by changing luminaire to luminaire s , plural, the text agrees with the NEC Style Manual in 3.3.3.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-68 Log #2119 NEC-P17 **Final Action: Reject**
(680.7)

Submitter: Bud Swathwood, Bud Swathwood Consulting
Recommendation: Add new last sentence to 680.7 after the last sentence to read:

The cord and plug may be factory assembled or field installed. If field installed, the cord and plug shall meet the requirements of 680.7(A), (B), and (C).

Substantiation: Many inspectors require the cord and plug installation be done at the manufacturing facilities of the equipment. This addition to the text will make it clear that a field installed cord and plug will be acceptable. (See proposals for 680.21(5)).
Panel Meeting Action: Reject
Panel Statement: The submitter's substantiation does not include the requrement for a cord-and-plug listed for the purpose.

Not all equipment is listed for cord-and-plug connection.

Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-69 Log #2722 NEC-P17 **Final Action: Reject**
(680.7(B))

Submitter: Steven D. Holmes, Underwriters Laboratories Inc.
Recommendation: Revise as follows:

680.7 Cord- and Plug-Connected Equipment. Fixed or stationary equipment other than an underwater luminaire (lighting fixture) for a permanently installed pool shall be permitted to be connected with a flexible cord to facilitate the removal or disconnection for maintenance or repair.

(A) Length. For other than storable pools, the flexible cord shall not exceed 900 mm (3 ft) in length.

~~(B) Equipment Grounding. The flexible cord shall be a copper equipment grounding conductor sized in accordance with 250.122 but not smaller than 12 AWG. The cord shall terminate in a grounding type attachment plug.~~

(B) Equipment Grounding.

(1) Lighting Assemblies for Storable Pools. Equipment grounding shall comply with 680.33.

(2) Other Equipment. The flexible cord shall have a copper equipment grounding conductor sized in accordance with 250.122 but not smaller than 12 AWG. The cord shall terminate in a grounding-type attachment plug.

Substantiation: The submitter requests and intends that this proposal for 680.7(B) be considered with the submitter's separate proposal for 680.33 to address the equipment grounding conductor requirements for lighting assemblies for storable pools.

Problem: 680.7(B) requires the jacketed flexible cords that are part of a (stationary) lighting assembly for storable pools to be sized in accordance with 250.122 but not smaller than 12 AWG. No other requirement in Article 680 Part I General or Part III Storable Pools modifies this requirement for lighting assemblies for a storable pool. The standard for Underwater Luminaires and Junction boxes, UL 676, requires the flexible cord extending away from the luminaire at the pool wall to be minimum 25 ft. Where involved safety issues remain addressed, permitting the flexible cord to be smaller than 12 AWG would provide for less expense for luminaire manufacturers and users and less bulk and weight for lighting assemblies that otherwise require only a smaller equipment grounding conductor in a flexible cord.

Substantiation for Proposal. 680.33 requires, in part, the luminaire at the storable pool wall to have no exposed metal parts. In the event of an electrical fault to grounded metal inside the luminaire, this internal grounded metal may exhibit a nonzero voltage potential with respect to the local earth or the pool water for the period of time until the circuit overcurrent protection device functions to de-energize the circuit supplying the luminaire. Because there are no exposed grounded metal parts on the luminaire and the luminaire has an impact-resistant lens and luminaire body, it is unlikely that a pool occupant will be able to contact a grounded metal part exhibiting any voltage potential that exists until the circuit overcurrent protection device de-energizes the circuit.

If a lens gasket or other water barrier part can fail and lead to the pool water flooding the luminaire, the Standard for Underwater Luminaires and Junction Boxes, UL 676, requires testing be completed to determine if the luminaire design limits the amount of electric current that conducts through the water and out of the luminaire into the pool. In the flooded condition, grounded metal inside the luminaire is sometimes relied upon to collect electric current from the water within the luminaire. This collected electric current conducts out of the luminaire through the equipment grounding conductor in the flexible cord. For some luminaire designs, and equipment grounding conductor in this flexible cord of less than 12 AWG is capable of enabling the luminaire to comply with this UL 676 escape current test requirement.

Therefore, the lighting assembly's equipment grounding conductor needs only to be sized to have the following characteristics:

(A) The conductor has impedance low enough to facilitate operation of the circuit overcurrent protection device.

(B) The conductor is capable of conducting the possible ground-fault current until operation of the circuit overcurrent protection device.

(C) The conductor has impedance low enough to enable the flooded luminaire to limit the amount of electric current that conducts out of the luminaire into the pool as specified in the Standard for Underwater Luminaires and Junction Boxes, UL 676.

Revising 680.7(B) as proposed excludes lighting assemblies for storable pools from the existing requirement that their equipment grounding conductors be 12 AWG or greater and, instead, refers the reader to (proposed revised) 680.33 to establish the minimum size of the equipment grounding conductor. The minimum size for an equipment grounding conductor in the flexible cords of an underwater luminaire is better addressed in 680.33.

Panel Meeting Action: Reject
Panel Statement: See panel action on Proposal 17-136.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:

BLEWITT, T.: The Panel indicated that the proposal would reduce the mechanical integrity of the equipment grounding conductor. However, UL 676, the Standard for Underwater Luminaires, addresses the likelihood of damage to cords and equipment grounding conductors.

17-70 Log #2724 NEC-P17 **Final Action: Reject**
(680.7(B))

Submitter: Steven D. Holmes, Underwriters Laboratories Inc.
Recommendation: Revise as follows:

680.7 Cord- and Plug-Connected Equipment. Fixed or stationary equipment other than an underwater luminaire (lighting fixture) for a permanently installed pool shall be permitted to be connected with a flexible cord to facilitate the removal or disconnection for maintenance or repair.

(A) Length. For other than storable pools, the flexible cord shall not exceed 900 mm (3 ft) in length.

~~(B) Equipment Grounding. The flexible cord shall be a copper equipment grounding conductor sized in accordance with 250.122 but not smaller than 12 AWG. The cord shall terminate in a grounding type attachment plug.~~

(B) Equipment Grounding.

(1) Lighting Assemblies for Storable Pools. Equipment grounding shall comply with 680.33.

(2) Other Equipment. The flexible cord shall have a copper equipment grounding conductor sized in accordance with 250.122 but not smaller than 12 AWG. The cord shall terminate in a grounding-type attachment plug.

Substantiation: The submitter requests and intends that this proposal for 680.7(B) be considered with the submitter's separate proposal for 680.33 to address the equipment grounding conductor requirements for lighting assemblies for storable pools.

Problem: Section 680.7(B) requires the jacketed flexible cords that are part of a (stationary) lighting assembly for storable pools to be provided with an equipment grounding conductor. No other requirement in Article 680 Part I General or Part III Storable Pools modifies this requirement for lighting assemblies for a storable pool. The Standard for Underwater Luminaires and Junction Boxes, UL 676, requires the flexible cord extending away from the luminaire at the pool wall to be minimum 25 ft. Some underwater luminaires for storable pools do not have non-current-carrying metal parts requiring grounding. Using flexible cord with an equipment grounding conductor when not required results in additional product bulk and weight and significant additional expense for both the lighting assembly manufacturers and users.

Substantiation for Proposal. It is unnecessary to require an equipment grounding conductor in the flexible cord extending from the luminaire at the pool wall if the luminaire does not have noncurrent-carrying metal parts requiring grounding. If provided, the equipment grounding conductor in the flexible cord for such a luminaire remains unconnected at the luminaire end.

If an entire 120 volt lighting assembly covered by 680.33(B) does not have noncurrent-carrying metal parts requiring grounding and, therefore, does not have an equipment grounding conductor, the manufacturer of a lighting assembly may choose to use an integral GFCI with a 2-wire polarized attachment plug instead of a GFCI with a 3-wire grounding-type attachment plug.

Revising 680.7(B) as proposed excludes lighting assemblies for storable pools from the existing requirement that their flexible cord have an equipment grounding conductor and, instead, refers the reader to (proposed revised) 680.33 to establish the need for an equipment grounding conductor. The need for an equipment grounding conductor in the flexible cord of an underwater luminaire is better addressed in 680.33.

Panel Meeting Action: Reject
Panel Statement: See panel action on Proposal 17-136.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:

BLEWITT, T.: The Panel indicated that the proposal would reduce the mechanical integrity of the equipment grounding conductor. However, UL 676, the Standard for Underwater Luminaires, addresses the likelihood of damage to cords and equipment grounding conductors.

17-71 Log #602 NEC-P17 **Final Action: Reject**
(680.8)

Submitter: Vincent Metallo, Sr., Baltimore County, MD / Rep. Baltimore County Electrical Inspections
Recommendation: Revise text to read:

680.8 Overhead Conductor Clearances (For Permanently Installed Swimming Pools.)

Substantiation: Add the wording for "permanently installed swimming pools." The intent of the rule was that long hand held extension type skimmer handles would have proper clearances from overhead lines when in use. This would remove the requirement that storable pools and outside hot tubs are governed by 680.8. Long hand held extension type skimmers are not used for storable pools or outside hot tubs.

Panel Meeting Action: Reject
Panel Statement: Long handle skimmers are also used on storable pools. This poses a safety hazard.

The panel disagrees with the substantiation that this is not the only reason for the requirement.

Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-72 Log #1549 NEC-P17 **Final Action: Accept**
(680.8)

Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Delete the term "effectively" from the terms "effectively grounded" and "effectively bonded" from Articles 680 and revise text as shown for the affected NEC sections.

680.8, Table 680.8: Insulated Cables, 0–750 Volts to Ground, Supported on and Cabled Together with an ~~Effectively~~ Solidly Grounded Bare Messenger or ~~Effectively~~ Solidly Grounded Neutral Conductor.

Substantiation: 680.8, Table 680.8: The definition of "effectively grounded" is ambiguous and very subjective without any defined values or parameters for one to judge as either "effective" or "ineffective." The proposal suggests replacing "effectively" with "solidly" to emphasize that cable has to be grounded solidly.

This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to delete the term "grounded, effectively" and its definition from Article 100 and other companion proposals throughout the NEC relative to this Task Group's recommendations. The substantiation of this proposal is as follows.

The term "Effectively Grounded" is used 29 times in the NEC. It appears as though in the majority of the locations where it is used, the word "grounded" or phrase "connected to an equipment grounding conductor" could be used. Other proposals are submitted to make those changes.

The 1996 NEC in Section 250.51 used the term "effective grounding path," and those concepts were incorporated in 250.2 (1999 NEC) and then expanded in 250.4(A) and (B) in the 2002 NEC. The performance criteria of grounding and bonding are currently provided in Section 250.4 and include the concepts contained in the vague definition of the term "effectively grounded."

The definition "Effectively Grounded" is very subjective and without any defined values or parameters for one to judge grounding as either "effective" or "ineffective." "Effective" is described in Section 250.4(A) and (B), but it relates to the effective ground-fault current path as a performance criteria. Deleting the term in the NEC and the definition is logical because there are no definitive parameters for Code users to make a determination on what constitutes "effectively grounded." Systems are solidly grounded, grounded through a resistor or impedance, or ungrounded. Equipment (normally noncurrent-carrying metal parts are grounded where connected to an equipment grounding conductor.

This proposal is to change the term "Effectively Bonded" to just "Bonded" in each of the section where it is used. The term "Effectively Bonded" is currently not defined in the NEC.

The term "effectively bonded" is also used a few times in the NEC and is undefined. The same situation exists. There are no defined parameters for Code users to judges what the difference between "Effectively Bonded" and "Bonded" really is. Where the term appears in the NEC, it is revised to just "bonded" and still has the same meaning in each rule.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-73 Log #2898 NEC-P17 **Final Action: Reject**
(680.8 Exception (New))

Submitter: Jim M. Schmer, Boise, ID
Recommendation: Add an exception to read as follows:

680.8(A) Power. With respect... Figure 680.8.

Exception: Self-Contained Spa or Hot Tub. The minimum clearances for overhead conductors shall be reduced to 3.0 m (10 ft) above the water level for Self-Contained Spa(s) or Hot Tub(s).

Substantiation: There is no reason for the overhead conductors to be over 3.0 m (10 ft) above the water level, because when it comes to clean the spa/hot-tub you can reach across it.

Panel Meeting Action: Reject
Panel Statement: The panel disagrees with the substantiation that long handle skimmers are not used on spas or hot tubs. The methods of cleaning the spa or hot tub is not the only reason for this requirement.

This poses a safety hazard.

The panel does not want to decrease the level of safety already established.

Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-74 Log #2202 NEC-P17 **Final Action: Reject**
(680.9)

Submitter: Thomas L. Harman, Univ. of Houston Clear Lake
Recommendation: Replace the first sentence of 680.9 with the following:

"The circuits supplying Listed instantaneous water heaters employing resistance-type immersion electric heating elements shall be permitted to be subdivided into circuits as defined in 422-11(F)(3)."

Substantiation: Due to the technological advances in tankless (instantaneous) water heater design, I believe that 680.9 should not apply as presently written to instantaneous electric water heaters that are protected within their rating. If an instantaneous water heater is a listed (UL or other organization) product that has been field tested with a variety of supply circuits, there is no technical or safety reason to limit the branch circuit protection to 60 amperes or cause the loads to be subdivided to 48 amperes.

This requirement for water heaters was introduced in the 1975 code with the justification that heaters with "small internal conductors" might be protected by unspecified sizes of overcurrent devices.

The restrictions on overcurrent protection of water heaters in the present code are unnecessarily restrictive for the new types of instantaneous water heaters. No technical justification has been given to limit the loads to 48 amperes. Field experience and testing has indicated that the design and control of today's instantaneous water heaters allows for their safe installation as described in 422.11(F)(3).

For example, an instantaneous water heater with four elements drawing a maximum of 22 amperes each would require four 30-ampere branch circuits by the present wording of 680.9 in the NEC. A safer alternative would be to subdivide the loads using two elements each on a 60-ampere circuit as allowed by 422.11. Then, only two circuit breakers need to be turned off to disconnect the unit. Since the heater must be a listed appliance, the internal wiring would be sufficient for the 60-ampere circuits.

Panel Meeting Action: Reject

Panel Statement: Section 422.11 pertains to appliances in an occupancy. A swimming pool is not an occupancy.

An instantaneous water heater is listed to UL 499 and not listed for pool use. UL 1261 applies to water heaters for swimming pools.

See panel action and statement on Proposal 17-5.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-75 Log #580 NEC-P17 **Final Action: Reject**
(680.10)

Submitter: Michael Tooke, Temecula, CA

Recommendation: This article as currently written:

Underground wiring shall not be permitted under the pool or within the area extending 1.5 m (5 ft) horizontally from the inside wall of the pool unless this wiring is necessary to supply the pool equipment permitted by this article. <u>Where space limitations prevent wiring from being routed a distance 1.5 m (5 ft)</u> or more from the pool, such wiring shall be permitted where installed in rigid metal conduit, intermediate metal conduit, or a nonmetallic raceway system. All metal conduit shall be corrosion resistant and suitable for the location. The minimum burial depth shall be as given in Table 680.10.

This article with the revision:

Underground wiring shall not be permitted under the pool or within the area extending 1.5 m (5 ft) horizontally from the inside wall of the pool unless this wiring is necessary to supply the pool equipment permitted by this article. <u>Where space limitations prevent wiring that is necessary to supply the pool equipment from being routed a distance 1.5 m (5 ft)</u> or more from the pool, such wiring shall be permitted where installed in rigid metal conduit, intermediate metal conduit, or a nonmetallic raceway system. All metal conduit shall be corrosion resistant and suitable for the location. The minimum burial depth shall be as given in Table 680.10.

Substantiation: The first sentence in this article states that NO underground wiring is permitted within 1.5 m (5 ft) from the inside wall of the pool unless it is necessary to supply pool equipment. The next sentence needs clarification, as it is being interpreted that ANY underground wiring (even if it is not necessary to supply the pool equipment) is permitted within the 1.5 m (5 ft) area so long as it is installed in an approved raceway at the depths listed in the chart. By adding the phrase <u>that is necessary to supply the pool equipment</u> to this second sentence (where I indicated above), it clarifies the intent of the article.

Panel Meeting Action: Reject

Panel Statement: The intent of the Code is to permit, when space is limited, conduits from other systems to be buried within 5 ft of the pool in accordance with 680.10 and Table 680.10.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-76 Log #1634 NEC-P17 **Final Action: Accept**
(680.10)

Submitter: L. Keith Lofland, International Association of Electrical Inspectors

Recommendation: Revise text to read as follows:

680.10 Underground Wiring Location.

Underground wiring shall not be permitted under the pool or within the area extending 1.5 m (5 ft) horizontally from the inside wall of the pool unless this wiring is necessary to supply pool equipment permitted by this article. Where space limitations prevent wiring from being routed a distance 1.5 m (5 ft) or more from the pool, such wiring shall be permitted where installed in <u>complete raceway systems of</u> rigid metal conduit, intermediate metal conduit, or a nonmetallic raceway system. All metal conduit shall be corrosion resistant and suitable for the location. The minimum burial depth shall be as given in Table 680.10.

Substantiation: The main requirements of 680.10 requires underground wiring systems to be located a minimum of 1.5 m (5 ft) horizontally from the inside wall of a pool. Where space limitations prevent this, an allowance inside the restricted 1.5 m (5 ft) distance is permitted when employing specified raceway systems. Clarification is needed as to whether these specified raceway systems are required to be complete raceway systems (transformer pad to meterbase at building as an example) or does the underground wiring system simply have to be "sleeved" where the underground wiring system is located within the restricted 1.5 m (5 ft) area of the pool.

Panel Meeting Action: Accept

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-77 Log #1907 NEC-P17 **Final Action: Accept**
(680.10)

Submitter: James W. Carpenter, International Association of Electrical Inspectors

Recommendation: Revise text to read as follows:

680.10 Underground Wiring Location. Underground wiring shall not be permitted under the pool or within the area extending 1.5 m (5 ft) horizontally from the inside wall of the pool unless this wiring is necessary to supply pool equipment permitted by this article. Where space limitations prevent wiring from being routed a distance 1.5 m (5 ft) or more from the pool, such wiring shall be permitted where installed in rigid metal conduit, intermediate metal conduit, or a nonmetallic raceway system. All metal conduit shall be corrosion resistant and suitable for the location. The minimum ~~burial~~ <u>cover</u> depth shall be as given in Table 680.10.

Table 680.10 Minimum ~~Burial~~ <u>Cover</u> Depths

Wiring Method	Minimum ~~Burial~~ <u>Cover</u> mm	in.
Rigid metal conduit	150	6
Intermediate metal conduit	150	6
Nonmetallic raceways listed for direct burial without concrete encasement	450	18
Other approved raceways*	450	18

*Raceways approved for burial only where concrete encased shall require a concrete envelope not less than 50 mm (2 in.) thick.

Substantiation: Changing the word "burial" to "cover" will provide consistency with 300.5 and will eliminate any confusion about whether the burial depth is measured to the bottom of the trench or to the fill above the raceway.

Panel Meeting Action: Accept

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-78 Log #2956 NEC-P17 **Final Action: Reject**
(680.10)

Submitter: Philip Simmons, Simmons Electrical Services

Recommendation: Revise 680.10 to permit jacketed type MC that is listed for direct burial as follows:

680.10 Underground Wiring Location. Underground wiring shall not be permitted under the pool or within the area extending 1.5 m (5 ft) horizontally from the inside wall of the pool unless this wiring is necessary to supply pool equipment permitted by this article.

Where space limitations prevent wiring from being routed a distance of 1.5 M (5 ft) or more from the pool, such wiring shall be permitted where installed in rigid metal conduit, intermediate metal conduit, <u>jacketed type MC cable that is listed for direct burial</u> , or a nonmetallic raceway system. All metal conduit shall be corrosion resistant and suitable for the location. The minimum burial depth shall be given in Table 680.10.

Table 680.10 Minimum Burial Depths

Wiring Method	Minimum Burial mm	in..
Rigid metal conduit	150	6
Intermediate metal conduit	150	6
Nonmetallic raceways listed for direct burial without concrete encasement	450	18
Other approved raceways*	450	18
<u>Jacketed MC cable listed for direct burial</u>	<u>600</u>	<u>24</u>

*Raceways approved for burial only where concrete encased shall require a concrete envelope not less than 50 mm (2 in.) thick.

Substantiation: Jacketed Type MC cable that is listed for direct burial is suitable for underground installations including those within 5 ft of a swimming pool. The burial depth that is proposed is taken from Table 300.5 as are the wiring methods and burial depths presently covered in Table 680.10. Jacketed Type MC cable that is listed for direct burial has both an outer jacket and a metallic armor that provides suitable mechanical protection for the cable in the proposed application.

A similar proposal was accepted by the Code Panel during the processing of the 2005 NEC but was later rejected. We think the installer should be given the opportunity to select a reliable and proven wiring method offered by Type MC cable that is suitable for the area. Most often, these conductors are not pulled out and replaced as offered by a raceway wiring method. These conductors generally stay in place for the life of the pool.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: With the highly corrosive nature of swimming pools, spas, and similar waters, the likelihood of the conductors becoming corroded is foreseeable.

Due to the construction method of MC cable, it is impossible to replace the conductors if damaged as foreseen. Therefore, the panel is against the use of MC cable in this application as it can create a hazardous condition to allow a wiring method to be employed that would encourage repairs on damaged conductors that would not meet the free-length requirement indicated under 300.14. Without a removable method, the conductors associated with MC cable will recreate a potentially hazardous condition.

The panel's actions are supported by 90.1(A,) which states that "the purpose of the NEC is to provide the practical safeguarding of persons and property from the hazards arising from the use of electricity." Section 90.1(B) further states, "compliance herewith and proper maintenance will result in an installation that is essentially free from hazard but not necessarily efficient, convenient, or adequate for good service or future expansion of electrical use." As stated in 90.1(C), "This Code is not intended as a design specification...".

In reviewing the above three requirements in conjunction with considering the submitter's proposed changes to Article 680, the panel does not consider the NEC requirements being limited to new or remodeling conditions, but to cover maintenance concerns as well and the associated hazards that can arise from adoption of this proposal.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

Comment on Affirmative:

BLEWITT, T.: Type MC cable is available with constructions designed to resist the chemical vapors likely in these installations. They are jacketed versions and are marked "Suitable for use in swimming pool motor circuits".

17-79 Log #900 NEC-P17 **Final Action: Reject**
(680.12)

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Revise text to read as follows:

One or more ~~means~~ <u>switches or circuit breakers</u> to <u>simultaneously</u> disconnect all ungrounded conductors..." (remainder unchanged).

Substantiation: Edit. Type of disconnecting means should be specified. The definition of disconnecting means in Article 100 is broad enough to include plug/receptacle, terminals, links (668.13(B)), relays, etc. Most Code sections specific type. Different wording pertaining to the same thing may cause confusion. 600.6 specifies switch or circuit breaker.

Panel Meeting Action: Reject

Panel Statement: The disconnecting means includes switches, circuit breakers, and other means; see 680.7.

The panel disagrees with the submitter's substantiation. Section 668.13(B) does not apply to this section.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-80 Log #1635 NEC-P17 **Final Action: Accept**
(680.12)

Submitter: L. Keith Lofland, International Association of Electrical Inspectors

Recommendation: Add new text as follows:

680.12 Maintenance Disconnecting Means.

One or more means to disconnect all ungrounded conductors shall be provided for all utilization equipment other than lighting. Each means shall be readily accessible and within sight from its equipment <u>, and shall be located at least 1.5 m (5 ft) horizontally from the inside walls of a pool, spa, or hot tub.</u>

Substantiation: The required maintenance disconnecting means was required to be located at least 1.5 m (5 ft) horizontally from the inside wall of a pool in the 1999 edition of the National Electrical Code. During the reorganization of Article 680 for the 2002 NEC, this requirement was removed from 680.12. A proposal was submitted for the 2005 NEC to bring back the 1.5 m (5 ft) rule to 680.12 (See 2005 ROP 17-69 Log #1434 NEC-P17). This proposal was rejected with the panel statement stating that "It is already required by 680.22(C)."

680.12 "Maintenance Disconnecting Means" is located in Part I of Article 680. 680.22(C) "Switching Devices" is located in Part II for "Permanently Installed Pools." This makes 680.22(C) not applicable to such things as spas, hot tubs, fountains, etc. Even if 680.22(C) were applicable, not all maintenance disconnecting means fit into the category of a "Switching Device." This was made evident in the 2005 NEC with the addition of 240.24(A) for accessibility of overcurrent devices. These added the "2.0 m (6 ft 7 in.)" rule in Article 240 and not rely on 404.8(A) "Switches" for this requirement.

Panel Meeting Action: Accept

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-81 Log #1366 NEC-P17 **Final Action: Accept**
(680.21)

Submitter: Mike Holt, Mike Holt Enterprises

Recommendation: Delete section (4) and make it an exception to (A)(1). Change the word "paragraph" to "section."

(A) Wiring Methods.

(1) Remain unchanged

<u>*Exception: In the interior of dwelling units, or in the interior of accessory buildings associated with a dwelling unit, any of the wiring methods recognized in Chapter 3 of this Code that comply with the provisions of this section shall be permitted. Where run in a cable assembly, the equipment grounding conductor shall be permitted to be uninsulated, but it shall be enclosed within the outer sheath of the cable assembly.*</u>

(2) Remain unchanged

(3) Remain unchanged

~~(4) One-Family Dwellings. In the interior of one-family dwellings, or in the interior of accessory buildings associated with a one-family dwelling, any of the wiring methods recognized in Chapter 3 of this Code that comply with the provisions of this paragraph shall be permitted. Where run in a cable assembly, the equipment grounding conductor shall be permitted to be uninsulated, but it shall be enclosed within the outer sheath of the cable assembly.~~

<u>(4)</u> Cord-and-Plug Connections. Pool-associated motors shall be permitted to employ cord-and-plug connections. The flexible cord shall not exceed 900 mm (3 ft) in length. The flexible cord shall include an equipment grounding conductor sized in accordance with 250.122 and shall terminate in a grounding-type attachment plug.

Substantiation: Parenthetical 4 refers to compliance with a paragraph. Because of this, it makes the entire subsection a moot point! Parenthetical 4 is basically an exception to parenthetical 1. It should be written as such, not as a separate subsection. Also, the proper terminology is a section or a subsection, not a paragraph.

Panel Meeting Action: Accept

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10 Negative: 1

Explanation of Negative:

YASENCHAK, R.: Most of the wiring methods mentioned in Chapter 3 are not allowed to be installed under Article 680.

17-82 Log #2122 NEC-P17 **Final Action: Reject**
(680.21(5))

Submitter: Bud Swathwood, Bud Swathwood Consulting

Recommendation: Add to 680.21(5) after the last sentence of paragraph (5):

The cord and plug may be factory installed or field installed and shall meet the requirements of 680.7(A), (B), and (C).

Substantiation: This proposal and the one for 680.7 will make it clear that the cord and plug may be either field or factory installed as long as the cord and plug meet the requirements of 680.7.

Panel Meeting Action: Reject

Panel Statement: The submitter's substantiation does not include the requirement for a cord-and-plug listed for the purpose.

Not all equipment is listed for cord-and-plug connection.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-83 Log #983 NEC-P17 **Final Action: Accept**
(680.21(A)(3))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Add "liquidtight flexible" ahead of "nonmetallic conduit".

Substantiation: Edit. The specific type of nonmetallic conduit should be specified.

Panel Meeting Action: Accept

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-84 Log #1303 NEC-P17 **Final Action: Reject**
(680.22)

Submitter: Jim Davis, Electrical Education Services, LLC

Recommendation: Revise text as follows:

680.22 ~~Area Lighting, Receptacles, and Equipment~~ <u>Receptacles, Area Lighting, and Switching Devices</u> .

Substantiation: Delete the present title of 680.22 and replace as suggested above. The proposed title provides a more accurate description of text content and is also a more logical order of item listing, which aids code users when searching for specific rules in this section. This increases code usability.
Panel Meeting Action: Reject
Panel Statement: The present section title best describes the section text. The section is broader than limiting it to receptacles, area lighting, and switching devices.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-85 Log #3493 NEC-P17 **Final Action: Reject**
(680.22)

TCC Action: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the panel as a public comment.
Submitter: Alan Manche, Square D Co.
Recommendation: Revise NEC 680.22 by deleting the last sentence of 680.22(A)(5), insert 680.22(B) as provided below, and renumber existing (B) as (C). Revise NEC 680.22 with the additions (underlined) and deletions (strike through) as shown. The entire text of 680.22(A)(5) is shown for clarity, but only those changes shown underlined or strike through are part of this proposal.
(5) GFCI Protection. All 15- and 20-ampere, single-phase, 125-volt receptacles located within 6.0 m (20 ft) of the inside walls of a pool shall be protected by a ground-fault circuit interrupter. ~~Receptacles that supply pool pump motors and that are rated 15 or 20 amperes, 125 volts through 250 volts, single phase, shall be provided with GFCI protection.~~
(B) GFCI Protection. Outlets supplying pool pump motors from branch circuits with short-circuit and ground-fault protection rated 15 or 20 amperes, 125 volt or 240 volt, single phase, whether by receptacle or direct connection, shall be provided with ground-fault circuit-interrupter protection for personnel.
Substantiation: This proposal reinstates the 1999 Code language requiring GFCI protection on single phase hard-wired pump motors. This is an important safety issue that should be reconsidered. Significant support exists as the panel has not provided an explanation as to why a cord and plug connected pump is more of a hazard than a hard-wired device as this is exactly what this requirement is stating. A similar proposal was made during the 2005 NEC cycle which the panel rejected, however, the Electrical Section supported a floor action to require single phase hard-wired pumps to be GFCI protected. The discussion on the floor supported the inclusion, but the wording was slightly flawed. This proposed wording change is identical to that proposed in the comment stage of the for the 2005 NEC by a supported of the original proposal.
The panel needs to provide an explanation for not requiring protection on a hard-wire system. The only difference between the hard-wired and the cord and plug pumps is the electrical connection, which is the receptacle interface. If the connection is the issue due to human interface or corrosion, it would appear the code panel would required a hard-wire connection of these pumps and restrict this installation from a receptacle connection. If the panel is truly concerned about electrical shock, which appears to be where industry support lies at this point, then why is a cord and plug connection treated differently than a hard-wired connection?
I urge the panel to address the electrical safety issue at hand with a solid electrical safety answer by requiring GFCI protection on single phase hard-wired pool pump motors on 15 and 20A branch circuits as proposed.
Panel Meeting Action: Reject
Panel Statement: The intent of the panel is to require GFCI protection on cord-and-plug-connected motors and not require GFCI protection on “hard-wired” motors.
The 1999 NEC did not require all motors to be GFCI protected. In “other than dwelling units”, motors whether cord-and-plug-connected or by direct connection were required to have GFCI protection. In the 2002 code-making cycle for the NEC, the requirement for direct connected “hard-wired” motors to be GFCI protected was removed for lack of substantiation to require it. In the 2005 code-making cycle for the NEC, proposals to require “hard-wired” motors to be GFCI protected were not only rejected by the panel but also at the general assembly on the floor.
The panel went back and reviewed the proposals and substantiations of the 1999 NEC on this subject. The panel has not been provided with sufficient substantiation to change the requirements at this time.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 8 Negative: 3
Explanation of Negative:
JHONSON, D.: I agree with the submitter’s point; the difference between a hard-wired pool pump motor and cord and plug connected pool pump motor is the receptacle connection.
The safety of the installation would be improved by requiring GFCI protection for both hard-wired and cord and plug connected pool pump motors. The common sense factor should be applied to the code. The majority of pool pump motors are installed outdoors at ground level. Any incident that may occur is potentially influenced during wet conditions.
ROCK, B.: GFCI protection of hard-wired pump motors in the 1999 NEC provides needed safety and these requirement should be reinstated in the 2008 NEC.
YASENCHAK, R.: The panel did not explain the removal of this requirement and has not provided substantiation for not reinstalling the limitation. I consider this a life safety hazard. These pump motors will be in a damp or wet location and should be considered a life safety hazard. This panel has accepted proposal 17-96 in which they stated “a life safety hazard could arise from a 30 volt outlet”, yet they are ignoring a 240V motor.

17-85a Log #CP1707 NEC-P17 **Final Action: Accept**
(680.22, 680.34, 680.43, 680.62 and 680.71)

Submitter: Code-Making Panel 17,
Recommendation: Change 680.22(A)(1) to read as follows:
“…shall be located at least 3.0m (10 ft) from the inside walls of the pool, or not less than 1.83 m (6 ft) from the inside walls of the pool if they meet the following…”
Change 680.22 (A)(2) to read as follows:
“Other receptacles shall be not less than 1.83 m.(6 ft.) from the inside walls of a pool.”
Change 680.22(A)(3) to read as follows:
“… a general purpose branch circuit shall be located not less than 1.83 m (6 ft) and not more than 6.0 m (20 ft) from the inside wall…”
Delete 680.22(A)(4)
Renumber 680.22(A)(5) and (6) to be (4) and (5)
Change 680.34 to read as follows:
“Receptacles shall not be located less than 1.83 m (6 ft.) from the inside walls’”
hange 680.43(A) to read as follows:
“…receptacle on a general purpose branch circuit shall be located not less than 1.83 m (6 ft.) and not exceeding 3.0 m (10 ft) from…”
Change 680.43(A)(1) to read as follows:
“Receptacles shall be located at least 1.83 m (6 ft) measured horizontally…”
Change 680.62(E) to read as follows:
“All receptacles within 1.83 m (6 ft) of a therapeutic tub shall be protected by a ground-fault circuit interrupter.”
Change 680.71 to read as follows:
“…all 125-volt, single-phase receptacles not exceeding 30 amperes and located within 1.83 m (6 ft) measured horizontally of the inside walls of a hydromassage tub be protected by a ground-fault circuit interrupter(s).”
Substantiation: The panel changed 5 ft to 6 ft and 10 ft to 6 ft for receptacle locations relative to distance to water to ensure consistency throughout Article 680. The 10 ft has been in the Code for many years, previous to the introduction of GFCI devices. The panel determined that 6 ft is sufficient. 6 ft correlates with standard power supply cord lengths.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-86 Log #1489 NEC-P17 **Final Action: Accept in Principle**
(680.22(A)(3))

Submitter: Jeffrey Slimmer, City of Maple Grove
Recommendation: Revise text to read as follows:
Dwelling Unit(s). Where a permanently installed pool is installed at a dwelling unit(s), no fewer than one 125-volt 15 amp or 20 amp receptacle on a general-purpose branch circuit shall be located not less than 1.5 m (5 ft) and not more than 6.0 m (20 ft) from the inside wall of pool.
Delete 680.22 (A)(4).
Substantiation: If the code allows the placement of a receptacle now within 10 ft for a swimming pool in a restricted space lot, why would this area be safer than a lot that has larger dimensions and could meet the minimum 10 ft requirement. By reducing the spacing to 5 ft, the code would not say that one area is better than the other.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 17-85a (Log #CP-1707).
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-87 Log #1637 NEC-P17 **Final Action: Reject**
(680.22(A)(3) (New))

Submitter: L. Keith Lofland, International Association of Electrical Inspectors
Recommendation: Add new text as follows:
(3) Dwelling Unit(s) Where a permanently installed pool is installed at a dwelling unit(s), no fewer than one 125-volt 15- or 20-ampere receptacle on a general-purpose branch circuit shall be located not less than 3.0 m (10 ft) from, and not more than 6.0 m (20 ft) from, the inside wall of the pool. This receptacle shall be located within sight of the pool and not more than 2.0 m (6 ft 6 in.) above the floor, platform, or grade level serving the pool.
Substantiation: This required receptacle is to be located within 3.0 m (10 ft) to 6.0 m (20 ft) from the pool to ensure that a convenience receptacle outlet is available and useable about the pool area. This also discourages the use of extension cords around pool areas. This required receptacle outlet is rendered useless in meeting this application if the homeowner or guest cannot see the required receptacle outlet. This added language would not only require the receptacle outlet within the 3.0 m (10 ft) to 6.0 m (20 ft) area of the pool, but

would require the receptacle outlet to be visible from the pool area. Existing language would allow the required receptacle outlet to be located on the opposite side of a fence from a pool as long as the receptacle outlet was within 3.0 m (10 ft) to 6.0 m (20 ft) of the pool and on the same grade level.
Panel Meeting Action: Reject
Panel Statement: It is not the intent of the Code to require the receptacle to be within sight of the pool. The panel rejects the substantiation. The submitter has has not provided adequate substantiation to establish a requirement "for within sight of the pool".
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-88 Log #1271 NEC-P17 **Final Action: Accept in Principle**
(680.22(A)(4))

Submitter: Mark Shapiro, Farmington Hills, MI
Recommendation: Revise the first sentence so as to permit a receptacle to be within up to 6 ft (a full 6 feet) of a pool with restrict space, rather than within 5 feet.
"Where a pool is within 3.0 m (10 ft) of a dwelling and the dimensions of the lot preclude meeting the required clearances, not more than one receptacle outlet shall be permitted if not less than ~~1.5 m (5 ft~~) <u>(1.83 m (6 ft)</u> measured horizontally from the inside wall of the pool.
Substantiation: This proposal differs from a companion proposal by requiring the receptacle to be 1.83 meters from the pool, rather than 1.8 meters. Where there is an issue of safety, extra digits are permitted in the metric conversion. UL standards also use 1.83 meters when referring to 6 foot cords.
The 2002 NEC's permission to allow parallel-blade receptacles within 5 feet of a pool reflects an attempt to balance the need for safety (safe clearances) versus the practical realities of lack of space in small areas.
Changing this dimension by 1 foot would still address the issue of small lots, but make the installation considerably safer.
With a receptacle 5 feet away from a pool, an appliance such as a radio, with a standard 6 foot long cord, could easily be in a position to fall into the water. If the receptacle is a full 6 feet away, it should at least pull the attachment plug out of the receptacle as it falls in.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 17-85a (Log #CP-1707).
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-89 Log #1272 NEC-P17 **Final Action: Accept in Principle**
(680.22(A)(4))

Submitter: Mark Shapiro, Farmington Hills, MI
Recommendation: Revise the first sentence so as to permit a receptacle to be installed within up to 6 ft of a pool with restricted space, rather than within 5 feet.
"Where a pool is within 3.0 m (10 ft) of a dwelling and the dimensions of the lot preclude meeting the required clearances, not more than one receptacle outlet shall be permitted if not less than ~~1.5 m (5 ft)~~ <u>1.8 m (6 ft)</u> measured horizontally from the inside wall of the pool."
Substantiation: The 2002 NEC's permission to allow parallel-blade receptacles within 5 feet of a pool reflects an attempt to balance the practical realities of lack of space in small areas with the need for safety (safe clearances).
Changing this dimension by 1 foot would still recognize the problem of small lots, but make the installation considerably safer.
When people have cord and plug connected appliances, such as radios, near pools, too many of them are plugged in and placed near the pool. With a receptacles 5 feet away from a pool, an appliance with a standard 6 foot long cord would easily be in a position to fall into the water. If the receptacle is 6 feet away, it should at least pull the attachment plug out of the receptacle as it falls in.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action on Proposal 17-88.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-90 Log #1850 NEC-P17 **Final Action: Reject**
(680.22(A)(5))

Submitter: David Williams, Lansing, MI
Recommendation: Revise as follows:
(5) GFCI Protection. All 15- and 20-ampere, single-phase, 125-volt receptacles located within 6.0 m (20 ft) of the inside walls of a pool shall be protected by a ground-fault circuit interrupter. ~~Receptacles that supply pool pump motors and that are rated 15- or 20-amperes, 125 volts through 250 volts, single phase, shall be provided with GFCI protection~~ . All pool pump motors shall be protected by a ground-fault circuit interrupter.
Substantiation: The code requirement for GFCI protection of all pool pump motors was removed without any substantiation. GFCI protection is a requirement by the pool pump manufacturers that are listed in their instructions. Many contractors and homeowners do not read these very important safety instructions. Most electrical inspectors do not have the time to read the instructions to make sure that the installations are complying with the instructions, which are a part of the listing investigation. Please correct this error in the code and reinstate GFCI protection for all pool pump motors.
Panel Meeting Action: Reject
Panel Statement: The submitter proposed removing existing GFCI protection for pool pump motors connected to 250 V receptacles. The panel disagrees with the submitter's substantiation that pool pump manufacturers require GFCI protection as per their installation instructions.
In regards to the last sentence as proposed by the submitter, see panel action and statement on Proposal 17-85.

Explanation of Negative:
YASENCHAK, R.: See my explanation of negative vote on Proposal 17-85.

17-91 Log #2196 NEC-P17 **Final Action: Reject**
(680.22(A)(5))

Submitter: James Paul, James R. Paul Jr. Electrical Contractor
Recommendation: Revise as follows:
Receptacles (<u>and Branch Circuits</u>) that supply pool pump motors...15 or 20 amps, 125-250 volts..., shall be provided with GFCI protection.
Substantiation: A problem exists that if someone chooses to "hardwire" a pool pump motor with liquidtight flex, etc., there is no requirement that circuit be GFI protected. A service switch would be the required disconnecting means. It may lead to a hazardous situation.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 17-85.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
YASENCHAK, R.: See my explanation of negative vote on Proposal 17-85.

17-92 Log #2542 NEC-P17 **Final Action: Reject**
(680.22(A)(5))

Submitter: Timothy D. Curry, Curry Electric, Inc.
Recommendation: Modify the second sentence as follows:
~~Receptacles~~ <u>Wiring</u> that supplies pool pump motors and is rated 15 and 20 amps, <u>120</u> to <u>240</u> volts, single phase, shall be provided with ground fault circuit interrupter protection for personnel.
Substantiation: This wording appeared in the 1999 NEC 680-6(D) after my proposal. It was even included in Fred Hartwell's draft rewrite of the 2002 code. Somehow, during the massive effort to reorganize the article, this requirement was dropped. I only recently became aware of the omission and am writing to correct it.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 17-85.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
YASENCHAK, R.: See my explanation of negative vote on Proposal 17-85.

17-93 Log #1367 NEC-P17 **Final Action: Reject**
(680.22(C))

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Delete 680.22(C) and make it a new section.
~~680.22(C) Switching Devices. Switching devices shall be located at least 1.5 m (5 ft) horizontally from the inside walls of a pool unless separated from the pool by a solid fence, wall, or other permanent barrier. Alternatively, a switch that is listed as being acceptable for use within 1.5 m (5 ft) shall be permitted.~~
Substantiation: This proposal is being submitted in concert with a proposal to create a new section of Article 680, part II, keeping the same language as 680.26(C). The relocation of this requirement will be helpful in making the code a user-friendlier document. 680.22 should cover receptacles and luminaries, but switching devices should be located in a section of their own. The type of equipment addressed here is much more than just a typical general use snap switch, and because of the many, many items that meet the term "switching device", a new section should be created. The existing language is not only buried too deeply in the Code, but it also has a tendency of making the Code user think of luminaire switches, as opposed to other types of switches.
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide a recommendation for consideration in accordance with the Regulations Governing Committee Projects, Section 4-3.3(c).
Deleting and making a new section would not improve usability of the Code.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-94 Log #2641 NEC-P17 **Final Action: Reject**
(680.22(C))

Submitter: Michael Grubbs, City of Medford, Oregon
Recommendation: Add a new sentence at the end of the existing paragraph. "Circuit breakers shall not be used to control pool luminaires. GFI protection shall be provided ahead of all switching.
Substantiation: With the current code, a circuit breaker can be used to control a pool wet niche luminaire. I have witnessed several installations. This can and does lead to a very dangerous situation. Imagine an individual who is swimming and decides to turn on the pool light, he or she walks to the breaker panel, soaking wet, standing on concrete, and bare foot...anything can happen. Shock potential is very high with this person reaching into a pool control or breaker panel to activate the light. Even with GFI breaker installed to protect the wet niche the panel itself most likely is not GFI protected, therefore subjecting anybody to electric shock. I also note that the GFI protection should be installed ahead of the single pole switch, if a single pole switch is to be used. This makes sense to GFI protect all electrical aspects of the pool luminaire circuit. This suggestion is a simple remedy to a potentially dangerous condition. It puts positive language into the code requiring some other method of controlling the luminaire which would reduce personnel contact with non GFI protected equipment. If there is no record of an injury, I believe it is only a matter of time before someone is seriously hurt.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided adequate substantiation.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11
Comment on Affirmative:
BLEWITT, T.: Only the insulated circuit breaker handle/face and grounded metal would be exposed to the user.

17-95 Log #1365 NEC-P17 **Final Action: Reject**
(680.22(C))

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Delete 680.22(C) and make it a new section.
Switching Devices. Switching devices shall be located at least 1.5 m (5 ft) horizontally from the inside walls of a pool unless separated from the pool by a solid fence, wall, or other permanent barrier. Alternatively, a switch that is listed as being acceptable for use within 1.5 m (5 ft) shall be permitted.
Substantiation: This proposal is being submitted in concert with a proposal to delete subsection 680.22(C). The relocation of this requirement will be helpful in making the code a user-friendlier document. 680.22 should cover receptacles and luminaries, but switching devices should be located in a section of their own. The type of equipment addressed here is much more than just a typical general use snap switch, and because of the many, many items that meet the term "switching device," a new section should be created. The existing language is not only buried too deeply in the code, but it also has a tendency of making the Code user think of luminaire switches, as opposed to other types of switches.

17-96 Log #389 NEC-P17 **Final Action: Accept in Principle**
(680.22(D))

Submitter: Bryan P. Holland, Holland Electric
Recommendation: Add new text as follows:
(D) Other Outlets. Other outlets containing circuits operating at 30 volts or more shall be not less than 3.0 m (10 ft) from the inside walls of the pool. Measurements shall be determined in accordance with 680.22(A)(6).
FPN: Other outlets may include, but are not limited to remote-control, signaling, fire alarm, and communications circuits.
Substantiation: A life safety hazard could arise from the use of other equipment used in the vicinity of a pool. The typical homeowner or pool user may not be aware of the potential hazards associated with communication and other "low-voltage" equipment and may wish to use this equipment near or at the pool if an outlet is also near or at the pool area. This restriction provides reasonable protection by increasing the distance from a pool at which these outlets may be installed.
Panel Meeting Action: Accept in Principle
Add new text as follows:
(D) Other Outlets. Other outlets shall be not less than 3.0 m (10 ft) from the inside walls of the pool. Measurements shall be determined in accordance with 680.22(A)(6).
FPN: Other outlets may include, but are not limited to, remote-control, signaling, fire alarm, and communications circuits.
Panel Statement: The panel agrees with the proposal that a safety hazard could arise. The panel is deleting the limitation to "30 V or more" as these outlets could also create a hazard.
The change meets the submitter's intent.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-97 Log #2640 NEC-P17 **Final Action: Reject**
(680.22(D) (New))

Submitter: Michael Grubbs, City of Medford, Oregon
Recommendation: Add new text to read:
(D) Panelboards, Services, Pool Control Panels. Panelboards, services, pool control panels, and electrical equipment shall not be located closer than 3.0 meters (10 ft) horizontally from the inside walls of a pool unless separated from the pool by a solid fence, wall, or other permanent barrier.
Substantiation: I have chose to add a new paragraph, but left under section 680.22 because it is titled "Area Lighting, Receptacles and Equipment". Panelboards, services etc. fall under the heading of Equipment.
In the current code, there is no direction as to how close a pool can be installed to existing service equipment and panelboards, or new service equipment and panelboards. I believe that the danger to a person who is swimming in the pool is too great if they can touch the equipment while still in the water. This addition would put positive language into the code as to exactly how close the equipment can be to the pool. I chose 3 m, (10 ft) because you want the equipment out of reach from anybody still in the pool. 1.5 m (5 ft) would be too close. I believe this is a good addition to Article 680 of the NEC. If this proposal is accepted it may be relocated to another section of Article 680 if the CMP feels it is better served elsewhere.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: Panelboards, pool control panels, and electrical equipment are already addressed in 680.22(C). The submitter is also referred to 680.8.

(680.23)

Submitter: Donald W. Zipse, Zipse Electrical Engineering, Inc.
Recommendation: Section 680.23 Underwater Luminaries (Lighting Fixtures).
Underwater Luminaries shall be NOT be installed in swimming pools.
Substantiation: The problem is that the Underwater Luminaries are "grounded" and there is electrical connections directly back to the high voltage primary side of the pole mounted or pad mounted or underground transformer. The details of this connection will be described later. This electrical connection from the underwater luminaries is a path for the continuously flowing stray current emanating from the utility companies multigrounded neutral electrical distribution systems that has the neutral connected to earth at least 4 times per mile. It is this current that enters the swimming pool to complete the electrical circuit. Bear in mind that the current may be flowing in the opposite direction. The direction is arbitrary.
In addition to the above multigrounded neutral electrical distribution system earthing, there is a second electrical circuit. The second circuit is the bastardized electrical connection between the high voltage primary neutral and the secondary neutral allowing primary high voltage electricity to flow directly into the residence, commercial or industrial facility using the secondary neutral which is bonded to the green equipment grounding conductor. Now this green color equipment grounding conductor is connected to the underwater luminaries metal frame allowing stray continuous flowing dangerous and hazardous current to complete the circuit.
What the above bastardize electrical connection does is allow the direct electrical connection of any lightning strike to nearby distribution system to flow directly into your own home and destroy the sensitive electrical equipment, which is not an act of God or Mother Nature, but directly attributable to the utility since 1932.
With the approval of Code Making Panel # 5's acceptance of the dangerous and hazardous multigrounded neutral distribution system, stray current has been measured flowing within swimming pools, hot tubs, showers, etc.
EPRI: "Created by the nation's electric utilities in 1973, EPRI is one of America's oldest and largest research consortia, with some 700 members and an annual budget of about $ 500 million. Linked to a global network of technical specialists, EPRI scientists and engineers develop innovative solutions to the world's toughest energy problems while expanding opportunities for a dynamic industry."
The Electric Power Research Institute (EPRI) an organization of utilities companies states that 40 to 60 percent of the return neutral current from the high voltage electrical circuit returns over or through the earth. We have measured as high as eighty-eight (88) percent of the neutral current returning over the earth and thus through dairies, back yards of homes through hot tubs, swimming pools, etc.
Ohm's Law states that **Voltage = Current X Resistance**

It is impossible to eliminate voltage gradients, except in your imagination as long as current is flowing continuously through the concrete and re-bar, which is happening in the real world.

Unless the buried in concrete metal mesh is at or near absolute zero temperature, the equipotential bonding will have some resistance. The concrete is semi-conductive being wet and especially since the concrete had a metallic mesh within it. Any current flowing over and through the equipotential bonding will produce a voltage per Ohm's Law. This has been proven by testing as will be described below.

It must be noted that the human body has approximately the same internal resistance as a cow. The electrical principle is the same for equipotential planes and equipotential bonding. The following will show conclusively that there is high voltage electric current flowing in the earth. In one court case, there were 18.5 amperes on the high voltage phase conductor and only 3.5 amperes on the multigrounded neutral electrical distribution system. Simple math shows that 15 amperes of return current in that case was flowing uncontrolled over the earth.

In another case, an engineering firm measured 5 amperes returning to the substation flowing over the earth shocking persons. This is a current hot tub stray current case.

What happens is the swimming pool with its water soaked concrete is such a good, efficient low impedance contact with the earth that the equipotential plane acts as a "sink" for the majority of the stray neutral current flowing through earth in the vicinity. It becomes a magnet for collecting the stray current. With the underwater luminaries connected to the equipment grounding conductor which is connected to the neutral service entrance conductor which, is connected to the utility power company's transformer which has the secondary neutral connected to the high voltage primary neutral thus completing the connection to the primary electrical circuit back to the substation completing the circuit.

Thus, in order to eliminate this dangerous and hazardous electrical connection the underwater luminaries must be completely removed.

There must be no electrical connection from the water in the pool back to the high voltage primary electrical system. The metallic frame of the pump motor need to be connected to the equipment grounding conductor and system in order to provide a low impedance path back to the service panel in order to trip the protective device, circuit breaker or fuse.

As the electrical load increases more and more stray current will enter the earth resulting in more and more shocking incidents. It is opined that as the electrical load increases to a critical level that may last for only an hour or a day, in any one multigrounded neutral electrical distribution system, someone will be electrocuted or drown because the persons muscles froze and they sank to the bottom of the pool and drowned. It may have already occurred.

No doubt, someone will make the comment that equipotential planes must do some good, must have a little advantage or may afford some help. That person needs to face the facts – **THERE IS NO BENEFIT IN ANY WAY, SHAPE OR FORM FROM EQUIPOTENTIAL PLANES, ONLY HARM.** The concept was based on erroneous ideas and conclusions and mis-understanding of electrical principles.

Panel Meeting Action: Reject

Panel Statement: The submitter did not provide a recommendation for consideration in accordance with the Regulations Governing Committee Projects, Section 4-3.3(c).

See panel action and statement on Proposal 17-99.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10 Negative: 1

Explanation of Negative:

CRIVELL, P.: 1. The proposal addresses a valid concern. There is a real potential for the underwater light fixture to act as part of the return path for unbalanced utility current.

2. Underwater luminaries should be required to be manufactured or installed in such a way as to eliminate the potential for underwater light fixtures from acting as part of the return path for unbalanced utility current (e.g., double insulation or isolation through an isolation transformer).

17-99 Log #2422 NEC-P17 **Final Action: Reject**
(680.23)

Submitter: Donald W. Zipse, Zipse Electrical Engineering, Inc.

Recommendation: Delete Section 680.23 Underwater Luminaries (Lighting Fixtures).

Substantiation: The problem is that the Underwater Luminaries are "grounded" and there is electrical connections directly back to the high voltage primary side of the pole mounted or pad mounted or underground transformer. The details of this connection will be described later. This electrical connection from the underwater luminaries is a path for the continuously flowing stray current emanating from the utility companies multigrounded neutral electrical distribution systems that has the neutral connected to earth at least 4 times per mile. 17-101 Log #2725 NEC-P17 **Final Action: Accept**
(680.23(A)(6))

Submitter: Steven D. Holmes, Underwriters Laboratories Inc.
Recommendation: [Changes proposed only for 680.23(A)(6). No change to other text of 680.23]

680.23 Underwater Luminaires (Lighting Fixtures). This section covers all luminaires (lighting fixtures) installed below the normal water level of the pool.

(A) General.

(6) Bottom-Mounted Luminaires (Fixtures). A luminaire (lighting fixture) facing upward shall <u>comply with either (a) or (b)</u> ; ~~have the lens adequately guarded to prevent contact by any person.~~

<u>(a) have the lens adequately guarded to prevent contact by any person.</u>

<u>(b) Be listed for use without a guard.</u>

Substantiation: 680.23(A)(6) does not provide for use of an upward-facing luminaire that has a lens with no guard and where the lens is, however, confirmed during evaluation for listing to withstand the loading and impact required of a lens guard. Luminaires with high-strength plastic lenses can be found suitable for this use. Luminaires with small diameter, particularly thick, glass lenses can be found suitable as well. Such alternative designs for upward-facing luminaires can be developed, listed, and used if 680.23(A)(6) is revised, such as proposed, to permit such alternate luminaire designs.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-102 Log #2726 NEC-P17 **Final Action: Reject**
(680.23(B))

Submitter: Steven D. Holmes, Underwriters Laboratories Inc.
Recommendation: [Changes proposed below for 680.23(B)(1), (2), (3), (4), and (5)]

680.23 Underwater Luminaires (Lighting Fixtures). This section covers all luminaires (lighting fixtures) installed below the normal water level of the pool.

(B) Wet-Niche Luminaires (Fixtures).

(1) Forming Shells. Forming shells shall be installed for the mounting of all wet-niche underwater luminaires (fixtures) and shall be equipped with provisions for conduit entries. Metal parts of the luminaire (fixture) and forming shell in contact with the pool water shall be of brass or other approved corrosion-resistant metal. All forming shells used with nonmetallic conduit systems, other than those that are part of a listed ~~low voltage~~ lighting system not requiring grounding, shall include provisions for terminating an 8 AWG copper conductor.

(2) Wiring Extending Directly to the Forming Shell. Conduit shall be installed from the forming shell to a junction box or other enclosure conforming to the requirements in 680.24. Conduit shall be rigid metal, intermediate metal, liquidtight flexible nonmetallic, or rigid nonmetallic.

(a) Metal Conduit. Metal conduit shall be approved and shall be of brass or other approved corrosion-resistant metal.

(b) Nonmetallic Conduit. Where a nonmetallic conduit is used, an 8 AWG insulated solid or stranded copper bonding jumper shall be installed in this conduit unless a listed ~~low voltage~~ lighting system not requiring grounding is used. The bonding jumper shall be terminated in the forming shell, junction box or transformer enclosure, or ground-fault circuit-interrupter enclosure. The termination of the 8 AWG bonding jumper in the forming shell shall be covered with, or encapsulated in, a listed potting compound to protect the connection from the possible deteriorating effect of pool water.

(3) Equipment Grounding Provisions for <u>Wet-Niche Luminaires (Lighting Fixtures)</u> ~~Cords~~ , Wet-niche luminaires (lighting fixtures) <u>shall comply with either (a) or (b)</u> : ~~that are supplied by a flexible cord or cable shall have all exposed noncurrent-carrying metal parts grounded by an insulated copper equipment grounding conductor that is an integral part of the cord or cable. This grounding conductor shall be connected to a grounding terminal in the supply junction box, transformer enclosure, or other enclosure. The grounding conductor shall not be smaller than the supply conductors and not smaller than 16 AWG.~~

<u>(a) Have all exposed non-current carrying metal parts grounded by an insulated copper equipment grounding conductor that is an integral part of the cord or cable. This grounding conductor shall be connected to a grounding terminal in the supply junction box, transformer enclosure, or other enclosure. The grounding conductor shall not be smaller than the supply conductors and not smaller than 16 AWG.</u>

<u>(b) Be a listed lighting system not requiring grounding.</u>

(4) Luminaire (Fixture) Grounding Terminations. The end of the flexible-cord jacket and the flexible-cord conductor terminations within a luminaire (fixture) shall be covered with, or encapsulated in, a suitable potting compound to prevent the entry of water into the luminaire (fixture) through the cord or its conductors. ~~In addition~~ <u>If present,</u> the grounding connection within a luminaire (fixture) shall be similarly treated to protect such connection from the deteriorating effect of the pool water in the event of water entry into the luminaire (fixture).

(5) Luminaire (Fixture) Bonding. <u>Unless listed as not requiring bonding, the</u> ~~The~~ luminaire (fixture) shall be bonded to and secured to the forming shell by a positive locking device that ensures a low-resistance contact and requires a tool to remove the luminaire (fixture) from the forming shell. ~~Bonding shall not be required for luminaires (fixtures) that are listed for the application and have no non-current carrying metal parts.~~

Substantiation: Problem 1 - Luminaires Unnecessarily Limited to Low Voltage. 680.23(B)(1) provides for forming shells used with nonmetallic conduit systems do not have provisions for terminating an 8 AWG copper conductor if the forming shell is part of a listed low-voltage lighting system not requiring grounding. 680.23(B)(2)(b) also provides for not installing an 8 AWG bonding jumper in nonmetallic conduit extending directly to the forming shell if the forming shell is part of a listed low-voltage lighting system not requiring grounding.

These requirements unnecessarily prevent development and use of 120 V wet-niche luminaires that do not have an equipment grounding conductor, even if they do not have non-current-carrying metal parts requiring grounding. The unnecessary low voltage limitation prevents luminaire manufacturers, pool builders, owners, and users from gaining the benefits of 120 V luminaires that do not require or have provision for grounding.

Substantiation for Changes for Problem 1

Forming shells and 120 V wet-niche luminaire without a grounding conductor can be designed so "that, where the luminaire (fixture) is properly installed without a ground-fault circuit-interrupter, there is no shock hazard with any likely combination of fault conditions during normal use (not relamping)" 1 . Test techniques for determining compliance with this NEC requirement are well developed and specified in the Standard for Underwater Lighting Fixtures and Junction Boxes, UL 676. during the evaluation for the required listing of wet-niche luminaires and forming shells, it can be determined if both an ungrounded 120 volt wet-niche luminaire and ungrounded mating forming shell(s) limit the risks of electric shock just as required for (a) low-voltage designs without a grounding conductor and (b) 120 V designs with a grounding conductor.

Forming shells and 120 V wet-niche luminaire designs without a grounding conductor and that limit the risks of electric shock can both be practical and comply with all safety requirements, including the lift for escape current conducting into the swimming pool water under damaged lens or gasket conditions, and other applicable fault conditions required in UL 676.

If replacement of the wet-niche luminaire is needed, the listed forming shell is marked where visible following installation to identify the luminaire(s) with which it is to be used, as required in UL 676. No wet-niche luminaires requiring grounded are permitted to be identified in the marking on a forming shell for use only with wet-niche luminaires not requiring grounding.

Problem 2 - Confusion Regarding Need for Equipment Grounding Conductor in Flexible Cord - 680.23(B)(3) requires all wet-niche luminaires supplied by a flexible cord to be grounded with an equipment grounding conductor within the cord. The text of 680.24(B)(4) implies there will always be an equipment grounding conductor in the flexible cord that terminates at a grounding connection within the wet-niche luminaire. The flexible cord of a listed low-voltage wet-niche luminaire not requiring grounding need not include an equipment grounding conductor. The flexible cord of a wet-niche luminaire is always 12 ft or more in length and is often longer, sometimes as much as 100 ft or more for installations needing greater length. Using flexible cord with an equipment grounding conductor when not required results in additional product bulk and weight and significant additional expense for both the lighting assembly manufacturers and users.

Substantiation for Changes for Problem 2 - 680.23(B)(1) and 680.23(B)(2)(b) already provide for a listed low-voltage lighting system not requiring grounding. The text of 680.23(B)(3) and 680.23(B)(4) requires or implies the presence of an equipment grounding conductor in the flexible cord for all wet-niche luminaires, including listed low-voltage lighting system not requiring grounding. To remove likely confusion about the need for an equipment grounding conductor in the flexible cord of listed low-voltage lighting system not requiring grounding, 680.23(B)(3) and 680.23(B)(4) need to be revised. The proposed text for 680.23(B)(3) and 680.23(B)(4) will avoid the confusion.

The term "low-voltage" has been purposely left out of the proposed phrase "Unless a listed lighting system not requiring grounding" for proposed 680.23(B)(3)(b). The substantiation for not including the term "low-voltage" is to provide for ungrounded 120 V luminaires, as described for problem 1 above.

Problem 3 - "No Non-Current-Carrying Metal Parts" Too Inclusive - 680.23(B)(5) requires a luminaire not requiring bonding to the forming shell to have "non-current-carrying metal parts." This results in the use of nonmetallic screws or other nonmetallic part securement means that often do not provide the needed or desired securement strength. It also precludes the use of other design-benefiting metal parts in plastic luminaires.

Substantiation for Changes for Problem 3 - As discussed in the comments for Problem 1 above, wet-niche luminaires without a grounding conductor can be designed so there is no shock hazard with any likely combination of fault conditions. Luminaires with ungrounded metal parts can be designed, and determined through testing for listing, to limit the risks of electric shock when these ungrounded metal parts are not bonding to the forming shell.

I present two of many examples of metal parts not requiring grounding and that should not be required to be bonded to the forming shell. First, manufacturers of plastic luminaires want to use metal screws to tightly secure and seal a front plastic bezel (face ring) over the lens and lens gasket. The screws secure to metal threaded inserts in or metal nuts behind an external plastic flange of the luminaire's plastic body. These metal fasteners do not penetrate into or come near the electrical enclosure. They are not capable of being inadvertently energized through the failure of electrical insulation, electrical spacings, or both. Another example would be a metal spring clip designed to hold a bi-pin lamp in its lampholder (such as a MR-16 type lamp). Even if not grounded or bonded to the forming shell, the plastic luminaire design may be such that, as confirmed through testing, it limits the escape current conducting into the swimming pool water under damaged lens or gasket conditions and other applicable fault conditions required in UL 676.

Where it is determined that the risks of electric shock are addressed by the luminaire design, designs with non-current-carrying metal parts not bonded to the forming shell can be permitted and should not be prevented by Section 680.23(B)(5).

Footnote

1 Quoted text is from 680.23(A)(1), Underwater Luminaires (Lighting Fixtures); General; Luminaire (Fixture) Design, Normal Operation.

Panel Meeting Action: Reject

Panel Statement: The proposal would reduce the mechanical integrity of the equipment grounding conductor. In addition, the proposal would permit 120 v luminaires.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10 Negative: 1

Explanation of Negative:

BLEWITT, T.: Panel should Accept in Principle in Part

UL 676, the Standard for Underwater Luminaires, specifies construction and performance requirements for line-voltage double-insulated luminaires. Therefore the 680.23(B)(2)(b) low voltage restriction for luminaires not requiring grounding is no longer necessary.

The revision to 680.23(B)(5) is therefore appropriate although it should be amended as follows:

(5) Luminaire (Fixture) Bonding. Unless listed with an approved system of double insulation, the luminaire (fixture) shall be bonded….

All other proposed revisions are editorial. Therefore, the Panel Statement regarding the mechanical integrity of the equipment grounding conductor may have been unintentionally included. The 16 AWG equipment grounding conductor already appears in 680.23(B)(3) and is not proposed to be changed.

Comment on Affirmative:

HIRSCH, B.: See comment for Proposal 17-64.

17-103 Log #2786 NEC-P17 **Final Action: Accept in Principle**
(680.23(B)(6))

Submitter: Steven D. Holmes, Underwriters Laboratories Inc.

Recommendation: Revise text to read as follows:

680.23 Underwater Luminaires (Lighting Fixtures) . This section covers all luminaires (lighting fixtures) installed below the normal water level of the pool.

(B) Wet-Niche Luminaires (Fixtures).

(1) through (5) [No change]

~~**(6) Servicing.** All luminaires shall be removable from the water for relamping or normal maintenance. Luminaires shall be installed in such a manner that personnel can reach the luminaire for relamping, maintenance, or inspection while on the deck or equivalently dry location.~~

(6) Servicing. All wet-niche luminaires shall be removable from the water for inspection, relamping, or other maintenance. The forming shell location and length of cord in the forming shell shall permit personnel to place the removed luminaire on the deck or other dry location for such maintenance. The luminaire maintenance location shall be accessible without entering or going in the pool water.

Substantiation: Problem/Substantiation - Servicing a Wet-Niche Luminaire – Section 680.23(B)(6) [new for 2005 NEC] requires it be possible to "reach the luminaire for relamping, maintenance, or inspection while on the deck or equivalently dry location."

This appears to require (or could easily be interpreted to require) that the wet-niche luminaire be located near enough to the deck (or equivalently dry location) that a service person can lie on the dry deck and then reach into the pool water and remove the luminaire from the forming shell.

Situation Requiring Clarified Text :

If 680.23(B)(6) is not intended to require the luminaire to be close enough to the deck to be reached from the deck, the present wording leaves it easy for readers to reach this conclusion and the wording should be revised to better avoid this confusion. Proposed 680.23(B)(6) more clearly describes the needed installation characteristics. It also draws the reader's attention to the need for the cord in the forming shell to have the needed length. It also proposes that the maintenance location be accessible without the service personnel having to enter or get over pool water, which helps the service person remain dry for the inspection, relamping, or other maintenance of the (electric) luminaire.

Situation Requiring Changed Requirement :

If 680.23(B)(6) is intended to require the luminaire to be close enough to the deck to be reached from the deck, this requirement should be changed to proposed 680.23(B)(6) for the following reasons.

Greater Depth Wanted or Needed - Historically and to date, designers for residential and commercial pools often locate the wet-niche luminaire at a depth greater than can be reached by a person lying on the deck. Pool designers and owners continue to want or need the greater depth. Wet-niche luminaires are mounted at the base of some walls to achieve a lighting effect across the bottom of the pool. Luminaires are also mounted a depths greater than can be reached for better viewing of pool occupants. One example is diving pools with 10 m diving platforms. These pools can often be as deep as 6 m. Illumination at the greater depths, typically at least 3 m luminaire depth, is required in order to view divers for possible injury and rescue. Greater luminaire depth for better viewing of pool occupants applies for many other pools too.

Difficulty of Removing/Reinstalling Luminaire from Deck - It is very difficult for service personnel lying on the deck to complete required tasks (a) through (c) below (with their immersed arms and hands).

(a) Remove the screw securing the wet-niche luminaire in and to the forming shell and then remove the luminaire and its coiled cord from the forming shell.

(b) Lift and place the luminaire on the deck.

(c) After completing relamping, maintenance, or inspection on the deck, recoil the cord and insert both the coiled cord and wet-niche luminaire back into the forming shell and align and tighten the securement screw with a tool.

The wet-niche luminaire will likely be installed with "the top of the luminaire (lens)" a minimum of "450 mm (18 in.) below the normal water level of the pool" to comply with 680.23(A)(5). The increased difficulty of completing the above tasks while lying on the deck can lead to improper reinstallation of the luminaire or damage to the luminaire or forming shell.

Entering Pool for Retrieving Luminaire is Reasonable and Common - It is reasonable to expect a person servicing a wet-niche luminaire to enter the pool to remove the de-energized luminaire from its forming shell and place it on the deck for maintenance. Sometimes, where needed, a service person with goggles will hold their breath while fully immersed to uninstall (and later reinstall) wet-niche luminaires that are not so deep as to prevent this approach. If needed, professional pool service personnel make use of underwater breathing equipment for servicing a wet-niche luminaire at a greater depth.

Service personnel often enter the pool (rather than work from the deck) to save significant time and effort, even if the luminaires can be reached from the deck. For example, service personnel will very likely use facemask, fins, weight belts, and underwater breathing equipment for pools with many luminaires (such as 35 luminaires in a 50 m racing pool).

Interpretation Not Clearly the Intent of Original Submitters - This requirement was initially proposed for the 2005 NEC (proposal 17-98 Log#3273 NEC-P17). A comment (Proposal 17-139 Log #1881 NEC-P17) with replacement text for proposed 680.23(B)(6) was subsequently received in the Receipt of Comments phase of 2005 NEC development. The replacement text was accepted and appears in the 2005 NEC. Nothing in the original proposal or the original and subsequent substantiation comments indicate an intent to require the luminaire to be close enough to the deck for it to be reached from the deck.

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

680.23 Underwater Luminaires (Lighting Fixtures). This section covers all luminaires (lighting fixtures) installed below the normal water level of the pool.

(B) Wet-Niche Luminaires (Fixtures).

(1) through (5) [No change]

~~(6) Servicing. All luminaires shall be removable from the water for relamping or normal maintenance. Luminaires shall be installed in such a manner that personnel can reach the luminaire for relamping, maintenance, or inspection while on the deck or equivalently dry location.~~

(6) Servicing. All wet-niche luminaires shall be removable from the water for inspection, relamping, or other maintenance. The forming shell location and

length of cord in the forming shell shall permit personnel to place the removed luminaire on the deck or other dry location for such maintenance. The luminaire maintenance location shall be accessible without entering or going in the pool water.
Panel Statement: The panel does not accept the last sentence of the substantiation as it was, in fact, addressed in Proposal 17-98 of the 2005 ROP.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-104 Log #1026 NEC-P17 **Final Action: Reject**
(680.23(F))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:
Branch circuit wiring on the supply side of enclosures and junction boxes, connected to conduits run to wet-niche and no-niche luminaries (fixtures), and the field wiring compartments of dry-niche luminaries (fixtures) shall be installed using rigid galvanized steel conduit, intermediate metal conduit, rigid silicon bronze conduit, stainless steel conduit, liquidtight flexible metal conduit, rigid nonmetallic conduit, rigid nonmetallic conduit, or Type MI cable . Where installed on buildings or structures electrical metallic tubing shall be permitted. For one-family dwellings, the provisions of 680.21(A) shall be permitted .
Exception: Where ~~connecting to~~ liquidtight flexible metal conduit or liquidtight flexible nonmetallic conduit is used for connecting to transformers for underwater pool lights ~~liquidtight flexible metal conduit or liquidtight flexible nonmetallic conduit shall be permitted The~~ the length shall not exceed ...(remainder unchanged).
Substantiation: Liquidtight flexible metal conduit and Type MI cable appear to be as suitable as liquidtight flexible nonmetallic conduit. The present rquirement for rigid metal conduit includes aluminum, which may not be suitable in corrosive conditions. The exception permitting liquidtight flexible nonmetallic conduit for transformers (enclosures) is already permitted in (1). Type MI cable apepars to be a suitable wiring method, resistant to corrosion and physical damage and providing a reliable grounding means. The proposal part for one family dwellings correlates with 680.21(A)(4) and removes a conflict.
Panel Meeting Action: Reject
Panel Statement: The use of MI cable is not suitable for pool use; see 332.12.
LFMC has not been substantiated for use in pool locations as it is subject to physical damage. LFMC is also not suitable for pool locations due to the corrosive environment.
The substantiation is incorrect. Aluminum conduit would not meet the requirements of the Code.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-105 Log #2342 NEC-P17 **Final Action: Reject**
(680.23(F)(1))

Submitter: Andre R. Cartal, Princeton Borough Building Dept.
Recommendation: Add new text:
AC cable containing an insulated equipment grounding conductor sized in accordance with Table 250.122 but not less than #12 AWG.
Substantiation: AC cable with an equipment grounding conductor provides an equal or better ground path than MC cable and should be permitted.
Panel Meeting Action: Reject
Panel Statement: All AC cables do not contain an insulated grounding conductor for general-use branch circuits.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-106 Log #2957 NEC-P17 **Final Action: Reject**
(680.23(F)(1))

Submitter: Philip Simmons, Simmons Electrical Services
Recommendation: Revise existing 680.23(F)(1) as follows:
(F) Branch-Circuit Wiring.
(1) Wiring Methods. Branch-circuit wiring on the supply side of enclosure and junction boxes connected to conduits run to wet-niche and no-niche luminaires (fixtures), and the field wiring compartments of dry-niche luminaires (fixtures), shall be installed using rigid metal conduit, intermediate metal conduit, liquidtight flexible metal conduit, ~~or~~ rigid nonmetallic conduit or listed type MC cable having an impervious outer nonmetallic jacket . Where installed on buildings, electrical metallic tubing shall be permitted, and where installed within buildings, electrical nonmetallic tubing or electrical metallic tubing shall be permitted.
Exception: Where connecting to transformers for pool lights, liquidtight flexible metal conduit , ~~*or*~~ *liquidtight flexible nonmetallic conduit or listed Type MC cable having an impervious outer nonmetallic jacket shall be permitted. The length shall not exceed 1.8 m (6 ft) for any one length or exceed 3.0 m (10 ft) in total length used. Liquidtight flexible nonmetallic conduit, Type B (LFNC-B), shall be permitted in lengths longer than 1.8 m (6 ft).*
Substantiation: Listed Type MC cable that has an impervious out nonmetallic jacket is listed for direct earth burial as well as concrete encasement. The cable contains an insulated equipment grounding conductor and should be an excellent wiring method for the application in this section.
A similar proposal was accepted by the Code Panel during the processing of the 2005 NEC but was later rejected. We think the installer should be given the opportunity to select a reliable and proven wiring method offered by Type MC cable that is suitable for the area. Most often, these conductors are not pulled out and replaced as offered by a raceway wiring method. These conductors generally stay in place for the life of the pool.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 17-78.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-107 Log #2787 NEC-P17 **Final Action: Reject**
(680.23(F)(2))

Submitter: Steven D. Holmes, Underwriters Laboratories Inc.
Recommendation: [Changes proposed only for 680.23(F) (2). No change to other text of 680.23]
680.23 Underwater Luminaires (Lighting Fixtures) . This section covers all luminaires (lighting fixtures) installed below the normal water level of the pool.
~~**(F)(2) Equipment Grounding.** Through-wall lighting assemblies, wet-niche, dry-niche, or no-niche luminaires (lighting fixtures) shall be connected to an insulated copper conductor equipment grounding conductor installed with the circuit conductors. The equipment grounding conductor shall be installed without joint or splice except as permitted in (F)(2)(a) and (F)(2)(b). The equipment grounding conductor shall be sized in accordance with Table 250.122 but shall not be smaller than 12 AWG~~
~~*Exception: An equipment grounding conductor between the wiring chamber of the secondary winding of a transformer and a junction box shall be sized in accordance with the overcurrent device in this circuit.*~~
(a) ~~If more than one underwater luminaire (lighting fixture) is supplied by the same branch circuit, the equipment grounding conductor, installed between the junction boxes, transformer enclosures, or other enclosures in the supply circuit to wet-niche luminaires 9fixtures), or between the field wiring compartments of dry-niche luminaires (fixtures) shall be permitted to be terminated on grounding terminals.~~
~~(b) If the underwater luminaire (lighting fixture) is supplied from a transformer, ground-fault circuit interrupter, clock-operated switch, or a manual snap switch that is located between the panelboard and a junction box connected to the conduit that extends directly to the underwater luminaire (lighting fixture) the equipment grounding conductor shall be permitted to terminate on grounding terminals on the transformer, ground-fault circuit interrupter, clock-operated switch enclosure, or an outlet box used to enclose a snap switch.~~
(F)(2) Equipment Grounding.
(a) Underwater Luminaires (lighting fixtures). Underwater luminaires (lighting fixtures) shall comply with (1) or (2):
(1) The luminaire shall be connected to an insulated copper equipment grounding conductor installed with the circuit conductors. The equipment grounding conductor shall be installed without joint or splice except as permitted in (F)(2)(b) and (F)(2)(c). The equipment grounding conductor shall be sized in accordance with Table 250.122 but shall not be smaller than 12 AWG
(2) The luminaire shall be listed as not requiring grounding.
Exception: An equipment grounding conductor between the wiring chamber of the secondary winding of a transformer and a junction box shall be sized in accordance with the overcurrent device in this circuit.
(b) Multiple Underwater Luminaires . If more than one underwater luminaire (lighting fixture) is supplied by the same branch circuit, the equipment grounding conductor, installed between the junction boxes, transformer enclosures, or other enclosures in the supply circuit to wet-niche luminaires (fixtures), or between the field wiring compartments of dry-niche luminaires (fixtures) shall be permitted to be terminated on grounding terminals.
(c) Enclosure Between Junction Box and Panelboard. If the underwater luminaire (lighting fixture) is supplied from a transformer, ground-fault circuit interrupter, clock-operated switch, or a manual snap switch that is located between the panelboard and a junction box connected to the conduit that extends directly to the underwater luminaire (lighting fixture); the equipment grounding conductor shall be permitted to terminate on grounding terminals on the transformer, ground-fault circuit interrupter, clock-operated switch enclosure, or an outlet box used to enclose a snap switch.
Substantiation: Problem 1 – Confusion Regarding Need to Connect Underwater Luminaire to Branch Circuit Equipment Grounding Conductor – Section 680.23(F)(2) requires an underwater luminaire to "be connected to an insulated copper equipment grounding conductor installed with the circuit conductors." Multiple requirements of Article 680 provide for the use of a low-voltage underwater luminaire not requiring grounding. If such a luminaire is not designed with provisions to connect to an equipment grounding conductor, installers and inspection authorities may question the capability of the luminaire to be installed in accordance with this 680.23(F)(2).

Alternatively, unnecessarily requiring a luminaire to have provision for connection to an equipment grounding conductor results in additional expense for both the lighting assembly manufacturers and users.

Substantiation for Changes for Problem 1 - It is unnecessary to require an underwater luminaire to be connected to a branch circuit equipment grounding conductor if the luminaire does not have non-current-carrying metal parts requiring grounding.

The terms "low-voltage" have been purposely left out of the proposed phrase "Unless listed as not requiring grounding" for list item (2) of proposed 680.23(F)(2)(a). 120 V luminaires without a grounding conductor can be designed so "that, where the luminaire (fixture) is properly installed without a ground-fault circuit-interrupter, there is no shock hazard with any likely combination of fault conditions during normal use (not relamping)"1. Test techniques for determining compliance with this NEC requirement are well developed and specified in the Standard for Underwater Lighting Fixtures and Junction Boxes, UL 676. During the evaluation for the required listing [see 680.23(A)(8)] of the luminaire, it can be determined if both an ungrounded 120 volt luminaire limits the risks of electric shock and fire just as required for (a) low-voltage designs without a grounding conductor and (b) 120 V designs with a grounding conductor.

120 V luminaire designs without a grounding conductor and that limit the risks of electric shock and fire can both be practical and comply with all safety requirements, including the limit for escape current conducting into the swimming pool water under damaged lens or gasket conditions and other applicable fault conditions required in UL 676.

To provide for luminaires listed as not requiring grounding in proposed 680.23(F)(2), the submitter has

·Revised the first sentence of present 680.23(F)(2) and relocated the requirements of the first paragraph of present 680.23(F)(2) to become list item (1) of proposed 680.23(F)(2)(a).

·Added the new provision for luminaires listed as not requiring grounding as list item (2) of proposed 680.23(F)(2)(a).

·Relocated the present exception to stay associated with the same requirement that is now located in proposed 680.23(F)(2)(a).

·Renumbered paragraphs (a) and (b) in present 680.23(F)(2) to new numbering of proposed 680.23(F)(2)(b) and 680.23(F)(2)(c), respectively

·Added proposed titles to each of proposed 680.23(F)(2)(a), (b) and (c), to make it easier for readers to determine applicability of the requirement.

Except for providing for listed luminaires not requiring grounding, the submitter is not intending to otherwise change the requirements.

Footnote

1) Quoted text is from 680.23(A)(1), Underwater Luminaires (Lighting Fixtures); General; Luminaire (Fixture) Design, Normal Operation.

Problem/Substantiation 2 – Simplify Wording – To simplify wording for improved ease of reading, the submitter also proposes replacing the terms "Through-wall lighting assemblies, wet-niche, dry-niche, or no-niche luminaires (lighting fixtures)" in the first sentence of 680.23(F)(2) with "underwater luminaires (lighting fixtures)". Except for underwater luminaires not requiring grounding as discussed above, all types of underwater luminaires need to be connected to the branch circuit equipment grounding conductor. There does not appear to be the need to state all types of underwater luminaires in the requirement when they can be referred to collectively as underwater luminaires. This change appears in first sentence of proposed 680.23(F)(a).

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 17-102.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10 Negative: 1

Explanation of Negative:

BLEWITT, T.: Proposal should be Accepted in Principle

All revisions are editorial except for proposed new 680.23(F)(2)(a)(2) referencing a listed luminaire not requiring grounding.

UL 676, the Standard for Underwater Luminaires, specifies construction and performance requirements for line-voltage double-insulated luminaires. For such luminaires, the requirement for grounding is not necessary.

New 680.23(F)(2)(a)(2) should therefore read:

(2) The luminaire shall be listed with an approved system of double insulation.

Comment on Affirmative:

HIRSCH, B.: See comment for Proposal 17-64.

17-108 Log #2788 NEC-P17 **Final Action: Accept**
(680.24)

Submitter: Steven D. Holmes, Underwriters Laboratories Inc.

Recommendation: Revise text to read as follows:

680.24 Junction Boxes and Electrical Enclosures for Transformers or Ground-Fault Circuit Interrupters.

(A) Junction Boxes. A junction box connected to a conduit that extends directly to a forming shell or mounting bracket of a no-niche luminaire (fixture) shall meet the requirements of this section.

(1) Construction. [No change]

(2) Installation. Where the luminaire (fixture) operates over 15 volts, the junction box location shall comply with (A)(2)(a) and (A)(2)(b). Where the luminaire (fixture) operates at ~~less than~~ 15 volts <u>or less</u> , the junction box location shall be permitted to comply with (A)(2)(c).

[Remainder of item (2) not changed]

[No change to 680.24(B), (C), (D), and (E)]

(F) Grounding. The <u>equipment grounding conductor terminals of a</u> junction box, transformer enclosure, or other enclosure in the supply circuit to a wet-niche or no-niche luminaire (lighting fixture) and the field-wiring chamber of a dry-niche luminaire (lighting fixture) shall be grounded to the equipment grounding terminal of the panelboard. This terminal shall be directly connected to the panelboard enclosure.

Substantiation: Problem/Substantiation 1 – Exactly 15 Volts not Addressed – The first two sentences of Section 680.24(A)(2) address installations where the luminaire operates both over or less than 15 volts but does not address installations where the luminaire operates at 15 volts. Proposed change for 680.24(A)(2) results in the 15 volt situation having to comply with the requirements presently assigned to the less than 15 volt situation. This is the association that is used elsewhere in Article 680, such as 680.23(A)(3) and (8), 680.33(A), and 680.51(A).

Problem/Substantiation 2 –Enclosure Can't be Grounded if Plastic

Section 680.24(F) refers to grounding a junction box, transformer enclosure, or other enclosure to the equipment grounding terminal of the panelboard. Swimming pool junction boxes, enclosures of transformers, and other enclosures can be entirely of plastic. Such enclosures may have only internal equipment grounding conductor terminals for the supply and load circuits and for grounding any internal non-current-carrying metal parts requiring grounding.

The submitter proposes revising 680.24(F) to require the grounding of the equipment grounding terminals of the swimming pool junction box (or other enclosure) rather than grounding the enclosure. All non-current-carrying metal parts requiring grounding will be bonded to the supply circuit equipment grounding conductor terminal as will all other equipment grounding conductor terminals in the enclosure.

Panel Meeting Action: Accept

Ballot Results: Affirmative: 11

17-109 Log #1625 NEC-P17 **Final Action: Accept in Principle**
(680.24(A)(2))

Submitter: Tom Henry, Code Electrical Classes, Inc.

Recommendation: Add new text as follows:

Where the luminaire (fixture) operates at <u>15 volts or less</u> , the junction box location shall be permitted to comply with (A)(2)(C).

Substantiation: The way this section reads now it does not cover 15 volts, it's either over 15 volts or less than 15 volts. Confusing wording.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Proposal 17-108.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-110 Log #907 NEC-P17 **Final Action: Reject**
(680.24(A)(2)(a))

Submitter: Sam Arcadu, Princeton, NJ

Recommendation: New text with deletions removed.

(a) Vertical Spacing. The junction box shall be located not less than 200 mm (8 in.), measured from the inside of the bottom of the box, above the maximum pool water level.

Substantiation: This section needs clarification for field use. The NEC provides a definition of Maximum Water Level so it appears obvious that 200 mm (8 in.) will always be the greater elevation. If it is the intent of this section to assure that water will not seep into these junction boxes than a height of 8 in. above the maximum water level would always meet the intent.

Panel Meeting Action: Reject

Panel Statement: This proposal reduces the level of safety provided by the current Code.

The panel does not agree with the submitter's substantiation as this will not always be the greater elevation.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

Comment on Affirmative:

BLEWITT, T.: Removal of the text specifying minimum 4 inch spacing above the ground level would inadvertently allow an installation of a box at ground level when the ground adjacent to the pool was 8 inches above the pool water level.

17-111 Log #364 NEC-P17 **Final Action: Accept**
(680.24(F))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read:
(F) Grounding. The junction box, transformer enclosure, or other enclosure in the supply circuit to a wet-niche or no-niche luminare (lighting fixture) and the field-wiring chamber of a dry-niche luminare (lighting fixture) shall be ~~grounded~~ connected to the equipment grounding terminal of the panelboard. This terminal shall be directly connected to the panelboard enclosure.
Substantiation: This is an editorial revision. The correct word to use here is connected, not grounded. The connection to the equipment grounding terminal is a bonding function that accomplishes the grounding required by this section.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

(680.24(F))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise latter part of the first sentence...shall be ~~grounded~~ connected to the equipment grounding terminal (if available) of the panelboard or the metal enclosure of the branch circuit overcurrent protective device . Delete the last sentence.
Substantiation: Edit. All circuits may not be supplied by a panelboard; they may originate from a fused switch or a single circuit breaker. The last sentence is covered by other standards.
Panel Meeting Action: Accept in Part
Panel Statement: See panel action on Proposal 17-111.
The panel does not accept "equipment grounding terminal (if available) of the panelboard or the metal enclosure of the branch circuit overcurrent protective device . Delete the last sentence." as the submitter has not provided adequate substantiation.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-113 Log #901 NEC-P17 **Final Action: Accept in Part**
(680.25(A))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise first sentence to read as follows:
Feeders shall be installed in rigid metal conduit, intermediate metal conduit, liquidtight flexible metal conduit, liquidtight flexible nonmetallic conduit, or rigid nonmetallic conduit.
Add exception: Aluminum conduit shall not be permitted in the pool area where subject to corrosion.
Substantiation: Liquidtight flexible metal conduit appears to be as suitable as liquidtight flexible nonmetallic conduit. Per 350.10(1). Chemical vapors may corrode aluminum.
Panel Meeting Action: Accept in Part
Revise 680.25(A) as follows:
(A) Wiring Methods. Feeders shall be installed in rigid metal conduit, intermediate metal conduit, liquidtight flexible nonmetallic conduit, or rigid nonmetallic conduit. Electrical metallic tubing shall be permitted where installed on or within a building, and electrical nonmetallic tubing shall be permitted where installed within a building.
Change existing exception to be Exception No. 1.
Add Exception No. 2 as follows:
Exception No. 2. Aluminum conduit shall not be permitted in the pool area where subject to corrosion.
Panel Statement: The panel rejects the submitter's proposed text to 680.25(A). LFMC has not been substantiated for use in pool locations as it is subject to physical damage. LFMC is also not suitable for pool locations due to the corrosive environment.
The panel accepts the new exception.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-114 Log #2958 NEC-P17 **Final Action: Reject**
(680.25(A))

Submitter: Philip Simmons, Simmons Electrical Services
Recommendation: Revise existing 680.25(A) as follows:
(A) Wiring Methods. Feeders installed outdoors shall be suitable for a wet or damp location. Feeders in a wet location shall be installed in rigid metal conduit, intermediate metal conduit, electrical metallic tubing, liquidtight flexible nonmetallic conduit, ~~or~~ rigid nonmetallic conduit , or Type MC cable with an impervious out jacket . Feeders installed in a dry or damp location shall be installed in rigid metal conduit, intermediate metal conduit, electrical metallic tubing, liquidtight flexible nonmetallic conduit, rigid nonmetallic conduit, or Type MC cable. ~~Electrical metallic tubing shall be permitted where installed on or within a building, and~~ Electrical nonmetallic tubing shall be permitted where installed within a building.
Substantiation: Type MC cable provides excellent protection from physical damage in compliance with the UL Product Safety Standard. Specific tests the cable must pass that are related to protection against physical damage include:
Impact Test
Crushing Test - All Cable
Crushing Test - Cable Marked for Direct Burial
Type MC cable must also pass a Fault Current Test and an Overload Current Test.
Ordinary Type MC cable is suitable for a dry and damp location. Type MC cable is also produced with an impervious PVC outer jacket and is suitable for installation in wet locations, for direct earth burial and for installation in poured concrete.
Obviously, wire installed in conduit or tubing is not required to pass these tests. Type MC cable is a superior wiring method and is superbly suited for installation as a feeder for panelboards used for applications covered by this section.
In addition, Type MC cable contains an insulated equipment grounding conductor that is in compliance with 250.122. This ensures a reliable and low impedance ground fault current return path. As a result, Type MC cable is an excellent wiring method for feeders to panelboards for swimming pool equipment.
Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject
Panel Statement: In accordance with 330.12(4), some MC cables are not suitable to be installed due to chlorine vapors.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11
Comment on Affirmative:
BLEWITT, T.: Type MC cable is available with constructions designed to resist the chemical vapors likely in these installations. There are jacketed versions and are marked "Suitable for use in swimming pool motor circuits."

17-114a Log #CP1708 NEC-P17 **Final Action: Accept**
(680.26)

TCC Action: The Technical Correlating Committee directs that the panel reconsider the proposal and rewrite the text to comply with the NEC Style Manual to correct items such as the mandatory text in Fine Print Notes No. 1 and No. 2, incomplete sentences, and correcting other NEC Style issues. This action will be considered by the panel as a public comment.
Submitter: Code-Making Panel 17,
Recommendation: Revise 680.26 to read as follows:
680.26 Equipotential Bonding.
(A) Performance. The equipotential bonding required by this section shall be installed to reduce voltage gradients in the pool area.
(B) Bonded Parts. The parts specified in 680.26(B)(1) through (B)(7) shall be bonded together using solid copper conductors, insulated covered, or bare, not smaller than 8 AWG or with rigid metal conduit of brass or other identified corrosion-resistant metal. Connections to bonded parts shall be made in accordance with 250.8. An 8 AWG or larger solid copper bonding conductor provided to reduce voltage gradients in the pool area shall not be required to be extended or attached to remote panelboards, service equipment, or electrodes.
(1) Conductive Pool Shells. Bonding to conductive pool shells shall be provided as specified in 680.26(B)(1)(a) or 680.26(B)(1)(b).
FPN No.1: Poured concrete, pneumatically applied or sprayed concrete, and concrete block with painted or plastered coatings are all considered conductive materials due to water permeability and porosity.
FPN No. 2: Vinyl liners and fiberglass composite shells are considered to be nonconductive materials.
a. Structural Reinforcing Steel. The structural reinforcing steel (rebar) of a concrete pool where the reinforcing rods are bonded together by steel tie wires or the equivalent. For structural reinforcing steel encapsulated in a nonconductive compound see 680.26(B)(1)(b).
b. Copper Conductor Grid.
1. Materials and Connections. The grid shall be constructed of minimum 8 AWG bare solid copper conductors. Conductors shall be bonded to each other at all points of crossing.
2. Grid Structure. The grid shall conform to the contour of the pool and the pool deck. It shall be arranged in a 300 mm (12 in.) by 300 mm (12 in.) network of conductors in a uniformly spaced perpendicular grid pattern with tolerance of 100 mm (4 in.).
3. Securing. The below-grade grid shall be secured within or under the pool. It shall follow the contours of the pool shell. When not part of the pool shell, it shall be secured no more than 150 mm (6 in.) from the outer contour of the pool shell.
(2) Perimeter Surfaces. Extends for 1 m (3 ft) horizontally beyond the inside walls of the pool. Includes unpaved surfaces as well as poured concrete and other types of paving. Bonding for perimeter surfaces shall be provided as specified in 680.26(B)(2)(a) or 680.26(B)(2)(b), and attached to the pool reinforcing steel or copper conductor grid at a minimum of four (4) points uniformly spaced around the perimeter of the pool. For non-conductive pool shells, bonding at four points shall not be required.

a. Structural Reinforcing Steel. Structural reinforcing steel shall be bonded in accordance with 680.26(B)(1)(a).

b. Alternate Means. Where structural reinforcing steel is not available copper conductors shall be utilized where the following conditions are met:

1. Materials and Connections. Bonding shall be by means of at least one minimum 8 AWG bare solid copper conductor. The conductors shall follow the contour of the perimeter surface. Approved splices shall be permitted. If only a single conductor is provided, it shall be 450 to 600 mm (18 to 24 inches) from the inside wall of the pool.

2. Securing. Perimeter surface equipotential bonding conductors shall be secured within or under the perimeter surface. An equipotential bonding conductor under the perimeter surface shall be considered secured when installed 100 to 150 mm (4 to 6 inches) below the subgrade.

(3) Metallic Components. All metallic parts of the pool structure, including reinforcing metal not addressed in 680.26(1)(a). Where reinforcing steel is encapsulated with a nonconductive compound it shall not be required to be bonded.

(4) Underwater Lighting. All metal forming shells and mounting brackets of no-niche luminaires (fixtures).

Exception: Listed low-voltage lighting systems with nonmetallic forming shells not requiring bonding.

(5) Metal Fittings. All metal fittings within or attached to the pool structure shall be bonded. Isolated parts that are not over 100 mm (4 in.) in any dimension and do not penetrate into the pool structure more than 25 mm (1 in.) shall not require bonding.

(6) Electrical Equipment. Metal parts of electrical equipment associated with the pool water circulating system, including pump motors and metal parts of equipment associated with pool covers, including electric motors.

Exception: Metal parts of listed equipment incorporating an approved system of double insulation.

a. Double-Insulated Water Pump Motors. Where a double-insulated water-pump motor is installed under the provisions of this rule, a solid 8 AWG copper conductor that is of sufficient length to make a bonding connection to a replacement motor shall be extended from the bonding grid to an accessible point in the motor vicinity. Where there is no connection between the swimming pool bonding grid and the equipment grounding system for the premises, this bonding conductor shall be connected to the equipment grounding conductor of the motor circuit.

b. Pool Water Heaters. Pool water heaters shall be bonded. Those heaters having specific instructions regarding bonding and grounding, only those parts designated to be bonded shall be bonded and only those parts designated to be grounded shall be grounded.

(7) Metal Wiring Methods and Equipment. Metal-sheathed cables and raceways, metal piping, and all fixed metal parts that are within the following distances of the pool, except those separated from the pool by a permanent barrier, shall be bonded.

a. Within 1.5 m (5 ft) horizontally of the inside walls of the pool.

b. Within 3.7 m (12 ft) measured vertically above the maximum water level of the pool, or as measured vertically above any observation stands, towers, or platforms, or any diving structures.

Substantiation: The panel revised text to add clarity of intent.

Panel Meeting Action: Accept

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-115 Log #2706 NEC-P17 **Final Action: Accept in Principle**
(680.26)

Submitter: Gary L. Siggins, Underwriters Laboratories Inc.

Recommendation: Revise as follows:

680.26 Equipotential Bonding.

(A) Performance. The equipotential bonding required by this section shall be installed to reduce ~~eliminate~~ voltage gradients in the pool area ~~as prescribed~~ . An 8 AWG or larger solid copper bonding conductor provided to reduce voltage gradients in the pool area shall not be required to be extended or attached to any remote panelboard, to service equipment, or to any electrode.

~~FPN: The 8 AWG or larger solid copper bonding conductor shall not be required to be extended or attached to any remote panelboard, service equipment, or any electrode.~~

(B) Bonded Parts. The parts specified in 680.26(B)(1) through (B)(~~5~~)(7) shall be bonded together ~~,~~ using solid copper conductors, insulated covered, or bare, not smaller than 8 AWG or with rigid metal conduit of brass or other identified corrosion-resistant metal. Connections to bonded parts shall be made in accordance with 250.8 .

(1) Conductive Pool Shells. Bonding to conductive pool shells shall be provided as specified in 680.26(B)(1)(a) and 680.26(B)(1)(b).

FPN: Poured concrete, pneumatically applied or sprayed concrete, and concrete block with painted or plastered coatings are all considered conductive materials due to water permeability and porosity.

FPN: Vinyl liners and fiberglass composite shells are considered to be nonconductive materials.

a. Structural Reinforcing Steel. The structural reinforcing steel (rebar) of a concrete pool where the reinforcing rods are bonded together by steel tie wires or the equivalent. Structural reinforcing steel encapsulated in a nonconductive compound shall not be relied upon for bonding .

b. Copper Conductor Grid.

1. Materials and Connections. The grid shall be constructed of minimum 8 AWG bare solid copper conductors. Conductors shall be bonded to each other at all points of crossing.

2. Grid Structure. The grid shall conform to the contour of the pool and the pool deck. It shall be arranged in a 300 mm (12 in.) by 300 mm (12 in.) network of conductors in a uniformly spaced perpendicular grid pattern with tolerance of 100 mm (4 in.).

3. Securing. The below-grade grid shall be secured within or under the pool. It shall follow the contours of the pool shell. When not part of the pool shell, it shall be secured no more than 150 mm (6 in.) from the outer contour of the pool shell.

(2) Perimeter Surfaces. Extends for 1 m (3 ft) horizontally beyond the inside walls of the pool. Includes unpaved surfaces as well as poured concrete and other types of paving. Bonding to walking surfaces shall be provided as specified in 680.26(B)(2)(a) or 680.26(B)(2)(b).

a. Structural Reinforcing Steel. In accordance with 680.26(B)(1)(a).

b. Copper Conductors.

1. Materials and Connections. Bonding shall be by means of at least one minimum 8 AWG bare solid copper conductor. The conductors shall follow the contour of the perimeter surface. Splices shall be permitted. If only a single conductor is provided, it shall be in the center of the perimeter surface.

2. Securing. A perimeter surface equipotential bonding conductor shall be secured within or under the perimeter surface. An equipotential bonding conductor under the perimeter surface shall be secured within 150 mm (6 inches) of the bottom of the paved surface.

(3)(~~1~~) Metallic Structural Components. All metallic parts of the pool structure, including reinforcing metal not addressed in 680.26(1)(a). Where reinforcing steel is encapsulated with a nonconductive compound it shall not be required to be bonded , ~~the reinforcing metal of the pool, shell, coping stones, and deck, shall be bonded. The usual steel tie wires shall be considered suitable for bonding the reinforcing steel together, and welding or special clamping shall not be required. These tie wires shall be made tight. If reenforcing steel is effectively insulated by an encapsulating nonconductive compound at the time of manufacture and installation, it shall not be required to be bonded. Where reinforcing steel of the pool shell or the reinforcing steel of coping stones and deck is encapsulated with a nonconductive compound or another conductive material is not available, provisions shall be made for an alternative means to eliminate voltage gradients that would otherwise be provided by unencapsulated, bonded reinforcing steel.~~

(4) ~~(2)~~ Underwater Lighting. All meal forming shells and mounting brackets of no-niche luminaires (fixtures) ~~shall be bonded unless a listed low voltage lighting system with nonmetallic forming shells not requiring bonding used.~~

Exception: Listed low-voltage lighting systems with nonmetallic forming shells not requiring bonding.

(5)(~~3~~) Metal Fittings. All metal fittings within or attached to the pool structure shall be bonded. Isolated parts that are not over 100 mm (4 in.) in any dimension and do not penetrate into the pool structure more than 25 mm (1 in.) shall not require bonding.

(6)(~~4~~) Electrical Equipment. Metal parts of electrical equipment associated with the pool water circulating system, including pump motors and metal parts of equipment associated with pool covers, including electric motors ~~, shall be bonded. Accessible metal parts of listed equipment incorporating an approved system of double insulation and providing a means for grounding internal nonaccessible, noncurrent-carrying metal parts shall not be bonded by a direct connection to the equipotential bonding grid. The mans for grounding internal nonaccessible, noncurrent carrying metal parts shall be an equipment grounding conductor run with the power supply conductors in the case of motors supplied with a flexible cord, or a grounding terminal in the case of motors intended for permanent connection.~~

Exception: Metal parts of listed equipment incorporating an approved system of double insulation.

a. Double-Insulated Water Pump Motors . Where a double-insulated water-pump motor is installed under the provisions of this rule, a solid 8 AWG copper conductor that is of sufficient length to make a bonding connection to a replacement motor shall be extended from the bonding grid to an accessible point in the motor vicinity. Where there is no connection between the swimming pool bonding grid and the equipment grounding system for the premises, this bonding conductor shall be connected to the equipment grounding conductor of the motor circuit.

b. Pool Water Heaters. For pool water heaters rated at more than 50 amperes and having specific instructions regarding bonding and grounding, only those parts designated to be bonded shall be bonded and only those parts designated to be grounded shall be grounded.

(7) (~~5~~) Metal Wiring Methods and Equipment. Metal-sheathed cables and raceways, metal piping, and all fixed metal parts that are within the following distances of the pool, except those separated from the pool by a permanent barrier, shall be bonded.

(1) Within 1.5 m (5 ft) horizontally of the inside walls of the pool.

(2) Within 3.7 m (12 ft) measured vertically above the maximum water level of the pool, or as measured vertically above any observation stands, towers, or platforms, or any diving structures.

~~(C) Equipotential Bonding Grid. The parts specified in 680.26(B) shall be connected to an equipotential bonding grid with a solid copper conductor, insulated, covered, or bare, not smaller than 8 AWG or rigid metal conduit of~~

~~brass or other identified corrosion-resistant metal conduit. Connection shall be made by exothermic welding or by listed pressure connectors or clamps that are labeled as being suitable for the purpose and are of stainless steel, brass, coper, or coper alloy. The equipotential common bonding grid shall extend under paved walking surfaces for 1 m (3 ft) horizontally beyond the inside walls of the pool and shall be permitted to be any of the following:~~

~~(1) Structural Reinforcing Steel. The structural reinforcing steel of a concrete pool where the reinforcing rods are bonded together by the usual steel tie wires or the equivalent.~~

~~(2) Bolted or Welded Metal Pools. The wall of a bolted or welded metal pool.~~

~~(3) Alternate Means. This system shall be permitted to be constructed as specified in (a) through (c):~~

~~a. Materials and Connections. The grid shall be constructed of minimum 8 AWG bare solid copper conductors. Conductors shall be bonded to each other at all points of crossing. Connections shall be made as required by 680.26(D).~~

~~b. Grid Structure. The equipotential bonding grid shall cover the contour of the pool and the pool deck extending 1 m (3 ft) horizontally from the inside walls of the pool. the equipotential bonding grid shall be arranged in a 300 mm (12 in.) by 300 mm (12 in.) network of conductors in a uniformly spaced perpendicular grid pattern with tolerance of 100 mm (4 in.)~~

~~c. Securing. The below grade grid shall be secured within or under the pool and deck media.~~

~~(D) Connections. Where structural reenforcing steel or the walls of bolted or welded metal pool structures are used as an equipotential bonding grid for nonelectrical parts, the connections shall be made in accordance with 250..~~

~~(E) Pool Water Heaters. For pool water heaters rated at more than 50 amperes and having specific instructions regarding bonding and grounding, only those parts designated to be bonded shall be bonded and only those parts designated to be grounded shall be grounded.~~

Substantiation: Existing text is difficult to interpret, it intermingles requirements for what shall be bonded, how to bond to the various parts and how to connect the parts together. Existing text can also be interpreted to require the Alternative Means Grid of 680.26(C) for vinyl liner and glass fiber composite shell pools. As these shells are nonconductive, the Alternative means Grid will not improve their safety. Also, the bonding of pool perimeter surfaces is not clearly defined. Specifically:

680.26(A) FPN: FPNs cannot contain mandatory statements. It was edited and moved to 680.26(A). The text was revised slightly as equipotential bonding cannot eliminate all voltage gradients, it can only substantially reduce them.

680.26(B) - Section revised to more clearly detail what shall be bonded, and how to bond to each part. Separate subsections were created for conductive pool shells and the perimeter surfaces around the pool. FPNs added to clarify what types of pool shells need to be bonded.

Discussed during the 2005 cycle but not clearly addressed were pools that were unpaved within the 3 ft area around the edge of the pool. As the shock hazard potential exists with unpaved earth as well as concrete or various types of pavers, this section was expanded to clearly address bonding to all types of perimeter constructions. Proposed 680.26(B)(2)(b) text is a new bonding option. Due to the limited width of the perimeter surface, a single 8 AWG solid copper conductor should be sufficient to collect any ground currents circulating through the pool perimeter.

680.26(B)(2) - Subsection regarding underwater lighting moved so all electrical equipment requirements are now in one place.

680.26(B)(4) - Much of the existing text concerning the bonding of double insulated electrical equipment is not necessary and is proposed to be deleted. The construction requirements for double-insulated pumps do not allow inaccessible grounded metal to be in contact with the water. also, accessible metal parts could not be grounded and would be required to be insulated from internal grounded metal.

680.26(C) - This section moved to indicate this construction is used to bond to conductive pool shells only.

680.26(D) Connections - General connection requirements were moved to 680.26(B).

680.26(E) - This was moved to put all requirements for electrical equipment in one place.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action on Proposal 17-114a (Log #CP-1708).

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-115a Log #CP1706 NEC-P17 **Final Action: Accept**

(680.26(A))

TCC Action: It was the action of the Technical Correlating Committee that this action be reconsidered and correlated with the action taken on Proposal 17-114a. This action will be considered by the panel as a public comment.

Submitter: Code-Making Panel 17,

Recommendation: Change 680.26(A) to read as follows:

(A) Performance The equipotential bonding required by this section shall be installed to reduce voltage gradients in the pool area as prescribed.

Substantiation: It was never the intent of the equipotential bonding grid to eliminate all voltage gradients.

Panel Meeting Action: Accept

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-116 Log #2423 NEC-P17 **Final Action: Reject**

(680.26(A))

Submitter: Donald W. Zipse, Zipse Electrical Engineering, Inc.

Recommendation: Remove Section 680.26 (A).

Substantiation: This error entered the NEC during the proposed amendments stage for the 1984 Code. NFPA Document NEC-TCR-83-A on page 342, Proposal 20-31 (680-22, FPN – (New)), Log #1932. It was “Accepted in Principle” and with a vote of 8 for acceptance and one negative.

During the comment stage, (See NEC-TCD, page 413, Comments 20-21 & 20-22), it is opined that the two comments received did not address the issue.

The definition of “equipotential Bonding” as given in Section 680 (A) **Performance** is a complete misunderstanding and misconception as there is **no such item as an equipotential bonding that prevents a difference in voltage gradients from developing within the pool area. It is impossible to eliminate voltage gradients, except in your imagination as long as current is flowing continuously through the concrete and re-bar, which is happening in the real world.**

Ohm’s Law states that **Voltage = Current X Resistance**

Unless the buried in concrete metal mesh is at or near absolute zero temperature, the equipotential bonding will have some resistance. The concrete is semi-conductive being wet and especially since the concrete had a metallic mesh within it. Any current flowing over and through the equipotential bonding will produce a voltage per Ohm’s Law. This has been proven by testing as will be described below.

With the approval of Code Making Panel # 5’s acceptance of the dangerous and hazardous multigrounded neutral distribution system, stray current has been measured flowing within swimming pools, hot tubs, showers, etc.

EPRI: “Created by the nation’s electric utilities in 1973, EPRI is one of America’s oldest and largest research consortia, with some 700 members and an annual budget of about $ 500 million. Linked to a global network of technical specialists, EPRI scientists and engineers develop innovative solutions to the world’s toughest energy problems while expanding opportunities for a dynamic industry.”

The Electric Power Research Institute (EPRI) an organization of utilities companies states that 40 to 60 percent of the return neutral current from the high voltage electrical circuit returns over or through the earth. We have measured as high as eighty-eight (88) percent of the neutral current returning over the earth and thus through dairies, back yards of homes through hot tubs, swimming pools, etc.

It must be noted that the human body has approximately the same internal resistance as a cow. The electrical principle is the same for equipotential planes and equipotential bonding.

Mr. Lawrence C Neubauer has conducted investigations and has measured stray current in over 600 – 800 dairies. To prove there is a voltage in an equipotential plane or in the case of Article 680, equipotential bonding, Mr. Neubauer took a large plastic container, which is an insulator. He placed a coil of bare copper under the bucket in intimate contact with the concrete. Next, he placed a coil of copper in the bottom of the plastic bucket. A milliammeter was connected between the coil in the bottom of the bucket and the coil of copper “connected” to the concrete holding area where the equipotential plane had been installed.

The plastic bucket was filled with water. As the cows entered they attempted to drink out of the plastic bucket, however, it was evident they received an electrical shock as they jerked their heads out of the water.

The electrical circuit was from the equipotential bonding, which supposedly prevents a difference in voltage from developing, up the legs of the cow, through the body to the tongue, into the water, through the copper in to bottom of the plastic bucket, to the milliammeter and finally to the copper which is in intimate contact with the concrete equipotential plane. Readings of over a milliamp were recorded on VHS.

Now instead of the cow substitute a human.

The American Society of Agricultural Engineers (ASAE) EP473-2001, Equipotential Planes in Animal Containment Areas is incorrect as it is producing a false sense of security when actually the equipotential plane is harming the animals and humans are also animals in the same classification.

How did the misunderstood equipotential planes get into the NEC? In the early 1980s it is opined that some agriculture professors read IEEE Standard 80 and being familiar with cow shit and not electrical engineering, misunderstood IEEE Standard 80. Four Ag professors wrote three papers on equipotential planes and dairies.

In 1985 the misinformed Ad Hoc Subcommittee on Electrical Grounding of Agriculture Buildings submitted the above inaccurate, ill-conceived proposal # 19-16, Log # 1363, 1985 ROP for the 1987 NEC, which since it came from a supposable informed subcommittee, was adopted by Panel 19 Unanimously Affirmative. Now it is hoped that none of the original members of the above groups are still on Panel 19, because it is against human nature to disown a concept supported previously.

It is opined that Gustafson, et al and the NEC Making Panels did not take into consideration the purpose of the IEEE Standard 80, "Guide for Safety in AC Substation Grounding".

IEEE Standard 80 states:

"1.2 Purpose. The intent of this guide is to provide guidance and information pertinent to safe grounding practices in ac substation design.

"The specific proposes of this guide are to

a) Establish, as a basis for design, the safe limits of potential differences that can exist in a substation under fault conditions between points that can be contacted by the human body.

b) Review substation grounding practices with special reference to safety, and develop criteria for a safe design.

c) Provide a procedure for the design of practical grounding systems, based on these criteria.

d) Develop analytical methods as an aid in the understanding and solution of typical gradient problems."

It is very clear that Clause 1.2 a) states that IEEE Standard 80 is under **fault conditions.** Stray current or if one insists, stray voltage, exists under normal steady state, continuous operating conditions, not fault conditions.

Professor Robert J. Gustafson writes, "Gradient control is used by the electrical industry to minimize the risk of hazardous step (foot-to-foot) and touch (hand-to-foot) potentials **under fault conditions** (emphases by author) at substations and around electrical equipment. In addition to protecting people, animals, and equipment **under fault or lightning conditions** , proper equipotential systems in livestock facilities can solve stray voltage/current problems." The concept of "equipotential planes" made up by the same Ag professors is totally false. Fault currents in electrical substations are several magnitudes larger than any fault current that will be found on dairy farms. In substations we expect hundreds of thousands of amperes where on a dairy farm in the middle of nowhere maybe have 5,000 amperes for seconds until the protective device such as the circuit breaker or fuse operates. They are two very different conditions, fault current and steady state normal flowing stray current, and are not related.

Now compare that small amount of FAULT current for a few seconds to the continuous flow of steady state stray neutral current flowing continuously from the dangerous and hazardous multigrounded neutral electrical distribution system which is flowing across the equipotential plane continuously causing the dairy cow harm. Electric Power Research Institute states that 40 to 60 percent of the neutral return current will flow over the earth.

It is evident that this is an enormous, immense, huge, gigantic, colossal, mammoth, tremendous, stupendous, gargantuan, mis-application of an electrical principle that has caused untold harm to dairy cows and to humans.

Now remember, the cow and the human are both from the same classification, Mammals, and they both have approximately the same internal resistance. The dairy farmers in Wisconsin long ago deleted from the state adopted NEC the sections on equipotential planes as they realized the danger and hazards equipotential planes presented to dairy farmers.

What happens is the equipotential plane is such a good, efficient low impedance contact with the earth that the equipotential plane acts as a "sink" for the majority of the stray neutral current flowing through earth in the vicinity. It becomes a magnet for collecting the stray current. This equipotential plane is connected to the equipment grounding conductor which is connected to the neutral service entrance conductor which, is connected to the utility power company's transformer which has the secondary neutral connected to the primary neutral thus completing the connection to the primary electrical circuit back to the transformer.

What should be done is to connect all conductive metallic surfaces that can become energized to the grounding system through bonding conductors. No more, no less just as would be done in a home or industry.

No doubt, someone will make the comment that equipotential planes must do some good, must have a little advantage or may afford some help. That person needs to face the facts – **THERE IS NO BENEFIT IN ANY WAY, SHAPE OR FORM FROM EQUIPOTENTIAL PLANES, ONLY HARM.** The concept was based on erroneous ideas and conclusions and mis-understanding of electrical principles.

If equipotential planes were such a great idea, why not require the basements and garage floors to have equipotential planes in case someone walked on the floor in their bare feet? Now watch some panel think that this is a great idea. A fool is born every code cycle.

The dairy farmers in Wisconsin long ago deleted from the state adopted NEC the sections on equipotential planes as they realized the danger and hazards equipotential planes presented to dairy farmers.

Panel Meeting Action: Reject

Panel Statement: The panel does not agree with the submitter's substantiation.

The Code provides for the establishment of an equipotential bonding grid to limit voltage gradients within the pool area. It is not the intent of the equipotential bonding grid to limit voltage gradients to 0 V but to reduce them.

See panel action on Proposal 17-115a (Log #CP-1706).

Number Eligible to Vote: 11

17-117 Log #2424 NEC-P17 **Final Action: Reject**
(680.26(B), (B)(1), (B)(2), (B)(3), & (B)(5))

Submitter: Donald W. Zipse, Zipse Electrical Engineering, Inc.

Recommendation: Remove Sections 680.26 (B) and (B) (1) and (B) (2) and (B) (3) and (B) (5)

Retain Section (B) (4)

Renumber

Substantiation: With the advent of the GFCI requirement there is no longer the fear of dropping a 120-volt powered electric device into a pool such as a radio or heating iron. Thus, there is no need to connect all metal within the pool area together and connect the bond back to the service entrance panel in order to trip an electric fault that yesterday would and could occur in a pool.

Today we do not allow receptacles within the pool area as we did previously. The excessive bonding of metallic parts that could not possibly become energized is obsolete and non-functioning. A carry over from other times.

Only metallic boxes that contain energized conductors need to be "grounded" today.

Today we have discovered a great secret that there is a constant flow of uncontrolled dangerous and hazardous stray current emanating from NOT the house wiring installed under the safe NEC, but from the utility.

This error entered the NEC during the proposed amendments stage for the 1984 Code. NFPA Document NEC-TCR-83-A on page 342, Proposal 20-31 (680-22, FPN – (New)), Log #1932. It was "Accepted in Principle" and with a vote of 8 for acceptance and one negative.

During the comment stage, (See NEC-TCD, page 413, Comments 20-21 & 20-22), it is opined that the two comments received did not address the issue.

The definition of "equipotential Bonding" as given in Section 680 (A) **Performance** is a complete misunderstanding and misconception as there is **no such item as an equipotential bonding that prevents a difference in voltage gradients from developing within the pool area. It is impossible to eliminate voltage gradients, except in your imagination as long as current is flowing continuously through the concrete and re-bar, which is happening in the real world.**

Ohm's Law states that **Voltage = Current X Resistance**

Unless the buried in concrete metal mesh is at or near absolute zero temperature, the equipotential bonding will have some resistance. The concrete is semi-conductive being wet and especially since the concrete had a metallic mesh within it. Any current flowing over and through the equipotential bonding will produce a voltage per Ohm's Law. This has been proven by testing as will be described below.

With the approval of Code Making Panel # 5's acceptance of the dangerous and hazardous multigrounded neutral distribution system, stray current has been measured flowing within swimming pools, hot tubs, showers, etc.

EPRI: "Created by the nation's electric utilities in 1973, EPRI is one of America's oldest and largest research consortia, with some 700 members and an annual budget of about $ 500 million. Linked to a global network of technical specialists, EPRI scientists and engineers develop innovative solutions to the world's toughest energy problems while expanding opportunities for a dynamic industry."

The Electric Power Research Institute (EPRI) an organization of utilities companies states that 40 to 60 percent of the return neutral current from the high voltage electrical circuit returns over or through the earth. We have measured as high as eighty-eight (88) percent of the neutral current returning over the earth and thus through dairies, back yards of homes through hot tubs, swimming pools, etc.

It must be noted that the human body has approximately the same internal resistance as a cow. The electrical principle is the same for equipotential planes and equipotential bonding.

Mr. Lawrence C Neubauer has conducted investigations and has measured stray current in over 600 – 800 dairies. To prove there is a voltage in an equipotential plane or in the case of Article 680, equipotential bonding, Mr. Neubauer took a large plastic container, which is an insulator. He placed a coil of bare copper under the bucket in intimate contact with the concrete. Next, he placed a coil of copper in the bottom of the plastic bucket. A milliammeter was connected between the coil in the bottom of the bucket and the coil of copper "connected" to the concrete holding area where the equipotential plane had been installed.

The plastic bucket was filled with water. As the cows entered they attempted to drink out of the plastic bucket, however, it was evident they received an electrical shock as they jerked their heads out of the water.

The electrical circuit was from the equipotential bonding, which supposedly prevents a difference in voltage from developing, up the legs of the cow, through the body to the tongue, into the water, through the copper in to bottom of the plastic bucket, to the milliammeter and finally to the copper which is in intimate contact with the concrete equipotential plane. Readings of over a milliamp were recorded on VHS.

Now instead of the cow substitute a human.

The American Society of Agricultural Engineers (ASAE) EP473-2001, Equipotential Planes in Animal Containment Areas is incorrect as it is producing a false sense of security when actually the equipotential plane is harming the animals.

How did the misunderstood equipotential planes get into the NEC? In the early 1980s it is opined that some agriculture professors read IEEE Standard 80 and being familiar with cow shit and not electrical engineering, misunderstood IEEE Standard 80. Four Ag professors wrote three papers on equipotential planes and dairies.

In 1985 the misinformed Ad Hoc Subcommittee on Electrical Grounding of Agriculture Buildings submitted the above inaccurate, ill-conceived proposal # 19-16, Log # 1363, 1985 ROP for the 1987 NEC, which since it came from a supposable informed subcommittee, was adopted by Panel 19 Unanimously Affirmative. Now it is hoped that none of the original members of the above groups are still on Panel 19, because it is against human nature to disown a concept supported previously.

It is opined that Gustafson, et al and the NEC Making Panels did not take into consideration the purpose of the IEEE Standard 80, "Guide for Safety in AC Substation Grounding".

IEEE Standard 80 states:

"1.2 Purpose. The intent of this guide is to provide guidance and information pertinent to safe grounding practices in ac substation design.

"The specific proposes of this guide are to

a) Establish, as a basis for design, the safe limits of potential differences that can exist in a substation under fault conditions between points that can be contacted by the human body.

b) Review substation grounding practices with special reference to safety, and develop criteria for a safe design.

c) Provide a procedure for the design of practical grounding systems, based on these criteria.

d) Develop analytical methods as an aid in the understanding and solution of typical gradient problems."

It is very clear that Clause 1.2 a) states that IEEE Standard 80 is under **fault conditions.** Stray current or if one insists, stray voltage, exists under normal steady state, continuous operating conditions, not fault conditions.

Professor Robert J. Gustafson writes, "Gradient control is used by the electrical industry to minimize the risk of hazardous step (foot-to-foot) and touch (hand-to-foot) potentials **under fault conditions** (emphases by author) at substations and around electrical equipment. In addition to protecting people, animals, and equipment **under fault or lightning conditions** , proper equipotential systems in livestock facilities can solve stray voltage/current problems." The concept of "equipotential planes" made up by the same Ag professors is totally false.

Fault currents in electrical substations are several magnitudes larger than any fault current that will be found on dairy farms. In substations we expect hundreds of thousands of amperes where on a dairy farm in the middle of nowhere maybe have 5,000 amperes for seconds until the protective device such as the circuit breaker or fuse operates. They are two very different conditions, fault current and steady state normal flowing stray current, and are not related.

Now compare that small amount of FAULT current for a few seconds to the continuous flow of steady state stray neutral current flowing continuously from the dangerous and hazardous multigrounded neutral electrical distribution system which is flowing across the equipotential plane continuously causing the dairy cow harm. Electric Power Research Institute states that 40 to 60 percent of the neutral return current will flow over the earth.

It is evident that this is an enormous, immense, huge, gigantic, colossal, mammoth, tremendous, stupendous, gargantuan, mis-application of an electrical principle that has caused untold harm to dairy cows and to humans.

Now remember, the cow and the human are both from the same classification, Mammals, and they both have approximately the same internal resistance. The dairy farmers in Wisconsin long ago deleted from the state adopted NEC the sections on equipotential planes as they realized the danger and hazards equipotential planes presented to dairy farmers.

What happens is the equipotential plane is such a good, efficient low impedance contact with the earth that the equipotential plane acts as a "sink" for the majority of the stray neutral current flowing through earth in the vicinity. It becomes a magnet for collecting the stray current. This equipotential plane is connected to the equipment grounding conductor which is connected to the neutral service entrance conductor which, is connected to the utility power company's transformer which has the secondary neutral connected to the primary neutral thus completing the connection to the primary electrical circuit back to the transformer.

What should be done is to connect all conductive metallic surfaces that can become energized to the grounding system through bonding conductors. No more, no less just as would be done in a home or industry.

No doubt, someone will make the comment that equipotential planes must do some good, must have a little advantage or may afford some help. That person needs to face the facts – **THERE IS NO BENEFIT IN ANY WAY, SHAPE OR FORM FROM EQUIPOTENTIAL PLANES, ONLY HARM.** The concept was based on erroneous ideas and conclusions and mis-understanding of electrical principles.

If equipotential planes were such a great idea, why not require the basements and garage floors to have equipotential planes in case someone walked on the floor in their bare feet? Now watch some panel think that this is a great idea. A fool is born every code cycle.

The dairy farmers in Wisconsin long ago deleted from the state adopted NEC the sections on equipotential planes as they realized the danger and hazards equipotential planes presented to dairy farmers.

Panel Meeting Action: Reject

Panel Statement: The panel does not agree with the submitter's substantiation.

The Code provides for the establishment of an equipotential bonding grid to limit voltage gradients within the pool area. It is not the intent of the equipotential bonding grid to limit voltage gradients to 0 V but to reduce them.

See panel action on Proposal 17-115a (Log #CP-1706).

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-118 Log #3137 NEC-P17 **Final Action: Accept in Part**
(680.26(B)(1))

Submitter: Eric Stromberg, Stromberg Engineering, Inc.

Recommendation: Revise text:

All metallic parts of the pool structure, including the reinforcing metal of the pool shell, coping stones, and deck, shall be bonded. The usual steel tie wires shall be considered suitable for bonding the reinforcing steel together, and welding or special clamping shall not be required. These tie wires shall be made tight. If reinforcing steel is effectively insulated by an encapsulating nonconductive compound at the time of manufacture and installation, <u>enough of the nonconductive compound shall be scraped off in order to completely bond every piece together to form a faraday cage.</u> ~~it shall not be required to be bonded. Where reinforcing steel of the pool shell or the reinforcing steel of coping stones and deck is encapsulated with a nonconductive compound or another conductive material is not available, provisions shall be made for an alternative means to eliminate voltage gradients that would otherwise be provided by unencapsulated, bonded reinforcing steel.~~ <u>Where fiberglass reinforced concrete is used, without reinforcing bar, a metal mesh must be installed in the concrete and bonded to the parts specified in 680.26(B)(1) through (B)(5) accordingly.</u>

Substantiation: People all over the country are not able to use their pools due to receiving shocks. In most cases, it is found that the grounding system has voltage on it, from the utility. The pools with standard rebar in them are less prone to shocking swimmers because they provide a faraday cage that protects the swimmers. Epoxy coated rebar, that is not bonded together, does not provide this protection. Fiberglass reinforced concrete offers no protection at all, and shouldn't be used for swimming pools.

Panel Meeting Action: Accept in Part

Panel Statement: Removing the protective coating will jeopardize the structural integrity of the pool.

The panel addressed the last sentence of the submitter's recommendation. See action on Proposal 17-114a (Log #CP-1708).

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-119 Log #2789 NEC-P17 **Final Action: Reject**
(680.26(B)(2))

Submitter: Steven D. Holmes, Underwriters Laboratories Inc.

Recommendation: [Changes proposed only for 680.23(B)(2). No change to other text of 680.26]

680.26 Equipotential Bonding

(B) Bonded Parts.

(2) Underwater Luminaires. All ~~metal~~ forming shells and mounting brackets of no-niche luminaires (fixtures) shall be bonded unless a listed ~~low-voltage~~ lighting system with nonmetallic forming shells not requiring bonding is used.

Substantiation: Problem/Substantiation 1 – Reinforce that nonmetallic forming shells shall be bonded – Some nonmetallic forming shells are required to be bonded to the pool bonding grid. The phrase "unless a listed low-voltage lighting system with nonmetallic forming shells not requiring bonding is used" does not literally permit one leaving a nonmetallic forming shell requiring bonding not bonded to the pool bonding grid. Even so, I propose that removing the term "metal" in 680.26(B)(2) would help dissuade the reader from incorrectly thinking that metal forming shells need to be bonded and (by 680.26(B)(2) not mentioning nonmetallic forming shells) that nonmetallic forming shells do not need to be bonded.

Problem 2 - Luminaires Unnecessarily Limited to Low Voltage. Section 680.26(B)(2) provides for forming shells and mounting brackets to not be bonded to the pool bonding grid if they are part of a listed low-voltage lighting system with nonmetallic forming shells not requiring bonding.

This requirement unnecessarily prevents development and use of 120 volt lighting systems with nonmetallic forming shells or mounting brackets that do not have provision for connecting to the pool bonding grid, even if the luminaires and forming shells or mounting brackets do not have non-current-carrying metal parts requiring grounding or bonding or that can bypass the equipotential bonding grid. The unnecessary low voltage limitation prevents luminaire manufacturers, pool builders, owners, and users from gaining the benefits of 120 V luminaires and nonmetallic forming shells or mounting brackets that do not require or have provision for bonding to the pool bonding grid.

Substantiation for Changes for Problem 2

All comments below referring to wet-niche luminaires and forming shells are intended to also apply to no-niche luminaires and their mounting brackets. For brevity, only the wet-niche luminaire and forming shell products are used for the comments.

120 V wet-niche luminaires and nonmetallic forming shells, both without grounding and without bonding to the pool bonding grid, can be designed so "that, where the luminaire (fixture) is properly installed without a ground-fault circuit-interrupter, there is no shock hazard with any likely combination of fault conditions during normal use (not relamping)"1. Test techniques for determining compliance with this NEC requirement are well developed and specified in the Standard for Underwater Lighting Fixtures and Junction Boxes, UL 676. During the evaluation for the required listing [see 680.23(A)(8)] of wet-niche luminaires and forming shells, it can be determined if an ungrounded/unbonded 120 volt wet-niche luminaire and ungrounded/unbonded mating nonmetallic forming shell(s) limit the risks of electric shock just as required for (a) low-voltage designs without grounding/bonding and (b) 120 V designs with grounding/bonding.

Forming shells and 120 V wet-niche luminaire designs without grounding and without bonding to the pool bonding grid and that limit the risks of electric shock can both be practical and comply with all safety requirements, including the limit for escape current conducting into the swimming pool water under damaged lens or gasket conditions and other applicable fault conditions required in UL 676.

Further, the nonmetallic forming shell can be required to not have any metal that forms a conductive connection between the pool water and the concrete or backfill in contact with the back side of forming shell. This would eliminate the possibility of electric current from sources outside the pool using a metal path through any metal of the forming shell to enter the pool. The equipotential bonding grid would not be compromised by use of such a nonmetallic forming shell.

If replacement of the wet-niche luminaire is needed, the listed forming shell is marked visible following installation to identify the luminaire(s) with which it is to be used, as required in UL 676. No wet-niche luminaires requiring grounded or bonding to the pool bonding grid are permitted to be identified in the marking on a nonmetallic forming shell not requiring bonding to the pool bonding grid.

Footnote

1) Quoted text is from 680.23(A)(1), Underwater Luminaires (Lighting Fixtures); General; Luminaire (Fixture) Design, Normal Operation.

Panel Meeting Action: Reject

Panel Statement: The proposal would reduce the mechanical integrity of the equipment grounding conductor. In addition, the proposal would permit 120 v luminaires.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10 Negative: 1

Explanation of Negative:

BLEWITT, T.: The proposal should have been Accepted in Principle

The deletion of the word "metal" is editorial. The requirement in that section applies to all forming shells, metallic and non-metallic.

UL 676, the Standard for Underwater Luminaires, specifies construction and performance requirements for line-voltage double-insulated luminaires. Therefore the low voltage restriction for luminaires not requiring grounding is no longer necessary.

The proposed change in 680.26(B)(2) should therefore read:

(2) **Underwater Lighting.** All ~~metal~~ forming shells and mounting brackets of no-niche luminaires (fixtures) shall be bonded unless a listed ~~low-voltage~~ lighting system with a nonmetallic forming shell ~~s~~ and an approved system of double-insulation ~~not requiring bonding~~ is used.

Comment on Affirmative:

HIRSCH, B.: See comment for Proposal 17-64.

17-120 Log #1304 NEC-P17 **Final Action: Accept in Principle**
(680.26(C))

Submitter: Jim Davis, Electrical Education Services, LLC

Recommendation: Revise text as follows:

680.26(C) "...The equipotential ~~common~~ bonding grid shall extend under paved walking surfaces for 1 m (3 ft) horizontally beyond the inside walls of the pool and shall be permitted to be any of the following:.

Substantiation: Delete the word "common" as it was part of the reference to "common bonding grid" in the earlier code editions which was replaced in the 2005 NEC by the "equipotential bonding grid." This is merely "editorial housekeeping."

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action on Proposal 17-114a (Log #CP-1708).

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-121 Log #1368 NEC-P17 **Final Action: Accept in Principle**
(680.26(C))

Submitter: Mike Holt, Mike Holt Enterprises

Recommendation: Change dimensional equivalent of the third sentence as follows:

The equipotential common bonding grid shall extend under paved walking surfaces for ~~1 m~~ 900 mm (3 ft) horizontally beyond the inside walls of the pool and shall be permitted to be any of the following:

Substantiation: This brings this section into alignment with the dimensional equivalents that are used elsewhere in the *Code* .

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action on Proposal 17-114a (Log #CP-1708).

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-122 Log #1894 NEC-P17 **Final Action: Reject**
(680.26(C) (New))

Submitter: Frank C. Lambert, Georgia Tech/NEETRAC / Rep. National Electric Energy Testing, Research, & Applications Center

Recommendation: Insert a new Section 680.26(C) as follows:

680.26(C) Pool Water. An intentional bond of a minimum conductive surface area of 5806 mm 2 (9 in 2) shall be installed in contact with the pool water. This bond shall be permitted to consist of parts that are required to be bonded in 680.26(B).

Renumber the present sections sequentially from (C) to (D), (D) to (E), and (E) to (F).

Substantiation: Bonding of metal parts in and around a swimming pool to an equipotential bonding grid is extensively covered in 680.26. The intent of this bonding is to equalize the voltages between the pool water and the deck including any attached metal structures or parts. 680.26 has been effective in mitigating stray voltage problems, especially in the case of fiberglass swimming pools or pools with insulated liners.

680.26 describes various metal parts and equipment that require bonding with an equipotential bonding grid. In describing these metal parts, it is assumed that one or more of the parts are in contact with the pool water. This may not always be the case. Some pools do not have any bonded metal parts in contact with the water. In such a case, intentional bonding of the water is necessary to equalize the water-to-deck voltages. Presently, 680.26 does not have a provision for intentional bonding of the pool water.

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided adequate substantiation. There are issues such as conductivity of water, changes with water temperature, current flow, size of conductors, etc. that need to be addressed.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 9 Negative: 2

Explanation of Negative:

HIRSCH, B.: The testing done by the National Electric Energy Testing, Research and Applications Center (NEETRAC) clearly substantiates that the potential for shock hazard is increased in pools where the pool water is not bonded via metal parts in the pool. Results of this testing were reported to Panel 17 at the proposal meeting in January of 2006. Based on this testing, EEI supports the adoption of this proposal and as such is voting negative to the panel's action. At the proposal meeting, Panel 17 indicated they had additional questions that needed to be answered before supporting this proposal. The panel statement, however, did little to document those concerns. Just as the submitter needs to provide compelling substantiation for a code change, the code panel has the responsibility to provide a justifiable technical basis to reject well supported proposals.

JHONSON, D.: I agree with the Submitter's substantiation, and, in addition, the substantiation of the NEETRAC testing results reported to Code-Making Panel 17 at the ROP meeting in January of 2006. I have provided additional relevant pool test results from a project supervised by the university of Newcastle, Australia and sponsored by Energy Australia. This reports a potential shock hazard when conditions exist effectively bridging the isolation of the pool water provided by an insulated pool shell.

This issue should be revisited.

Note: Supporting Material is available for review at NFPA headquarters.

17-123 Log #3422 NEC-P17 **Final Action: Accept in Principle**
(680.26(C))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: Revise as follows:

(C) Equipotential Bonding Grid. The parts specified in 680.26(B) shall be connected to an equipotential bonding grid with a solid copper conductor, insulated, covered, or bare, not smaller than 8 AWG. ~~or~~ Rigid metal conduit of brass or other identified corrosion-resistant metal conduit shall be permitted to be included as part of the bonding path within an equipotential bonding grid. Connection shall be made by exothermic welding or by listed pressure connectors or clamps that are labeled as being suitable for the purpose and are of stainless steel, brass, copper, or copper alloy. The equipotential bonding grid shall extend under paved walking surfaces for 1 m (3 ft) horizontally beyond the inside walls of the pool and shall be permitted to be any of the following:

(1) Structural Reinforcing Steel. The structural reinforcing steel of a concrete pool or deck where the conductive (unencapsulated) reinforcing ~~rods~~ elements are bonded together by the usual steel tie wires or the equivalent

(2) Bolted or Welded Metal Pools. The wall of a bolted or welded metal pool

(3) Bare Copper Conductor. A solid, bare copper conductor run around the entire perimeter of the pool and just below or within any paved surfaces adjacent to the pool walls

~~(3)~~ (4) Alternate Means. An alternate means to eliminate voltage gradients that would otherwise be provided by unencapsulated, bonded reinforcing steel This system shall be required adjacent to any portions of pool construction that employ reinforcing steel encapsulated with a nonconductive compound. The grid shall comply with a. through c.:

a. Materials and Connections. The grid shall be constructed of minimum 8 AWG bare solid copper conductors. Conductors shall be bonded to each other at all points of crossing. Connections shall be made as required by 680.26(D).

b. Grid Structure. The equipotential bonding grid shall cover all contours of the pool and the pool deck that use encapsulated reinforcing elements within 1 m (3 ft) horizontally from the inside walls of the pool. The equipotential bonding grid shall be arranged in a 300 mm (12 in.) by 300 mm (12 in.) network of conductors in a uniformly spaced perpendicular grid pattern with tolerance of 100 mm (4 in.).

c. Securing. The below-grade grid shall be secured within or under the pool and deck media.

Substantiation: This proposal is submitted as a constructive alternative to the TIA released to solve the immediate problem of providing substation quality ground grids around vinyl pools. The changes from the 2005 NEC version of this subsection are as follows, taken sequentially:

1. Brass rigid metal conduit is never going be a bonding grid in and of itself, but it might form one element of a required bonding path. The current usage is unrealistic and should be revisited. The current literal text suggests that conduit could be backwrapped around or bolted to conductive elements. In actuality conductive elements might be connected to such conduit in strategic locations. This proposal correctly describes the conduit function in this context.

2. In (C)(1) the deck steel is included per the TIA. In addition, the terminology has been adjusted so reinforcing rods are not the only bonding option. The proposal does this by substituting "elements" for "rods" and only qualifying unencapsulated steel, which was overlooked in the TIA. A number of authorities disallowed the customary steel mesh under the deck because it did not employ "rods" in its construction. This problem also remains with the TIA in effect..

3. In (C)(3) this proposal restores the allowance for a 8 AWG solid copper conductor to be a permissible key constituent of a bonding grid. This was a consistent feature of Article 680 from the 1965 NEC to the 2002 NEC, where it was covered in 680.26(C)(3) after the article rewrite. However, it has been modified to better accommodate its equipotential bonding function by being bare, and running around the perimeter of the pool. This moves in the direction of the substantiated concerns that provoked the current text in 680.26(C) without creating an astronomical expense. This would probably be the usual approach for vinyl pools. The TIA includes a requirement to bond metallic structural elements of such pools which this proposal does not. The reason is that such conductive elements are already required to be bonded by 680.26(B)(1) and there is no need to duplicate the requirement.

4. The alternate means becomes mandatory in the vicinity of encapsulated, nonconductive reinforcing steel. This is simply and clearly laid out in the proposed second paragraph of 680.26(C)(4). The remainder of the proposal duplicates the current requirements. The wording is clear and does not require the use of an exception to make the relevant points.

Panel Meeting Action: Accept in Principle

17-126 Log #545 NEC-P17 **Final Action: Accept in Principle**
(680.26(C) & 680.26(C)(1))

Submitter: Code-Making Panel 17,
Recommendation: Revise 680.26 (C) & 680.26 (C)(1) as follows:

(C) Equipotential Bonding Grid. The parts specified in 680.26(B) shall be connected to an equipotential bonding grid with a solid copper conductor, insulated, covered, or bare, not smaller than 8 AWG or rigid metal conduit of brass or other identified corrosion-resistant metal conduit. Connection shall be made by exothermic welding or by listed pressure connectors or clamps that are labeled as being suitable for the purpose and are of stainless steel, brass, copper, or copper alloy. The equipotential bonding grid shall conform to the contours of the pool and shall extend within or under paved walking surfaces for 1 m (3 ft) horizontally beyond the inside walls of the pool and shall be permitted to be any of the following:

Exception: The equipotential bonding grid shall not be required to be installed under the bottom of or vertically along the walls of vinyl lined polymer wall,
fiberglass composite, or other pools constructed of non-conductive materials. Any metal parts of the pool, including metal structural supports, shall be bonded in accordance with 680.26(B). For the purposes of this section, poured concrete, pneumatically-applied (sprayed) concrete, and concrete block, with painted or plastered coatings, shall be considered conductive material.

(1) Structural Reinforcing Steel. The structural reinforcing steel of a concrete pool or deck where the reinforcing rods are bonded together by the usual steel tie wires or the equivalent. Where deck reinforcing steel is not an integral part of the pool, the deck reinforcing steel shall be bonded to other parts of the bonding grid using a minimum 8 AWG solid copper conductor. Connection shall be per 680.26(D).

Substantiation: Submitters Reason:

In accordance with Section 5-2(f) of the NFPA Regulations Governing Committee Projects, the Task Group on behalf of CMP-17, is requesting a Tentative Interim Amendment to address two unintended consequences of the revisions to 680.26 published in the 2005 National Electrical Code. The first unintended consequence that occurred in 680.26 is that certain requirements for providing an equipotential bonding grid around
swimming pools are being interpreted in ways not anticipated or intended by the CMP.
This has resulted in an adverse impact on certain swimming pool designs and new, unnecessary construction features being mandated at considerable expense. Specifically, Article 680.26 (C) and 680.26 (C) (1), is being interpreted to require the builder to construct an equipotential bonding grid under or along the side of a nonconductive, vinyl lined polymer walled or fiberglass composite pool. This extensive
bonding grid is not necessary for pools that are constructed with non conductive vinyl
liners or fiberglass composite shells. The proposed revision permits the conductive structural elements that are installed within or under the concrete pool deck or other type of paved deck surface to serve as the equipotential bonding grid.

The second unintended consequence that occurred in the 2005 revision to 680.26 is the interpretation that the 1 meter (3 ft.) horizontal extension of the bonding grid is required to be installed as a continuous, unbroken extension of the structural reinforcing steel or metal wall of a pool. CMP-17 only intended that the bonding grid extend up to three feet horizontally within or under a concrete pool deck or other paved walking surface and not that this portion of the equipotential bonding grid be an unbroken extension of the pool wall rebar or metal pool wall. It was also not intended that the deck reinforcing steel be required to be a continuous structure of the pool shell. It could be a separate structure bonded to the swimming pool in accordance with present requirements in the Code. Continuous extensions of reinforcing steel into the deck will result in damage to the structure of the pool and deck due to differences in movement between the two structures. We appreciate the Standards Council's consideration of our request for this Tentative Interim Amendment.

Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 17-114a (Log #CP-1708).
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-127 Log #2425 NEC-P17 **Final Action: Reject**
(680.26(C) and (D))

Submitter: Donald W. Zipse, Zipse Electrical Engineering, Inc.
Recommendation: Remove Sections 680.26 (C) and (D)
Retain Section (E)
Renumber
Substantiation: With the advent of the GFCI requirement there is no longer the fear of dropping a 120-volt powered electric device into a pool such as a radio or heating iron. Thus, there is no need to connect all metal within the pool area together and connect the bond back to the service entrance panel in order to trip an electric fault that yesterday would and could occur in a pool.

Today we do not allow receptacles within the pool area as we did previously. The excessive bonding of metallic parts that could not possibly become energized is obsolete and non-functioning. A carry over from other times.

Only metallic boxes that contain energized conductors need to be "grounded" today.

Today we have discovered a great secret that there is a constant flow of uncontrolled dangerous and hazardous stray current emanating from NOT the house wiring installed under the safe NEC, but from the utility.

This error entered the NEC during the proposed amendments stage for the 1984 Code. NFPA Document NEC-TCR-83-A on page 342, Proposal 20-31 (680-22, FPN – (New)), Log #1932. It was "Accepted in Principle" and with a vote of 8 for acceptance and one negative.

During the comment stage, (See NEC-TCD, page 413, Comments 20-21 & 20-22), it is opined that the two comments received did not address the issue.

The definition of "equipotential Bonding" as given in Section 680 (A) **Performance** is a complete misunderstanding and misconception as there is **no such item as an equipotential bonding that prevents a difference in voltage gradients from developing within the pool area. It is impossible to eliminate voltage gradients, except in your imagination as long as current is flowing continuously through the concrete and re-bar, which is happening in the real world.**

Ohm's Law states that **Voltage = Current X Resistance**

Unless the buried in concrete metal mesh is at or near absolute zero temperature, the equipotential bonding will have some resistance. The concrete is semi-conductive being wet and especially since the concrete had a metallic mesh within it. Any current flowing over and through the equipotential bonding will produce a voltage per Ohm's Law. This has been proven by testing as will be described below.

With the approval of Code Making Panel # 5's acceptance of the dangerous and hazardous multigrounded neutral distribution system, stray current has been measured flowing within swimming pools, hot tubs, showers, etc.

EPRI: "Created by the nation's electric utilities in 1973, EPRI is one of America's oldest and largest research consortia, with some 700 members and an annual budget of about $ 500 million. Linked to a global network of technical specialists, EPRI scientists and engineers develop innovative solutions to the world's toughest energy problems while expanding opportunities for a dynamic industry."

The Electric Power Research Institute (EPRI) an organization of utilities companies states that 40 to 60 percent of the return neutral current from the high voltage electrical circuit returns over or through the earth. We have measured as high as eighty-eight (88) percent of the neutral current returning over the earth and thus through dairies, back yards of homes through hot tubs, swimming pools, etc.

It must be noted that the human body has approximately the same internal resistance as a cow. The electrical principle is the same for equipotential planes and equipotential bonding.

Mr. Lawrence C Neubauer has conducted investigations and has measured stray current in over 600 – 800 dairies. To prove there is a voltage in an equipotential plane or in the case of Article 680, equipotential bonding, Mr. Neubauer took a large plastic container, which is an insulator. He placed a coil of bare copper under the bucket in intimate contact with the concrete. Next, he placed a coil of copper in the bottom of the plastic bucket. A milliammeter was connected between the coil in the bottom of the bucket and the coil of copper "connected" to the concrete holding area where the equipotential plane had been installed.

The plastic bucket was filled with water. As the cows entered they attempted to drink out of the plastic bucket, however, it was evident they received an electrical shock as they jerked their heads out of the water.

The electrical circuit was from the equipotential bonding, which supposedly prevents a difference in voltage from developing, up the legs of the cow, through the body to the tongue, into the water, through the copper in to bottom of the plastic bucket, to the milliammeter and finally to the copper which is in intimate contact with the concrete equipotential plane. Readings of over a milliamp were recorded on VHS.

Now instead of the cow substitute a human.

The American Society of Agricultural Engineers (ASAE) EP473-2001, Equipotential Planes in Animal Containment Areas is incorrect as it is producing a false sense of security when actually the equipotential plane is harming the animals.

How did the misunderstood equipotential planes get into the NEC? In the early 1980s it is opined that some agriculture professors read IEEE Standard 80 and being familiar with cow shit and not electrical engineering, misunderstood IEEE Standard 80. Four Ag professors wrote three papers on equipotential planes and dairies.

In 1985 the misinformed Ad Hoc Subcommittee on Electrical Grounding of Agriculture Buildings submitted the above inaccurate, ill-conceived proposal # 19-16, Log # 1363, 1985 ROP for the 1987 NEC, which since it came from a supposable informed subcommittee, was adopted by Panel 19 Unanimously Affirmative. Now it is hoped that none of the original members of the above groups are still on Panel 19, because it is against human nature to disown a concept supported previously.

It is opined that Gustafson, et al and the NEC Making Panels did not take into consideration the purpose of the IEEE Standard 80, "Guide for Safety in AC Substation Grounding".

IEEE Standard 80 states:

"**1.2 Purpose.** The intent of this guide is to provide guidance and information pertinent to safe grounding practices in ac substation design.

"The specific proposes of this guide are to

a) Establish, as a basis for design, the safe limits of potential differences that can exist in a substation under fault conditions between points that can be contacted by the human body.

b) Review substation grounding practices with special reference to safety, and develop criteria for a safe design.

c) Provide a procedure for the design of practical grounding systems, based on these criteria.

d) Develop analytical methods as an aid in the understanding and solution of typical gradient problems."

It is very clear that Clause 1.2 a) states that IEEE Standard 80 is under **fault conditions.** Stray current or if one insists, stray voltage, exists under normal steady state, continuous operating conditions, not fault conditions.

Professor Robert J. Gustafson writes, "Gradient control is used by the electrical industry to minimize the risk of hazardous step (foot-to-foot) and touch (hand-to-foot) potentials **under fault conditions** (emphases by author) at substations and around electrical equipment. In addition to protecting people, animals, and equipment **under fault or lightning conditions** , proper equipotential systems in livestock facilities can solve stray voltage/current problems." The concept of "equipotential planes" made up by the same Ag professors is totally false.

Fault currents in electrical substations are several magnitudes larger than any fault current that will be found on dairy farms. In substations we expect hundreds of thousands of amperes where on a dairy farm in the middle of nowhere maybe have 5,000 amperes for seconds until the protective device such as the circuit breaker or fuse operates. They are two very different conditions, fault current and steady state normal flowing stray current, and are not related.

Now compare that small amount of FAULT current for a few seconds to the continuous flow of steady state stray neutral current flowing continuously from the dangerous and hazardous multigrounded neutral electrical distribution system which is flowing across the equipotential plane continuously causing the dairy cow harm. Electric Power Research Institute states that 40 to 60 percent of the neutral return current will flow over the earth.

It is evident that this is an enormous, immense, huge, gigantic, colossal, mammoth, tremendous, stupendous, gargantuan, mis-application of an electrical principle that has caused untold harm to dairy cows and to humans.

Now remember, the cow and the human are both from the same classification, Mammals, and they both have approximately the same internal resistance. The dairy farmers in Wisconsin long ago deleted from the state adopted NEC the sections on equipotential planes as they realized the danger and hazards equipotential planes presented to dairy farmers.

What happens is the equipotential plane is such a good, efficient low impedance contact with the earth that the equipotential plane acts as a "sink" for the majority of the stray neutral current flowing through earth in the vicinity. It becomes a magnet for collecting the stray current. This equipotential plane is connected to the equipment grounding conductor which is connected to the neutral service entrance conductor which, is connected to the utility power company's transformer which has the secondary neutral connected to the primary neutral thus completing the connection to the primary electrical circuit back to the transformer.

What should be done is to connect all conductive metallic surfaces that can become energized to the grounding system through bonding conductors. No more, no less just as would be done in a home or industry.

No doubt, someone will make the comment that equipotential planes must do some good, must have a little advantage or may afford some help. That person needs to face the facts – **THERE IS NO BENEFIT IN ANY WAY, SHAPE OR FORM FROM EQUIPOTENTIAL PLANES, ONLY HARM.** The concept was based on erroneous ideas and conclusions and mis-understanding of electrical principles.

If equipotential planes were such a great idea, why not require the basements and garage floors to have equipotential planes in case someone walked on the floor in their bare feet? Now watch some panel think that this is a great idea. A fool is born every code cycle.

The dairy farmers in Wisconsin long ago deleted from the state adopted NEC the sections on equipotential planes as they realized the danger and hazards equipotential planes presented to dairy farmers.

Panel Meeting Action: Reject
Panel Statement: The panel does not agree with the submitter's substantiation.

The Code provides for the establishment of an equipotential bonding grid to limit voltage gradients within the pool area. It is not the intent of the equipotential bonding grid to limit voltage gradients to 0 V but to reduce them.

See panel action on Proposal 17-115a (Log #CP-1706).

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-128 Log #380 NEC-P17 **Final Action: Reject**

(680.26(C)(3))

Submitter: David Otzman, Detroit Edison

Recommendation: I propose that you return to the simpler wording in the 2002 NEC and change 680-26(C)(3) to read:

"A solid copper conductor, insulated, covered, or bare, not smaller than 8 AWG, encircling the pool, 450 mm (18 in.) horizontally from the inside walls of the pool."

Substantiation: I agree that the bonding grid does not need to be as extensive as now specified in 680.26(C)(3). The grid can be as simple as an 8 AWG solid copper conductor encircling the pool. However, some type of grid must be provided whether or not the pool walls are conductive.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The panel rejects the use of an insulated or covered conductor for the bonding grid.

See panel action on Proposal 17-114a (Log #CP-1708).

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-129 Log #3581 NEC-P17 **Final Action: Reject**

(680.26(C)(3))

Submitter: David A. Kerr, Jr., Tri-State Inspection Agency, Inc.

Recommendation: Delete this section.

Substantiation: The equipotential bonding grid alternate means is a vast change in swimming pools. It will cost people $500 or $1000 to comply. Only lawyers will ever figure out what it means. There was previous little by way of technical substantiation.

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided adequate substantiation.

Economic cost is not a technical justification.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-130 Log #593 NEC-P17 **Final Action: Accept in Principle**

(680.26(C)(3)d.)

Submitter: Don Nicoll, Latham International

Recommendation: Add the following paragraph:

d. Pool Decks. When not constructed using unencapsulated steel rebar, wire mesh, or other reinforcing metal capable of creating an equipotential bonding grid; pool decks shall have an equipotential bonding grid directly below the deck material, constructed of minimum 8 AWG bare solid copper conductors extending 1 m (3 ft) horizontally from the inside walls of the pool. The equipotential bonding grid shall be arranged in a 300 mm (12 in.) by 300 mm (12 in.) network of conductors in a uniformly spaced perpendicular grid pattern with a tolerance of 100 mm (4 in.). The points of crossing shall be secured by copper tie wires that have been made tight, or in accordance with 250.8. When a pool is required to have an equipotential bonding grid, the deck's bonding grid shall be bonded to the pool's bonding grid with minimum 8 AWG bare solid copper conductors in three places minimum uniformly spaced around the pool.

Substantiation: Clarification.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action on Proposal 17-114a (Log #CP-1708).

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-131 Log #2427 NEC-P17 **Final Action: Reject**

(680.27(A))

Submitter: Donald W. Zipse, Zipse Electrical Engineering, Inc.

Recommendation: Section 680.23 (A) Underwater Audio Equipment.

New (3) and renumber present (3) to (4).

(3) Isolation Method. There shall be no electrical connection permitted that will allow stray current to flow back to the equipment grounding system from the water immersed speaker.

Substantiation: The problem is that the Underwater Luminaries are "grounded" and there is electrical connections directly back to the high voltage primary side of the pole mounted or pad mounted or underground transformer. The details of this connection will be described later. This electrical connection from the underwater luminaries is a path for the continuously flowing stray current emanating from the utility companies multigrounded neutral electrical distribution systems that has the neutral connected to earth at least 4 times per mile. It is this current that enters the swimming pool to complete the electrical circuit. Bear in mind that the current may be flowing in the opposite direction. The direction is arbitrary.

In addition to the above multigrounded neutral electrical distribution system earthing, there is a second electrical circuit. The second circuit is the bastardized electrical connection between the high voltage primary neutral and the secondary neutral allowing primary high voltage electricity to flow directly into the residence, commercial or industrial facility using the secondary neutral which is bonded to the green equipment grounding conductor. Now this green color equipment grounding conductor is connected to the underwater luminaries metal frame allowing stray continuous flowing dangerous and hazardous current to complete the circuit.

What the above bastardize electrical connection does is allow the direct electrical connection of any lightning strike to nearby distribution system to flow directly into your own home and destroy the sensitive electrical equipment, which is not an act of God or Mother Nature, but directly attributable to the utility since 1932.

With the approval of Code Making Panel # 5's acceptance of the dangerous and hazardous multigrounded neutral distribution system, stray current has been measured flowing within swimming pools, hot tubs, showers, etc.

The Electric Power Research Institute (EPRI) an organization of utilities companies states that 40 to 60 percent of the return neutral current from the high voltage electrical circuit returns over or through the earth. We have measured as high as eighty-eight (88) percent of the neutral current returning over the earth and thus through dairies, back yards of homes through hot tubs, swimming pools, etc.

Ohm's Law states that **Voltage = Current X Resistance**

It is impossible to eliminate voltage gradients, except in your imagination as long as current is flowing continuously through the concrete and re-bar, which is happening in the real world.

Unless the buried in concrete metal mesh is at or near absolute zero temperature, the equipotential bonding will have some resistance. The concrete is semi-conductive being wet and especially since the concrete had a metallic mesh within it. Any current flowing over and through the equipotential bonding will produce a voltage per Ohm's Law. This has been proven by testing as will be described below.

It must be noted that the human body has approximately the same internal resistance as a cow. The electrical principle is the same for equipotential planes and equipotential bonding. The following will show conclusively that there is high voltage electric current flowing in the earth. In one court case, there were 18.5 amperes on the high voltage phase conductor and only 3.5 amperes on the multigrounded neutral electrical distribution system. Simple math shows that 15 amperes of return current in that case was flowing uncontrolled over the earth.

In another case, an engineering firm measured 5 amperes returning to the substation flowing over the earth shocking persons.

What happens is the swimming pool with its water soaked concrete is such a good, efficient low impedance contact with the earth that the equipotential plane acts as a "sink" for the majority of the stray neutral current flowing through earth in the vicinity. It becomes a magnet for collecting the stray current. With the underwater luminaries connected to the equipment grounding conductor which is connected to the neutral service entrance conductor which, is connected to the utility power company's transformer which has the secondary neutral connected to the high voltage primary neutral thus completing the connection to the primary electrical circuit back to the substation completing the circuit.

Thus, in order to eliminate this dangerous and hazardous electrical connection the underwater luminaries must be completely removed.

There must be no electrical connection from the water in the pool back to the high voltage primary electrical system. The metallic frame of the pump motor need to be connected to the equipment grounding conductor and system in order to provide a low impedance path back to the service panel in order to trip the protective device, circuit breaker or fuse.

As the electrical load increases more and more stray current will enter the earth resulting in more and more shocking incidents. It is opined that as the electrical load increases to a critical level that may last for only an hour or a day, in any one multigrounded neutral electrical distribution system, someone will be electrocuted or drown because the persons muscles froze and they sank to the bottom of the pool and drowned. It may have already occurred.

Panel Meeting Action: Reject

Panel Statement: The submitter referenced an incorrect section.

The panel does not agree with the submitter's substantiation.

Removing underwater luminaires or underwater audio equipment will not prevent stray currents. The Code provides for the establishment of an equipotential bonding grid to limit voltage gradients within the pool area.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10 Negative: 1

Explanation of Negative:

CRIVELL, P.: 1. The proposal addresses a valid concern. There is a real potential for the underwater light fixture to act as part of the return path for unbalanced utility current.

2. Underwater luminaries should be required to be manufactured or installed in such a way as to eliminate the potential for underwater light fixtures from acting as part of the return path for unbalanced utility current (e.g., double insulation or isolation through an isolation transformer).

17-132 Log #888 NEC-P17 **Final Action: Accept**
(680.27(A)(2))

Submitter: Noel Williams, Noel Williams Consulting
Recommendation: Revise 680.27(A)(2) to read as follows:
"Rigid metal conduit ~~or intermediate metal conduit~~ of brass or other identified corrosion-resistant metal...".
Substantiation: This issue was corrected in 680.26(C) in the 2005 NEC. Intermediate metal conduit is a steel product by definition. Unlike RMC, IMC is not available in other metals. Since IMC will not be brass or the equivalent, it should not be mentioned as a possible wiring method.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-133 Log #3258 NEC-P17 **Final Action: Accept in Principle**
(680.27(A)(2))

Submitter: Donald Dekker, N. Muskegon, MI
Recommendation: Revise text to read as follows:
~~Rigid metal conduit or intermediate metal conduit of brass or other identified corrosion resistant metal, liquidtight flexible nonmetallic conduit (LFNC-B), or rigid nonmetallic conduit)~~ (Conduit shall be rigid metal, intermediate metal, liquidtight flexible nonmetallic or rigid nonmetallic. The metal conduit shall be approved and shall be of brass or other approved corrosion-resistant metal. The conduit) shall extent from the forming shell...
Substantiation: The wording in this section implies that we can use Rigid Metal Conduit (RMC) or Intermediate Metal Conduit (IMC) to run from an underwater forming shell to the listed junction box. RMC and IMC, as we would normally purchase them, are not corrosion-resistant metals. I recommend revising the wording in this section to match the wording in 680.23(B)(2) & 680.23(B)(2)(a).
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 17-132.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-134 Log #2019 NEC-P17 **Final Action: Reject**
(680.27(C)(3))

Submitter: Russell Childs, Heatizen System
Recommendation: 680.27(C)(3) Radiant Heating Cables Not Permitted. Radiant heating cables embedded in or below the deck shall not be permitted.
680.27(C)(3) Radiant Heating Cables Not Permitted. Radiant heating cables embedded in or below the deck shall not be permitted, unless cables operating at less than 30V and powered by an isolation transformer. The transformer shall have a grounded metal barrier between the primary and secondary windings.
Substantiation: This change would enable decks and concrete around swimming pools and spas to be safely heated. Low voltage heating systems produce high current from the secondary of a step down a transformer. Low voltage transformers with an isolated ungrounded secondary winding that has a grounded metal barrier between the primary and secondary are permitted for lighting for swimming pools and spas in the NEC 2005 680.23 under a transformer. With the secondary of the transformer being isolated from ground there is no need for a GFCI. The addition of a GFCI in the secondary of the transformer in a listed product would not provide any additional protection because the isolated secondary does not have a connection to ground and so would not operate a GFCI if a fault to ground was placed on the circuit. (Also, with a fault to ground there is no circuit so no current flow to other grounded equipment in the area.
Panel Meeting Action: Reject
Panel Statement: Faults in the heater cable could still enable faults that would cause a safety shock hazard and deterioration of the equipotential bonding grid.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11
Comment on Affirmative:
BLEWITT, T.: The use of a transformer with a grounded copper shield would not protect persons on the deck or in the pool from fault currents flowing from one side of the transformer secondary to the other. These could result from faults in the heater conductors. In addition, faults in the heater cables might result in significant current flowing continuously through parts of the equipotential bonding grid. This would substantially accelerate the corrosion of these current paths.

17-135 Log #3640 NEC-P17 **Final Action: Accept in Principle in Part**
(680.32)

Submitter: Aaron B. Chase, Leviton Mfg. Co. Inc.
Recommendation: Revise text to read:
680.32 Ground Fault Circuit Interrupters Required. All electrical equipment, including power-supply cords, used with storable pools shall be protected by ground-fault circuit interrupters.
~~All 125 volt receptacles located within 6.0 m (20 ft) of the inside walls of a storable pool shall be protected by a ground fault circuit interrupter. In determining these dimensions, the distance to be measured shall be the shortest path the supply cord of an appliance connected to the receptacle would follow without piercing a floor, wall, ceiling, doorway with hinged or sliding door, window opening, or other effective permanent barrier.~~
Delete entire second paragraph of 680.32. Add new text as second line of first paragraph:
The ground-fault-circuit interrupter shall be an integral part of the attachment plug or located in the power supply cord within 300 mm (12 in.) of the attachment plug.
Substantiation: The above proposal was adopted by CMP-17 during the last Code cycle, but was placed on hold by the TCC. The reason for the TCC hold was that the Panel proposal (Log #CC1700) to address TIA 02.2 introduced new material not presented during the ROP phase.
The intent of this proposal is to submit the panel's proposal during the ROP in order to have the panel's position properly incorporated in the next edition of NFPA 70.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle in Part
Change 680.31 to read as follows:
680.31 Pumps
A cord-connected pool filter pump shall incorporate an approved system of double insulation or its equivalent and shall be provided with means for grounding only the internal and nonaccessible non–current-carrying metal parts of the appliance.
The means for grounding shall be an equipment grounding conductor run with the power-supply conductors in the flexible cord that is properly terminated in a grounding-type attachment plug having a fixed grounding contact member.
Cord-connected pool filter pumps shall be provided with a ground-fault circuit interrupter that is an integral part of the attachment plug or located in the power supply cord within 300 mm (12 in.) of the attachment plug.
Panel Statement: The panel accepts the submitter's recommendation to add two new paragraphs. However, these were combined and relocated to 680.31 for clarity.
The panel chose to retain "All 125-volt receptacles … barrier" in 680.32.

Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
HIRSCH, B.: The EEI/EL&P believe the current code wording amply covers the GFCI requirements. The change does not offer any additional protection for the public and in the case of pool pumps will require duplicate GFCI protection. In addition, requirements for pool pump cords should be covered in the appliance standards and not in the NEC. The submitter did not provide substantiation for the change, but simply that the proposal was placed on hold by the TCC during the 2005 comment cycle due to being new material.

17-136 Log #2790 NEC-P17 **Final Action: Reject**
(680.33)

Submitter: Steven D. Holmes, Underwriters Laboratories Inc.
Recommendation: Revise text to read as follows:
680.33 Luminaires (Lighting Fixtures). An underwater luminaire (lighting fixture), if installed, shall be installed in or on the wall of the storable pool. It shall comply with 680.33(A) and either 680.33(~~A~~ B) or 680.33(~~B~~ C).
(A) Non-Current-Carrying Metal Parts . Non-current-carrying metal parts shall comply with (1) or (2):
(1) The parts shall be grounded by means of an equipment grounding conductor in the supply cord, terminating on the grounding contact of a grounding-type attachment plug. The size of the equipment grounding conductor shall comply with 250.122(E)
(2) The parts shall be separated from current-carrying parts by an approved system of double insulation or its equivalent.
The metal parts specified in items (3) and (4) shall be separated from current-carrying parts and grounded metal of the lighting assembly by an approved system of double insulation or its equivalent.
(3) Metal parts with an electrically conductive path to the pool water
(4) Metal parts within 1.5 m (5 ft) horizontally of the inside walls of the pool and that are capable of being touched
(~~A~~ B) 15 Volts or Less. A luminaire (lighting fixture) shall be part of a cord-and-plug-connected lighting assembly. This assembly shall be listed as an assembly for the purpose and have the following construction features:
~~(1) No exposed metal parts~~
(~~2~~ 1) A luminaire (fixture) lamp that operates at 15 volts or less
(~~3~~ 2) An impact-resistant polymeric lens, luminaire (fixture) body, and transformer enclosure
(~~4~~ 3) A transformer meeting the requirements of 680.23(A)(2) with a primary rating not over 150 volts
(B C) Over 15 Volts But Not Over 150 Volts . A lighting assembly without a transformer and with the luminaire (fixture) lamp(s) operating at not over 150 volts shall be permitted to be cord-and-plug connected where the assembly is listed as an assembly for the purpose. The installation shall comply with 680.23(A)(5), and the assembly shall have the following construction features:

~~(1) No exposed metal parts~~
(~~2~~ 1) An impact-resistant polymeric lens and luminaire (fixture) body
(~~3~~ 2) A ground-fault circuit interrupter with open neutral protection as an integral part of the assembly
(~~4~~ 3) The luminaire (fixture) lamp permanently connected to the ground-fault circuit interrupter with open-neutral protection
(~~5~~ 4) Compliance with the requirements of 680.23(A)

Substantiation: Problem 1 – "No Exposed Metal Parts" Too Inclusive - Section 680.33(A)(1) and 680.33(B)(1) require the lighting assembly's luminaire at the pool wall and the assembly's remote transformer or remote ground-fault circuit-interrupter to have no exposed metal parts and, therefore, excludes metal screws, fasteners, and mounting brackets. Polymeric screws or other nonmetallic part securement means often does not provide the needed or desired securement strength. Section 680.33(A)(1) and (B)(1) prevents the use of metal brackets and fasteners for securing the luminaire to the pool wall and for supporting the transformer or GFCI near the utilized receptacle, even when such metal parts are unlikely to become energized and are the best or only choice for achieving needed or desired mounting strength for the luminaire and transformer or GFCI.

Substantiation for Changes Addressing Problem 1 - Risk of electric shock involving exposed metal parts on the lamp enclosure or other electrical enclosure within 5 ft of the pool wall can be made unlikely by requiring the exposed metal parts to be separated from current-carrying parts and grounded metal of the lighting assembly by an approved system of double insulation or its equivalent. Where the transformer or GFCI enclosure is located more than 5 ft from the inside wall of the pool, the risk of electric shock involving exposed metal on its enclosure can be addressed by either one of the following two methods commonly used for electric equipment located away from the pool, such as the transformer or GFCI assembly or other enclosures.
(1) The exposed metal is required to be grounded and separated from current-carrying parts by "normal" electrical insulation (not double insulation). Item (1) in proposed 680.33(A) provides for this.
(2) The exposed metal, if not grounded, is required to be separated from current-carrying parts by an approved system of double insulation or its equivalent that complies with the Standard for Double Insulation Systems for Use in Electrical Equipment, UL1097. See 4.5 of the Fifth Edition of UL 1097 for this requirement provision. Item (2) in proposed 680.33(A) provides for this.
Items (3) and (4) of proposed 680.33(A) also require double insulation for metal parts that have an electrically conductive path to the pool water and for metal parts that are within 5 ft of the pool and capable of being touched. This provides the additional reduced risk of shock for a pool occupant, as warranted.

Problem 2 – The Term "Exposed" Not Specific Enough - Consider the definition of the term Exposed (as applied to live parts) in Part I of Article 100.
Exposed (as applied to live parts). Capable of being inadvertently touched or approached nearer than a safe distance by a person. It is applied to parts that are not suitably guarded, isolated, or insulated.
Someone assessing a luminaire for compliance with the "No exposed metal parts" requirement of 680.33(A)(1) or 680.33(B)(1), whether or not they are familiar with the Article 100 definition for exposed, may not notice or might conclude that an immersed metal part of the luminaire that cannot be seen or touched after luminaire installation is not exposed . If electrical insulation between this "not exposed" immersed metal part and the electrical parts within the luminaire fails, the immersed metal part might conduct electric current into the pool, exposing pool occupants to a risk of electric shock.
Also consider an unseen and inaccessible grounded metal part that is not considered "exposed" and that is in contact with the pool water. This grounded metal part might conduct electric current in the pool during a ground fault within the lighting assembly or within another grounded electrical product connected to an equipment grounding conductor of the premises wiring system. There are also metal parts not immersed in the pool water (they are on the non-water side of the pool wall) and that can be touched only by inserting a finger into an opening in or gap between nonmetallic surfaces of the luminaire. These metal parts might be concluded to be not exposed . Examples include (a) a metal screw head that is recessed in the bottom of a hole in a nonmetallic surface and (b) a metal part inside an air vent opening in a nonmetallic surface. If electrical insulation fails between these types of "not exposed" metal parts and electrical parts, a person inserting their finger and touching the metal part can experience an electric shock. Also, if the metal part is grounded, a person touching it through the opening or gap is exposed to a risk of electric shock if there is an uninterrupted (higher impedance) ground fault within the lighting assembly or within another grounded electrical product connected to an equipment grounding conductor of the premises wiring system.

Substantiation for Changes Addressing Problem 2 – Section 680.33 needs to address the risks of shock described in the Problem comments. Proposed new 680.33(A) requires metal parts with an electrically conductive path to the pool water or capable of being touched within 5 ft of the pool to be separated from current-carrying parts and grounded metal of the lighting assembly by an approved system of double insulation or equivalent. The proposed text removes the potentially more subjective determination of whether or not a metal part is exposed and replaces it with the less subjective determination of whether or not a metal part is capable of being touched or is in contact with the pool water. The "electrically conductive path" phrase in the proposed text also addresses designs where an internal metal part is not, itself, in direct contact with the pool water but needs double insulation because it is in contact with a second metal part that is in direct contact with the pool water.

Problem 3 - Equipment Grounding Conductor Excessively Large or Not Needed -
The submitter requests and intends that this proposal for the new text for proposed 680.33 associated with the equipment grounding conductor and grounding of non-current-carrying metal parts likely to become energized be considered with the submitter's separate proposals for 680.7(B) also related to these issues for lighting assemblies for storable pools.
Section 680.7(B) requires the flexible cords that are part of a lighting assembly for storable pools to be provided with an equipment grounding conductor sized in accordance with Section 250.122 but not smaller than 12 AWG. No other requirement in Article 680 Part I General or Part III Storable Pools modifies this requirement for lighting assemblies for a storable pool. The Standard for Underwater Luminaires and Junction Boxes, UL 676, requires the flexible cord extending away from the luminaire at the pool wall to be minimum 25 ft. Some underwater luminaires for storable pools do not have non-current-carrying metal parts requiring grounding. For luminaires that do have non-current-carrying metal parts requiring grounding, an equipment grounding conductor smaller than 12 AWG can often address the involved safety issues as needed. Using flexible cord with an equipment grounding conductor when one is not required or with a larger equipment grounding conductor than needed results in additional product bulk and weight and significant additional expense for both the lighting assembly manufacturers and users.

Substantiation for Changes Addressing Problem 3 - Well developed test techniques for determining, during the listing investigation, "that, where the luminaire (fixture) is properly installed without a ground-fault circuit-interrupter, there is no shock hazard with any likely combination of fault conditions during normal use (not relamping)."1 These test techniques are effective for evaluating storable pool lighting assemblies with no equipment grounding conductor or less than 12 AWG equipment grounding conductor just as they are affective for swimming pool luminaires with grounded non-current carrying metal parts for permanent swimming pools. Storable pool luminaires without grounding or with less than a 12 AWG equipment grounding conductor can both be practical and comply with all safety requirements, including the limit for escape current conducting into the swimming pool water under damaged lens or gasket conditions and other applicable fault conditions required in the UL Standard for Underwater Luminaires and Junction Boxes, UL 676. To provide for such designs of storable pool lighting assemblies, proposed 680.33(A) requires non-current-carrying metal parts to be grounded if they are not separated from current-carrying parts by an approved system of double insulation or its equivalent. Also, the proposed text requires the size of the equipment grounding conductor to comply with 250.122(E), which provides for, among other things, the equipment grounding conductor in flexible cord to "not be smaller than the circuit conductors" for flexible cords with circuit conductors up to 10 AWG. It is unlikely that a lighting assembly will ever require an equipment circuit conductors greater than 10 AWG, however, 250.122(E) addresses this situation as well, if one day needed.
Footnote
1) Quoted text is from 680.23(A)(1), Underwater Luminaires (Lighting Fixtures); General; Luminaire (Fixture) Design, Normal Operation. Though 680.23(A)(1) is not applicable to luminaires for storable pools, this text for underwater luminaires for permanent swimming pools illustrates the accepted approach of relying on the design of the swimming pool luminaire to address the risks of electric shock.

Panel Meeting Action: Reject
Panel Statement: The proposal would reduce the mechanical integrity of the equipment grounding conductor. In addition, the proposal would permit 120 v luminaires with exposed metal parts.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
BLEWITT, T.: Proposal should have been Accepted in Principle
The proposed changes reflect newer designs of storable pool luminaires. UL 676, the Standard for Underwater Luminaires addresses the construction and performance of equipment grounding conductors in cords smaller than 12 AWG. It also addresses double insulated luminaire constructions.

17-137 Log #1618 NEC-P17 **Final Action: Accept**
(680.33(B)(3))

Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Make the following change in 680.33(B)(3):
Change "neutral" to "neutral conductor."
The revised text would appear as follows:
(3) A ground-fault circuit interrupter with open neutral conductor protection as an integral part of the assembly
Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).

The Task Group has proposed the following definitions to be added to Article 100:

● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.

● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals

● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.

● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.

Additional information is available in the Task Group report.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-138 Log #1648 NEC-P17 **Final Action: Reject**

(680.41)

Submitter: Jim Davis, Electrical Education Services, LLC

Recommendation: Revise text to read as follows:

680.41 Emergency Switch for Spas and Hot Tubs. A clearly labeled emergency shutoff or control switch for the purpose of stopping the motor(s) that provide power to the recirculation system and jet system shall be installed at a point ~~readily~~ <u>immediately</u> accessible to the users and not less than 1.5 m (5 ft) away, adjacent to, and within sight of the spa or hot tub. This requirement shall not apply to single-family dwellings.

Substantiation: Delete the word "readily" and use the word "immediately" as suggested above to invoke a new definition "immediately accessible" to better describe the purpose of this switch or shutoff. See the companion proposal for Article 100 of the addition of "immediately Accessible". The use of this new definition, especially in this section, ensures that the level of emergency is more clearly understood, and that the switch location and labeling will provide for the safety of the spa and hot tub users.

Panel Meeting Action: Reject

Panel Statement: The term "readily accessible" is defined and "immediately" is not. The panel refers the submitter to the NEC Style Manual, 3.2.5.5.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-139 Log #560 NEC-P17 **Final Action: Reject**

(680.42)

Submitter: Brian Magilley, Current Electric

Recommendation: Delete the following text:

~~680.42(A)(1) Flexible Conduit. Liquidtight flexible metal conduit or liquidtight flexible nonmetallic conduit shall be permitted in lengths of not more than 1.8 m (6 ft).~~

Substantiation: I do not see what purpose this 6 foot limitation serves. I feel that removing this section will allow for easier connection of the spa to the required disconnect. If I set the required disconnect 5 feet from the edge of a residential spa then I cannot run LFNMC the entire length from the disconnect to the spa without using two different conduit types. Having the option of running an unlimited length of LFNMC from the spa disconnect 5 feet away to the spa control panel, would make the installation much quicker than having to run say PVC (RNMC) from the disconnect up to the spa, and then make a transition over the LFNMC to the spa control panel.

Panel Meeting Action: Reject

Panel Statement: Other wiring methods are permitted precluding the use of LFMC.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

Comment on Affirmative:

BLEWITT, T.: UL Guide Information for LFMC specifies the length limitation when the metal jacket is part of the equipment grounding path:

"Where terminated in fittings investigated for grounding and where installed with not more than 6 ft (total length) in any ground return path, liquid-tight flexible metal conduit in the 3/8 and 1/2 (12 and 16) trade sizes is suitable for grounding where used on circuits rated 20 A or less, and the 3/4, 1 and 1-1/4 (21, 27 and 35) trade sizes are suitable for grounding where used on circuits rated 60 A or less." Also see 250.118(5).

17-140 Log #3608 NEC-P17 **Final Action: Reject**

(680.42)

Submitter: Jim M. Schmer, Boise, ID

Recommendation: 680.42 Outdoor Conductor Clearance. (D)Overhead conductors shall have a minimum clearance of 3.0 m (10 ft.) above the water level for Self-Contained Spa(s) or Hot Tub(s).

Substantiation: There is no reason for the overhead conductors to be over 3.0 m (10 ft.) above the waater level, because when it comes to cleaning the Spa/ Hot Tub, you normally can reach clear across them.

Panel Meeting Action: Reject

Panel Statement: Long handle skimmers are used on spas or hot tubs. The methods of cleaning the spa or hot tub is not the only reason for this requirement.

This poses a safety hazard.

The panel does not want to decrease the level of safety already established.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-141 Log #511 NEC-P17 **Final Action: Reject**

(680.42(A)(1))

Submitter: Mike Wilson, Mike Wilson Electrical Service / Rep. Wake County Electrical Contractors Association

Recommendation: Revise text to read:

Flexible Conduit. Liquidtight flexible metal conduit or liquidtight flexible nonmetallic conduit shall be permitted ~~in lengths of not more than 1.8 m (6 ft)~~ .

Substantiation: Flex that is 6 ft is not long enough to run from a control panel under the tub to a disconnect (5 ft) away. The tub is manufactured in an entry on the left side. Control panel is (4 ft) from the side of the (text unreadable by NFPA staff). A disconnect could not be (text unreadable by NFPA staff) using (6 ft) of flex.

Panel Meeting Action: Reject

Panel Statement: Other wiring methods are permitted precluding the use of LFMC.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

Comment on Affirmative:

BLEWITT, T.: UL Guide Information for LFMC specifies the length limitation when the metal jacket is part of the equipment grounding path:

" Where terminated in fittings investigated for grounding and where installed with not more than 6 ft (total length) in any ground return path, liquid-tight flexible metal conduit in the 3/8 and 1/2 (12 and 16) trade sizes is suitable for grounding where used on circuits rated 20 A or less, and the 3/4, 1 and 1-1/4 (21, 27 and 35) trade sizes are suitable for grounding where used on circuits rated 60 A or less." 17-152 Log #2699 NEC-P17 **Final Action: Accept**
(680.50)

Submitter: Gary L. Siggins, Underwriters Laboratories Inc.
Recommendation: Revise as follows:
680.50 General. The provisions of Part I and Part V of this article shall apply to all permanently installed fountains as defined in 680.2. Fountains that have water in common to a pool shall additionally comply with the requirements in

Part II of this article. Part V does not cover self-contained, portable fountains ~~not larger than 1.5 m (5 ft) in any dimension~~ . Portable fountains shall comply with Parts II and III of Article 422.
Substantiation: The text specifying a 5 ft dimension limit is arbitrary. There are portable fountains larger than 5 ft. Indicating "Part V does not cover self-contained portable fountains" achieves the same result.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-153 Log #3144 NEC-P17 **Final Action: Reject**
(680.51(A))

Submitter: Dale Rooney, Municipality of Anchorage
Recommendation: After the words... "Luminaires (~~lighting fixtures~~)," add '"heat trace,".
Substantiation: In cold climates heat trace may be installed to keep the fountain operational and due to the close proximity of the public should have more that an equipment level of protection.
Panel Meeting Action: Reject
Panel Statement: The proposal needs to identify the specific applications and products being used. The submitter should use standard terms; see 426 and/or 427.
The submitter has not provided adequate substantiation.
The submitter is encouraged to review and resubmit for the ROC with specific proposed text.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-154 Log #2791 NEC-P17 **Final Action: Accept**
(680.51(C))

Submitter: Steven D. Holmes, Underwriters Laboratories Inc.
Recommendation: [Changes proposed only for 680.51(C). No change to other text of 680.51]
680.51 Luminaires (Lighting Fixtures), Submersible Pumps, and Other Submersible Equipment.
(C) Luminaire (Lighting Fixture) Lenses. Luminaires (lighting fixtures) shall be installed with the top of the luminaire (fixture) lens below the normal water level of the fountain unless listed for above-water locations. A luminaire (lighting fixture) facing upward shall <u>comply with either (1) or (2):</u> ~~have the lens adequately guarded to prevent contact by any person.~~
<u>(1) Have the lens adequately guarded to prevent contact by any person.</u>
<u>(2) Be listed for use without a guard.</u>

Substantiation: Section 680.51(C) does not provide for use of an upward-facing luminaire that has a lens with no guard and where the lens is, however, confirmed during evaluation for listing to withstand loading and impact required of a lens guard. Luminaires with high-strength plastic lenses can be found suitable for this use. Luminaires with small diameter, particularly thick, glass lenses can be found suitable as well. The Standard for Underwater Luminaires and Junction Box, UL 676, requires submersible luminaires with an integral lens guard to withstand a 250 lb loading test and a 100 ft-lbf impact (a 50 lb, 9-inch diameter cylinder dropped 2 feet). Luminaires with high-strength plastic lenses or small diameter, thick glass lenses and no guard can be as strong as required for luminaires with a guard. Such alternative designs for upward-facing luminaires can be developed, listed, and used if 680.51(C) is revised, such as proposed, to permit such alternate luminaire designs.
Panel Meeting Action: Accept

Recommendation: Revise second sentence:
The maximum length of <u>any one</u> exposed cord... (remainder unchanged).
Substantiation: Edit. Present wording limits aggregate length of cords to 10 feet.
Panel Meeting Action: Accept in Principle
Revise 2nd sentence of 680.51(E) to read as follows:
The maximum length of <u>each</u> exposed cord... (remainder unchanged).
Panel Statement: The change meets the submitter's intent.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-156 Log #2287 NEC-P17 **Final Action: Reject**
(680.52(B), 680.53, AND 680.57(E))

Submitter: John Leder, Georgia Fountain Co. Inc.
Recommendation: Please find below our suggested changes to improve the safety and security of electrical equipment installations in fountains. Of course, some of the associated articles elsewhere would require adjustments too. We have also included details as we routinely use them for illustration.
● (680.52(B)(1)A)
The threaded conduit entries should be expanded to include the words (tapered threads). It only makes sense to make sure that the connection of a junction box to a conduit be made water tight. The standard we apply in our company is "NPT" as this refers to the national standard for fluid and gas lines (<u>N</u> ational <u>P</u> ipe <u>T</u> apered). All standard electrical fittings produced use the "NPS"-standard (or <u>N</u> ational <u>P</u> ipe <u>S</u> traight or straight threads).
● (680.52(B)(2()b)
Relating the above add the requirement for thread sealant (such as Teflon paste) to increase the standard for water tight seal between junction box and metallic conduit.
● New Article suggestion (680.52(C)
Relating to the above, many water intrusion problems often occur not from within the fountain but from outside the fountain in the form of groundwater in broken underground conduit runs, mostly from broken electrical PVC adapters and couplings which are not very strong. We usually specify a requirement.:
1) When using PVC conduit underground, the use of SCH80 PVC pressure fitting adaptors is required.
2) When using PVC conduit underground, the use of PVC primer and glue is required.
This requirement has cut back on failure rates significantly. However, we do occasionally have inspectors who will not reason on this because it is not anchored in the code.
● (680.52(B)(2)(b)
We strongly recommend abolishing the words and related implications of "non-metallic conduit". It is our experience over the years that non-metallic conduit (such as PVC) is susceptible to breakage during cold weather and UV damage, not necessarily when the fountain is in operation but more so during winter months when the fountains are usually shut down and empty. Frequently, fountains are also used in the winter months for Christmas tree locations and snow plow deposits.
● New Article suggestion (680.52(B)(1()c)
All pool floor and wall conduit concrete penetrations shall be made of SCH40 red brass, machined with tapered (NPT) threads and shall feature an integral square brass water stop plate with SST or brass bonding screw. The reference to the square brass plate will insure that the brass conduit cannot be turned and separated from the serving conduit below the concrete.
● (680-52(B)(2)(a)
The term "approved potting compound" leaves many options open, of which many inspectors still believe paraffin wax to be one of them. It has been our experience that should a breach in the junction box seal occur and if undo temperatures exist in the conductor junction, the wax will return to a liquid state and separate from the conductors and allow any water in the box to come in contact with the junction. This leads to eventual corrosion of the juncture and increases the electrical shock hazard. There are today several compounds available that provide a much greater protection such as 3M Scotchcast #2112 which is a two component re-enterable soft compound. We suggest making provisions to the effect to guide the industry toward up-to-date material technology. Duct sealant to seal the conduit before potting is still required.
● (680-52(B)(2()b)
References to copper should be expanded to include a requirement that "all copper surfaces be painted or wrapped BEFORE concrete pours". The danger is not deterioration from currents between dissimilar metals in the system, but from the attack on the copper from the concrete itself being in direct contact with the copper.
● New Article suggestion (680.52B)(2c)
Where a brass conduit penetration through the concrete is connected to an EMT steel conduit system (such as in office buildings) a dielectric union shall be installed between the two materials. This will provide protection from galvanic action between the two materials.
● New Article suggestion (680.52(B)(1)(d)
Cord connected equipment and luminaries shall be installed to a junction box using a UL listed corrosion proof metal watertight strain relief. The cord seal/strain relief shall be equipped with neoprene seal. We are seeing the use of various plastic seals which again in winter time can be extremely brittle and susceptible to breakage when the fountain is in the winter period but also the influence of UV rays and chemical treatment combinations.
● (680.52(B)(1)(b)
Change the last word of that article from "material" to "metal". Plastic junction boxes are often understood to mean boxes such as "Carlon" PVC boxes. Though qualifying as a corrosion resistant material it is often used for under water purposes. Again the influence of temperatures, ice and chemical treatment has a very negative influence on the stability of the material.
● Article (680.53)
Add additional reference to Article 680.26 and remove reference to Article 250.122.
● Article 680.57(E)
Add additional reference to Articles 680.26 (for bonding) and 680.53.
● New Article suggestion (680.51)(A)(1)
All three phase submersible pumps shall be connected to a 3-Phase GFCI with 30mA max. fault trip range. In order to provide the industry with guidance on the use of three phase submersible pumps, we suggest this new article as the current 3-Phase equipment available world wide, is equipped with 10mA, 30mA, and 300mA fault trip ranges. Most European countries use 10mA and 30mA ranges for person protection.

Substantiation: We are in the fountain business world Note: wide hand have been at it for over 20 years. We have seen every installation imaginable. Having reviewed the 2005 NEC carefully, we still find, in our opinion, some code deficiencies that we would like to bring to your attention for consideration in the 2008 issue.

Many of the issues reflect the requirement to attention in the areas of the material selection with respect to temperature extremes (summer-winter ice) ice expansion and chemical resistance (UV rays and water treatment chemicals).

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The submitter did not provide a recommendation for consideration in accordance with the Regulations Governing Committee Projects, Section 4-3.3(c).

The submitter has not provided adequate substantiation.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-157 Log #934 NEC-P17 **Final Action: Reject**
(680.52(B)(2)(b))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Revise second sentence:

~~Where the~~ A junction box ~~is~~ not exceeding 1650 cm 3 (100 in. 3) in size shall be permitted to be supported only by the conduit (s) . The conduit (s) shall be made of copper, brass, stainless steel, or other corrosion-resistant metal and threaded wrenchtight into a threaded box entry .

Substantiation: Edit. 314.23(E) indicates enclosures (boxes) may be supported by two conduits under certain conditions. This section suggests, but does not specifically permit support by one conduit, therefore, does not modify the requirements of 314.23(E). The proposal provides specific modification of that section.

Panel Meeting Action: Reject

Panel Statement: The submitter did not correctly quote the current Code text.

In accordance with 314.14(A), the box is not permitted to be supported by only one conduit. This imposes a safety risk.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-158 Log #2792 NEC-P17 **Final Action: Reject**
(680.54)

Submitter: Steven D. Holmes, Underwriters Laboratories Inc.

Recommendation: Revise text to read as follows:

680.54 Grounding. The following equipment shall be grounded:

(1) All electrical equipment located within the fountain or within 1.5 m (5 ft) of the inside wall of the fountain , unless listed as not requiring grounding.

(2) All electrical equipment associated with the recirculating system of the fountain

(3) Panelboards that are not part of the service equipment and that supply any electrical equipment associated with the fountain.

Substantiation: Problem - Some underwater luminaires for fountains do not have non-current-carrying metal parts requiring grounding. Requiring such luminaires to have provision for being grounded to permit an installation complying with 680.54 results in additional expense for both the luminaire manufacturers and users. This same situation occurs or is likely to occur for other types of electrical equipment located with the fountain or within 1.5 m (5 ft) of the inside wall of the fountain.

Substantiation – Standards for safety for electrical equipment used in or within 5 ft of the inside wall of a fountain provide for equipment designs that do not have non-current-carrying metal parts requiring grounding. One example is the Standard for Underwater Luminaires and Junction Boxes, UL676, which covers submersible luminaires intended for use in fountains. Section 680.54 should not require grounding for electric products that have been determined as part of their listing to not require grounding to address the risks of electric shock and fire.

Panel Meeting Action: Reject

Panel Statement: The proposal does not clearly identify specific types of product or equipment.

The fact that the product may be listed does not specify the equivalent methods for grounding.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10 Negative: 1

Explanation of Negative:

BLEWITT, T.: Panel should have Accepted in Principle. The Submitter did not make it clear that double insulation was intended.

UL 676, the Standard for Underwater Luminaires, specifies construction and performance requirements for line-voltage double-insulated luminaires.

Proposed revised 680.54(1) should be amended as follows:

(1) All electrical equipment located within the fountain or within 1.5 m (5 ft) of the inside wall of the fountain , unless listed with an approved system of double insulation .

Comment on Affirmative:

HIRSCH, B.: See comment for Proposal 17-64.

17-158a Log #CP1702 NEC-P17 **Final Action: Accept**
(680.55(B))

Submitter: Code-Making Panel 17,

Recommendation: Revise 680.55(B) to read as follows:

(B) Supplied by a Flexible Cord. Electrical equipment that is supplied by a flexible cord shall have all exposed non–current-carrying metal parts grounded by an insulated copper equipment grounding conductor that is an integral part of this cord. The equipment grounding conductor shall be connected to ~~a~~ an equipment grounding terminal in the supply junction box, transformer enclosure, or other enclosure.

Revise 680.62(D)(1) to read as follows:

(D) Grounding.

(1) Fixed or Stationary Equipment. The equipment specified in (D)(1)(a) and (D)(1)(b) shall be ~~grounded~~ connected to the equipment grounding conductor .

Revise 680.62(D)(1)(a) to read as follows:

(a) Location. All electrical equipment located within 1.5 m (5 ft) of the inside wall of the tub shall be ~~grounded~~ connected to the equipment grounding conductor.

Revise 680.62(D)(1)(b) to read as follows:

(b) Circulation System. All electrical equipment associated with the circulating system of the tub shall be ~~grounded~~ connected to the equipment grounding conductor.

Substantiation: As Proposal 17-1 pertained to several articles (Articles 422, 426, 680 and 682), the panel chose to separate these into four (4) separate committee proposals to minimize confusion and act on them separately.

Panel Meeting Action: Accept

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

17-159 Log #2793 NEC-P17 **Final Action: Reject**
(680.55(B))

Submitter: Steven D. Holmes, Underwriters Laboratories Inc.

Recommendation: Revise text to read as follows:

680.55 Methods of Grounding.

(A) Applied Provisions . [no change]

~~**(B) Supplied by a Flexible Cord.** Electrical equipment that is supplied by a flexible cord shall have all exposed non-current-carrying metal parts grounded by an insulated copper equipment grounding conductor that is an integral part of this cord. The grounding conductor shall be connected to a grounding terminal in the supply junction box, transformer enclosure, or other enclosure.~~

(B) Supplied by a Flexible Cord. Electrical equipment that is supplied by a flexible cord shall comply with (1) or (2):

(1) The electrical equipment shall have all exposed non-current-carrying metal parts grounded by an insulated copper equipment grounding conductor that is an integral part of this cord. The grounding conductor shall be connected to a grounding terminal in the supply junction box, transformer enclosure, or other enclosure.

(2) The electrical equipment shall be listed as not requiring grounding.

Substantiation: Problem – The design of some flexible cord-supplied underwater luminaires for fountains with exposed non-current-carrying metal parts is such that not grounding one or more of the exposed non-current-carrying metal parts does not increase the risks of electric shock or fire. Requiring such exposed non-current-carrying metal parts to be bonded to the equipment grounding conductor of the flexible cord results in additional expense for both the luminaire manufacturer and users. Further requiring an equipment grounding conductor in the flexible cord for a luminaire with all exposed non-current-carrying metal parts not requiring grounding (and no other internal non-current-carrying metal parts requiring grounding) results in unnecessary expense for the luminaire manufacturer and users.

This same situation occurs or is likely to occur for other types of flexible cord-supplied electrical equipment associated with the fountain.

Substantiation – Standards for safety for flexible cord-supplied electrical equipment associated with a fountain provide for internal non-current-carrying metal parts that are not grounded. These electrical equipment designs are required to addresses the risks of electric shock and fire without the grounding of the internal non-current-carrying metal parts. One example is the Standard for Underwater Luminaires and Junction Boxes, UL676, which covers submersible luminaires intended for use in fountains. Section 680.55 should not require exposed non-current-carrying metal parts to be grounded where the electrical equipment is confirmed through listing to address the risks of electric shock and fire without the grounding of the exposed non-current-carrying metal parts.

Panel Meeting Action: Reject

Panel Statement: See panel action on Proposal on 17-158.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10 Negative: 1

Explanation of Negative:

BLEWITT, T.: Panel should have Accepted in Principle. The Submitter did not make it clear that double insulated construction was intended.

UL 676, the Standard for Underwater Luminaires, specifies construction and performance requirements for line-voltage double-insulated luminaires.

Proposed new 680.55(B)(2) should therefore be amended as follows:
(2) The electrical equipment shall be listed with an approved system of double insulation.
The current 680.55(B) requires external metallic fasteners of a non-metallic junction box to be grounded. This is difficult to accomplish and is not necessary because they are not likely to become energized.
Additional text should therefore be added after proposed 680.55(B)(1)
Exception: Metallic fasteners that do not enter the interior of electrical equipment shall not be required to be grounded .
Comment on Affirmative:
HIRSCH, B.: See comment for Proposal 17-64.

17-160 Log #977 NEC-P17 **Final Action: Reject**
(680.56(D))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
"Connections with flexible cord shall be ~~permanent~~ in accordance with 110.14 except with..." (remainder unchanged)
Substantiation: Edit. There is no definition of what constitutes a permanent connection. Plug and receptacle connections are inferred as not permanent connections even though permitted for many "permanently" installed utilization equipments.
Panel Meeting Action: Reject
Panel Statement: See panel action on Proposal 17-161.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-161 Log #1010 NEC-P17 **Final Action: Reject**
(680.56(D))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:
Connections with flexible cord shall be ~~permanent~~ in accordance with 110.14 except that...(remainder unchanged.)
Substantiation: Edit. 110.14 is more specific; "permanent connection" is not defined; many permanent installations are permitted cord-and-plug connections.
Panel Meeting Action: Reject
Panel Statement: The submitter's proposal would incorrectly exclude the termination of attachment plugs and receptacles from compliance with 110.14.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-162 Log #540 NEC-P17 **Final Action: Reject**
(680.56(D), FPN (New))

Submitter: Chris Dreier, Ludvik Electric
Recommendation: Add a Fine Print note to read:
1. Terminations and connections with flexible cord shall be permanent, except that grounding type attachment plugs and receptacles shall be permitted to facilitate removal or disconnection for maintenance, repair or storage of fixed or stationary equipment not located in any water containing part of a fountain.
3. I wold like to see a fine print note added that would state, factory installed whips with molded plugs shall be permitted to be used for stationary submersible equipment [pumps, lights, etc]. That the receptacle have GFCI protection, and where the receptacle and cap are only accessible to authorized and qualified persons. To facilitate the removal for repair or storage of submersible equipment that are located in the water containing part of a fountain.
Substantiation: When installing store bought submersible pumps with cords and molded caps, according to the code you cannot place the pump in water unless it is permanently attached. The problem being, store bought pumps only have a twelve foot cord and are stationary at best. Without a fine print note, it makes it so you cannot use these pumps.
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide a recommendation for consideration in accordance with the Regulations Governing Committee Projects, Section 4-3.3(c).
FPNs are informational only and are not enforceable as requirements of the Code; see 90.5(C).
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-163 Log #1511 NEC-P17 **Final Action: Reject**
(680.62(B) and (D))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: (B) Revise first sentence:
The following parts shall be bonded together and grounded .
Revise (D)(1)(a):
Location: All exposed noncurrent-carrying metal equipment...(remainder unchanged).
(D)(1)(b): Circulation Systems. All exposed noncurrent-carrying metal equipment ...(remainder unchanged).
Substantiation: Edit. A grounding requirement should accompany bonding. Grounding should be limited to exposed and noncurrent-carrying metal. Equipment is a broad term including conductors, fuses, circuit breakers, etc. per Article 100, which cannot be grounded.
Panel Meeting Action: Reject
Panel Statement: See panel action on Proposal 17-151.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-164 Log #2343 NEC-P17 **Final Action: Accept in Principle**
(680.71)

Submitter: Andre R. Cartal, Princeton Borough Building Dept.
Recommendation: Add new text:
A GFCI receptacle shall not be located in the tub motor space or cavity.
Substantiation: The installation of a GFCI type receptacle in the tub motor space is not apparent to the average homeowner as evidenced by the many complaints received in our office. Even if the tub occupant is aware of the location of the receptacle, it does not seem appropriate to expect a person to exit the tub and remove the side of the tub or the access panel to reset the receptacle.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 17-165.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-165 Log #2547 NEC-P17 **Final Action: Accept in Principle**
(680.71)

Submitter: Robert P. McGann, City of Cambridge
Recommendation: Revise text to read as follows:
Hydromassage bathtubs and their associated electrical components must be on dedicated circuit(s) and shall be (protected by a) ground-fault interrupter.
Substantiation: If it is not spelled out in the listing papers, contractors are tapping in on hallway, living room and/or bedroom circuit without a violation.
Panel Meeting Action: Accept in Principle
Change 680.71 to read as follows:
Hydromassage bathtubs and their associated electrical components shall be on a dedicated circuit and protected by a readily accessible ground-fault circuit interrupter. All 125-volt, single-phase receptacles not exceeding 30 amperes and located within 1.5 m (5 ft) measured horizontally of the inside walls of a hydromassage tub shall be protected by a ground-fault circuit interrupter(s).

Panel Statement: The change meets the submitter's intent.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-166 Log #347 NEC-P17 **Final Action: Accept in Principle**
(680.74)

TCC Action: The Technical Correlating Committee directs that the panel reconsider and clarify the panel action on this proposal by using mandatory language in accordance with the NEC Style Manual. This action will be considered by the panel as a public comment.
Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read as follows:
680.74 Bonding. All metal piping systems and all grounded metal parts in contact with the circulating water shall be bonded together using a copper bonding jumper, insulated, covered, or bare, not smaller that 8 AWG solid. The bonding jumper shall be connected to the terminal on the circulating pump motor that is intended for this purpose. The bonding jumper shall not be required to be connected to a double insulated circulating pump motor.
FPN: The 8 AWG or larger solid copper bonding jumper is required for equipotential bonding in the area of the hydromasage bathtub and shall not be required to be extended or attached to any remote panelboard, service equipment, or any electrode.
Substantiation: This proposed wording is an effort to provided clear direction within this rule to users and enforcement about where the connections are required to be made. The new FPN is consistent with the FPN to 680.26 in an effort to inform the users of the Code, what the purpose of the bonding required by this section is intended to accomplish. There continues to be a significant number of enforcement officials requiring the bonding jumper covered by this section to be run to the serving panelboard or service, and connected to the grounding electrode. This connection is already accomplished through the equipment grounding conductor of the circulation motor equipment grounding conductor. The revision should provide the needed clarity and result in more consistent application of the rules to these types of installations.
Panel Meeting Action: Accept in Principle
Revise 680.74 to read as follows:
680.74 Bonding. All metal piping systems and all grounded metal parts in contact with the circulating water shall be bonded together using a copper bonding jumper, insulated, covered, or bare, not smaller that 8 AWG solid. The bonding jumper shall be connected to the terminal on the circulating pump motor that is intended for this purpose. The bonding jumper shall not be

required to be connected to a double insulated circulating pump motor. The 8 AWG or larger solid copper bonding jumper is required for equipotential bonding in the area of the hydromasage bathtub and shall not be required to be extended or attached to any remote panelboard, service equipment, or any electrode.
Panel Statement: The change meets the submitter's intent.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11
Comment on Affirmative:
BLEWITT, T.: The terminal for bonding will not always be on the pump motor. The second sentence might better read:
"The bonding jumper shall be connected to the terminal identified for this purpose."

17-167 Log #618 NEC-P17 **Final Action: Accept in Principle**
(680.74)

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read as follows:
680.74 Bonding. All metal piping systems supplying hydromassage bathtubs, including metal piping and all grounded metal parts in contact with the circulating water, shall be bonded ~~together~~ using a copper bonding jumper, insulated, covered, or bare, not smaller than 8 AWG solid. The bonding jumper shall terminate at the pump motor on a terminal for this purpose.
FPN: The 8 AWG or larger solid copper bonding conductor shall not be required to be extended or attached to any remote panelboard, service equipment, or any electrode.
Substantiation: The proposed revision is for clarification purposes. There continues to be considerable confusion and inconsistency in how this requirement is being applied in the field. The common practices currently include bonding the hot and cold water piping supplying the tub to the terminal lug on the pump motor (other than double insulated types). The current text is being viewed and interpreted by some as only requiring "metal piping systems and grounded metal parts in contact with the circulation water" to be bonded. The piping for the circulation water of a hydromassage tub is typically nonmetallic. The questions arise as to the requirement for bonding the hot and cold water supply piping system that is connected to the tub. If the objective is to place all metal piping and metal parts such as faucets and valves associated with the hydromassage tub at the same equipotential plane, then the Code should clearly require that, and not leave users with any question as to what is required to be bonded and where the bonding jumper is required to be connected. The proposed FPN is the same one that follows 680.26 to help clarify that this bonding conductor does not have to be routed to a panelboard or service equipment or grounding electrode.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 17-166.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-168 Log #890 NEC-P17 **Final Action: Accept**
(680.74)

Submitter: Noel Williams, Noel Williams Consulting
Recommendation: Revise 680.74 as follows:
"All metal piping systems and all grounded metal parts in contact with the circulating water shall be bonded together using a solid copper bonding jumper, insulated, covered, or bare, not smaller than 8 AWG ~~solid~~ ."
Substantiation: According to the current language, an 8 AWG stranded conductor could be used because it is as big (or bigger) than an 8 AWG solid conductor. The application is essentially the same as 680.26(C) and 680.62(C)(4) and should have similar wording that ensures the use of a solid copper conductor.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-169 Log #1035 NEC-P17 **Final Action: Accept in Principle**
(680.74)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise latter part:
"... ~~Not smaller than~~ using a solid copper bonding jumper, insulated, covered, or bare, not smaller than 8 AWG ~~solid~~ ."
Substantiation: Edit. An 8 AWG aluminum conductor is not smaller than a solid copper conductor. Present wording infers but does not specifically require copper, but only relates to the size of 8 AWG solid conductors.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 17-168.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-170 Log #1370 NEC-P17 **Final Action: Accept in Principle**
(680.74)

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Edit for clarification
Bonding.
All metal piping systems and all grounded metal parts in contact with the circulating water shall be bonded together using a solid copper bonding jumper, insulated, covered, or bare, not smaller than 8 AWG ~~solid.~~
Substantiation: As written, the *Code* would permit a stranded bonding jumper, if larger than the circular mil of 8 AWG solid. If this is the intent, it should be spelled out to reflect the intent, as it is in 680.27(A)(2) and 680.26(C).
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 17-168.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

17-171 Log #3200 NEC-P17 **Final Action: Reject**
(680, Part VIII)

Submitter: Donald Cook, Shelby County Development Services
Recommendation: Add a new Part VIII to cover Baptisteries.
680.80 General. Baptisteries as defined in 680.2 shall comply with Part VIII of this article.
680.81 Protection.
(A) Baptistery Equipment. Baptistery electrical components shall be protected by a ground-fault circuit interrupter.
(B) Receptacles. Receptacles rated 125-volts and 30 amperes or less and located within 3.0 m (10 ft) of the inside walls of the baptistery vessel shall be protected by a ground-fault circuit interrupter.
680.82 Installations.
(A) Luminaires, Lighting Outlets, and Ceiling Fans. Luminaires (lighting fixtures), except as covered in 680.82(B), lighting outlets, and ceiling-suspended (paddle) fans located over the baptistery or within 1.5 m (5 ft) from the inside walls of the baptistery shall comply with the clearances specified in (A)(1), (A)(2) and (A)(3) above the maximum water level.
(1) Without GFCI. Where no GFCI protection is provided, the mounting height shall be not less than 3.7 m (12 ft).
(2) With GFCI. Where GFCI protection is provided, the mounting height shall be permitted to be not less than 2.3 m (7ft 6 in.).
(3) Below 2.3 m (7 ft 6 in.). Luminaires (lighting fixtures) meeting the requirements of item (a) or (b) and protected by a ground-fault circuit interrupter shall be permitted to be installed less than 2.3 m (7 ft 6in.) over a baptistery:
(a) Recessed luminaires (lighting fixtures) with a glass or plastic lens, nonmetallic or electrically isolated metal trim, and suitable for damp locations
(b) Surface-mounted luminaires (lighting fixtures) with a glass or plastic globe, a nonmetallic body, or a metallic body isolated from contact, and suitable for damp locations
(B) Underwater Applications. Underwater luminaires (lighting fixtures) shall comply with the provisions of 680.23 or 680.33.
(C) Wall Switches. Switches shall be located at least 1.5 m (5 ft), measured horizontally, from the inside wall of the baptistery.
(D) Bonding. The following parts shall be bonded together:
(1) All metal fittings within or attached to the baptistery structure
(2) Metal parts of electrical equipment associated with the baptistery circulating system, including pump motors.
(3) Metal conduit and metal piping that are within 1.5 m (5 ft) of the inside walls of the baptistery and that are not separated from the baptistery by a permanent barrier
(4) All metal surfaces that are within 1.5 m (5 ft) of the inside walls of the baptistery and are not separated from the baptistery by a permanent barrier
(E) Method of Bonding. All parts required to be bonded by 680.82(D) shall bonded together using an insulated, covered, or bare, copper bonding jumper, not smaller than 8 AWG solid.
(F) Grounding. The following equipment shall be grounded:
(1) All electric equipment located within 1.5 m (5 ft) of the inside wall of the baptistery
(2) All electric equipment associated with the circulating system of the baptistery
Substantiation: Baptisteries are not currently covered by this article or any other special equipment requirements of the NEC. Many involve immersion of the user and the same electrical hazards as pools, hot tubs, spas, hydromassages, and other vessels included in Article 680. Currently, nothing in the NEC requires bonding of metal parts, GFCI protection of equipment, separation of electrical and electronic devices from the vessel. This and companion proposals address that lack of coverage. The attached newspaper article related to the death of a user is submitted for substantiation that requirements are needed.
●Based on NEC 90.2(A) and (B), the distribution system is within the scope of the NEC.
●The service point, which is defined in Article 100 is the line of demarcation and separates the "utility system" from the "premises wiring". See definitions

for service point and premises wiring. The combination of those definitions and the information in 90.2 clearly places this installation within the scope of the NEC.

● The value of the Fine Print Notes (FPN) to the enforcement of the installation can be determined by reading NEC 90.5(C).

● Based on 90.2(C), the authority having jurisdiction (Shelby County) may grant exceptions to the requirements found in the NEC for outdoor distribution work.

* Raceways approved for burial only where concrete encased shall require a concrete envelope not less than 50 mm (2 in.) thick.Little or none of the equipment utilized in distribution installations has been evaluated by any NRTL.

● Although the NEC has some rules for installations over 600 volts, it was not developed to evaluate overhead distribution systems.

● After discussing this type installation with respected inspection agencies all over the US, with respected NEC experts all over the country, with NFPA staff, we have agreed to provide that exception based on the owner providing a third party evaluation of the equipment and the installation.

● We also provided an option of transferring ownership of the distribution system back to Alabama Power. If that choice was made, the service point would be re-located to each well site and the NEC would be much easier to use.

● We can not use the NESC. That document has not been adopted in this jurisdiction. We can accept an evaluation from an acceptable third party agency. Since the approval of any installation is the responsibility of the AHJ, it is the responsibility of Shelby County to determine what third party agency we will approve.

90.2 Scope.

(A) Covered. This Code covers the installation of electrical conductors, equipment, and raceways; signaling and communications conductors, equipment, and raceways; and optical fiber cables and raceways for the following:

(1) Public and private premises, including buildings, structures, mobile homes, recreational vehicles, and floating buildings

(2) Yards, lots, parking lots, carnivals, and industrial substations

FPN to (2): For additional information concerning such installations in an industrial or multibuilding complex, see ANSI C2-2002, National Electrical Safety Code.

(3) Installations of conductors and equipment that connect to the supply of electricity

(4) Installations used by the electric utility, such as office buildings, warehouses, garages, machine shops, and recreational buildings, that are not an integral part of a generating plant, substation, or control center.

(C) Special Permission. The authority having jurisdiction for enforcing this Code may grant exception for the installation of conductors and equipment that are not under the exclusive control of the electric utilities and are used to connect the electric utility supply system to the service-entrance conductors of the premises served, provided such installations are outside a building or terminate immediately inside a building wall.

90.5 Mandatory Rules, Permissive Rules, and Explanatory Material.

(A) Mandatory Rules. Mandatory rules of this Code are those that identify actions that are specifically required or prohibited and are characterized by the use of the terms shall or shall not.

(B) Permissive Rules. Permissive rules of this Code are those that identify actions that are allowed but not required, are normally used to describe options or alternative methods, and are characterized by the use of the terms shall be permitted or shall not be required.

(C) Explanatory Material. Explanatory material, such as references to other standards, references to related sections of this Code, or information related to a Code rule, is included in this Code in the form of fine print notes (FPNs). <u>**Fine print notes are informational only and are not enforceable as requirements of this Code.**</u>

ARTICLE 100 Definitions

Approved. Acceptable to the authority having jurisdiction.

Premises Wiring (System). That interior and exterior wiring, including power, lighting, control, and signal circuit wiring together with all their associated hardware, fittings, and wiring devices, both permanently and temporarily installed, that extends from the service point or source of power, such as a battery, a solar photovoltaic system, or a generator, transformer, or converter windings, to the outlet(s). Such wiring does not include wiring internal to appliances, luminaires (fixtures), motors, controllers, motor control centers, and similar equipment.

Service Point. The point of connection between the facilities of the serving utility and the premises wiring.

110.2 Approval. The conductors and equipment required or permitted by this Code shall be acceptable only if approved.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject
Panel Statement: Refer to panel action and statement on Proposal 17-60.

Ballot Results: Affirmative: 11
Comment on Affirmative:

BLEWITT, T.: A baptistery is a type of pool. Article 680 already covers pools.

17-172 Log #3557 NEC-P17 **Final Action: Reject**
(680.80 (New))

Submitter: Donald Cook, Shelby County Building Inspections
Recommendation: Add new article to read as follows:

680.80 General. Baptistries as defined in 680.2 shall comply with Part VIII of this article.

680.81 Protection.

(A) Baptistery Equipment. Baptistery electrical components shall be protected by a ground-fault circuit interrupter.

(B) Receptacles. Receptacles rated 125-volts and 30 amperes or less and located within 3.0 m (10 ft) of the inside walls of the baptistery vessel shall be protected by a ground-fault circuit interrupter.

680.82 Installations.

(A) Luminaires, Lighting Outlets, and Ceiling Fans, Luminaires (lighting fixtures), except as covered in 680.82(B), lighting outlets and ceiling-suspended (paddle) fans located over the baptistery or within 1.5 m (5 ft) from the inside walls of the baptistery shall comply with the clearances specified in (A)(1), (A)(2) and (A)(3) above the maximum water level.

(1) Without GFCI. Where no GFCI protection is provided, the mounting height shall be not less than 3.7 m (12 ft).

(2) With GFCI. Where GFCI protection is provided, the mounting height shall be permitted to be not less than 2.3 m (7 ft 6 in.)

(3) Below 2.3 m (7 ft 6 in.). Luminaires (lighting fixtures) meeting the requirements of item (a) or (b) and protected by a ground-fault circuit interrupter shall be permitted to be installed less than 2.3 m (7 ft 6 in.) over a baptistery:

(a) Recessed luminaires (lighting fixtures) with a glass or plastic lens, nonmetallic or electrically isolated metal trim, and suitable for damp locations.

(b) Surface-mounted luminaires (lighting fixtures) with a glass or plastic globe, a nonmetallic body, or a metallic body isolated from contact, and suitable for damp locations.

(B) Underwater Applications. Underwater luminaires (lighting fixtures) shall comply with the provisions of 680.23 or 680.33.

(C) Wall Switches. Switches shall be located at least 1.5 m (5 ft), measured horizontally, from the inside wall of the baptistery.

(D) Bonding. The following parts shall be bonded together:

(1) All meal fittings within or attached to the baptistery structure.

(2) Metal parts of electrical equipment associated with the baptistery circulating system, including pump motors.

(3) Metal conduit and metal piping that are within 1.5 m (5 ft) of the inside walls of the baptistery and that are not separated from the baptistery by a permanent barrier.

(4) All metal surfaces that are within 1.5 m (5 ft) of the inside walls of the baptistery and are not separated from the baptistery by a permanent barrier.

(E) Method of Bonding. All parts required to be bonded by 680.82(D) shall be bonded together using an insulated, covered, or bare, copper bonding jumper, not smaller than 8 AWG solid.

(F) Grounding. The following equipment shall be grounded:

(1) All electric equipment located within 1.5 m (5 ft) of the inside wall of the baptistery

(2) All electric equipment associated with the circulating system of the baptistery

680.83 Listing. All electrical equipment and all electrically powered utilization equipment associated with the baptistery vessel shall be listed.

Substantiation: Baptisteries are not currently covered by this article or any other special equipment requirements of the NEC. Many involve immersion of the user and the same electrical hazards as pools, hot tubs, spas, hydromassages, and other vessels included in Article 680. Currently, nothing in the NEC requires bonding of metal parts, GFCI protection of equipment, separation of electrical and electronic devices from the vessel. This and companion proposals address that lack of coverage. The newspaper article related t the death of a user is submitted for substantiation that requirements are needed.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject
Panel Statement: Refer to panel action and statement on Proposal 17-60.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11
Comment on Affirmative:

BLEWITT, T.: A baptistery is a type of pool. Article 680 already covers pools.

ARTICLE 682 — NATURAL AND ARTIFICALLY MADE BODIES OF WATER

17-173 Log #3256 NEC-P17 **Final Action: Reject**
(682.2)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reported as "Reject" because Code-Making Panel 19 did not agree that a common definition in Article 100 would meet their needs.
Submitter: Donald Dekker, N. Muskegon, MI
Recommendation: Delete the following text:
~~(Equipotential Plane. An area where wire mesh or other conductive elements are on, embedded in or placed under the walk surface within 75 mm (3 in.), bonded to all metal structures and fixed nonelectrical equipment that may become energized, and connected to the electrical grounding system to prevent a difference in voltage from developing within the plane.)~~
Substantiation: The term Equipotential Plane is defined in 2 separate sections of the Code and its methods are utilized in 3 distinct articles. I recommended deleting the 2 separate definitions and adding the definition of Equipotential Plane to 100-1. See companion proposals.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

17-174 Log #3423 NEC-P17 **Final Action: Accept**
(682.11)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Insert the words "shall be" after "live parts" and before "elevated."
Substantiation: Grammar and clarity call for parallel construction within this sentence.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

17-175 Log #3424 NEC-P17 **Final Action: Accept**
(682.13)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Revise as follows:
Liquidtight flexible metal conduit or liquidtight flexible nonmetallic conduit with approved fittings shall be permitted for feeders and where flexible connections are required for services. Extra-hard usage portable power cable listed for both wet locations and sunlight resistance shall be permitted for a feeder or a branch circuit where flexibility is required. Other wiring methods, suitable for the location shall be permitted to be installed where flexibility is not required. Temporary wiring in accordance with 590.4 shall be permitted.
Substantiation: This section is perhaps the most blatant violation of the whole-article reference prohibition in the entire ROP. After reviewing the referenced articles and considering 90.3, the reference to Chapter 3 is unnecessary, and the relevant requirements in Articles 553 and 555 have been incorporated into this comment. Here, the proposed language in this proposal comes from 553.7, but the last sentence was broadened to include cable assemblies. The whole article reference to Article 590 has been limited to 590.4, which should include the necessary requirements.
This objection was part of a public comment in the 2005 cycle; CMP 17 failed to provide any substantiation for not accepting this part of that comment. If these references are not clarified at this point, the TCC should intervene and enforce 4.1.1 of the NEC Style Manual.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

17-176 Log #3425 NEC-P17 **Final Action: Reject**
(682.14)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Revise as follows:
Submersible or Floating Equipment Power Connection(s). Submersible or floating equipment shall be cord- and plug-connected, using extra hard usage cord, as designated in Table 400.4 and listed with a "W" suffix. The plug and receptacle combination shall be arranged to be suitable for the location while in use. Disconnecting means shall be provided to isolate each submersible or floating electrical equipment from its supply connection(s) without requiring the plug to be removed from the receptacle.
(A) Type. The disconnecting means shall consist of a circuit breaker, switch, or both, or molded case switch, and shall be specifically marked todesignate which receptacle it controls.
(B) Location. The disconnecting means shall be readily accessible on land, located not more than 750 mm (30 in.) from the receptacle it controls, and shall be located in the supply circuit ahead of the receptacle. The disconnecting means shall be located within sight but not closer than 1.5 m (5 ft) from the shoreline. Uninsulated live parts shall be elevated not less than 300 mm (12 in.) above the datum plane.
Substantiation: This section needs to begin with language governing cords and cord- and plug-connections, because the rest of the section discusses disconnects for receptacles without ever requiring receptacles, so an essential element is missing. The cord designation comes from equivalent requirements for fountains. The wording of (A) reflects the fact that this is supposed to be a requirement that limits the permitted types of disconnecting means, but the wording is merely permissive. Molded case switches are added because there is no valid reason to exclude them in this context. The sentence also avoids the imprecise term "properly" in favor of text that complies with the NEC Style Manual.
(B) This wording is slightly editorially improved from the NEC text in terms of flow. It also uses the term "uninsulated" ahead of live parts in order to have a sensible requirement. (Refer to Article 100.)
Panel Meeting Action: Reject
Panel Statement: The proposal would limit connections of s ubmersible or floating equipment to cord-and-plug connected devices.
The disconnectiing means already includes switches and circuit breakers.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10
Comment on Affirmative:
BLEWITT, T.: The first part of Submitter's proposal deals with wiring methods and installation. This is covered under 682.13 not 682.14. Referenced requirements in Article 555 allow the use of cords in Table 400.4 with the "W" suffix.
No revision to 682.14(A) is necessary to allow the use of a molded case switch.
The Panel did not address the editorial correction requested at the end of 682.14(B). The last sentence should be amended to delete the words "and live parts". The requirements for live parts are already addressed in 682.12.

17-177 Log #902 NEC-P17 **Final Action: Reject**
(682.14(A))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
The disconnecting means shall ~~be permitted~~ consist of a circuit breaker(s), switch(es), or both, <u>that simultaneously disconnects all ungrounded conductors of the circuit it supplies,</u> and shall be properly identified as to which structure or equipment it controls.
Substantiation: Edit. No specific type of disconnect is required as in similar Code sections. The definition of disconnecting means in Article 100 is broad enough to include plug/receptacle, terminals. Wire connectors, relays, links (668.13(B)) etc.
Panel Meeting Action: Reject
Panel Statement: The proposal limits the disconnecting means to consist of a circuit breaker(s), switch(es), or both.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

17-178 Log #3426 NEC-P17 **Final Action: Accept in Principle**
(682.30)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 19 for Information.
Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Revise as follows:
682.30 System Grounding. The grounded circuit conductor (neutral) shall be an insulated conductor identified in conformance with 200.6. The neutral conductor shall be connected to the equipment grounding terminal in the service equipment, and, except for that connection, it shall be insulated from the equipment grounding conductors, equipment enclosures, and all other grounded parts.
Substantiation: This language corrects another sequence of blatant whole-article reference violations. The relevant requirements in Articles 553 and 555 have been suitably adapted and incorporated into this proposal. Here again, 4.1.1 of the NEC Style Manual should be enforced.
Panel Meeting Action: Accept in Principle
Change 682.30 to read as follows:
Grounding
Wiring and equipment within the scope of this article shall be grounded as specified in Part III of 553, 555.15 and with the requirements in Part III of this Article.
Panel Statement: The change meets the submitter's intent.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

17-178a Log #CP1703 NEC-P17 **Final Action: Accept**
(682.31(B))

Submitter: Code-Making Panel 17,
Recommendation: Revise 682.31(B) to read as follows:
Where a feeder supplies a remote panelboard, an insulated equipment ~~grounded~~ grounding conductor shall extend from a grounding terminal in the service to a grounding terminal and busbar in the remote panelboard.
Substantiation: As Proposal 17-1 pertained to several articles (Articles 422, 426, 680 and 682), the panel chose to separate these into four (4) separate committee proposals to minimize confusion and act on them separately.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

17-179 Log #1060 NEC-P17 **Final Action: Accept**
(682.31(D))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Delete "required to be".
Substantiation: Edit. Where grounding is done by choice (not required) the requirement should apply. 250.1 indicates grounding requirements cover installations "permitted".
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

17-180 Log #2540 NEC-P17 **Final Action: Reject**
(682.33)

Submitter: Timothy D. Curry, Curry Electric, Inc.
Recommendation: Delete the entire section.
Substantiation: While I applaud the efforts of the committee to put a new article together, I do not believe that there is sufficient documented danger to require this plane especially when a large amount of this type equipment is placed in areas of soil/vegetation, and a plane would be approximately 7 in. in diameter.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided adequate substantiation.
This proposal reduces the level of safety provided by the current Code.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

17-181 Log #2541 NEC-P17 **Final Action: Accept in Principle**
(682.33)

Submitter: Timothy D. Curry, Curry Electric, Inc.
Recommendation: Revise text to read:
Equipotential Planes ~~and Bonding of Equipment Planes~~
Substantiation: After this title, no where in this or any other section is "Equipment Plane" mentioned, let alone defined. If we don't know what it is, and there are no rules pertaining to it, it should be deleted.
Panel Meeting Action: Accept in Principle
Revise the title of 682.33 to read as follows:
682.33 Equipotential Planes and Bonding of Equipotential Planes
Panel Statement: The change meets the submitter's intent.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

ARTICLE 685 — INTEGRATED ELECTRICAL SYSTEMS

12-152 Log #1713 NEC-P12 **Final Action: Reject**
(685.1, Table 685.3)

Submitter: Stephen McCluer, American Power Conversion Corp
Recommendation:
Revise 685.1 and Table 685.3 as noted:
685.1 Scope.
This article covers integrated electrical systems, other than unit equipment, in which orderly shutdown is necessary to ensure safe operation or to prevent disruption of mission-critical operation. An integrated electrical system as used in this article is a unitized segment of an industrial wiring system where all of the following conditions are met:

(1) An orderly shutdown is required to minimize personnel hazard and equipment damage or to prevent disruption of mission-critical operation.

Table 685.3 Application of Other Articles

Conductor/Equipment	Section
More than one building or other structure	225, Part II
Ground-fault protection of equipment	230.95, Exception No. 1
Protection of conductors	240.4
Electrical system coordination	240.12
Ground-fault protection of equipment	240.13(1)
Grounding ac systems of 50 volts to 1000 volts	250.21
Equipment protection	427.22
Orderly shutdown	430.44
Disconnection	430.74, Exception Nos. 1 and 2
Disconnecting means in sight from controller	430.102(A), Exception No. 2
Energy from more than one source	430.113, Exception Nos. 1 and 2
Disconnecting means	645.10, Exception Nos. 1. and 2
	645.10(1)**
Uninterruptible power supplies (UPS)	645.11(1)
Point of connection	705.12(A)

**(comment: This reference to "645.10, Exceptions" is contingent upon acceptance of a separate proposal that would add a 2nd exception to 645.10. Delete the reference here if that proposal is not accepted.)

Substantiation: This proposal expands the scope of Article 685 to include "mission-critical" equipment. "Orderly shutdown" of an industrial process is not the only situation where "safe operation" is jeopardized. Continuous operation of certain equipment, such as information technology (IT) equipment, is so critical that unplanned power interruption can have catastrophic financial as well as human safety consequences.
Examples of "mission critical" operations include:
- Financial organizations controlling the flow of international finances in real time
- Hospital operations in which such things as patient records, diagnostic procedures, radiological scans, and medicine dispensing are all critically tied into IT equipment
- Transportation companies tracking the location and status of every vehicle, ship or airplane in real time
- Management of U.S. communications, such as Voice over Internet
- Online transactions for e-base commerce, banks, and other commercial operations in real time

Panel Meeting Action: Reject
Panel Statement: Article 685 is developed to "…minimize personnel hazard and equipment damage." Examples mentioned in this proposal (with the possible exception of hospital operations) do not involve personnel hazard or equipment damage. Nothing in the code prevents these organizations from incorporating orderly shutdowns, or more important, alternate power sources. The proposal is too vague and would be difficult to enforce.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
JANIKOWSKI, R.: Integrated Electrical Systems today have far more reaching applications than even systems of a short three years ago. I am in favor of orderly shutdown of integrated electrical systems that not only minimize personnel hazard but also prevent the disruption of mission-critical operations. Word financial networks, networked hospital operations, global transportation, global communications and e-base commerce just to name of few of the mission-critical operations that utilize Integrated Electrical Systems.

12-153 Log #116 NEC-P12 **Final Action: Reject**
(685.3)

Submitter: Stephen Urick, STV Incorporated
Recommendation: Revise as follows:
685. ~~3~~ 2 Application of Other Articles. The articles/sections in Table 685. ~~3~~ 2 apply...
Substantiation: There may be confusion going from paragraph 1 to paragraph 3.
Panel Meeting Action: Reject
Panel Statement: Subsection 2 of an article is reserved for definitions, per 2003 NEC Style Manual, 2.2.2.2.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 690 — SOLAR PHOTOVOLTAIC SYSTEMS

13-17 Log #2582 NEC-P13 **Final Action: Accept in Principle**
(690)

Submitter: Timothy M. Croushore, Allegheny Power
Recommendation: **Listed below are the proposed text and the revised figures of Article 690.**

ARTICLE 690 Solar Photovoltaic Systems

I. General

690.1 Scope.

The provisions of this article apply to solar photovoltaic electrical energy systems, including the array circuit(s), inverter(s), and controller(s) for such systems. [See Figure 690.1(A) and Figure 690.1(B).] Solar photovoltaic systems covered by this article ~~may be~~ are either interactive with other electrical power production and distribution network sources or stand-alone, with or without electrical energy storage such as batteries. These systems may have ac or dc output for utilization.

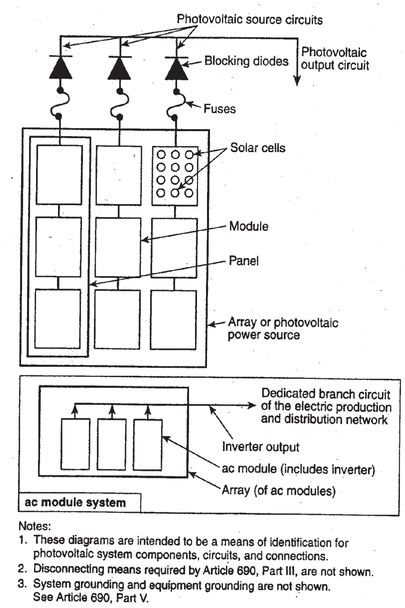

Figure 690.1(A) Identification of Solar Photovoltaic System Components.

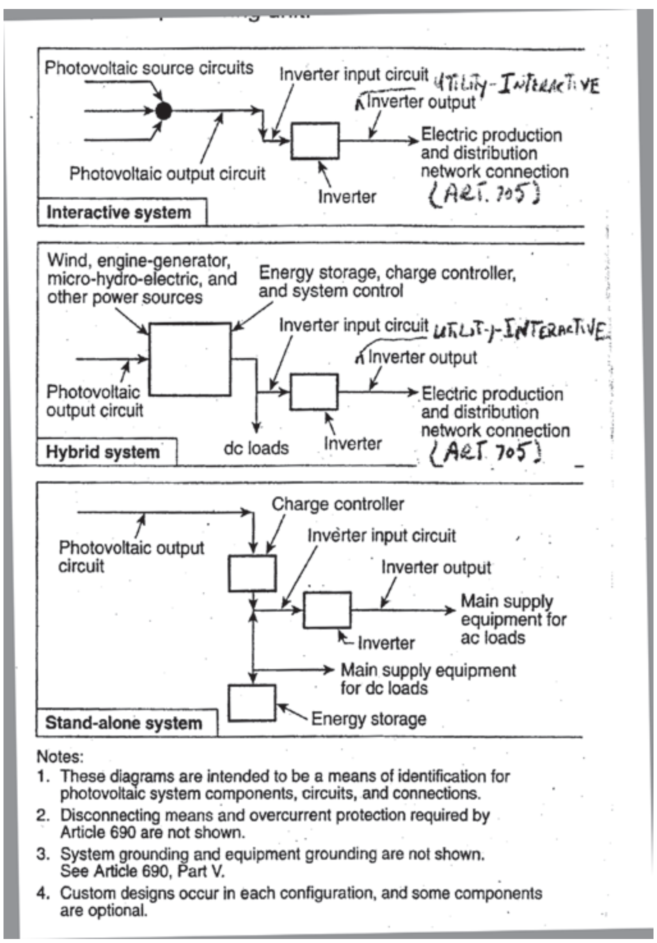

Figure 690.1(B) Identification of Solar Photovoltaic System Components in Common System Configurations.

690.2 Definitions.

Alternating-Current (ac) Module (Alternating-Current Photovoltaic Module). A complete, environmentally protected unit consisting of solar cells, optics, inverter, and other components, exclusive of tracker, designed to generate ac power when exposed to sunlight.

Array. A mechanically integrated assembly of modules or panels with a support structure and foundation, tracker, and other components, as required, to form a direct-current power-producing unit.

Bipolar Photovoltaic Array. A photovoltaic array that has two outputs, each having opposite polarity to a common reference point or center tap.

Blocking Diode. A diode used to block reverse flow of current into a photovoltaic source circuit.

Building Integrated Photovoltaics. Photovoltaic cells, devices, modules, or modular materials that are integrated into the outer surface or structure of a building and serve as the outer protective surface of that building.

Charge Controller. Equipment that controls dc voltage or dc current, or both, used to charge a battery.

Diversion Charge Controller. Equipment that regulates the charging process of a battery by diverting power from energy storage to direct-current or alternating-current loads or to an interconnected utility service.

~~**Electrical Production and Distribution Network.** A power production, distribution, and utilization system, such as a utility system and connected loads, that is external to and not controlled by the photovoltaic power system.~~

~~**Hybrid System.** A system comprised of multiple power sources. These power sources may include photovoltaic, wind, micro-hydro generators, engine-driven generators, and others, but do not include electrical production and distribution network systems. Energy storage systems, such as batteries, do not constitute a power source for the purpose of this definition.~~

~~**Interactive System.** A solar photovoltaic system that operates in parallel with and may deliver power to an electrical production and distribution network. For the purpose of this definition, an energy storage subsystem of a solar photovoltaic system, such as a battery, is not another electrical production source.~~

Inverter. Equipment that is used to change voltage level or waveform, or both, of electrical energy. Commonly, an inverter [also known as a power conditioning unit (PCU) or power conversion system (PCS)] is a device that changes dc input to an ac output. Inverters may also function as battery chargers that use alternating current from another source and convert it into direct current for charging batteries.

Inverter Input Circuit. Conductors between the inverter and the battery in stand-alone systems or the conductors between the inverter and the photovoltaic output circuits ~~for electrical production and distribution network~~.

Inverter Output Circuit. Conductors between the inverter and an ac panelboard for stand-alone systems. ~~or the conductors between the inverter and the service equipment or another electric power production source, such as a utility, for electrical production and distribution network.~~

Module. A complete, environmentally protected unit consisting of solar cells, optics, and other components, exclusive of tracker, designed to generate dc power when exposed to sunlight.

Panel. A collection of modules mechanically fastened together, wired, and designed to provide a field-installable unit.

Photovoltaic Output Circuit. Circuit conductors between the photovoltaic source circuit(s) and the inverter or dc utilization equipment.

Photovoltaic Power Source. An array or aggregate of arrays that generates dc power at system voltage and current.

Photovoltaic Source Circuit. Circuits between modules and from modules to the common connection point(s) of the dc system.

Photovoltaic System Voltage. The direct current (dc) voltage of any photovoltaic source or photovoltaic output circuit. For multiwire installations, the photovoltaic system voltage is the highest voltage between any two dc conductors.

Solar Cell. The basic photovoltaic device that generates electricity when exposed to light.

Solar Photovoltaic System. The total components and subsystems that, in combination, convert solar energy into electrical energy suitable for connection to a utilization load.

Stand-Alone System. A solar photovoltaic system that supplies power independently of an electrical production and distribution network.

690.3 Other Articles.

Wherever the requirements of other articles of this *Code* and Article 690 differ, the requirements of Article 690 shall apply. ~~and, if the system is operated in parallel with a primary source(s) of electricity, the requirements in 705.14, 705.16, 705.32, and 705.43 shall apply.~~ <u>Solar photovoltaic systems that are interactive with other electrical power production sources shall follow the requirements of Article 705</u>

Exception: Solar photovoltaic systems, equipment, or wiring installed in a hazardous (classified) location shall also comply with 500.1, 505.1, and 510.1.

690.4 Installation.

(A) Solar Photovoltaic System. A solar photovoltaic system shall be permitted to supply a building or other structure in addition to any service(s) of another electricity supply system(s).

(B) Conductors of Different Systems. Photovoltaic source circuits and photovoltaic output circuits shall not be contained in the same raceway, cable tray, cable, outlet box, junction box, or similar fitting as feeders or branch circuits of other systems, unless the conductors of the different systems are separated by a partition or are connected together.

(C) Module Connection Arrangement. The connections to a module or panel shall be arranged so that removal of a module or panel from a photovoltaic source circuit does not interrupt a grounded conductor to another photovoltaic source circuit. Sets of modules interconnected as systems rated at 50 volts or less, with or without blocking diodes, and having a single overcurrent device shall be considered as a single-source circuit. Supplementary overcurrent devices used for the exclusive protection of the photovoltaic modules are not considered as overcurrent devices for the purpose of this section.

(D) Equipment. Inverters or motor generators shall be identified for use in solar photovoltaic systems.

690.5 <u>DC</u> Ground-Fault Protection.

Roof-mounted dc photovoltaic arrays located on dwellings shall be provided with dc ground-fault protection to reduce fire hazards.

(A) Ground-Fault Detection and Interruption. The <u>DC</u> ground-fault protection device or system shall be capable of detecting a ground fault, interrupting the flow of fault current, and providing an indication of the fault.

(B) Disconnection of Conductors. The ungrounded conductors of the faulted source circuit shall be automatically disconnected. If the grounded conductors of the faulted source circuit are disconnected to comply with the requirements of 690.5(A), all conductors of the faulted source circuit shall be opened automatically and simultaneously. Opening the grounded conductor of the array or opening the faulted sections of the array shall be permitted to interrupt the ground-fault current path.

(C) Labels and Markings. Labels and markings shall be applied near the ground-fault indicator at a visible location, stating that, if a ground fault is indicated, the normally grounded conductors may be energized and ungrounded.

690.6 Alternating-Current (ac) Modules.

(A) Photovoltaic Source Circuits. The requirements of Article 690 pertaining to photovoltaic source circuits shall not apply to ac modules. The photovoltaic source circuit, conductors, and inverters shall be considered as internal wiring of an ac module.

(B) Inverter Output Circuit. The output of an ac module shall be considered an inverter output circuit.

(C) Disconnecting Means. A single disconnecting means, in accordance with 690.15 and 690.17, shall be permitted for the combined ac output of one or more ac modules. Additionally, each ac module in a multiple ac-module system shall be provided with a connector, bolted, or terminal-type disconnecting means.

(D) Ground-Fault Detection. Alternating-current-module systems shall be permitted to use a single detection device to detect only ac ground faults and to disable the array by removing ac power to the ac module(s).

(E) Overcurrent Protection. The output circuits of ac modules shall be permitted to have overcurrent protection and conductor sizing in accordance with 240.5(B)(2).

II. Circuit Requirements

690.7 Maximum Voltage.

(A) Maximum Photovoltaic System Voltage. In a dc photovoltaic source circuit or output circuit, the maximum photovoltaic system voltage for that circuit shall be calculated as the sum of the rated open-circuit voltage of the series-connected photovoltaic modules corrected for the lowest expected ambient temperature. For crystalline and multicrystalline silicon modules, the rated open-circuit voltage shall be multiplied by the correction factor provided in Table 690.7. This voltage shall be used to determine the voltage rating of cables, disconnects, overcurrent devices, and other equipment. Where the lowest expected ambient temperature is below -40°C (-40°F), or where other than crystalline or multicrystalline silicon photovoltaic modules are used, the system voltage adjustment shall be made in accordance with the manufacturer's instructions.

Table 690.7 Voltage Correction Factors for Crystalline and Multicrystalline Silicon Modules

Ambient Temperature (°C)	Correction Factors for Ambient Temperatures Below 25°C (77°F) (Multiply the rated open-circuit voltage by the appropriate correction factor shown below.)	Ambient Temperature (°F)
25 to 10	1.06	77 to 50
9 to 0	1.10	49 to 32
-1 to -10	1.13	31 to 14
-11 to -20	1.17	13 to -4
-21 to -40	1.25	-5 to -40

(B) Direct-Current Utilization Circuits. The voltage of dc utilization circuits shall conform with 210.6.

(C) Photovoltaic Source and Output Circuits. In one- and two-family dwellings, photovoltaic source circuits and photovoltaic output circuits that do not include lampholders, fixtures, or receptacles shall be permitted to have a maximum photovoltaic system voltage up to 600 volts. Other installations with a maximum photovoltaic system voltage over 600 volts shall comply with Article 690, Part I.

(D) Circuits Over 150 Volts to Ground. In one- and two-family dwellings, live parts in photovoltaic source circuits and photovoltaic output circuits over 150 volts to ground shall not be accessible to other than qualified persons while energized.

FPN: See 110.27 for guarding of live parts, and 210.6 for voltage to ground and between conductors.

(E) Bipolar Source and Output Circuits. For 2-wire circuits connected to bipolar systems, the maximum system voltage shall be the highest voltage between the conductors of the 2-wire circuit if all of the following conditions apply:

(1) One conductor of each circuit is solidly grounded.

(2) Each circuit is connected to a separate subarray.

(3) The equipment is clearly marked with a label as follows:

WARNING
BIPOLAR PHOTOVOLTAIC ARRAY.
DISCONNECTION OF NEUTRAL OR
GROUNDED CONDUCTORS MAY RESULT IN
OVERVOLTAGE ON ARRAY OR INVERTER.

690.8 Circuit Sizing and Current.

(A) Calculation of Maximum Circuit Current. The maximum current for the specific circuit shall be calculated in accordance with 690.8(A)(1) through (A)(4).

(1) Photovoltaic Source Circuit Currents. The maximum current shall be the sum of parallel module rated short-circuit currents multiplied by 125 percent.

(2) Photovoltaic Output Circuit Currents. The maximum current shall be the sum of parallel source circuit maximum currents as calculated in 690.8(A)(1).

(3) Inverter Output Circuit Current. The maximum current shall be the inverter continuous output current rating.

(4) Stand-Alone Inverter Input Circuit Current. The maximum current shall be the stand-alone continuous inverter input current rating when the inverter is producing rated power at the lowest input voltage.

(B) Ampacity and Overcurrent Device Ratings. Photovoltaic system currents shall be considered to be continuous.

(1) Sizing of Conductors and Overcurrent Devices. The circuit conductors and overcurrent devices shall be sized to carry not less than 125 percent of the maximum currents as calculated in 690.8(A). The rating or setting of overcurrent devices shall be permitted in accordance with 240.4(B) and (C).

Exception: Circuits containing an assembly, together with its overcurrent device(s), that is listed for continuous operation at 100 percent of its rating shall be permitted to be utilized at 100 percent of its rating.

(2) Internal Current Limitation. Overcurrent protection for photovoltaic output circuits with devices that internally limit the current from the photovoltaic output circuit shall be permitted to be rated at less than the value calculated in 690.8(B)(1). This reduced rating shall be at least 125 percent of the limited current value. Photovoltaic output circuit conductors shall be sized in accordance with 690.8(B)(1).

Exception: An overcurrent device in an assembly listed for continuous operation at 100 percent of its rating shall be permitted to be utilized at 100 percent of its rating.

(C) Systems with Multiple Direct-Current Voltages. For a photovoltaic power source that has multiple output circuit voltages and employs a common-return conductor, the ampacity of the common-return conductor shall not be less than the sum of the ampere ratings of the overcurrent devices of the individual output circuits.

(D) Sizing of Module Interconnection Conductors. Where a single overcurrent device is used to protect a set of two or more parallel-connected module circuits, the ampacity of each of the module interconnection conductors shall not be less than the sum of the rating of the single fuse plus 125 percent of the short-circuit current from the other parallel-connected modules.

690.9 Overcurrent Protection.

(A) Circuits and Equipment. Photovoltaic source circuit, photovoltaic output circuit, inverter output circuit, and storage battery circuit conductors and equipment shall be protected in accordance with the requirements of Article 240. Circuits connected to more than one electrical source shall have overcurrent devices located so as to provide overcurrent protection from all sources.

Exception: An overcurrent device shall not be required for circuit conductors sized in accordance with 690.8(B) and located where one of the following apply:

(a) There are no external sources such as parallel-connected source circuits, batteries, or backfeed from inverters.

(b) The short-circuit currents from all sources do not exceed the ampacity of the conductors.

FPN: Possible backfeed of current from any source of supply, including a supply through an inverter into the photovoltaic output circuit and photovoltaic source circuits, is a consideration in determining whether adequate overcurrent protection from all sources is provided for conductors and modules.

(B) Power Transformers. Overcurrent protection for a transformer with a source(s) on each side shall be provided in accordance with 450.3 by considering first one side of the transformer, then the other side of the transformer, as the primary.

Exception: A power transformer with a current rating on the side connected toward the photovoltaic power source, not less than the short-circuit output current rating of the inverter, shall be permitted without overcurrent protection from that source.

(C) Photovoltaic Source Circuits. Branch-circuit or supplementary-type overcurrent devices shall be permitted to provide overcurrent protection in photovoltaic source circuits. The overcurrent devices shall be accessible but shall not be required to be readily accessible.

Standard values of supplementary overcurrent devices allowed by this section shall be in one ampere size increments, starting at one ampere up to and including 15 amperes. Higher standard values above 15 amperes for supplementary overcurrent devices shall be based on the standard sizes provided in 240.6(A).

(D) Direct-Current Rating. Overcurrent devices, either fuses or circuit breakers, used in any dc portion of a photovoltaic power system shall be listed for use in dc circuits and shall have the appropriate voltage, current, and interrupt ratings.

(E) Series Overcurrent Protection. In series-connected strings of two or more modules, a single overcurrent protection device shall be permitted.

690.10 Stand-Alone Systems.

The premises wiring system shall be adequate to meet the requirements of this *Code* for a similar installation connected to a service. The wiring on the supply side of the building or structure disconnecting means shall comply with this *Code* except as modified by 690.10(A), (B), and (C).

(A) Inverter Output. The ac inverter output from a stand-alone system shall be permitted to supply ac power to the building or structure disconnecting means at current levels below the rating of that disconnecting means.

(B) Sizing and Protection. The circuit conductors between the inverter output and the building or structure disconnecting means shall be sized based on the output rating of the inverter. These conductors shall be protected from overcurrents in accordance with Article 240. The overcurrent protection shall be located at the output of the inverter.

(C) Single 120-Volt Supply. The inverter output of a stand-alone solar photovoltaic system shall be permitted to supply 120 volts to single-phase, 3-wire, 120/240-volt service equipment or distribution panels where there are no 240-volt outlets and where there are no multiwire branch circuits. In all installations, the rating of the overcurrent device connected to the output of the inverter shall be less than the rating of the neutral bus in the service equipment. This equipment shall be marked with the following words or equivalent:

WARNING
SINGLE 120-VOLT SUPPLY. DO NOT CONNECT
MULTIWIRE BRANCH CIRCUITS!

III. Disconnecting Means

690.13 All Conductors.

Means shall be provided to disconnect all current-carrying conductors of a photovoltaic power source from all other conductors in a building or other structure. A switch or circuit breaker shall not be installed in a grounded conductor unless that switch or circuit breaker is part of a ground-fault detection system required by 690.5 and that switch or circuit breaker is automatically opened and indicated as a normal function of the device in responding to ground faults.

FPN: The grounded conductor may have a bolted or terminal disconnecting means to allow maintenance or troubleshooting by qualified personnel.

690.14 Additional Provisions.

Photovoltaic disconnecting means shall comply with 690.14(A) through 690.14(D).

(A) Disconnecting Means. The disconnecting means shall not be required to be suitable as service equipment and shall be rated in accordance with 690.17.

(B) Equipment. Equipment such as photovoltaic source circuit isolating switches, overcurrent devices, and blocking diodes shall be permitted on the photovoltaic side of the photovoltaic disconnecting means.

(C) Requirements for Disconnecting Means. Means shall be provided to disconnect all conductors in a building or other structure from the photovoltaic system conductors.

(1) Location. The photovoltaic disconnecting means shall be installed at a readily accessible location either on the outside of a building or structure or inside nearest the point of entrance of the system conductors.

Exception: Installations that comply with 690.31(E) shall be permitted to have the disconnecting means located remote from the point of entry of the system conductors.

The photovoltaic system disconnecting means shall not be installed in bathrooms.

(2) Marking. Each photovoltaic system disconnecting means shall be permanently marked to identify it as a photovoltaic system disconnect.

(3) Suitable for Use. Each photovoltaic system disconnecting means shall be suitable for the prevailing conditions. Equipment installed in hazardous (classified) locations shall comply with the requirements of Articles 500 through 517.

(4) Maximum Number of Disconnects. The photovoltaic system disconnecting means shall consist of not more than six switches or six circuit breakers mounted in a single enclosure, in a group of separate enclosures, or in or on a switchboard.

(5) Grouping. The photovoltaic system disconnecting means shall be grouped with other disconnecting means for the system to comply with 690.14(C)(4). A photovoltaic disconnecting means shall not be required at the photovoltaic module or array location.

~~**(D) Utility-Interactive Inverters Mounted in Not-Readily-Accessible Locations.** Utility-interactive inverters shall be permitted to be mounted on roofs or other exterior areas that are not readily accessible. These installations shall comply with (1) through (4):~~

~~(1) A direct-current photovoltaic disconnecting means shall be mounted within sight of or in the inverter.~~

~~(2) An alternating-current disconnecting means shall be mounted within sight of or in the inverter.~~

~~(3) The alternating-current output conductors from the inverter and an additional alternating-current disconnecting means for the inverter shall comply with 690.14(C)(1).~~

~~(4) A plaque shall be installed in accordance with 705.10.~~

690.15 Disconnection of Photovoltaic Equipment.

Means shall be provided to disconnect equipment, such as inverters, batteries, charge controllers, and the like, from all ungrounded conductors of all sources. If the equipment is energized from more than one source, the disconnecting means shall be grouped and identified.

A single disconnecting means in accordance with 690.17 shall be permitted for the combined ac output of one or more inverters or ac modules in an interactive system.

690.16 Fuses.

Disconnecting means shall be provided to disconnect a fuse from all sources of supply if the fuse is energized from both directions and is accessible to other than qualified persons. Such a fuse in a photovoltaic source circuit shall be capable of being disconnected independently of fuses in other photovoltaic source circuits.

690.17 Switch or Circuit Breaker.

The disconnecting means for ungrounded conductors shall consist of a manually operable switch(es) or circuit breaker(s) complying with all of the following requirements:

(1) Located where readily accessible

(2) Externally operable without exposing the operator to contact with live parts

(3) Plainly indicating whether in the open or closed position

(4) Having an interrupting rating sufficient for the nominal circuit voltage and the current that is available at the line terminals of the equipment

Where all terminals of the disconnecting means may be energized in the open position, a warning sign shall be mounted on or adjacent to the disconnecting means. The sign shall be clearly legible and have the following words or equivalent:

WARNING
ELECTRIC SHOCK HAZARD.
DO NOT TOUCH TERMINALS. TERMINALS
ON BOTH THE LINE AND
LOAD SIDES MAY BE ENERGIZED
IN THE OPEN POSITION.

Exception: A connector shall be permitted to be used as an ac or a dc disconnecting means, provided that it complies with the requirements of 690.33 and is listed and identified for the use.

690.18 Installation and Service of an Array.

Open circuiting, short circuiting, or opaque covering shall be used to disable an array or portions of an array for installation and service.

FPN: Photovoltaic modules are energized while exposed to light. Installation, replacement, or servicing of array components while a module(s) is irradiated may expose persons to electric shock.

IV. Wiring Methods

690.31 Methods Permitted.

(A) Wiring Systems. All raceway and cable wiring methods included in this *Code* and other wiring systems and fittings specifically intended and identified for use on photovoltaic arrays shall be permitted. Where wiring devices with integral enclosures are used, sufficient length of cable shall be provided to facilitate replacement.

FPN: Photovoltaic modules operate at elevated temperatures when exposed to high ambient temperatures and to bright sunlight. These temperatures may routinely exceed 70°C (158°F) in many locations. Module interconnection conductors are available with insulation rated for wet locations and a temperature rating of 90°C (194°F) or greater.

(B) Single-Conductor Cable. Types SE, UF, USE, and USE-2 single-conductor cable shall be permitted in photovoltaic source circuits where installed in the same manner as a Type UF multiconductor cable in accordance with Part II of Article 340. Where exposed to sunlight, Type UF cable identified as sunlight-resistant shall be used.

(C) Flexible Cords and Cables. Flexible cords and cables, where used to connect the moving parts of tracking PV modules, shall comply with Article 400 and shall be of a type identified as a hard-service cord or portable power cable; they shall be suitable for extra-hard usage, listed for outdoor use, water resistant, and sunlight resistant. Allowable ampacities shall be in accordance with 400.5. For ambient temperatures exceeding 30°C (86°F), the ampacities shall be derated by the appropriate factors given in Table 690.31(C).

Table 690.31(C) Correction Factors

	Temperature Rating of Conductor				
Ambient Temperature (°C)	**60°C (140°F)**	**75°C (167°F)**	**90°C (194°F)**	**105°C (221°F)**	**Ambient Temperature (°F)**
30	1.00	1.00	1.00	1.00	86
31–35	0.91	0.94	0.96	0.97	87–95
36–40	0.82	0.88	0.91	0.93	96–104
41–45	0.71	0.82	0.87	0.89	105–113
46–50	0.58	0.75	0.82	0.86	114–122
51–55	0.41	0.67	0.76	0.82	123–131
56–60	—	0.58	0.71	0.77	132–140
61–70	—	0.33	0.58	0.68	141–158
71–80	—	—	0.41	0.58	159–176

(D) Small-Conductor Cables. Single-conductor cables listed for outdoor use that are sunlight resistant and moisture resistant in sizes 16 AWG and 18 AWG shall be permitted for module interconnections where such cables meet the ampacity requirements of 690.8. Section 310.15 shall be used to determine the cable ampacity and temperature derating factors.

(E) Direct-Current Photovoltaic Source and Output Circuits Inside a Building. Where direct current photovoltaic source or output circuits of a utility-interactive inverter from a building-integrated or other photovoltaic system are run inside a building or structure, they shall be contained in metallic raceways or enclosures from the point of penetration of the surface of the building or structure to the first readily accessible disconnecting means. The disconnecting means shall comply with 690.14(A) through 690.14(D).

690.32 Component Interconnections.

Fittings and connectors that are intended to be concealed at the time of on-site assembly, where listed for such use, shall be permitted for on-site interconnection of modules or other array components. Such fittings and connectors shall be equal to the wiring method employed in insulation, temperature rise, and fault-current withstand, and shall be capable of resisting the effects of the environment in which they are used.

690.33 Connectors.

The connectors permitted by Article 690 shall comply with 690.33(A) through 690.33(E).

(A) Configuration. The connectors shall be polarized and shall have a configuration that is noninterchangeable with receptacles in other electrical systems on the premises.

(B) Guarding. The connectors shall be constructed and installed so as to guard against inadvertent contact with live parts by persons.

(C) Type. The connectors shall be of the latching or locking type.

(D) Grounding Member. The grounding member shall be the first to make and the last to break contact with the mating connector.

(E) Interruption of Circuit. The connectors shall be capable of interrupting the circuit current without hazard to the operator.

690.34 Access to Boxes.

Junction, pull, and outlet boxes located behind modules or panels shall be so installed that the wiring contained in them can be rendered accessible directly or by displacement of a module(s) or panel(s) secured by removable fasteners and connected by a flexible wiring system.

690.35 Ungrounded Photovoltaic Power Systems.

Photovoltaic power systems shall be permitted to operate with ungrounded photovoltaic source and output circuits where the system complies with 690.35(A) through 690.35(G).

(A) Disconnects. All photovoltaic source and output circuit conductors shall have disconnects complying with 690, Part III.

(B) Overcurrent Protection. All photovoltaic source and output circuit conductors shall have overcurrent protection complying with 690.9.

(C) Ground-Fault Protection. All photovoltaic source and output circuits shall be provided with a ground-fault protection device or system that complies with (1) through (3):

(1) Detects a ground fault.

(2) Indicates that a ground fault has occurred

(3) Automatically disconnects the conductors and/or shuts off the utility-interactive inverter or charge controller for that portion of the faulted array

(D) The photovoltaic source and output conductors shall consist of sheathed (jacketed) multi-conductor cables or shall be installed in a raceway.

(E) The photovoltaic power system direct-current circuits shall be permitted to be used with ungrounded battery systems complying with 690.71(G).

(F) The photovoltaic power source shall be labeled with the following warning at each junction box, combiner box, disconnect, and device where the ungrounded circuits may be exposed during service:

WARNING
ELECTRIC SHOCK HAZARD. THE DIRECT
CURRENT CIRCUIT CONDUCTORS OF THIS
PHOTOVOLTAIC POWER SYSTEM ARE
UNGROUNDED BUT MAY BE ENERGIZED
WITH RESPECT TO GROUND DUE TO
LEAKAGE PATHS AND/OR GROUND FAULTS.

(G) The inverters or charge controllers used in systems with ungrounded photovoltaic source and output circuits shall be listed for the purpose.

V. Grounding

690.41 System Grounding.

For a photovoltaic power source, one conductor of a two-wire system with a photovoltaic system voltage over 50 volts and the reference (center tap) conductor of a bipolar system shall be solidly grounded or shall use other methods that accomplish equivalent system protection in accordance with 250.4(A) and that utilize equipment listed and identified for the use.

Exception: Systems complying with 690.35.

690.42 Point of System Grounding Connection.

The dc circuit grounding connection shall be made at any single point on the photovoltaic output circuit.

FPN: Locating the grounding connection point as close as practicable to the photovoltaic source better protects the system from voltage surges due to lightning.

690.43 Equipment Grounding.

Exposed non–current-carrying metal parts of module frames, equipment, and conductor enclosures shall be grounded in accordance with 250.134 or 250.136(A) regardless of voltage.

690.45 Size of Equipment Grounding Conductor.

Where not protected by the ground-fault protection equipment required by 690.5, the equipment-grounding conductor for photovoltaic source and photovoltaic output circuits shall be sized for 125 percent of the photovoltaic-originated short-circuit currents in that circuit. Where protected by the ground-fault protection equipment required by 690.5, the equipment-grounding conductors for photovoltaic source and photovoltaic output circuits shall be sized in accordance with 250.122.

690.47 Grounding Electrode System.

(A) Alternating-Current Systems. If installing an ac system, a grounding electrode system shall be provided in accordance with 250.50 through 250.60. The grounding electrode conductor shall be installed in accordance with 250.64.

(B) Direct-Current Systems. If installing a dc system, a grounding electrode system shall be provided in accordance with 250.166 for grounded systems or 250.169 for ungrounded systems. The grounding electrode conductor shall be installed in accordance with 250.64.

(C) Systems with Alternating-Current and Direct-Current Grounding Requirements. Photovoltaic power systems with both alternating-current and direct-current (dc) grounding requirements shall be permitted to be grounded as described in (1) or (2):

(1) A grounding-electrode conductor shall be connected between the identified dc grounding point to a separate dc grounding electrode. The dc grounding-electrode conductor shall be sized according to 250.166. The dc grounding electrode shall be bonded to the ac-grounding electrode to make a grounding electrode system according to 250.52 and 250.53. The bonding conductor shall be no smaller than the largest grounding electrode conductor, either ac or dc.

(2) The dc grounding electrode conductor and ac grounding electrode conductor shall be connected to a single grounding electrode. The separate grounding electrode conductors shall be sized as required by 250.66 (ac) and 250.166 (dc).

690.48 Continuity of Equipment Grounding Systems.

Where the removal of equipment disconnects the bonding connection between the grounding electrode conductor and exposed conducting surfaces in the photovoltaic source or output circuit equipment, a bonding jumper shall be installed while the equipment is removed.

690.49 Continuity of Photovoltaic Source and Output Circuit Grounded Conductors.

Where the removal of the utility-interactive inverter or other equipment disconnects the bonding connection between the grounding electrode conductor and the photovoltaic source and/or photovoltaic output circuit grounded conductor, a bonding jumper shall be installed to maintain the system grounding while the inverter or other equipment is removed.

VI. Marking

690.51 Modules.

Modules shall be marked with identification of terminals or leads as to polarity, maximum overcurrent device rating for module protection, and with the following ratings:

(1) Open-circuit voltage

(2) Operating voltage

(3) Maximum permissible system voltage

4) Operating current

(5) Short-circuit current

6) Maximum power

690.52 Alternating-Current Photovoltaic Modules.

Alternating-current modules shall be marked with identification of terminals or leads and with identification of the following ratings:

(1) Nominal operating ac voltage

(2) Nominal operating ac frequency

(3) Maximum ac power

(4) Maximum ac current

(5) Maximum overcurrent device rating for ac module protection

690.53 Direct-Current Photovoltaic Power Source.

A marking for the direct-current photovoltaic power source indicating items (1) through (4) shall be provided by the installer at an accessible location at the disconnecting means for this power source:

(1) Operating current

(2) Operating voltage

(3) Maximum system voltage

(4) Short-circuit current

FPN: Reflecting systems used for irradiance enhancement may result in increased levels of output current and power.

~~**690.54 Interactive System Point of Interconnection.**~~

~~All interactive system(s) points of interconnection with other sources shall be marked at an accessible location at the disconnecting means as a power source with the maximum ac output operating current and the operating ac voltage.~~

690.55 Photovoltaic Power Systems Employing Energy Storage.

Photovoltaic power systems employing energy storage shall also be marked with the maximum operating voltage, including any equalization voltage and the polarity of the grounded circuit conductor.

690.56 Identification of Power Sources.

(A) Facilities with Stand-Alone Systems. Any structure or building with a photovoltaic power system that is not connected to a utility service source and is a stand-alone system shall have a permanent plaque or directory installed on the exterior of the building or structure at a readily visible location acceptable to the authority having jurisdiction. The plaque or directory shall indicate the location of system disconnecting means and that the structure contains a stand-alone electrical power system.

~~**(B) Facilities with Utility Services and PV Systems.** Buildings or structures with both utility service and a photovoltaic system shall have a permanent plaque or directory providing the location of the service disconnecting means and the photovoltaic system disconnecting means, if not located at the same location.~~

~~**VII. Connection to Other Sources**~~

~~**690.60 Identified Interactive Equipment.**~~

~~Only inverters and ac modules listed and identified as interactive shall be permitted in interactive systems.~~

~~**690.61 Loss of Interactive System Power.**~~

~~An inverter or an ac module in an interactive solar photovoltaic system shall automatically de-energize its output to the connected electrical production and distribution network upon loss of voltage in that system and shall remain in that state until the electrical production and distribution network voltage has been restored.~~

~~A normally interactive solar photovoltaic system shall be permitted to operate as a stand-alone system to supply loads that have been disconnected from electrical production and distribution network sources.~~

~~**690.62 Ampacity of Neutral Conductor.**~~

~~If a single-phase, 2-wire inverter output is connected to the neutral and one ungrounded conductor (only) of a 3-wire system or of a 3-phase, 4-wire wye-connected system, the maximum load connected between the neutral and any one ungrounded conductor plus the inverter output rating shall not exceed the ampacity of the neutral conductor.~~

~~**690.63 Unbalanced Interconnections.**~~

~~**(A) Single Phase.** Single-phase inverters for photovoltaic systems and ac modules in interactive solar photovoltaic systems shall not be connected to 3-phase power systems unless the interconnected system is designed so that significant unbalanced voltages cannot result.~~

~~**(B) Three Phase.** Three-phase inverters and 3-phase ac modules in interactive systems shall have all phases automatically de-energized upon loss of, or unbalanced, voltage in one or more phases unless the interconnected system is designed so that significant unbalanced voltages will not result.~~

~~**690.64 Point of Connection.**~~

~~The output of a photovoltaic power source shall be connected as specified in 690.64(A) or 690.64(B).~~

~~**(A) Supply Side.** A photovoltaic power source shall be permitted to be connected to the supply side of the service disconnecting means as permitted in 230.82(6).~~

~~**(B) Load Side.** A photovoltaic power source shall be permitted to be connected to the load side of the service disconnecting means of the other source(s) at any distribution equipment on the premises, provided that all of the following conditions are met:~~

~~(1) Each source interconnection shall be made at a dedicated circuit breaker or fusible disconnecting means.~~

~~(2) The sum of the ampere ratings of overcurrent devices in circuits supplying power to a busbar or conductor shall not exceed the rating of the busbar or conductor.~~

~~*Exception: For a dwelling unit, the sum of the ampere ratings of the overcurrent devices shall not exceed 120 percent of the rating of the busbar or conductor.*~~

~~(3) The interconnection point shall be on the line side of all ground-fault protection equipment.~~

~~*Exception: Connection shall be permitted to be made to the load side of ground-fault protection, provided that there is ground-fault protection for equipment from all ground-fault current sources.*~~

~~(4) Equipment containing overcurrent devices in circuits supplying power to a busbar or conductor shall be marked to indicate the presence of all sources.~~

~~*Exception: Equipment with power supplied from a single point of connection.*~~

~~(5) Circuit breakers, if backfed, shall be identified for such operation. Dedicated circuit breakers backfed from listed utility-interactive inverters complying with 690.60 shall not be required to be individually clamped to the panelboard bus bars. A front panel shall clamp all circuit breakers to the panelboard bus bars. Main circuit breakers connected directly to energized feeders shall also be individually clamped.~~

VIII. Storage Batteries

690.71 Installation.

(A) General. Storage batteries in a solar photovoltaic system shall be installed in accordance with the provisions of Article 480. The interconnected battery cells shall be considered grounded where the photovoltaic power source is installed in accordance with 690.41.

(B) Dwellings.

(1) Operating Voltage. Storage batteries for dwellings shall have the cells connected so as to operate at less than 50 volts nominal. Lead-acid storage batteries for dwellings shall have no more than twenty-four 2-volt cells connected in series (48-volts nominal).

Exception: Where live parts are not accessible during routine battery maintenance, a battery system voltage in accordance with 690.7 shall be permitted.

(2) Guarding of Live Parts. Live parts of battery systems for dwellings shall be guarded to prevent accidental contact by persons or objects, regardless of voltage or battery type.

FPN: Batteries in solar photovoltaic systems are subject to extensive charge–discharge cycles and typically require frequent maintenance, such as checking electrolyte and cleaning connections.

(C) Current Limiting. A listed, current-limiting, overcurrent device shall be installed in each circuit adjacent to the batteries where the available short-circuit current from a battery or battery bank exceeds the interrupting or withstand ratings of other equipment in that circuit. The installation of current-limiting fuses shall comply with 690.16.

(D) Battery Nonconductive Cases and Conductive Racks. Flooded, vented, lead-acid batteries with more than twenty-four 2-volt cells connected in series (48 volts, nominal) shall not use conductive cases or shall not be installed in conductive cases. Conductive racks used to support the nonconductive cases shall be permitted where no rack material is located within 150 mm (6 in.) of the tops of the nonconductive cases.

This requirement shall not apply to any type of valve-regulated lead-acid (VRLA) battery or any other types of sealed batteries that may require steel cases for proper operation.

(E) Disconnection of Series Battery Circuits. Battery circuits subject to field servicing, where more than twenty-four 2-volt cells are connected in series (48 volts, nominal), shall have provisions to disconnect the series-connected strings into segments of 24 cells or less for maintenance by qualified persons. Non–load-break bolted or plug-in disconnects shall be permitted.

(F) Battery Maintenance Disconnecting Means. Battery installations, where there are more than twenty-four 2-volt cells connected in series (48 volts, nominal), shall have a disconnecting means, accessible only to qualified persons, that disconnects the grounded circuit conductor(s) in the battery electrical system for maintenance. This disconnecting means shall not disconnect the grounded circuit conductor(s) for the remainder of the photovoltaic electrical system. A non–load-break-rated switch shall be permitted to be used as the disconnecting means.

(G) Battery Systems of More Than 48 Volts. On photovoltaic systems where the battery system consists of more than twenty-four 2-volt cells connected in series (more than 48 volts, nominal), the battery system shall be permitted to operate with ungrounded conductors, provided the following conditions are met:

(1) The photovoltaic array source and output circuits shall comply with 690.41.

(2) The dc and ac load circuits shall be solidly grounded.

(3) All main ungrounded battery input/output circuit conductors shall be provided with switched disconnects and overcurrent protection.

(4) A ground-fault detector and indicator shall be installed to monitor for ground faults in the battery bank.

690.72 Charge Control.

(A) General. Equipment shall be provided to control the charging process of the battery. Charge control shall not be required where the design of the photovoltaic source circuit is matched to the voltage rating and charge current requirements of the interconnected battery cells and the maximum charging current multiplied by 1 hour is less than 3 percent of the rated battery capacity expressed in ampere-hours or as recommended by the battery manufacturer.

All adjusting means for control of the charging process shall be accessible only to qualified persons.

FPN: Certain battery types such as valve-regulated lead acid or nickel cadmium can experience thermal failure when overcharged.

(B) Diversion Charge Controller.

(1) Sole Means of Regulating Charging. A photovoltaic power system employing a diversion charge controller as the sole means of regulating the charging of a battery shall be equipped with a second independent means to prevent overcharging of the battery.

(2) Circuits with Direct-Current Diversion Charge Controller and Diversion Load. Circuits containing a dc diversion charge controller and a dc diversion load shall comply with the following:

(1) The current rating of the diversion load shall be less than or equal to the current rating of the diversion load charge controller. The voltage rating of the diversion load shall be greater than the maximum battery voltage. The power rating of the diversion load shall be at least 150 percent of the power rating of the photovoltaic array.

(2) The conductor ampacity and the rating of the overcurrent device for this circuit shall be at least 150 percent of the maximum current rating of the diversion charge controller.

(3) PV Systems Using Utility-Interactive Inverters. Photovoltaic power systems using utility-interactive inverters to control battery state-of-charge by diverting excess power into the utility system shall comply with (1) and (2):

(1) These systems shall not be required to comply with 690.72(B)(2). The charge regulation circuits used shall comply with the requirements of 690.8.

(2) These systems shall have a second, independent means of controlling the battery charging process for use when the utility is not present or when the primary charge controller fails or is disabled.

690.74 Battery Interconnections.

Flexible cables, as identified in Article 400, in sizes 2/0 AWG and larger shall be permitted within the battery enclosure from battery terminals to a nearby junction box where they shall be connected to an approved wiring method. Flexible battery cables shall also be permitted between batteries and cells within the battery enclosure. Such cables shall be listed for hard-service use and identified as moisture resistant.

IX. Systems Over 600 Volts

690.80 General.

Solar photovoltaic systems with a maximum system voltage over 600 volts dc shall comply with Article 490 and other requirements applicable to installations rated over 600 volts.

690.85 Definitions.

For the purposes of Part IX of this article, the voltages used to determine cable and equipment ratings are as follows.

Battery Circuits. In battery circuits, the highest voltage experienced under charging or equalizing conditions.

Photovoltaic Circuits. In dc photovoltaic source circuits and photovoltaic output circuits, the maximum system voltage.

Substantiation: This proposal is part of 2 other proposals dealing with interconnecting electric power sources in Article 690, Article 692 and Article 705. This proposal is part of 3 other proposals to place common definitions in Article 100. The purpose of this proposal is to revise Article 690. This work incorporates the equipment that would be listed by Underwriters Laboratory Standard 1741 - Inverters, Converters and Controllers for Use in Independent Power Systems.

The figure in the substantiation section of this proposal shows the common wiring in building systems that should be covered by Article 705. It also shows technology specific wiring that would be covered by Articles 690 and 692. The main purpose of this proposal is to put all interconnection requirements in Article 705 and all technology specific issues in their respective articles.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle

See panel action on Proposal 13-184, Article 705 and 13-71, Article 692.

Panel Statement: The panel did not accept the change as recommended in this proposal on Article 690. The panel concluded that this is a good idea and agreed to some of the recommended duplication of the interconnection issues in Article 705 (Proposal 17-184), but there was insufficient information provided as well as too little industry input to make the proposed change in Article 690. The panel has addressed elements of the issue in Proposal 13-184 (Article 705).

Number Eligible to Vote: 17
Ballot Results: Affirmative: 15 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
SWAYNE, R.: The Panel action should be Reject because the Panel did not accept the change and did not identify those items that are addressed in Proposal 13-184.
Comment on Affirmative:
BOWER, W.: I vote affirmative with comment. I agree with the panel action to **NOT** accept the sweeping change as recommended in this proposal on Article 690. Further, I disagree with the recommended duplication of the interconnection issues in Article 705 (Proposal 17-184) as accepted, without a thorough industry-supported substantiation for each change. The impacts for each technology must be assessed. There was insufficient substantiation provided with the proposal, and little industry input to make this proposed change in Article 690, 692 or 705. I believe this change that was accepted in principle for 705 brings the action to the attention of the industry and needs careful public and industry scrutiny.
HORNBERGER, B.: I agree with the panel action to accept in principle, however since the interconnection provisions have been incorporated in Article 705, the parallel redundant requirements for Photovoltaic utility interconnected power inverters should be removed from Article 690.
KRASTINS, K.: As indicated by the panel statements, none of the proposed language was included in Articles 690 or 692. There was no substantiation included in the originally submitted proposal, except for a statement as to the intent of the proposal. But even the intent of moving only those requirements applicable to all interconnected power systems from Articles 690 and 692 is not adhered to entirely by the submitter. In some instances, requirements have been moved directly from those articles, in other instances requirements have been cherry-picked from one article or the other, in some instances requirements were deleted, and in other instances entirely new requirements are introduced. Without substantiation for each proposed change, it is difficult to evaluate the validity of choosing the language of the proposed changes over requirements that could be more appropriate and technically sound. As just one example illustrates, there is no technical substantiation provided as to why rotating equipment is subject to a single requirement (705.43) while static inverters are subject to several pages of requirements (705.60 through 705.100).
The intent of the submitter is a laudable one but requires further industry input and review to ensure that technology-specific requirements are not inadvertently introduced into Article 705 or removed from Articles 690 and 692.
STAFFORD, T.: This Panel Member agrees with the intent of the submitter that all of the interconnection issues should be addressed in a single article of the NEC. The action taken by the panel is welcomed as a first step to determine a uniform acceptance of interconnection issues within the NEC.
ZGONENA, T.: More input is needed from the DG industries that will be impacted by Article 705 to ensure it addresses the nuances of the various DG products.

13-18 Log #546 NEC-P13 **Final Action: Accept in Principle**
(690 and 690.50 (New))

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal since 250.120(C) deals with equipment grounding conductors, not equipment bonding jumpers. This action will be considered by the Panel as a Public Comment.
Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise the title of Part V of Article 690 as follows:
Part V Grounding <u>and Bonding</u> .
Add a new section that covers bonding jumper sizes and physical protection as follows:
<u>690.50 Bonding Jumpers. Bonding jumpers installed exposed between modules shall be not less than 6 AWG and shall not be subject to physical damage.</u>
Substantiation: 690.48 and 690.49 cover bonding requirements. It is logical for the title of Part V of Article 690 to include bonding since bonding is covered in 690.48 and 690.49. The definition of Bonded (Bonding) includes the concept of maintaining continuity between metallic parts to form an electrically conductive path. 690.48 and 690.49 are both related to establishing and maintaining continuity and both sections use the term “bonding jumper.”
Photovoltaic modules installed in arrays are often required to be bonded together with bonding jumpers but no Code rules currently exist that address concerns about protection from physical damage of such bonding jumpers. These bonding jumpers are installed exposed and requirements for a minimum size will ensure a greater degree of protection.
Panel Meeting Action: Accept in Principle
Add a new section 690.50
<u>690.50 Equipment Bonding Jumpers. Equipment bonding jumpers, if used, shall comply with 250.120(C).</u>
Panel Statement: The proposed wording should satisfy the intent of the submitter, as this change affords equivalent protection while using existing language from Article 250.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 15 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
SWAYNE, R.: The Panel Action is contrary to the proposal recommendation. The proposed change requires that the bonding jumper be 6 AWG or larger. The Panel reference to 250.120(C) refers to equipment grounding conductors, not bonding jumpers, and is for conductors smaller than 6 AWG, not larger. Additionally, the proposed change to add “and Bonding” is appropriate since the Panel Action refers to “Bonding Jumpers”.
Comment on Affirmative:
BOWER, W.: I vote affirmative with comment on the panel action’s new language “690.50 Equipment Bonding Jumpers. “Equipment bonding jumpers, if used, shall comply with 250.120(C).” There an inconsistency in the terminology in that the new 690.50 actually refers to Equipment Grounding Conductors therefore the title should be changed to “ **Equipment Grounding Conductors** ” and the first sentence changed to “ **Equipment grounding conductors ~~, if used,~~ shall comply...** ” I also note there is an excellent chance that this reference to 250.120(C) will be interpreted to mean “ **all** ” equipment-grounding conductors used between PV modules must be 6 AWG minimum. The language in Article 690 must be explicit and clear therefore I suggest a fine print note to address the issues listed below. A suggested fine print note would read
FPN: Physical limitations associated with PV modules often limit the size of equipment grounding conductors that can be attached, with some as small as 10AWG. PV module instruction manuals often dictate the size of directly attached wire connections. When conductors are less than 6AWG, stress relief of the conductor is recommended for wire lengths less than 6 inches. Approved alternate methods of grounding will be provided with PV modules where applicable.
This FPN addresses the following:
1. Most, if not all, PV modules are constructed so as they cannot accept greater than a 10 AWG conductor without additional hardware.
2. Some modules have pre-punched grounding holes that are located where the addition of hardware to accommodate 6 AWG conductors is difficult or impossible.
3. UL 1703 and IEC 61730 PV module standards are being revised to allow several alternate methods of grounding.
4. The term “bonding jumper” as accepted propagates the “equipment grounding” confusion and is not appropriate for these “equipment-grounding conductors”. In fact the reference in the accepted language refers to 250.120(C), which is the section for equipment grounding conductors.

13-19 Log #1524 NEC-P13 **Final Action: Reject**
(690 and 702)

Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Revise Articles 690 and 702 as described in the following, relative to the terms bonding and grounding.
690.47(C)(1) Revise 690.47(C)(1) as follows:
(1) A grounding-electrode conductor shall be connected between the identified dc grounding point to a separate dc grounding electrode. The dc grounding-electrode conductor shall be sized according to 250.166. The dc grounding electrode shall be ~~bonded~~ <u>connected</u> to the ac grounding electrode to make a grounding electrode system according to 250.52 and 250.53. The bonding conductor shall be no smaller than the largest grounding electrode conductor, either ac or dc.
702.10(B)Revise 702.10(B) as follows:
(B) Nonseparately Derived System Where a portable optional standby source is used as a nonseparately derived system, the equipment grounding conductor shall be <u>connected</u> ~~bonded~~ to the system grounding electrode.
Substantiation: 690.47(C)(1): Connected is proposed to work cooperatively with the proposed revision of the definition of bonded (bonding).
702.10(B): Connected is proposed to work cooperatively with the proposed revision of the definition of bonded (bonding).
This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to the proposed revision to the terms “bonded”, “grounded”, and “equipment grounding conductor” in Article 100 relative to this Task Group’s recommendations. These changes clarify the present requirement in more prescriptive language.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The text in question has been deleted by another proposal (13-51).
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.

13-20 Log #891 NEC-P13 **Final Action: Accept**
(690.3 Exception)

Submitter: Noel Williams, Noel Williams Consulting
Recommendation: Revise 690.3, Exception as follows:
"Solar photovoltaic systems, equipment, or wiring installed in a hazardous (classified) location shall also comply with the applicable portions of Articles 500 through 516 ~~500.1, 505.1, and 510.1.~~
Substantiation: The current language refers only to scope sections that contain no requirements. The requirements that might apply are elsewhere in the articles and the referenced requirements should include all classified areas, not just Class I areas.
Panel Meeting Action: Accept
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.
Comment on Affirmative:
BOWER, W.: I vote affirmative with a comment because the reference to Articles 500 through 516 is better than the reference to scopes being replaced, but in contradiction with the style manual and makes using the code even more cumbersome. A task group or knowledgeable person should use the public comment period to search through the Articles 500 through 516 and reference only the applicable sections.

13-21 Log #2083 NEC-P13 **Final Action: Accept in Principle**
(690.4(D))

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Recommendation: Revise the section as follows:
690.4(D) Equipment. Inverters ~~or motor generators~~ , photovoltaic modules, photovoltaic panels, ac photovoltaic modules, source-circuit combiners, and charge controllers intended for use in photovoltaic power systems shall be identified and listed for the application .
Substantiation: Motor generators are removed from the requirement since motor generators have not been used in PV systems for more than 10 years. The complexity of PV system equipment and PV system designs dictate that the PV modules, the combiner boxes, the charge controllers, and the inverters be identified for use in PV systems and examined for safety (listed) by a third party against standards established by Underwriters Laboratory (UL). Electrical inspectors, sometimes faced with systems containing unlisted equipment in these categories, have requested that this complex equipment be specifically listed to assist them in their jobs. Also the identification and proper listing of these components would rule out the inappropriate use of electrical components such as inverters and charge controllers that may be listed to inappropriate standards such as telecom and marine standards.
Panel Meeting Action: Accept in Principle
Revise proposal to read as follows:
690.4(D) Equipment. Inverters, ~~or~~ motor generators, photovoltaic modules, photovoltaic panels, ac photovoltaic modules, source-circuit combiners, and charge controllers intended for use in photovoltaic power systems shall be identified and listed for the application .
Panel Statement: The panel does not accept the deletion of motor generators, as this would allow unlisted devices to be used.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.

13-22 Log #2060 NEC-P13 **Final Action: Accept**
(690.5)

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal on Exception No. 2 since the size of an equipment grounding conductor is based on overcurrent protective devices in accordance with 250.122, not based upon the ampacity of the conductor with temperature and conduit fill correction factors. The Technical Correlating Committee directs that the Panel Action on Exception No. 2 be referred to Code-Making Panel 5 for comment.
Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Recommendation: Revise the section as follows:
690.5 Ground-Fault Protection. ~~Roof-mounted dc photovoltaic arrays located on dwellings shall be provided with dc ground-fault protection to reduce fire hazards.~~
Grounded dc photovoltaic arrays shall be provided with dc ground-fault protection meeting the requirements of 690.5 (A) through (C) to reduce fire hazards. Ungrounded dc photovoltaic arrays shall comply with 690.35.
Exception 1: Ground-mounted or pole-mounted photovoltaic arrays with not more than two paralleled source circuits and with all dc source and dc output circuits isolated from buildings shall be permitted without ground-fault protection.
Exception 2: PV arrays mounted on other than dwelling units shall be permitted without ground-fault protection if each equipment-grounding conductor has an ampacity of at least two (2) times the temperature and conduit fill corrected circuit conductor ampacity.
Substantiation: Recent ground-fault events and analyses of different types of PV systems, possible types of ground faults, and circulating ground-fault currents have revealed the necessity of requiring these ground-fault protection devices (fire hazard reduction) on nearly all PV arrays, not just PV arrays on the roofs of dwellings. Ground faults in PV source and output circuits can result in continuously circulating full output short-circuit currents that do not trip overcurrent devices. It is not possible to place an overcurrent device in a circuit conductor (either grounded or ungrounded) that can interrupt these ground-fault currents without affecting the ability of the circuits to carry normal and expected operating currents. The current-limited characteristic of PV modules, sub arrays, and arrays and the ability to generate sustained ground-fault currents dictate that these ground-fault currents are sensed and interrupted at current levels depending on the system size to eliminate the need for significant over sizing of equipment-grounding conductors. Over-sizing of equipment-grounding conductors is also an option on installations that do not involve dwelling units. UL listing of the applicable equipment (inverters, charge controllers, and separate ground-fault devices) will determine the fault detection level. Ground faults involving arcing fault currents will also be interrupted at this value. Related proposals are also being made for 690.5(A) and 690.45.
UL is developing parallel requirements in UL Standard 1741 for PV inverters. The ground-fault protective device will be integral with utility-interactive inverters and any inverter that has the output of the PV array connected directly to the inverter (for example, some inverters that have battery back up capabilities). Stand-alone PV systems (usually 12-48 volts nominal) will use the separate ground-fault protective devices already available.
The first exception is added because there is little danger of fire (either in the PV array wiring or in a building) on a ground-mounted or pole-mounted PV array with the dc circuits isolated from any building where there are not more than two parallel-connected source circuits.
The second exception applies to non-dwelling unit installations. All dwelling unit installations must have ground-fault protection to reduce fire hazards. In other than dwelling unit installations, the use of equipment-grounding conductors with an ampacity two times the ampacity of the circuit conductors will provide adequate safety for the possibly large circulating ground-fault currents discussed above.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept
Number Eligible to Vote: 17
Ballot Results: Affirmative: 15 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
SWAYNE, R.: Exception 2 should be rejected. It is not apparent why an equipment grounding conductor that is twice the size of the circuit conductor will provide safety since this same ground fault current would also flow in the circuit conductors. It would appear, then, that the circuit conductors should also be doubled in size. Will this sizing be adequate to provide the additional fault current necessary to operate the overcurrent device?

13-23 Log #2065 NEC-P13 **Final Action: Accept in Principle**
(690.5(A))

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Recommendation: Revise the section as follows:
690.5(A) Ground-Fault Detection and Interruption . The ground-fault protection device or system shall be capable of detecting a ground-fault current, interrupting the flow of fault current, and providing an indication of the fault.
Automatically opening the grounded conductor of the faulted circuit to interrupt the ground-fault current path shall be permitted. If a grounded conductor is opened to interrupt the ground-fault current path, all conductors of the faulted circuit shall be automatically and simultaneously opened.
Manual operation of the main PV dc disconnect shall not activate the ground-fault protection device or result in grounded conductors becoming ungrounded.
Substantiation: The added second paragraph is moved from 690.5(B) to 690.5(A) because it describes the various optional methods of interrupting the fault current as required by 690.5(A). A minor grammatical error was corrected.
The addition of the third paragraph establishes requirements that prevent interconnecting the main dc PV disconnect with the ground-fault protection device that could leave the PV array ungrounded when the PV disconnect was opened manually during normal service operations or in other situations. The intent is to keep a grounded PV system solidly grounded under all normal operating conditions including when the main PV or other disconnect is opened. This procedure minimizes the hazards of having white-colored grounded conductors possibly floating and energized. Only during automatic ground-fault actions (an abnormal condition) should these conductors be allowed to be ungrounded to deal with the ground fault.
Panel Meeting Action: Accept in Principle
Revise the section to read as follows:
690.5(A) Ground-Fault Detection and Interruption . The ground-fault protection device or system shall be capable of detecting a ground-fault current, interrupting the flow of fault current, and providing an indication of the fault.

Automatically opening the grounded conductor of the faulted circuit to interrupt the ground-fault current path shall be permitted. If a grounded conductor is opened to interrupt the ground-fault current path, all conductors of the faulted circuit shall be automatically and simultaneously opened.

Exception: Product listing shows equivalent protection

When the main PV dc disconnect also activates the ground-fault protection device or results in grounded conductors becoming ungrounded, it shall be labeled: Warning: PV CIRCUIT CONDUCTORS ARE UNGROUNDED WHEN IN THE OFF POSITION.

Panel Statement: The panel added an exception to allow listed equipment that is capable of interrupting the flow of fault current to be used.

In addition, the requirement for a redundant disconnect was changed to a labelling requirement, as no known safety hazard exists.

Number Eligible to Vote: 17

Ballot Results: Affirmative: 15 Negative: 1

Ballot Not Returned: 1 Gustafson, R.

Explanation of Negative:

ZGONENA, T.: Subsequent to the panel meeting, it was determined that this proposal is in direct conflict with the following requirement that was recently added to UL 1741 for PV inverters. This requirement becomes effective on May 7, 2007.

31.9 An integral ground-fault detector/interrupter (GFDI) or a separate device shall not be linked to any main photovoltaic disconnect (internal or external to the unit) and operation of the main photovoltaic disconnect shall not affect the normal grounding of the system.

The justification for the UL 1741 requirement included:

1. A combined GFDI/disconnect would not allow for differentiation between the functions. If the system is approached and the GFDI/disconnect is in the “Off” position, it is not possible to known whether a ground fault occurred or if the system was merely turned off. If a ground fault occurs when the switch is opened, a ground fault will not be indicated. If the ground-fault clears itself, then there will be no indication that a ground fault has occurred.

2. Every time a combined PV GFDI/disconnect is opened, whether to service the equipment or during a ground fault, the PV array becomes ungrounded. Grounded conductors, marked white, are now ungrounded and energized presenting a safety hazard for service persons that expects white conductors to be either at ground potential or not energized.

Comment on Affirmative:

BOWER, W.: I vote affirmative with comment. The action described in the last paragraph of the accepted language “When the main PV dc disconnect also activates the ground-fault protection device or results in grounded conductors becoming ungrounded, it shall be labeled: Warning: PV CIRCUIT CONDUCTORS ARE UNGROUNDED WHEN IN THE OFF POSITION.” is contrary to the current version of the UL1741 standard for listing inverters, so either the new code language or the UL standard needs revision.

13-24 Log #224 NEC-P13 **Final Action: Reject**
(690.5(B))

NOTE: The following proposal consists of Comment 13-12 on Proposal 13-26 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 13-26 was:

Change the title of the section and revise the text:

690.5(B) Shutting Down the Faulted System. The ground-faults device or system shall automatically disconnect the ungrounded faulted conductors and/or shut off the utility-interactive inverter or charge controller for that portion of the faulted array. If the grounded conductor of the faulted source or output circuit is disconnected to comply with 690.5(A), all conductors of the faulted source or output circuit shall be opened automatically and simultaneously. Opening the grounded conductor of the faulted source or output circuit shall be permitted to interrupt the ground-fault current path.

The Technical Correlating Committee directs that the Panel Action on Comment 13-12 be reported as “Hold” consistent with Section 4-4.6.2.2(a) of the NFPA Regulations Governing Committee Projects.

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University

Recommendation: Revise the proposal as follows:

690.5(B) Disabling the Faulted System. The ground-fault device or system shall automatically disconnect the ungrounded faulted conductors and/or shut off the utility-interactive inverter or charge controller for that portion of the faulted array. If the grounded conductor of the faulted source or output circuit is disconnected to comply with 690.5(A), all conductors of the faulted source or output circuit shall be opened automatically and simultaneously. Opening the grounded conductor of the faulted source or output circuit shall be permitted to interrupt the ground-fault currents.

Substantiation: The words “Shutting Down” in the Section Title were replaced with the less awkward term “Disabling.”

While the current 690.5(A) and 690.5(B) ensure adequate language to safely disable the PV array and remove faults as mentioned in the Panel Statement, it is becoming increasingly difficult to provide automatic disconnect equipment that can operate at the higher voltages (up to 600) and/or currents (more than 100 amps) that are occurring more frequently in modern residential PV systems. While such disconnect equipment is available (i.e. industrial motor-driven safety switches), the cost and size of this equipment precludes using it in residential PV systems. Electronic shutdown of the inverters or charge controllers provides equivalent system protection since it provides the same alerting feature as disconnected conductors - no power/current is allowed through the faulted system. Underwriters Standard for Safety 1741 (Inverters and Charge Controllers) allows such electronic shutdown and UL-listed equipment is being sold and installed throughout the country.

This proposal adds an optional method of disabling the faulted circuits (i.e. shutting down the electronic equipment). It does not necessarily increase the complexity of meeting the requirement and many low-voltage, low-power PV systems mounted on the roofs of dwellings will continue to meet the requirements of this section by using ground-fault systems that disconnect ungrounded conductors.

Panel Meeting Action: Reject

Panel Statement: See Panel action of Proposal 13-25, which completely revised this section. Proposal 13-25 more accurately reflects the intent and requirements of this section. Also, the last two sentences of this section were moved to 690.5(A) in the panel action on Proposal 13-23.

Number Eligible to Vote: 17

Ballot Results: Affirmative: 16

Ballot Not Returned: 1 Gustafson, R.

13-25 Log #2084 NEC-P13 **Final Action: Accept**
(690.5(B))

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum

Recommendation: Revise the section as follows:

(B) ~~Disconnection of Conductors.~~ ~~The ungrounded conductors of the faulted source circuit shall be automatically disconnected. If the grounded conductors of the faulted source circuit are disconnected to comply with the requirements of 690.5(A), all conductors of the faulted source circuit shall be opened automatically and simultaneously. Opening the grounded conductor of the array or opening the faulted sections of the array shall be permitted to interrupt the ground-fault current path.~~

(B) Isolating Faulted Circuits. The faulted circuits shall be isolated by one of the two following methods.

(1) The ungrounded conductors of the faulted circuit shall be automatically disconnected.

(2) The inverter or charge controller fed by the faulted circuit shall automatically cease to supply power to output circuits.

Substantiation: Revising the title from “Disconnection of Conductors” to “Isolating Faulted Circuits” more accurately reflects the intent and requirements of the section. An inverter that ceases to supply power provides the desired effect: The faulted PV circuit (including the inverter) produces no power, is essentially isolated from other circuits in the system, and the lack of output power provides additional safety and an additional indication that there is a problem. UL is currently listing inverters that cease to supply power under ground-fault conditions as meeting this requirement as written in the *2005 NEC* . These utility-interactive inverters do not fully shut down or turn off because they must continually provide an indication of the ground fault. A similar requirement would apply to charge controllers if option (1) were not used. The rewording allows the code requirements to agree with the existing listed hardware that has been deemed to meet safety standards.

The last two sentences in this section are moved to 690.5(A) where they properly describe options for interrupting fault currents. These sentences do not deal with isolating faulted circuits.

Panel Meeting Action: Accept

Number Eligible to Vote: 17

Ballot Results: Affirmative: 16

Ballot Not Returned: 1 Gustafson, R.

13-26 Log #2066 NEC-P13 **Final Action: Accept in Principle**
(690.5(C))

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum

Recommendation: Revise the section as follows:

(C) Labels and Markings. A warning label ~~Labels and markings~~ shall appear on the utility-interactive inverter or be applied by the installer near the ground-fault indicator at a visible location stating ~~that, if a ground fault is indicated, the normally grounded conductors may be energized and ungrounded~~ the following :

WARNING
ELECTRIC SHOCK HAZARD
IF A GROUND FAULT IS INDICATED, ALL NORMALLY GROUNDED CONDUCTORS MAY BE UNGROUNDED AND ENERGIZED

When the photovoltaic system also has batteries, the same warning shall also be applied by the installer in a visible location at the batteries.

Substantiation: A ground fault in a PV system and the response of the required ground-fault protection device modify the normal grounding of the system. The need for an appropriate warning label on the inverter containing the ground-fault device or an installer-applied label on those systems with a separate ground-fault device must be clearly defined. Requiring specific wording and a second label on the battery banks (if installed and usually operating at or less than 48 volts, nominal) will increase user/operator awareness and is required since the battery banks may also become ungrounded during ground faults.
Panel Meeting Action: Accept in Principle
Revise to read the section as follows:
(C) Labels and Markings. A warning label ~~Labels and markings~~ shall appear on the utility-interactive inverter or be applied by the installer near the ground-fault indicator at a visible location stating ~~that, if a ground fault is indicated, the normally grounded conductors may be energized and ungrounded~~ the following :

WARNING
ELECTRIC SHOCK HAZARD
IF A GROUND FAULT IS INDICATED, NORMALLY GROUNDED CONDUCTORS MAY BE UNGROUNDED AND ENERGIZED

When the photovoltaic system also has batteries, the same warning shall also be applied by the installer in a visible location at the batteries.
Panel Statement: The panel deleted the word "all" in the warning label from the proposal, as it was deemed unnessary.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.
Comment on Affirmative:
BOWER, W.: I vote affirmative with a comment to better define the language. I suggest that the last sentence be changed from "When the photovoltaic system also has batteries, the same warning shall also be applied by the installer in a visible location at the batteries" to "When the photovoltaic system includes batteries an identical warning shall be applied at a visible location at the batteries."

13-27 Log #2085 NEC-P13 **Final Action: Accept**
(690.7(A))

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Recommendation: Add the following sentence to this section as a second paragraph and completely replace the Table 690.7 as follows:
When open-circuit voltage temperature coefficients are supplied in the instructions for listed PV modules, they shall be used to calculate the maximum photovoltaic system voltage as required by 110.3(B) instead of using Table 690.7.

Table 690.7 Voltage Correction Factors for Crystalline and Multicrystalline Silicon Modules

Correction Factors for Ambient Temperatures Below 25°C (77°F). (Multiply the rated open circuit voltage by the appropriate correction factor shown below)

Ambient Temperature (°C)	Factor	Ambient Temperature (°F)
24 to 20	1.02	76 to 68
19 to 15	1.04	67 to 59
14 to 10	1.06	58 to 50
9 to 5	1.08	49 to 41
4 to 0	1.10	40 to 32
-1 to -5	1.12	31 to 23
-6 to -10	1.14	22 to 14
-11 to -15	1.16	13 to 5
-16 to -20	1.18	4 to -4
-21 to -25	1.20	-5 to -13
-26 to -30	1.21	-14 to -22
-31 to -35	1.23	-23 to -31
-36 to -40	1.25	-32 to -40

Substantiation: Some PV module manufacturers are supplying the necessary open-circuit voltage temperature coefficients in the instruction manuals for their modules. The use of these coefficients to determine the maximum system voltage at temperatures below 25°C (77°F) will be more accurate than using Table 690.7. Section 110.3(B) requires that these instructions be followed for listed products.
Table 690.7 has been expanded to provide more resolution in the look-up procedure. This expansion can result in more accurate maximum system voltage calculations.
The temperatures in the table have been rounded to whole numbers and the °F values have been adjusted to provide continuous ranges with no gaps.
Panel Meeting Action: Accept
Number Eligible to Vote: 17
Ballot Results: Affirmative: 15 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
SWAYNE, R.: This proposal should be rejected because it does not provide information to all who may have a need for it. The Authority Having Jurisdiction does not have access to instructions and must rely on the Code. If a module is replaced with one having a different temperature coefficient, the maximum circuit voltage may change. This is similar to Article 430 Part XIV where the table values rather than nameplate are used for ampacity rating.

13-28 Log #2769 NEC-P13 **Final Action: Reject**
(690.8(A)(1))

Submitter: Truman C. Surbrook, Michigan State University
Recommendation: Delete the words "multiplied by 125 percent" from the end of the sentence so the section reads as follows:
(1) Photovoltaic Source Circuit Currents. The maximum current shall be the sum of parallel module rated short-circuit currents ~~multiplied by 125 percent~~ .
Substantiation: Minimum size of conductor and overcurrent protection is specified in 690.8(B) and are required to be rated at 125 percent. Is it the intent to multiply the source circuited current by 125 percent twice? In 690.8(A)(1) photovoltaic source circuit current is determined by taking the sum of the parallel module short circuit currents and multiplying by 1.25. In 690.8(A)(2) the output circuit current is the sum of the source circuit currents. In 690.8(B)(1) the conductors and overcurrent device are required to carry 125 percent of the output circuit current which is already based on 125 percent of the rated maximum module shot circuit current. Is it necessary to increase the size by 25 percent twice? The conductor is, therefore, sized at 156 percent of the rated maximum short circuit current.
Panel Meeting Action: Reject
Panel Statement: Double de-rating is required due to the continuous nature of the power source and enhanced solar radiation.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.
Comment on Affirmative:
SWAYNE, R.: I agree with the Reject action but there still appears to be a problem with whether or not double derating is required. There should be an explicit requirement for double derating as indicated by the Panel Statement.

13-29 Log #2067 NEC-P13 **Final Action: Accept in Principle**
(690.10(A))

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Recommendation: Revise the section as follows:
(A) Inverter Output. The ac ~~inverter~~ output from the stand-alone inverter(s) ~~system~~ shall be permitted to supply ac power to the building or structure service disconnecting means at current levels ~~below the rating of that disconnecting means.~~ less than the calculated load connected to that disconnect. The inverter output rating or the rating of an alternate energy source shall be equal to or greater than the load posed by the largest single utilization equipment that may be connected to the system. Calculated, general lighting loads shall not be considered as a single load.
Substantiation: Some AHJs are requiring that the PV system have an output rated equal to the rating of the service entrance equipment and/or calculated loads. For example, some AHJs are requiring a PV system with a 240-volt, 200-amp ac output.
Stand-alone PV systems (PV array, inverters, batteries) are designed and operated based on the available solar energy. Energy conservation by the users permits the supplied buildings or structures to be operated on significantly less power and energy than would normally be used in similar buildings. While the building wiring meets all *Code* requirements from the main service disconnect through the branch circuits for safety reasons as required by 690.10, the power and energy supplied by the stand-alone system need meet only the actual use requirements of the building as controlled by the user.
Article 702, Optional Standby Systems, also allows for the standby source to be sized for the supply of all equipment intended to be operated at one time
702.5 Capacity and Rating. An optional standby system shall have adequate capacity and rating for the supply of all equipment intended to be operated at one time. Optional standby system equipment shall be suitable for the maximum available fault current at its terminals. The user of the optional standby system shall be permitted to select the load connected to the system.
Although not a safety issue, good system design ensures that the electrical system is able to start and run the largest load on the site. This largest load may remain disconnected or turned off until needed by the user. The largest load might be a well pump, microwave oven, vacuum cleaner, furnace blower or the

like. This large load may be either hardwired or plug connected. Many systems have an alternate energy source (for example, backup or standby generator, wind system, or hydro system) that is used routinely to start and run larger loads. Either the inverter or the alternate energy source should be rated to start that single largest load. The inverter may be sized to start smaller loads than the alternate energy source can start. Because calculated lighting loads (3 watts/square foot) are under the direct control of the users, are intermittent in nature, and may be reduced to zero as desired, they should not considered a single load in the operation of a stand-alone PV system.

Panel Meeting Action: Accept in Principle

Revise the section to read as follows:

(A) Inverter Output. The ac ~~inverter~~ output from the stand-alone inverter(s) ~~system~~ shall be permitted to supply ac power to the building or structure service disconnecting means at current levels ~~below the rating of that disconnecting means.~~ less than the calculated load connected to that disconnect. The inverter output rating or the rating of an alternate energy source shall be equal to or greater than the load posed by the largest single utilization equipment connected to the system. Calculated, general lighting loads shall not be considered as a single load.

Panel Statement: The panel deleted "that may be" from the proposal, as it referred to the future and the assessment should be at the present.

Number Eligible to Vote: 17

Ballot Results: Affirmative: 14 Negative: 2

Ballot Not Returned: 1 Gustafson, R.

Explanation of Negative:

STAFFORD, T.: The proposed change would be redundant code. Taking a look at the scope for Article 702, a stand-alone PV system would fall under Article 702's scope. Article 702.5 already states what the submitter wishes to add. The necessity for non repetitious code is apparent; if we change how the capacity and rating of Optional Standby Systems it should be done uniformly and with the same provisions and requirements for all Systems.

SWAYNE, R.: The word "service" should not be added since not all buildings have an electrical supply directly from a utility.

13-30 Log #2086 NEC-P13 **Final Action: Accept in Principle**
(690.10(D))

TCC Action: The Technical Correlating Committee directs that the panel action be revised to change the Panel Action text from "are not required" to "shall not be required" to comply with 90.5(B) for permissive text.

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum

Recommendation: Add the new section as follows:

690.10(D) Energy Storage Requirements. This code neither requires nor specifies the size of any energy storage system in a stand-alone photovoltaic power system.

Substantiation: Some AHJs are requiring an energy storage source with any PV system, even where such energy storage sources are not necessary (such as water pumping systems). Other AHJs are requiring a minimum sized energy storage system that is not based on any particular knowledge of how the PV system is going to be used.

Stand-alone PV systems (PV array, inverters, batteries) are designed and operated based on the available solar energy. Some stand-alone PV systems are directly connected to the loads without any energy storage (for example, water pumping systems). When energy storage systems are employed, energy conservation by the users permits the supplied buildings or structures to be operated on significantly less power and energy than would normally be used in similar buildings. Users of these systems manually adjust energy usage to match available solar energy and the size of the energy storage system. Energy use may be reduced to zero or near zero during extended periods of cloudy weather, or a back-up energy supply may be used. Specifying some specific minimum size in the Code for the energy storage system is not practical given the numerous variables, nor is such a specification an electrical safety issue. This section should be added to the Code because some AHJs are trying to require a minimum size of battery bank.

Panel Meeting Action: Accept in Principle

Revise to read as follows:

690.10(D) Energy Storage or Backup Power System Requirements. Energy storage or backup power supplies are not required.

Panel Statement: Section 690.10 is written to expect the PV system to replace a typical utility service. Energy storage and backup power supplies should not be required if the loads are not expected to operate during low light levels. Storage may be other than electrical, such as stored water in a tank. Section 690.10(D) is another exception to the general rule in 690.10.

Number Eligible to Vote: 17

Ballot Results: Affirmative: 16

Ballot Not Returned: 1 Gustafson, R.

13-31 Log #2068 NEC-P13 **Final Action: Accept in Principle**
(690.10(E))

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum

Recommendation: Add the new section as follows:

690.10(E) Backup Power System. This code neither requires nor specifies the size of any backup power system in a stand-alone photovoltaic power system.

Substantiation: Some AHJs are requiring that stand-alone, off grid PV systems have backup generators. This requirement is not consistent with the design of many stand-alone PV systems.

Stand-alone PV systems (PV array, inverters, batteries) are designed and operated based on the available solar energy. Many stand-alone PV systems do not employ backup power systems. Energy conservation by the users allows the supplied buildings or structures to be operated on significantly less power and energy than would normally be used in similar buildings. Users of these systems manually adjust energy usage to match available solar energy and the size of the energy storage system. Energy use may be reduced to zero or near zero during extended periods of cloudy weather. Specifying the requirement in the Code for a backup power system is not practical given the numerous variables, would commonly entail the use of non-renewable fuels, nor is such a requirement an electrical safety issue. This section should be added to the Code because some AHJs are trying to require a backup power system for stand-alone PV systems.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Proposal 13-30, which should satisfy the intent of the submitter.

Number Eligible to Vote: 17

Ballot Results: Affirmative: 16

Ballot Not Returned: 1 Gustafson, R.

13-31a Log #CP1301 NEC-P13 **Final Action: Accept**
(690-13)

TCC Action: The Technical Correlating Committee understands that the Panel Action on this Proposal only revises the first sentence. The second sentence and the FPN remain unchanged.

Submitter: Code-Making Panel 13,

Recommendation: Revise 690-13 to read as follows:

Means shall be provided to disconnect all ~~current-carrying~~ ungrounded conductors of a photovoltaic power source from all other conductors in a building or other structure.

Substantiation: The first sentence in 690-13 was inconsistent with the second sentence.

Panel Meeting Action: Accept

Number Eligible to Vote: 17

Ballot Results: Affirmative: 16

Ballot Not Returned: 1 Gustafson, R.

Comment on Affirmative:

BOWER, W.: I vote affirmative with comment. Although the new language corrects the inconsistency in the first and second sentence of the 690.13 language, it appears to violate the original intent of the requirement. A thorough study is suggested.

KRASTINS, K.: The language proposed by the panel, requiring that a means shall be provided to disconnect all ungrounded current carrying conductors, could be misinterpreted to imply that a means for disconnecting ungrounded conductors (outside of ground fault protection) is not permitted. The panel should consider clarifying the language further to indicate that means for disconnecting grounded conductors is permitted.

13-32 Log #2087 NEC-P13 **Final Action: Accept**
(690.13)

TCC Action: The Technical Correlating Committee understands that the Panel Action on Proposal 13-31a modifies the Panel Action on this Proposal. The Technical Correlating Committee directs the panel to reconsider the use of the term "may" to be consistent with the NEC Style Manual. This action will be considered by the panel as a public comment.

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum

Recommendation: Revise the section as follows:

690.13 All Conductors. Means shall be provided to disconnect all current-carrying conductors of a photovoltaic power source from all other conductors in a building or other structure. A switch, circuit breaker, or other device, ~~unless that switch or circuit breaker is part of a ground-fault detection system required by 690.5 and that switch or circuit breaker is automatically opened and indicated as a normal function of the device in responding to ground faults.~~ either ac or dc, shall not be installed in a grounded conductor if operation of that switch, circuit breaker, or other device may leave the marked, grounded conductor in an ungrounded and energized state.

Exception: A switch or circuit breaker that is part of a ground-fault detection system required by 690.5 may be permitted to open the grounded conductor when that switch or circuit breaker is automatically opened and indicated only as a normal function of the device in responding to ground faults.

Substantiation: Other sections of the *Code* (240.22) allow a multi-pole overcurrent device to open a grounded conductor. This allowance is acceptable in a load circuit where the disconnected and the now ungrounded conductor becomes unenergized when it is disconnected from the source of energy. However, in many power source circuits such as dc PV source circuits and ac generator or inverter output circuits, the grounded circuit conductor is usually bonded to ground at a central location on the load side of any disconnecting means. If the disconnecting means or overcurrent device opens the grounded circuit conductor, then that conductor (usually marked white as a grounded conductor) on the source side of the disconnect may be energized and ungrounded. This is an unsafe condition and should only occur under abnormal conditions such as during a ground fault. This proposal addresses the issue for PV source/supply circuits (ac and dc), where these types of circuits may be more common than load circuits that are used (and ungrounded) in other electrical systems, and prevents the ungrounded conductor from being opened under normal operation.

The exception is slightly reworded to allow the grounded conductor to be opened when and only when opened as an automatic function of a code-required ground-fault device. This clarified requirement will ensure that 690.5 ground-fault protection devices are not included as part of the main user-accessible PV disconnect switch that could open a grounded conductor or unground the PV array under normal, manual shutdown operations.

Panel Meeting Action: Accept
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.

13-33 Log #2909 NEC-P13 **Final Action: Reject**
(690.13)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Delete the words "and indicated" from the last sentence, and add the following sentence at the end: "The switch or circuit breaker shall be indicating."
Substantiation: Editorial. Expressing the indication requirement as a complete sentence is much more understandable. In addition, it uses a word ("indicating") that is customary in the NEC for this intent. Undoubtedly that was a factor in the kind expression of support for this wording by the senior member of the NEC Committee in the previous cycle.
Panel Meeting Action: Reject
Panel Statement: It is the occurrence of the ground fault that is required to be indicated, not the state of the switch.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.
Comment on Affirmative:

STAFFORD, T.: Although I agree with panel's action and statement, when we use a switch or circuit breaker in a ground fault detection system, that device does the indicating. Instead of adding the following sentence at the end: "The switch or circuit breaker shall be indicating." We should have completed the sentence to read, "The switch or circuit breaker shall indicate the presence of a ground fault."

13-34 Log #2069 NEC-P13 **Final Action: Reject**
(690.14)

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Recommendation: Revise the section as follows:

690.14 Additional Provisions. <u>The main, direct-current (dc)</u> photovoltaic <u>output circuit</u> disconnecting means shall comply with 690.14(A) through 690.14(D).

Substantiation: The proposal clarifies the intent of this section to apply to the main (primary) dc PV disconnect and not to any secondary dc disconnects, or ac disconnects that may be installed in the same system, such as PV source-circuit combiner disconnects, PV disconnects between charge controllers and batteries, equipment servicing disconnects, or the ac disconnect on the output of a utility-interactive inverter.
Panel Meeting Action: Reject
Panel Statement: The proposed wording would prevent the provisions of 690.14(A) through 690.14(D) from applying to other disconnecting means in the system.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 15 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:

BOWER, W.: I vote negative to the reject. The panel statement was "The proposed wording would prevent the provisions of 690.14(A) through 690.14(D) from applying to other disconnecting means in the system." Actually the proposed wording applies only to 690.14(A) through 690.14(C). In my opinion, the intent of the proposal was to clarify that 690.14 applies to the main disconnect and <u>not</u> to other disconnects in the system. The requirements for other disconnects are spelled out in 690.13, 690.15 and 690.17.

13-35 Log #1492 NEC-P13 **Final Action: Accept in Principle**
(690.14(A))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Delete:

"...and shall be rated in accordance with 690.17."

Substantiation: Edit. "Rated" is usually associated with voltage or current; 690.17 has additional requirements and makes the proposed deletion superfluous.
Panel Meeting Action: Accept in Principle

Revise proposal to read as follows:

"...and shall <u>comply</u> with 690.17".

Panel Statement: The panel agrees with the intent of the submitter, and by changing the wording to "and shall comply with 690.17" fulfills the submitters original substantiation.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.

13-35a Log #CP1300 NEC-P13 **Final Action: Accept**
(690-14(C))

TCC Action: The Technical Correlating Committee understands that this change does not affect existing (1) through (5) of 690.14(C).
Submitter: Code-Making Panel 13,
Recommendation: Revise 690-14(C) to read as follows:

Requirements for Disconnecting Means. Means shall be provided to disconnect all <u>ungrounded</u> conductors in a building or other structure from the photovoltaic system conductors.

Substantiation: The existing language was inconsistent with 690-13.
Panel Meeting Action: Accept
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.
Comment on Affirmative:

BOWER, W.: I vote affirmative with comment. Although the new language corrects the inconsistency in the first and second sentence of the 690.14(C) language, it appears to violate the original intent of the requirement. A thorough study is suggested.

KRASTINS, K.: See my affirmative with comment on Proposal 13-31a.

13-36 Log #140 NEC-P13 **Final Action: Reject**
(690.14(C)(5))

Submitter: Daniel McIntyre, Town of Westwood, MA
Recommendation: Delete or change last sentence.

Means shall be provided to disconnect Array from source conductors outside the building at the Array.

Substantiation: All electric sources have some means of disconnection at the source including utility power. Fire departments and roof repair crews should be able to isolate the Array so the wiring across the roof is dead, to facilitate venting due to fire, ladder placement and roof repairs.
Panel Meeting Action: Reject
Panel Statement: A means to disconnect at the PV array is not always accessible or practical. The required use of metallic conduit from entrance into the building [690.31(E)] to the accessible disconnect provides safety similar to that of a service entrance drop.

In addition, the photovoltaic modules will still be energized even if the output circuits are disconnected.

Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.
Comment on Affirmative:

STAFFORD, T.: The submitter's intent is recognized as a potentially hazardous operating independent power production source. The panel action was correct in that all systems would be required to implement such disconnecting means, even for systems that are not practical or accessible to have such provisions incorporated.

13-37 Log #2088 NEC-P13 **Final Action: Accept in Principle**
(690.31(A))

TCC Action: The Technical Correlating Committee understands that the Panel Action on this Proposal only added a second paragraph to (A) and did not change the text nor combine the two sentences in the first paragraph into one sentence. The Technical Correlating Committee directs that this proposal be referred to Code-Making Panel 3 for comment.
Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum

Recommendation: Revise the section as follows:

(A) Wiring Systems. All raceway and cable wiring methods included in this Code and other wiring systems and fittings specifically intended and identified for use on photovoltaic arrays shall be permitted. When ~~Where~~ wiring devices with integral enclosures are used, sufficient length of cable shall be provided to facilitate replacement.

When PV source and output circuits operating at system voltages greater than 50 volts are installed in readily accessible locations, circuit conductors shall be installed in a raceway.

FPN: Photovoltaic modules operate at elevated temperatures when exposed to high ambient temperatures and to bright sunlight. These temperatures may routinely exceed 70°C (158°F) in many locations. Module interconnection conductors are available with insulation rated for wet locations and a temperature rating of 90°C (194°F) or greater.

Substantiation: PV source and output circuits may operate at dc voltages up to 600 volts. Voltages greater than 50 volts are deemed to be more dangerous than lower voltages. Single-conductor, exposed cables as allowed by 690.31(B) in readily accessible locations are subject to ready access by the unqualified public and are not generally designed to resist casual contact and/or abuse, either inadvertent or intentional. Public safety considerations dictate that they be afforded added physical protection by being installed in raceways. These same conductors in more protected areas that are not readily accessible (such as a close-to-roof mounted PV array) are not subject to casual contact and are afforded more physical protection by the location of the installation. These cables do not need to be installed in raceways.

Panel Meeting Action: Accept in Principle

Revise the proposal as follows:

(A) Wiring Systems. All raceway and cable wiring methods included in this Code and other wiring systems and fittings specifically intended and identified for use on photovoltaic arrays shall be permitted where wiring devices with integral enclosures are used, sufficient length of cable shall be provided to facilitate replacement.

Where photovoltaic source and output circuits operating at system voltages greater than 30 volts are installed in readily accessible locations, circuit conductors shall be installed in a metallic raceway.

FPN: Photovoltaic modules operate at elevated temperatures when exposed to high ambient temperatures and to bright sunlight. These temperatures may routinely exceed 70°C (158°F) in many locations. Module interconnection conductors are available with insulation rated for wet locations and a temperature rating of 90°C (194°F) or greater.

Panel Statement: The proposal was revised by deleting "when" in sentence two of first paragraph and the first word in paragraph two; and change "50" to "30" and adding "metallic" before "raceway" to make it consistent with Table 11(B), Note 4 for accessible Class II circuits in wet locations.

Number Eligible to Vote: 17

Ballot Results: Affirmative: 16

Ballot Not Returned: 1 Gustafson, R.

Comment on Affirmative:

BOWER, W.: I vote affirmative with comment to the panel action because the added term "metallic" before raceway should be removed. The other changes are technically correct. Adding the term "metallic" makes connections of the PV array impossible. Consider that the plastic module junction boxes manufactured on PV modules, when they exist with conduit knockouts, may be spaced as closely as 18 inches in some installations of adjacent PV modules. These are not easily connected with EMT without the possibility of over stressing them during the installation. There are no PV modules with metal junction boxes. Most module installations using conduit today use flexible, nonmetallic, liquidtight conduit with the appropriate fittings. Flexible, metallic liquidtight does not have sufficient temperature ratings and the metallic fittings provide no thermal isolation. Furthermore grounding metallic raceways connected between non-metallic junction boxes which contain no grounding provisions is impossible.

13-38 Log #2070 NEC-P13 **Final Action: Accept**
(690.31(B))

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum

Recommendation: Revise text to read:

(B) Single-Conductor Cable. Single-conductor cable type ~~s~~ ~~SE, UF, USE, and~~ USE-2, and single-conductor cable listed and labeled as Photovoltaic (PV) Wire shall be permitted in exposed outdoor locations in photovoltaic source circuits for photovoltaic module interconnections within the photovoltaic array . ~~where installed in the same manner as a Type UF multiconductor cable in accordance with Part II of Article 340. Where exposed to sunlight, Type UF cable, identified as sunlight-resistant shall be used~~ .

Exception: Raceways shall be used when required by 690.31(A).

Substantiation: Type USE cable was removed from the list of acceptable cables because it does not have the necessary 90°C, wet-rated insulation required in PV module wiring. Type UF cable was removed from the list because it is not readily available as a single conductor, and even when available, is restricted in the Code (340.8) and in the UL *White Book (General Equipment Directory-2005)* to a 60°C temperature rating. Type SE was removed from the list because it is commonly available only as a multi-conductor cable and may have only a 75°C insulation. A listed and labeled Photovoltaic (PV) Wire, complying with a new UL Subject 4703 for such cable, was added and is available for these installations. This cable has a 90°C, wet-rated insulation that is more durable than SE and USE cable insulation and it has passed the long-duration 720-hour accelerated sunlight/UV exposure tests. Passing such a test will allow the new PV wire to be marked "Sunlight Resistant." This PV Wire will also meet the requirements for PV cables on the ungrounded PV systems allowed by 690.35. The revised sentence restricts the use of these exposed cables to module interconnections within the PV array, and that should prevent them from being used away from the PV array (as some installers are doing). The reference to Article 340 is removed because connecting and routing conductors between modules has little relationship to the wiring requirements in 340 II. Long series-connected strings of PV modules and the marked grounding points on PV module frames (at the sides of the modules and away from the module junction boxes) preclude routing all conductors of a circuit together inside the PV array as required in 340 II. All conductors routed away from the PV array will be grouped together as a normal *NEC* Chapter 3 wiring system. See a related proposal for 690.43.

The new Exception is added to comply with the restrictions established for exposed conductors in readily accessible areas that are made in a proposal for 690.31(A).

Panel Meeting Action: Accept

Number Eligible to Vote: 17

Ballot Results: Affirmative: 16

Ballot Not Returned: 1 Gustafson, R.

13-39 Log #2089 NEC-P13 **Final Action: Accept in Part**
(690.31(E))

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum

Recommendation: Revise the section as follows:

690.31(E) Direct-Current Photovoltaic Source and Output Circuits Inside a Building. ~~Where~~ When direct current photovoltaic source or output circuits of a utility-interactive inverter from a building-integrated or other photovoltaic system are run inside a building or structure, they shall be contained in metallic raceways, metallic cable assemblies , or metallic enclosures, from the point of penetration of the surface of the building or structure to the first readily accessible disconnecting means. The disconnecting means shall comply with 690.14(A) through 690.14(D).

Substantiation: This proposal adds metallic cable assemblies to the list of allowable raceways. For new construction, the preferred wiring method is type MC cable or EMT for direct-current photovoltaic source circuits or the output circuits of a utility-interactive inverter from a building-integrated or other photovoltaic system run inside a building or structure. Other flexible metallic raceways or cable assemblies can be used that can meet the installation conditions (concealed spaces, length, etc.).

Panel Meeting Action: Accept in Part

Revise the section as follows:

690.31(E) Direct-Current Photovoltaic Source and Output Circuits Inside a Building. Where d irect current photovoltaic source or output circuits of a utility-interactive inverter from a building-integrated or other photovoltaic system are run inside a building or structure, they shall be contained in metallic raceways or metallic enclosures, from the point of penetration of the surface of the building or structure to the first readily accessible disconnecting means. The disconnecting means shall comply with 690.14(A) through 690.14(D).

Panel Statement: The panel preferred "Where" instead of "When" in compliance with the NEC Manual of Style. Most metallic cable assemblies are limited in their rating associated with grounding (250.118). The panel deleted "metallic cable assemblies."

Number Eligible to Vote: 17

Ballot Results: Affirmative: 16

Ballot Not Returned: 1 Gustafson, R.

Comment on Affirmative:

BOWER, W.: I vote affirmative for the panel action with the comment that the "metallic cable assemblies" term deleted by the panel should be reinstated. Other changes are technically correct. Every wiring system, including "metallic cable assemblies" has uses permitted and uses not permitted, as well as other restrictions. "Metallic cable assembles" are allowed for electrical wiring inside buildings and these are the only assemblies that can be readily installed in a retrofit in an existing dwelling. Furthermore, these PV systems installed on the roofs of dwellings employ a ground fault protection device that will typically limit any ground fault currents to about 1 amp or less (eliminating the concern that faults might stress the equipment grounding provisions in metallic cable assemblies).

FLACH, G.: Change AIP to read:

"Where direct current photovoltaic source or output circuits of a utility-interactive inverter from a building-integrated or other photovoltaic system are run inside a building or structure they shall be contained in metallic raceways, Type MI cable, Type MC cable with an impervious outer jacket or metallic enclosures...".

13-40 Log #2061 NEC-P13 **Final Action: Accept in Principle**
(690.31(F) (New))

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Recommendation: Add the new section as follows:
690.31(F) Flexible, Fine-Stranded Cables. Flexible, fine-stranded cables shall only be terminated with terminals, lugs, or connectors that are identified and listed for such use.
Substantiation: UL Standard 486 A and B requires that connectors, lugs, and terminals that are intended for use with fine-stranded cables be so marked for use with such cables. Very few connectors and terminals have been listed for such use and few are so marked. The vast majority of connectors and terminals are unsuitable for use with flexible, fine-stranded cables. However, the limited distribution and wording of the standard has resulted in these non-marked connectors being used improperly with flexible, fine-stranded cables. Failures in several widely different industries have been reported.
A similar proposal has been submitted for 110.14(A).
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Add the new section as follows:
690.31(F) Flexible, Fine-Stranded Cables. Flexible, fine-stranded cables shall only be terminated with terminals, lugs, devices, or connectors that are identified and listed for such use.
Panel Statement: The panel added the word "devices," as there may be other devices that are listed for the purpose.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 15 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
NASBY, J.: The proposal is overly restrictive. It imposes a burden on all fine strand cable regardless of gauge and regardless of what circuit the cable is used and whether or not every circuit is covered by this section. Further, it discourages the use of fine strand cable in favor of building type wire or cable when fine strand cable may be more appropriate. The proposal also fails to recognize other, commercially available, suitable means of handling the purported cable termination problem.
Moreover, this is a workmanship issue not a Code issue per Article 110.12. Multiple sources of wire ferrules exist that address this issue.

13-41 Log #2071 NEC-P13 **Final Action: Accept in Principle**
(690.33(C))

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Recommendation: Add a second sentence to this section as follows:
Connectors that are readily accessible in circuits operating at over 50 volts (maximum system voltage for dc circuits or nominal voltage for ac circuits) shall require a tool to open.
Substantiation: Circuits with operating voltages above 50 volts (either dc maximum systems voltages or ac nominal voltages) pose shock hazards when the energized conductors are exposed. Note the grounding requirement established at this voltage limit in 690.41. Connectors are allowed in PV systems (690.33), and they are commonly used in PV source circuits where the voltages typically range from 27 volts to 600 volts. Most of the currently used connectors are of the latching type and may be opened by just pulling them apart. Although these existing connectors are manufactured as "touch safe," they are not designed to be opened under load. If inadvertently opened under load, the resulting arc (particularly on dc circuits) may disable the "touch-safe" feature by carbonizing the insulation. The carbonized connector part now has a conductive tip, is energized, and represents a shock hazard. Where these connectors are installed in readily accessible locations, they should be of a type that requires a tool to open. In not-readily-accessible locations, it is doubtful that the unqualified person will have access to these areas and the "tool-required" feature is not needed. The "tool" may be a connector-specific opening device or merely the blade of a screwdriver or other pointed instrument. In some cases, the connector may consist of a latching connector with a locking shell that prevents the connector from being pulled apart. UL is developing changes to UL Standard 1703 that will apply these requirements to the connectors attached to listed PV modules. This proposal will ensure that other field-installed connectors used in the system will meet the same safety requirement. An Exception is being proposed for 690.33(E) that will require a warning label on these connectors.
Panel Meeting Action: Accept in Principle
Change "50 volts" to "30 volts"
Panel Statement: See panel action on Proposal 13-37. The panel changed the voltage from "50" to "30" to make it consistent with Table 11(B), Note 4 for accessible Class II circuits in wet locations.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.

13-42 Log #2090 NEC-P13 **Final Action: Accept in Principle**
(690.33(E) Exception (New))

TCC Action: The Technical Correlating Committee understands that the Panel Action on Proposal 13-41 modifies the Panel Action on this Proposal.
The Technical Correlating Committee directs that the action on this Proposal be rewritten to comply with the NEC Style Manual to read as follows: "Connectors shall comply with either (1) or (2):".
Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Recommendation: Add the new exception as follows:
690.33(E) Interruption of Circuit . The connectors shall be capable of interrupting the circuit current without hazard to the operator.
Exception: Connectors marked: "Do Not Disconnect Under Load" or "Not for Current Interrupting"
Substantiation: All existing latching type and locking type (locks are releasable by hand) connectors used in PV systems today suffer damage if disengaged under load and may present a shock hazard even though the basic design is "touch safe". Therefore, all of them have to be labeled as mentioned in the exception as a matter of fact. The exception establishes the requirement that will apply to all connectors available today while the basic 690.33(E) remains unchanged and can be applied when new connectors are developed.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
690.33 Connectors. The connectors permitted by Article 690 shall comply with 690.33(A) through 690.33(E).
(A) Configuration. The connectors shall be polarized and shall have a configuration that is noninterchangeable with receptacles in other electrical systems on the premises.
(B) Guarding. The connectors shall be constructed and installed so as to guard against inadvertent contact with live parts by persons.
(C) Type. The connectors shall be of the latching or locking type.
(D) Grounding Member. The grounding member shall be the first to make and the last to break contact with the mating connector.
(E) Interruption of Circuit. ~~The c~~ Connectors shall either (1) or (2):
1. Be rated for interrupting current without hazard to the operator.
2. Be a type that requires the use of a tool to open and marked "Do Not Disconnect Under Load" or "Not for Current Interrupting ."
Panel Statement: The proposed exception without additional qualification may allow unsafe conditions to occur.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.

13-43 Log #2072 NEC-P13 **Final Action: Reject**
(690.35(C)(3))

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Recommendation: Revise the section as follows:
(3) Automatically disconnects ~~the~~ all conductors ~~and/or shuts off the utility-interactive inverter or charge controller for that portion of the faulted array~~ or causes the inverter or charge controller connected to ~~that portion of~~ the faulted ~~array~~ circuit to automatically cease supplying power to output circuits .
Substantiation: Aligns the text for these ungrounded systems with the text in 690.5 dealing with grounded PV systems. Establishes that the faulted circuit may be isolated by disconnecting the conductors (typically done on low-voltage systems (12, 24, and 48)) or by causing the connected inverter or charge controller to cease supplying power (typically done on higher voltage systems). Either of these methods serves the purpose of ceasing power production and providing an additional indication that something has happened that needs attention.
Panel Meeting Action: Reject
Panel Statement: The submitter's recommendation is unclear in that there are more words being deleted than are in the current language.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 15 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
BOWER, W.: I vote negative to the reject. The language as proposed is " **690.35(C)(3). Automatically disconnects all conductors or causes the inverter or charge controller connected to the faulted circuit to automatically cease supplying power to output circuits.** " The language is very clear, clarifies the existing code and does not match the panel statement that the recommendation is unclear in that there are more words being deleted than are in the current language. The panel statement is likely a result of the strikeout/underline format causing some confusion in what the final language was.
This proposal allows the ungrounded inverter to cease supplying power to the output under ground-fault conditions. This allowance would be an acceptable substitute to opening the ungrounded conductors. UL allows this interpretation in existing listed inverters. This is the same as isolating the faulted PV array on grounded PV arrays that was accepted in 13-25 [690.5(B)].

13-44 Log #2091 NEC-P13 **Final Action: Accept in Part**
(690.35(D))

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Recommendation: Revise the section as follows:
The photovoltaic source ~~and output~~ conductors shall consist of <u>(1) sheathed (jacketed) multi-conductor cables, (2) conductors installed in raceways, or (3) conductors listed and identified as Photovoltaic (PV) Wire installed as exposed, single-conductor cable.</u>
Substantiation: In addition to jacketed, multi-conductor cables and conductors in raceways, a new single-conductor cable is added to the allowable wiring methods.
UL has developed a new cable specification/standard (UL Subject 4703) for a cable type specifically designed for PV installations where exposed, single-conductor cable is used. The cable is intended to meet the safety requirements associated with cables used in the <u>ungrounded</u> PV installations permitted by 690.35. This cable has a 90°C, wet-rated insulation that is more durable than SE and USE cable insulation, and it has passed the long-duration, 720-hour accelerated sunlight exposure tests. It has the necessary durability to meet both the longevity and safety requirements required in ungrounded PV systems when used as a single-conductor exposed cable. Additionally, if the PV Wire also qualifies (by the listing agency) as type USE-2 and is so marked, it will automatically fall under the provisions of 690.31(B). The reverse is not true, and cables marked <u>only</u> with the USE-2 designation will not be acceptable for use in ungrounded PV source circuits.
The PV output conductors are deleted from this section because they are typically in the circuits routed away from the PV combiner boxes and would not be included in these wiring provisions. A proposal for 690.31(B) restricts the use of single-conductor cable to the area within the PV array.
Panel Meeting Action: Accept in Part
Revise the section to read as follows:
The photovoltaic source and output conductors shall consist of <u>(1) sheathed (jacketed) multi-conductor cables, (2) conductors installed in raceways, or (3) conductors listed and identified as Photovoltaic (PV) Wire installed as exposed, single-conductor cable.</u>
Panel Statement: The panel retained the words “and output” to ensure that the text covers both source and output circuits.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.
Comment on Affirmative:
BOWER, W.: I vote affirmative with comment to the panel action. Because the words “and output” were retained, the section needs categorization. The new language should read “ **The photovoltaic source conductors shall consist of (1) sheathed (jacketed) multi-conductor cables, (2) conductors installed in raceways, or (3) conductors listed and identified as Photovoltaic (PV) Wire installed as exposed, single-conductor cable** ” and should pertain to only the PV source circuit. Further, for the output circuit conductors, the requirements should read “ **The photovoltaic output circuit conductors shall consist of (1) sheathed (jacketed) multi-conductor cables, or (2) conductors installed in raceways.** ”
The PV output circuits (as defined in 690.2) are run between the source circuits and the inverter or other dc equipment. These circuits are typically the outputs of combiner boxes and are routed away from the PV array and should NOT be wired with single-conductor exposed cable or exposed jacketed cable. PV output circuits typically need to be run in raceways or should be sheathed (jacketed) multi-conductor cables to afford them the physical protection needed in these exposed locations (across the roof and down the outside of the buildings).

13-45 Log #2073 NEC-P13 **Final Action: Accept in Principle**
(690.35(F))

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Recommendation: Revise the section as follows:
(F) The photovoltaic power source shall be labeled with the following warning at each junction box, combiner box, disconnect, and device ~~where~~ <u>when</u> energized, <u>uninsulated terminals or connections</u> ~~the ungrounded circuits~~ may be exposed during service

WARNING
ELECTRIC SHOCK HAZARD.
THE <u>DC</u> ~~DIRECT~~
~~CURRENT CIRCUIT~~ CONDUCTORS ~~OF THIS~~
~~PHOTOVOLTAIC POWER SYSTEM~~ ARE
UNGROUNDED AND MAY BE ENERGIZED
WITH RESPECT TO GROUND DUE TO
LEAKAGE PATHS AND/OR GROUND FAULTS.

Substantiation: The section is modified to indicate that the label shall be required only where there are exposed, uninsulated, energized terminals. Pull boxes where there are no exposed, energized terminals would not require the label. The Warning is simplified to reduce the space needed for installation, while keeping the intent clear.
Panel Meeting Action: Accept in Principle
Revise the section to read as follows:
(F) The photovoltaic power source shall be labeled with the following warning at each junction box, combiner box, disconnect, and device where energized, ungrounded circuits may be exposed during service

WARNING
ELECTRIC SHOCK HAZARD.
THE <u>DC</u> ~~DIRECT~~
~~CURRENT CIRCUIT~~ CONDUCTORS OF THIS
PHOTOVOLTAIC ~~POWER~~ SYSTEM ARE
UNGROUNDED AND MAY BE ENERGIZED
~~WITH RESPECT TO GROUND DUE TO~~
~~LEAKAGE PATHS AND/OR GROUND FAULTS.~~

Panel Statement: The submitter’s substantiation references a pull box where there are no exposed energized terminals. Not having a label on that pull box with 600 v dc conductors exposed during service would create a greater hazard to the installer/maintainer than presently exists now in current language. The panel’s wording accomplishes this. Words were eliminated to clarify the language.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.
Comment on Affirmative:
SWAYNE, R.: The words “DIRECT CURRENT” are more descriptive to the general public, who will be seeing this sign, than “DC” and should be retained.

13-46 Log #2092 NEC-P13 **Final Action: Accept in Principle**
(690.42 Exception (New))

TCC Action: The Technical Correlating Committee directs that the Action on this Proposal be rewritten to comply with the NEC Style Manual by replacing “may…” with “shall be permitted to…” and understands that the new Exception will be located immediately following 690.42, before the FPN.
Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Recommendation: Add the new Exception as follows:
690.42 Point of System Grounding Connection.
<u>*Exception: Systems with a 690.5 ground-fault protection device, either as a separate device or as a part of the inverter, may have the required grounding point (bond) made by the ground-fault protection device. This bond, if internal to the ground-fault equipment, shall not be duplicated with an external connection.*</u>
Substantiation: Section 690.5 ground-fault protection devices actually make the grounded conductor-to-ground bond for the entire dc system. It is important that no additional bond (as required by 690.42) be made in a system employing one of these devices. While many PV systems employ such a device, there are still numerous ground-mounted PV systems that do not require them. A proposal (690.5) has been submitted to require a ground-fault protection device on all PV systems. The basic 690.42 is still required but may be deleted in future revisions of the *Code* if the ground-fault protection device becomes a requirement on all PV systems.
Panel Meeting Action: Accept in Principle
Add the new Exception as follows:
690.42 Point of System Grounding Connection.
<u>*Exception: Systems with a 690.5 ground-fault protection device may have the required grounding bond made by the ground-fault protection device. This bond, if internal to the ground-fault equipment, shall not be duplicated with an external connection.*</u>
Panel Statement: The panel deleted “either as a separate device or as part of the inverters” as it was deemed unnecessary language. In addition, grounding point (bonds) was changed to grounding bond in accordance with Article 100 terminology.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.
Comment on Affirmative:
BOWER, W.: I vote affirmative with comment. The new language as accepted in principle by the panel violates a style manual rule in that it uses discretionary language. The exception as accepted is “ **690.42 Point of System Grounding Connection** .
Exception: Systems with a 690.5 ground-fault protection device may have the required grounding bond made by the ground-fault protection device. This bond, if internal to the ground-fault equipment, shall not be duplicated with an external connection.”
The word “may,” in the first sentence should be replaced with “is permitted to”.

13-47 Log #2074 NEC-P13 **Final Action: Accept in Principle**
(690.43)

TCC Action: The Technical Correlating Committee directs that the panel reconsider the Action on this Proposal to comply with the NEC Style Manual by changing "are permitted" to "shall be permitted" in both sentences of the new second paragraph and changing the proposed text from "when required" to "where installed" in the second paragraph of the Proposal which becomes the new third paragraph in the section.
This action will be considered by the Panel as a Public Comment.
Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Recommendation: Add a second and third paragraph to the existing section as follows:
Devices listed and identified for grounding the metallic frames of PV modules are permitted to ground the exposed metallic frames of PV modules to grounded mounting structures. Devices identified and listed for bonding the metallic frames of PV modules are permitted to bond the exposed metallic frames of PV modules to the metallic frames of adjacent PV modules.
Equipment-grounding conductors for the PV array and structure (when required) shall be contained within the same raceway or cable, or otherwise run with the PV array circuit conductors when those circuit conductors leave the vicinity of the PV array.
Substantiation: The proposed second paragraph is added because module grounding clips and other devices are being developed and listed that will effectively penetrate the oxide or anodizing on aluminum framed PV modules and ground them to grounded PV array mounting structures or effectively bond them to adjacent PV modules which, in turn, may be grounded. The existing grounding and bonding requirements in Sections 250.134 or 250.136 do not specifically or generally allow the use of such devices. Nor do they prohibit the use of such devices. Clarification is needed in Article 690.

The proposed third paragraph is required because Section 250.134(B) Exception 2 allows dc equipment-grounding conductors to be routed separately from the circuit conductors. A proposal has been submitted to remove this exception.

With the resurgence of dc power systems (renewable energy systems, fuel cells, uninterruptible power systems, and various industrial processes), the routing of dc equipment-grounding conductors needs to be reconsidered. *IEEE/ANSI Standard 1375, Guide for the Protection of Stationary Battery Systems* provides an excellent tutorial on the issues associated with using overcurrent devices in dc circuits. One of the many issues that this standard points out is the difficulty in getting proper overcurrent device operation as the circuit time constant goes above 10 milliseconds (the time constant limit of testing in UL Standards 198 and 489). The Guide points out that fuses and circuit breakers may not operate properly when inductance in the circuit results in a time constant exceeding 10 milliseconds. Calculations shown in the IEEE Standard indicate that the normal circuit inductance in many dc systems results in time constants between 5 and 10 milliseconds. It wouldn't take much spacing between the equipment-grounding conductor and the circuit conductors to increase the fault-circuit time constant to greater than 10 milliseconds. If Exception number 2 in 250.134(B) is followed, the routing of the equipment-grounding conductor away from the circuit conductors may allow the time constant under ground-fault conditions to exceed 10 milliseconds. These longer time constants, under ground-fault conditions, could prevent the dc overcurrent devices from functioning properly and possibly affect the operation of 690.5-required dc ground-fault protection equipment.

PV module frames are commonly large rectangles of aluminum (1' x 4' to 4' x 6' or larger) that are generally grounded by equipment-grounding conductors at one point on the frame. In PV arrays with modules mounted side by side, the UL-designated grounding points on the modules allow one equipment-grounding conductor to be connected to a number of modules, grounding all at one time. The junction boxes on the modules for the dc power leads are some distance (1-3 feet) away from the grounding points on the same modules. Since the grounded frames are in close proximity to the junction boxes, the equipment-grounding conductors are effectively close to the circuit conductors throughout the array field. However, once the circuit conductors leave the vicinity of the PV array, the equipment-grounding conductor(s) should be routed with the circuit conductors to minimize the time constant described above.
Panel Meeting Action: Accept in Principle
In the second paragraph change "(when required)" to "(where installed)".

Add a second and third paragraph to the existing section as follows:
Devices listed and identified for grounding the metallic frames of PV modules are permitted to ground the exposed metallic frames of PV modules to grounded mounting structures. Devices identified and listed for bonding the metallic frames of PV modules are permitted to bond the exposed metallic frames of PV modules to the metallic frames of adjacent PV modules.
Equipment-grounding conductors for the PV array and structure (when required) shall be contained within the same raceway or cable, or otherwise run with the PV array circuit conductors when those circuit conductors leave the vicinity of the PV array.
Panel Statement: This change more accurately complies with the NEC Manual of Style.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.
Comment on Affirmative:

GALLO, E.: This proposal and Panel Action address grounding of PV arrays. However, the substantiation submitted with the proposal seems to address grounding of other types of dc systems. Statements in the substantiation related to routing of dc equipment grounding conductors are not valid for other types of dc systems. As IEEE 1375 points out, long time constant in excess of level used in UL testing are unlikely for stationary battery systems.

STAFFORD, T.: The panel meeting action stated is correct, but the change does not take place in the rewrite of the paragraph. The words "when required" are still there.

13-48 Log #3587 NEC-P13 **Final Action: Accept in Principle**
(690.43)

TCC Action: It was the action of the Technical Correlating Committee that the panel reconsider the Panel Action and correct the wording by replacing "is required" with "shall be required" to comply with the NEC Style Manual. This action will be considered by the panel as a public comment.
Submitter: Robert H. Wills, Intergrid, LLC
Recommendation: Revise as follows:

690.43 Equipment Grounding. Exposed noncurrent-carrying metal parts of module frames, equipment, and conductor enclosures shall be grounded in accordance with 250.134 or 250.136(A) regardless of voltage. An equipment grounding conductor is required between a PV array and other equipment even if multiple grounding electrodes are used.
Substantiation: Supplementary grounding electrodes are often installed at PV arrays to help with lightning protection. Some installers interpret the use of a supplementary grounding electrode as sufficient to meet the requirements of 690.43 and so do not install a grounding equipment conductor between the PV array metal frame and other equipment (such as inverters and charge controllers).

This leads to a hazardous situation as a PV groundfault may cause a high voltage between the grounding electrodes, and may also cause PV ground fault protection devices to malfunction.

The proposed language makes this requirement explicit.
Panel Meeting Action: Accept in Principle
Add a second sentence to 690.43 to read as follows:

An equipment grounding conductor between a PV array and other equipment is required in accordance with 250.110.
Panel Statement: The panel revised the proposal to simplify the language.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.
Comment on Affirmative:

STAFFORD, T.: The panel action was correct in requiring that the required equipment grounding conductor is specified in accordance with 250.110. However, this is repetitious code. The requirements of Article 250.110 already apply without having to specify requirements in Article 690.43.

13-49 Log #2093 NEC-P13 **Final Action: Accept in Principle in Part**
(690.45)

TCC Action: It was the action of the Technical Correlating Committee that the Panel Action be clarified by writing the exception in a complete sentence to comply with the NEC Style Manual.

This action will be considered by the Panel as a Public Comment.
Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Recommendation: Revise the section as follows:
690.45 Size of Equipment-Grounding Conductor : ~~Where not protected by the ground-fault protection equipment required by 690.5, the equipment-grounding conductor for photovoltaic source and photovoltaic output circuits shall be sized for 125 percent of the photovoltaic-originated short-circuit currents in that circuit. Where protected by the ground-fault protection equipment required by 690.5, the equipment-grounding conductors for photovoltaic source and photovoltaic output circuits shall be sized in accordance with 250.122.~~
690.45 Size of Equipment-Grounding Conductor. Equipment-grounding conductors in photovoltaic source and photovoltaic output circuits shall be sized in accordance with Table 250.122. When no overcurrent protective device is used in the circuit, an assumed overcurrent device rated at the photovoltaic rated short-circuit current shall be used in Table 250.122. Increases in equipment-grounding conductor size to address voltage drop considerations shall not be required. If equipment-grounding conductors sized per 690.5(A) Exception 2 are used, the above sizing requirements are not to be used. The equipment-grounding conductor shall be no smaller than 14 AWG.
Substantiation: This proposal is a result of the proposed new ground-fault protection device requirements in 690.5 and 690.5(A). The language simplifies and clarifies the requirement. The ground-fault protective devices will interrupt

any dc ground-fault currents that are in excess of a maximum value determined by Underwriters Laboratories based on the size of the utility-interactive inverter. Values of 1 amp or lower per 10 kW are being used. This means that the equipment-grounding conductor will never have to carry but a small fraction of the available short-circuit current as circulating ground-fault current on a continuous basis. Requiring the size to be based on Table 250.122 (or an assumed overcurrent device rated at the short-circuit current where there are no overcurrent devices in the circuit) will size the equipment-grounding conductors to an acceptable size that will minimize physical/mechanical abuse when being installed along with circuit conductors sized at 1.56 times the short-circuit current. Because even a 20 AWG conductor can carry the 1 amp maximum current on a smaller system, there is no increase in size required by 250.122(B) where circuit conductors have been increased in size for voltage drop. Also, there are no overcurrent devices that need a low-impedance equipment-grounding connection for proper operation because the ground-fault device will activate at a significantly lower current level than any overcurrent device in the circuits. Typically, inverters up to about 10 kW are using 0.5-1.0 amp ground-fault trigger levels and higher power inverters will have the value set at 1 amp per 10kW or lower. UL Standard 1741 will establish the ground-fault detection/interruption limits. Off-grid, stand-alone systems are commonly using a 1-amp ground-fault-protection-device-trip level. The 690.5(A) Exception 2 that allows equipment-grounding conductors to be sized to twice the size of the circuit conductors will result in a suitable equipment-grounding conductor that is significantly larger than that required here.

Panel Meeting Action: Accept in Principle in Part

Reword proposal as follows:

690.45 Size of Equipment-Grounding Conductors. Equipment-grounding conductors in photovoltaic source and photovoltaic output circuits shall be sized in accordance with Table 250.122. Where no overcurrent device is used in the circuit, an assumed overcurrent device rated at 125% of the photovoltaic rated short-circuit current shall be used. Increases in equipment-grounding conductor size to address voltage drop considerations shall not be required.

Exception: Equipment-grounding conductors sized per 690.5 (A) Exception No. 2.

Panel Statement: The over-sizing of the equipment grounding conductor recognizes that the ground fault condition without an overcurrent device may continue for a period of 3 hours or greater. Overheating of the conductor's insulation is the issue, not voltage drop. Table 250-122 does not permit ground conductor sizes smaller than #14 CU.

Number Eligible to Vote: 17

Ballot Results: Affirmative: 15 Negative: 1

Ballot Not Returned: 1 Gustafson, R.

Explanation of Negative:

SWAYNE, R.: The exception should be deleted because the reference to 690.5(A) Exception 2 does not exist in the 2005 NEC. In addition, Table 250.122 specifies minimum size. An equipment grounding conductor sized to twice the circuit conductor would always comply.

13-50 Log #2094 NEC-P13 **Final Action: Accept in Principle**
(690.47(C))

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum

Recommendation: Revise the section as follows:

690.47(C) Systems with Alternating and Direct - Current Grounding Requirements. <u>Utility-interactive and stand-alone inverters employing either an internal or external power transformer shall require both alternating-current (ac) and direct-current (dc) grounding systems.</u> <u>Alternating Current PV modules are not included in this requirement. For utility-interactive inverters, the</u> <u>premises grounding system serves as the ac grounding system.</u> Photovoltaic power systems with both <u>ac</u> ~~alternating-current~~ and <u>dc</u> ~~direct-current (dc)~~ grounding requirements shall be permitted to be grounded as described in (1) or (2):

Substantiation: The existing language, while stating how to provide both ac and dc grounding, did not establish any requirement or guidance as to when it should apply.

The power transformer in either a utility-interactive or standalone inverter effectively isolates the grounded, dc-circuit conductor from the grounded, ac-circuit conductor. This isolation dictates that each of these circuits be properly grounded. In many cases, the ac output of these inverters is effectively grounded outside the inverter through the existing ac distribution system, however standalone systems must establish the ac bond, as there is no existing distribution system. The dc circuit system being isolated from the grounded ac system must be properly grounded. In most utility-interactive inverters, the dc grounded-conductor-to-ground bond is made in the inverter as part of the ground-fault detection device. However, a code-compliant dc grounding electrode conductor terminal and appropriate path for surge currents is still required external to the inverter. While the ac and dc equipment-grounding conductors meet at the inverter chassis, the size requirements may differ between them due to different ac and dc circuit currents and overcurrent protection. The sizes, routing, and multiple splices allowed for equipment-grounding conductors do not meet the requirements for a dc grounding-electrode conductor. These grounding requirements make the code consistent with UL Standard requirements for the internal construction of the inverters.

Alternating Current PV modules have no external dc circuitry and are grounded via the ac equipment-grounding conductor.

Panel Meeting Action: Accept in Principle

Panel Statement: The panel action and statement on Proposal 13-51 should satisfy the intent of the submitter.

Number Eligible to Vote: 17

Ballot Results: Affirmative: 16

Ballot Not Returned: 1 Gustafson, R.

Comment on Affirmative:

BOWER, W.: I vote affirmative with comment to the panel action to accept in principle because the follow-on proposal and the rewrite of 690.47 needs another rewrite or to be rejected as is. This proposal should have been accepted in order to retain the requirements for dc grounding. This affirmative vote applies only if suggested changes to the 13-51 are incorporated since the current rewrite is lacking the proper grounding requirements in a few areas.

13-51 Log #3585 NEC-P13 **Final Action: Accept in Principle**
(690.47(C))

TCC Action: The Technical Correlating Committee directs that the Action on this Proposal be rewritten to comply with the NEC Style Manual by replacing "may…" with "shall be permitted to…" in (5) and (6).

The Technical Correlating Committee understands that (3) should read "for equipment bonding jumpers (250.102)" to correlate with the title of 250.102.

These actions will be considered by the panel as a public comment.

Submitter: Robert H. Wills, Intergrid, LLC

Recommendation: Change 690.47(C) to the following:

(C) Systems with Alternating-Current and Direct-Current Grounding Requirements.

<u>When photovoltaic power systems have both alternating -current (ac) and direct-current(D) grounding requirements, the dc grounding system shall be bonded to the ac grounding system. The bonding conductor shall be sized according to 690.45. A single common grounding electrode and grounding bar may be used for both systems in which case the common grounding electrode conductor shall be sized to meet the requirements of both 250.66(ac) and 250.166(dc).</u>

Substantiation: The previous language for 690.4(C) was new to the 2005 code.

It required that:

- the dc to ac ground system bond be run directly from electrode to electrode (if separate ac and dc electrodes were used).
- that the bond be sized as a grounding electrode conductor.
- redundant, dual grounding electrode conductors when a single electrode was used for both ac and dc.

These requirements were excessive and have unnecessarily increased the installation cost of photovoltaic power systems.

The intent of bonding is to hold both ground systems and all equipment,, whether ac or dc, at the same potential. As fault current does not run through this bond (the ac and dc systems are separate), a conductor sized the same as an equipment grounding conductor (as defined in 690.45) is sufficient to meet this intent.

The bonding conductor between the ac and dc grounding systems should not be confused with main or system bonding conductors that are required to carry full fault currents. Both the ac and dc grounding systems will have bonds from the ground system to their respective grounded conductors that need to be sized according to 250.66(ac) and 250.166(dc).

Panel Meeting Action: Accept in Principle

Change 690.47(C) to the following:

(C) Systems with Alternating-Current and Direct-Current Grounding Requirements

Systems with alternating-current and direct-current grounding requirements shall comply with items (1) through (7) below:

<u>(1) Where photovoltaic power systems have both alternating-current (ac) and direct-current (dc) grounding requirements, the dc grounding system shall be bonded to the ac grounding system.</u>

<u>(2) A bonding conductor between these systems and equipment grounding conductors in these systems shall be sized as the larger of the dc requirement (according to 690.45) and the ac requirement (based on the inverter alternating-current overcurrent device rating and 250.122).</u>

<u>(3) A conductor that serves as both an equipment grounding conductor and as part of the bond between ac and dc systems for an inverter incorporating dc ground-fault protection shall meet the requirements of equipment grounding jumpers (250.102) but shall not be subject to the requirements for bonding jumpers (250.28).</u>

<u>(4) A bonding conductor or equipment grounding conductor that serves multiple inverters shall be sized based on the sum of applicable maximum currents used in (2).</u>

(5) A common ground bus may be used for both systems.

(6) A common grounding electrode may be used for both systems in which case the grounding electrode conductor shall be connected to the ac ground system bonding point.

(7) Grounding electrode conductor(s) shall be sized to meet the requirements of both 250.66 (ac system) and 250.166 (dc system).

Existing Text

690.43 Equipment Grounding

Exposed non–current-carrying metal parts of module frames, equipment, and conductor enclosures shall be grounded in accordance with 250.134 or 250.136(A) regardless of voltage.

690.47 Grounding Electrode System

(A) Alternating-Current Systems If installing an ac system, a grounding electrode system shall be provided in accordance with 250.50 through 250.60. The grounding electrode conductor shall be installed in accordance with 250.64.

(B) Direct-Current Systems If installing a dc system, a grounding electrode system shall be provided in accordance with 250.166 for grounded systems or 250.169 for ungrounded systems. The grounding electrode conductor shall be installed in accordance with 250.64.

(C) Systems with Alternating-Current and Direct-Current Grounding Requirements Photovoltaic power systems with both alternating-current and direct-current (dc) grounding requirements shall be permitted to be grounded as described in (1) or (2):

(1) A grounding-electrode conductor shall be connected between the identified dc grounding point to a separate dc grounding electrode. The dc grounding-electrode conductor shall be sized according to 250.166. The dc grounding electrode shall be bonded to the ac grounding electrode to make a grounding electrode system according to 250.52 and 250.53. The bonding conductor shall be no smaller than the largest grounding electrode conductor, either ac or dc.

(2) The dc grounding electrode conductor and ac grounding electrode conductor shall be connected to a single grounding electrode. The separate grounding electrode conductors shall be sized as required by 250.66 (ac) and 250.166 (dc).

Panel Statement: The wording of the proposal was changed to clarify requirements and to define the connection location for a single grounding electrode conductor (located at the ac ground system bonding point, as the ac system will have greater available fault current). Sizing requirements in general were changed to be based on the larger of the ac and dc requirements to reflect the fact that both ac and dc fault currents could be carried in either grounding system. Language was added to address multiple inverter installations.

Number Eligible to Vote: 17

Ballot Results: Affirmative: 14 Negative: 2

Ballot Not Returned: 1 Gustafson, R.

Explanation of Negative:

STAFFORD, T.: The action taken by the panel was not consistent with the intent of the submitter. The submitter's intent was to clarify the intent of the NEC. The action taken by the panel was to rewrite the proposal at the ROP meeting to add multiple items with which the installation could comply with the NEC. The submitter did not seek to add the multiple items', specifically the submitter wanted to require a single provision for ac and dc grounding requirements. It is felt that adequate time is needed to review and verify proposals submitted for adoption, not to write proposals at the ROP meeting.

SWAYNE, R.: The Panel Action is commendable in form and provides an improvement from the present wording. There are, however, several items that need correction, as follows:

1) In Section 690.47(C)(3), the term "equipment grounding conductor" needs to be changed to "equipment bonding conductor" to coordinate with the title of Section 250.102.

2) It is not clear, nor is there any substantiation for, what the need is for Section 690.47(C)(5).

3) In Section 690.47(C)(6), the word "may" should be changed to "shall" in order to make it a requirement that there be a single electrode for the building or structure.

4) In Section 690.47(C)(6), all of the words after "both systems" should be deleted because it implies that there is only one grounding electrode conductor. In fact, there are two, one for each system. Each grounding electrode conductor may be connected to a single common grounding electrode or each may be connected to two separate grounding electrodes provided that the two separate grounding electrodes are bonded together to be a single grounding electrode as specified in Section 250.58.

Comment on Affirmative:

BOWER, W.: My vote is affirmative with comments.

The currently adopted language in the 2005 NEC is:

"690.45(C) Systems with Alternating-Current and Direct-Current Grounding Requirements Photovoltaic power systems with both alternating-current and direct-current (dc) grounding requirements shall be permitted to be grounded as described in (1) or (2):

(1) A grounding-electrode conductor shall be connected between the identified dc grounding point to a separate dc grounding electrode. The dc grounding-electrode conductor shall be sized according to 250.166. The dc grounding electrode shall be bonded to the ac grounding electrode to make a grounding electrode system according to 250.52 and 250.53. The bonding conductor shall be no smaller than the largest grounding electrode conductor, either ac or dc.

(2) The dc grounding electrode conductor and ac grounding electrode conductor shall be connected to a single grounding electrode. The separate grounding electrode conductors shall be sized as required by 250.66 (ac) and 250.166 (dc)."

The panel accepted language for the 2008 NEC is:

"690.47(C) Systems with Alternating-Current and Direct-Current Grounding Requirements; Systems with alternating-current and direct-current grounding requirements shall comply with items (1) through (7) below:

(1) Where photovoltaic power systems have both alternating-current (ac) and direct-current (dc) grounding requirements, the dc grounding system shall be bonded to the ac grounding system.

(2) A bonding conductor between these systems and equipment grounding conductors in these systems shall be sized as the larger of the dc requirement (according to 690.45) and the ac requirement (based on the inverter alternating-current overcurrent device rating and 250.122).

(3) A conductor that serves as both an equipment grounding conductor and as part of the bond between ac and dc systems for an inverter incorporating dc ground-fault protection shall meet the requirements of equipment grounding jumpers (250.102) but shall not be subject to the requirements for bonding jumpers (250.28).

(4) A bonding conductor or equipment grounding conductor that serves multiple inverters shall be sized based on the sum of applicable maximum currents used in (2).

(5) A common ground bus may be used for both systems

(6) A common grounding electrode may be used for both systems in which case the grounding electrode conductor shall be connected to the ac ground system bonding point.

(7) Grounding electrode conductor(s) shall be sized to meet the requirements of both 250.66 (ac system) and 250.166 (dc system)."

My suggested language appears below in strikeout/underline format.

" **690.47(C) Systems with Alternating-Current and Direct-Current Grounding Requirements.**

Inverters converting direct-current (dc) photovoltaic energy to alternating current (ac) shall ac and dc grounding systems. Alternating-current PV modules are not included in this requirement. For utility-interactive inverters, the premises ac grounding system serves as the ac grounding system.

Systems with alternating-current and direct-current grounding requirements shall comply with items (1) through (8) below:

1) A grounding-electrode conductor shall be connected between the identified dc grounding point to a separate dc grounding electrode.

2) ~~Where photovoltaic power systems have both alternating-current (ac) and direct-current (dc) grounding requirements,~~ The dc grounding system shall be bonded to the ac grounding system according to 250.52 .

3) Grounding electrode conductor(s) shall be sized to meet the requirements of both 250.66 (ac system) and 250.166 (dc system)."

4) A bonding conductor between the ~~se~~ dc and ac grounding systems and equipment grounding conductors ~~in these systems~~ shall be sized as the larger of the dc requirement according to 690.45 ~~and~~ or the ac requirement based on the inverter alternating-current overcurrent device rating and 250.122.

5) ~~A~~ The bonding conductor or equipment grounding conductor that serves multiple inverters shall be sized based on the sum of applicable maximum currents used in (4).

6) A conductor that serves as both an equipment grounding conductor and as part of the bond between ac and dc systems for an inverter incorporating dc ground-fault protection shall meet the requirements of equipment grounding jumpers (250.102), but shall not be subject to the requirements for bonding jumpers (250.28).

7) A common ground bus ~~may~~ is permitted to be used for both systems

8) A common grounding electrode ~~may~~ is permitted to be used for both systems with the requirement that the dc grounding electrode conductor shall be connected to the ac ground system bonding point.

The suggested language now includes a requirement for dc grounding. Redundancy in the wording has been minimized. The sentences in which discretionary language was used are modified to use required or permitted language.

13-52 Log #2075 NEC-P13 **Final Action: Accept in Principle**
(690.47(C)(3))

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum

Recommendation: Add the new section as follows:

690.47(C)(3) DC Grounding-Electrode Conductors for Multiple Inverter Installations. A single, direct-current common grounding electrode conductor shall be permitted with tap conductors to each separate inverter in grounded, multi-inverter systems. The tap conductors for each inverter and the common-grounding electrode conductor shall each be sized in accordance with 250.166.

The taps shall be made with a listed irreversible connector or exothermic welding.

Also: Add the number (3) to the end of 690.47(C) to include this proposal in that list.

Substantiation: Utility interactive PV systems using multiple smaller inverters (i.e. 1000-6000 watts) are frequently installed to provide additive power at much higher levels. Systems with multiple small inverters up to nearly 100 kW have been installed in the US, and larger systems are being planned. Each inverter normally has an internal transformer and, therefore, the dc side of the system must be grounded. Since each PV inverter represents a separate PV system for the building or structure, faults in the dc PV array for one inverter do not affect any of the other inverter systems. For this reason, the size of the common equipment-grounding conductor should be no larger than that required for a single inverter and should be based on 250.166. There is no technical or safety reason to have the common, dc grounding-electrode conductor any larger than the sizes required by 250.166 as is required for ac multiple separately derived systems in 250.30(A)(4)(a).

Panel Meeting Action: Accept in Principle

Panel Statement: The panel action and statement on Proposal 13-51 should satisfy the intent of the submitter.

Number Eligible to Vote: 17

Ballot Results: Affirmative: 14 Negative: 2

Ballot Not Returned: 1 Gustafson, R.

Explanation of Negative:

BOWER, W.: I vote negative to the panel action to accept in principle with the statement that 13-51 covers the requirements of the proposal. I disagree that the accept-in-principle 13-51 covers the requirements proposed. The proposal " **690.47(C)(3) DC Grounding-Electrode Conductors for Multiple Inverter Installations.** A single, direct-current common grounding electrode conductor shall be permitted with tap conductors to each separate inverter in grounded, multi-inverter systems. The tap conductors for each inverter and the common-grounding electrode conductor shall each be sized in accordance with 250.166. The taps shall be made with a listed irreversible connector or exothermic welding." is not covered or addressed with the accepted rewrite of 690.47(C).

Note: I believe the exothermic welding requirement applies only to grounding electrode conductors and not to equipment grounding conductors. There is confusion whether the proposal meant to apply to grounding electrode conductors or to equipment grounding conductors with its multiple inverter taps.

SWAYNE, R.: The Panel Action taken on Proposal 13-51 makes no reference to a common grounding electrode conductor and tap conductors which are the subject of this proposal. This proposal should be Accepted and added to the list in Proposal 13-51.

13-53 Log #2076 NEC-P13 **Final Action: Accept in Principle**
(690.47(D) (New))

TCC Action: The Technical Correlating Committee directs that the Panel reconsider the proposal and clarify the language and the placement of the text. In addition, the text needs to be rewritten to be in compliance with the NEC Style Manual.

This action will be considered by the Panel as a Public Comment.

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum

Recommendation: Add the new section as follows:

690.47(D) Additional Grounding Electrodes for Equipment Grounding. Additional, supplementary grounding electrodes for equipment grounding shall be installed in accordance with the methods described in 250.54 as modified by (1) and (2). They are not required to be bonded to the main dc grounding electrode.

(1) A grounding electrode shall be installed at the location of ground-mounted or pole-mounted PV arrays.

(2) A grounding electrode shall be installed at the location of any PV array that is mounted on a building or structure that is separate from the building or structure containing other power equipment in the system.

Substantiation: PV arrays may be mounted in locations that are some distance from the structure that holds the other power equipment in the system (inverters, batteries, interface equipment, etc.). To maintain the potential of the exposed metal surfaces as close to the potential of the local earth as possible, supplementary grounding electrodes are required at the remote locations where the PV arrays are located. These grounding electrodes do not have to be bonded directly to other grounding electrodes in the system. The equipment-grounding conductors, however, indirectly connect them to other grounding electrodes in the systems. The installation provisions of 250.54 are appropriate, but these grounding electrodes are required, not permissive.

Panel Meeting Action: Accept in Principle

Add the following text:

690.47(D) Grounding Electrodes for Array Grounding.
Grounding electrodes for equipment grounding shall be installed in accordance with 250.50 at the location of all ground and pole-mounted photovoltaic arrays and as close as possible to the location of roof-mounted photovoltaic arrays. The electrodes shall be connected to the array frame(s) or structure.

The structure of a ground or pole-mounted photovoltaic array can be considered a grounding electrode if it meets the requirements of 250.52. Roof-mounted photovoltaic arrays may use the metal frame of a building or structure if the requirements of 250.52(3) are met.

Exception No 1: Where the load served by the array is integral with the array.

Exception No 2: Where the grounding electrode would be adjacent to the main grounding electrode.

Panel Statement: The addition of grounding electrodes has been a recommended practice for all PV array installations for many years. The electrode and grounding electrode conductor are installed to provide a direct path to ground for lightning.

The panel decided that there is a safety benefit in making this practice mandatory for all.

Number Eligible to Vote: 17

Ballot Results: Affirmative: 15 Negative: 1

Ballot Not Returned: 1 Gustafson, R.

Explanation of Negative:

SWAYNE, R.: This proposal should be rejected for several reasons. The first sentence implies that the grounding electrode could replace the need for an equipment grounding conductor. This is not the case and an equipment grounding conductor is required whether or not supplementary grounding electrodes are installed and connected to the equipment grounding conductor. The words "for equipment grounding" in the first sentence should be deleted. The reference to 250.50 is not for installation of electrodes but for the interconnection of all electrodes that are part of the system grounding system (not equipment grounding). Electrodes that are installed and connected to the equipment grounding conductor are not required to be separately bonded together. The reference for metal frame use as a grounding electrode should be 250.52(A)(2).

Comment on Affirmative:

BOWER, W.: I vote affirmative to the panel action because the proposal as submitted for supplementary grounding electrodes should considered separately and agree that the supplementary terminology should not have been used. This does create a new mandatory requirement for grounding the array whether it be a rooftop or ground mounted but I also believe the new requirement will help keep lightning induced surges on the outside of buildings.

The panel-accepted language

" **690.47(D) Grounding Electrodes for Array Grounding. Grounding electrodes for equipment grounding shall be installed in accordance with 250.50 at the location of all ground and pole-mounted photovoltaic arrays and as close as possible to the location of roof-mounted photovoltaic arrays. The electrodes shall be connected to the array frame(s) or structure.**

The structure of a ground or pole-mounted photovoltaic array can be considered a grounding electrode if it meets the requirements of 250.52. Roof-mounted photovoltaic arrays may use the metal frame of a building or structure if the requirements of 250.52(3) are met.

Exception No 1: Where the load served by the array is integral with the array.

Exception No 2: Where the grounding electrode would be adjacent to the main grounding electrode. "

is correct and I believe the panel acted correctly by removing the supplementary terminology.

ZGONENA, T.: Revise Exception No. 1 to read:

"Where the array serves only loads which are integral to the array."

This clarifies that ungrounded arrays may not be interconnected with other equipment.

13-54 Log #2095 NEC-P13 **Final Action: Accept in Principle**
(690.53)

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal so that the text is in accordance with the NEC Style Manual. This action will be considered by the Panel as a Public Comment.

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum

Recommendation: Revise the section as follows:

690.53 Direct-Current Photovoltaic Power Source. A ~~marking~~ permanent label for the direct-current photovoltaic power source indicating items (1) through ~~(4)~~ (5) shall be provided by the installer at the photovoltaic disconnecting means ~~for this power source~~ :

(1) ~~Operating current~~ . Rated maximum power-point current

(2) ~~Operating voltage.~~ Rated maximum power-point voltage

(3) Maximum system voltage (690.7)

(4) Maximum ~~short-circuit~~ current (690.8)

(5) Maximum rated output current of the charge controller (if installed)

Substantiation: The basic paragraph is reworded to indicate that a label is required rather than a marking and to eliminate unnecessary words. The term "rated" is added to items (1), (2), and (4) to clarify exactly what values should be on the label. This term is not required on item (3) because Maximum System Voltage is defined in 690.7. Item (5) is added to identify the maximum rated output of the charge controller since that device, where installed, may significantly increase the current from the PV array. The PV disconnecting means must be readily accessible per 690.14.

Panel Meeting Action: Accept in Principle

Revise the section as follows:

690.53 Direct-Current Photovoltaic Power Source. A <u>permanent</u> <u>label or</u> marking for the direct-current photovoltaic power source indicating items (1) through (4) shall be provided by the installer at the <u>photovoltaic</u> disconnecting means ~~for this power source~~ :

(1) Operating current.
(2) Operating voltage.
(3) Maximum system voltage <u>(690.7)</u>
(4) Short-circuit current <u>(690.8)</u>

Panel Statement: The term maximum power point is not defined in the code. Item (5) was deleted, as that rating is shown on the product.

Number Eligible to Vote: 17

Ballot Results: Affirmative: 16

Ballot Not Returned: 1 Gustafson, R.

13-55 Log #2077 NEC-P13 **Final Action: Accept**
(690.54)

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum

Recommendation: Revise the section as follows:

690.54 Interactive System Point of Interconnection. All interactive system(s) points of interconnection with other sources shall be marked at an accessible location at the disconnecting means as a power source <u>and</u> with the <u>rated</u> ~~maximum~~ ac output ~~operating~~ current and the <u>nominal</u> operating ac voltage.

Substantiation: Clarifies the required marking to show the rated ac-output current (of the inverter), which is the current upon which conductors and overcurrent devices are based (690.8, 690.9). The existing text is sometimes interpreted as the maximum operating current for the installed system, which may be considerably less than the rated output current. Some installers were also marking a range of ac voltages. Both changes provide inspectors with better information to use in determining if *Code* requirements have been met.

Panel Meeting Action: Accept

Number Eligible to Vote: 17

Ballot Results: Affirmative: 16

Ballot Not Returned: 1 Gustafson, R.

13-56 Log #225 NEC-P13 **Final Action: Accept in Principle**
(690.57)

TCC Action: The Technical Correlating Committee directs that the panel reconsider this proposal and clarify where the text is to be placed since 690.57 is in Part VI, dealing with marking.

This action will be considered by the Panel as a Public Comment.

NOTE: The following proposal consists of Comment 13-37 on Proposal 13-52 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 13-52 was:

Add a new Section 690.57 to read as follows:

690.57 Interactive System Point of Interconnection. All interactive system(s) points of interconnection with other sources shall be marked at an accessible location at the disconnecting means as a power source with the maximum ac output operating current and the operating ac voltage. Where interactive systems may operate as a Stand-Alone System through bypassing the inverter, disconnecting means shall indicate normal and bypass positions.

The Technical Correlating Committee directs that the Panel Action on Comment 13-37 be reported as "Hold" and additional consideration be given to the negative votes in the 2004 NEC Report on Comments.

Submitter: Michael I. Callanan, IBEW

Recommendation: The Panel should have accepted this proposal in principle to read as follows:

690.57 Where Interactive Systems operate as a Stand-Alone System through bypassing of the inverter, disconnecting means shall indicate both normal and bypass positions.

Substantiation: We recognize that the bypass function performed by the inverter is performed with internal circuitry as stated by the panel, but this does not alleviate the potential for hazards to personnel working on the system branch circuits. Inverters may operate in a "Bypass" mode where AC power is routed through the inverter to critical loads. Presently some disconnecting means on inverters indicate an "off" position but allow AC Utility Power to supply loads driven by the inverter. The intent here is not to prevent inverters from operating in the bypass mode but rather to have marking indicate when an inverter is operating in a bypass mode. Someone performing work upon the system could come into contact with energized branch circuits that are indicated "off" at its source, i.e., the inverter. The branch circuits supplied by an interactive inverter operating in the stand-alone mode are not internal to the inverter, they are accessible.

We also recognize the panel's attempt to alleviate the same hazard identified by proposal 13-77. The panel action taken on proposal 13-77 removes the same hazard identified for fuel cell systems which is identical to the one stated above. The new Section 690-57 attempts to alleviate the same hazard for photovoltaic systems and it is desired for the same level of system safety to be present for both power sources, fuel cells and photovoltaics. This Comment represents the official position of the International Brotherhood of Electrical Workers Codes and Standards Committee.

Panel Meeting Action: Accept in Principle

Add a New Section 690.57, Load Disconnect, to read as follows:

690.57 Load Disconnect. A load disconnect that has multiple sources of power shall disconnect all sources when in the off position.

Panel Statement: The submitter's first sentence was already in 690.54. Revised text better addresses the safety issue and should satisfy the concerns of the submitter.

Number Eligible to Vote: 17

Ballot Results: Affirmative: 16

Ballot Not Returned: 1 Gustafson, R.

Comment on Affirmative:

BOWER, W.: I vote affirmative with comment on the panel action to accept in principle. I agree with the language for load disconnects that are not internal to an inverter. However, this may be an area where inspectors become confused, and they may require a second load disconnect when one is part of an inverter. If the load disconnect is within the inverter, then this is a listing issue and not a code issue.

13-57 Log #1619 NEC-P13 **Final Action: Accept**
(690.62)

Submitter: Technical Correlating Committee on National Electrical Code®,

Recommendation: Make the following change in 690.62:

Change "neutral" to "neutral conductor."

The revised text would appear as follows:

If a single-phase, 2-wire inverter output is connected to the neutral <u>conductor</u> and one ungrounded conductor (only) of a 3-wire system or of a 3-phase, 4-wire wye-connected system, the maximum load connected between the <u>neutral</u> conductor and any one ungrounded conductor plus the inverter output rating shall not exceed the ampacity of the neutral conductor.

Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).

The Task Group has proposed the following definitions to be added to Article 100:

● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.

● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals

● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.

● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.

Additional information is available in the Task Group report.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept

Number Eligible to Vote: 17

Ballot Results: Affirmative: 15 Negative: 1

Ballot Not Returned: 1 Gustafson, R.

Explanation of Negative:

STAFFORD, T.: Based on comments made by Task Group members it doesn't look like this proposal was completed at the TG level. Based upon supporting material submitted to the Panel it appears that the work on the Task Group was not complete, nor in agreement. Supporting materials submitted also specified that the entire list of proposals created and submitted by the task group should be rejected.

13-58 Log #2096 NEC-P13 **Final Action: Accept in Principle**
(690.62)

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal so that the text is in accordance with the NEC Style Manual. This action will be considered by the Panel as a Public Comment.

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum

Recommendation: Add the following second paragraph:
A neutral conductor connection to a single-phase or 3-phase utility-interactive inverter used solely for instrumentation or voltage or phase detection purposes and not for power transmission shall be permitted to be as small as 14 AWG.
Substantiation: Many utility interactive inverters have a 240V, 208V, or 480V output that requires no connection to a neutral conductor for power transmission. However, due to various IEEE Standards and local jurisdiction requirements, a connection to the electrical power system neutral conductor is required to detect a loss of phase and/or to monitor unbalanced line-to-neutral voltages of the inverter. This neutral connection, used only for phase detection or instrumentation, carries no appreciable power and can safely be made very small. A minimum requirement of 14 AWG ensures that this conductor is physically robust enough to be pulled through conduits with the power conductors.
Panel Meeting Action: Accept in Principle
Revise the second paragraph to read as follows:
A neutral conductor connection to a single-phase or 3-phase utility-interactive inverter used solely for instrumentation or voltage or phase detection purposes and not for power transmission shall be no smaller than the equipment grounding conductor.
Panel Statement: A 14 AWG may not be sufficient to carry fault current from the branch circuit breaker. Changing the requirement that the minimum conductor size be no smaller than the equipment grounding conductor ensures that this instrumentation conductor will be able to carry fault current and trip the circuit overcurrent device.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.
Comment on Affirmative:
STAFFORD, T.: My panel notes indicate the requirement of the minimum conductor size be no smaller than the equipment grounding conductor allowed for the proposal to pass at the ROP meeting.

13-59 Log #2100 NEC-P13 **Final Action: Accept**
(690.64)

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Recommendation: Revise the section as follows:
690.64 Point of Connection. The output of a ~~photovoltaic power source~~ utility-interactive inverter shall be connected as specified in 690.64(A) or 690.64(B).
Substantiation: Over the evolution of article 690 since 1984, the definition of Photovoltaic Power Source has referred to the dc output of a PV array. All of Part VII in 690 has always referred to the ac output of utility-interactive inverters. The terms "photovoltaic power source" was used incorrectly in this section. The wording change makes the section consistent with the intent of Part VII and removes any ambiguity.
Panel Meeting Action: Accept
Number Eligible to Vote: 17

(690.64(A))

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Recommendation: Revise the section as follows:
(A) Supply Side. ~~A photovoltaic power source~~ The output of a utility-interactive inverter shall be permitted to be connected to the supply side of the service disconnecting means as permitted in 230.82(6).
Substantiation: Over the evolution of article 690 since 1984, the definition of Photovoltaic Power Source has referred to the dc output of a PV array. All of Part VII in 690 has always referred to the ac output of utility-interactive inverters. The terms "photovoltaic power source" was used incorrectly in this section. The wording change makes the section consistent with the intent of Part VII and removes any ambiguity.
Panel Meeting Action: Accept
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.
Comment on Affirmative:
SWAYNE, R.: It should be recognized that the utility-interactive inverter is designed and tested to shut down in the event of loss of voltage from the utility. Otherwise, there is a danger to utility workmen.

13-61 Log #2081 NEC-P13 **Final Action: Accept in Principle**
(690.64(B))

TCC Action: The Technical Correlating Committee understands that the Panel Action on Proposal 13-69 modifies the Panel Action on this Proposal. The Technical Correlating Committee directs that this proposal be referred to Code-Making Panel 9 for comment relative to the overcurrent protection for the panelboard.
Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum
Recommendation: Revise the section as follows:
(B) Load Side. ~~A photovoltaic power source~~ The output of a utility-interactive inverter shall be permitted to be connected to the load side of the service disconnecting means of the other source(s) at any distribution equipment on the premises, provided that all of the following conditions are met:
Substantiation: Over the evolution of article 690 since 1984, the definition of Photovoltaic Power Source has referred to the dc output of a PV array. All of Part VII in 690 has always referred to the ac output of utility-interactive inverters. The terms "photovoltaic power source" was used incorrectly in this section. The wording change makes the section consistent with the intent of Part VII and removes any ambiguity.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
690.64 Point of Connection. The output of a ~~photovoltaic power source~~ utility-interactive inverter shall be connected as specified in 690.64(A) or 690.64(B).
(A) Supply Side. ~~A photovoltaic power source~~ The output of a utility-interactive inverter shall be permitted to be connected to the supply side of the service disconnecting means as permitted in 230.82(6).
(B) Load Side. ~~For a photovoltaic power source~~ The output of a utility-interactive inverter shall be permitted to be connected to the load side of the service disconnecting means of the other source(s) at any distribution equipment on the premises. Connections shall comply with 690.64(B)(1) through 690.64(B)(5)
(1) Each source interconnection shall be made at a dedicated circuit breaker or fusible disconnecting means.
(2) The interconnection point shall be on the line side of all ground-fault protection equipment.
Exception: Connection shall be permitted to be made to the load side of ground-fault protection, provided that there is ground-fault protection for equipment from all ground-fault current sources. Ground-fault protection devices used with supplies connected to the load-side terminals shall be identified and listed as suitable for backfeeding.
(3) Equipment containing more than one circuit supplying power to a busbar or conductor shall be marked at the overcurrent device for each supply.
(4) Circuit breakers, if backfed, shall be identified for such operation. Dedicated circuit breakers backfed from listed utility-interactive inverters complying with 690.60 shall not be required to be individually clamped to the panelboard busbars. A front panel shall clamp all circuit breakers to the panelboard busbars. Main circuit breakers connected directly to energized feeders shall also be individually clamped.
FPN. Circuit breakers that are marked "Line" and "Load" are not identified as suitable for backfeeding.
(5) The rating of the bus or conductor to which the utility-interactive inverter breaker or fusible disconnect is connected shall meet all of the conditions in 690.65(B)(5)(a) or 690.65(B)(5)(b)
(a) Where connected at other than the opposite (farthest) end of the busbar from the feeder or service, the sum of all overcurrent devices supplying the busbar or conductor shall not exceed the rating of the busbar or conductor, except in dwelling unit installations where the sum of all overcurrent devices supplying the busbar or conductor shall not exceed 120 percent of the busbar or conductor rating.
(b) Where connected at the opposite (farthest) end of the busbar from the feeder or service, the sum of ampere rating of the backfed PV supply overcurrent /disconnect device(s) shall not exceed the rating of the busbar or conductor. The following permanent plaque shall be installed at the PV supply connection or circuit breaker location:

WARNING: THIS PV SUPPLY CONNECTION MUST REMAIN CONNECTED OR INSTALLED AT THIS LOCATION, WHICH IS FARTHEST FROM THE FEEDER OR SERVICE CONNECTION.

Panel Statement: The panel placed existing and revised proposed language in 690.64(B) to meet the intent of the proposal and fit into the new formatting for Section 690.64(B).
Number Eligible to Vote: 17
Ballot Results: Affirmative: 14 Negative: 2
Ballot Not Returned: 1 Gustafson, R.

Explanation of Negative:

HORNBERGER, B.: This rewording of 690.64(B) will permit the sum of the overcurrent devices supplying current to a bus or conductor to exceed the ampacity rating of the bus or conductor by 200%. If the bus or conductor is not sized for the loads served, in accordance with article 220, an overload condition may exist on the bus or conductor that would not be detected by any of the overcurrent devices supplying current to the system. In addition, this is a "generic" requirement for utility interactive inverters and not specifically a photovoltaic system issue. Please see recommended rewording as part of my comment on 13-184 to incorporate a reference to article 220 and move the text to article 705.

NASBY, J.: NEMA is voting negative on the panel action for the following reasons:

1) The FPN proposed in 690.64(B)(4) is misleading and actually creates more confusion relative to what circuit breakers can be backfed. In reality, the main text of 690.64(B)(4) is incorrect in that circuit breakers that are suitable for backfeeding are not required to have any additional identification. Those circuit breakers that are identified with "Line" and "Load" markings are not suitable for backfeeding. Thus, the FPN is incorrect because the "Line" and "Load" markings are actually identification that the circuit breaker is not suitable for backfeeding.

To correct the confusion, the panel should delete the first sentence of 690.64(B)(4), delete the FPN and add a new last sentence to the main paragraph that states "Circuit breakers with "Line" and "Load" markings are not suitable for backfeeding.

2) The new text in 690.64(B)(5)(b) is not proper and can lead to overloading of the panelboard. The text implies that that you can have a feeder/service supply that is rated the full ampere rating of the panelboard and also have a backfed PV supply overcurrent device that is also rated the full ampere rating of the panelboard. This will allow the panelboard to be overloaded and circumvents the basic rule in Article 408 that a lighting and appliance branch circuit panelboard be provided with protection that does not exceed the rating of the panelboard. There is not justification to allow a panelboard applied in a PV application to be misapplied in this manner and be subjected to possible overloading.

Comment on Affirmative:

BOWER, W.: I vote affirmative with comment. This is to address some concerns by an inspector that have developed after the CMP meetings. There are some concerns about thermal overloading of a panel board with power being fed from both ends. This does not appear to be a problem that comes out of additional power being available, but by marginal designs of the panel boards, the circuit breakers and the like. Some have argued that panel boards will overheat and cause plastic failures or nuisance trips when loads are increased. It seems the increase in loads will cause nuisance trips or overheating regardless if more energy is available. The question in the case of increased loads is "will the main breaker trip or will a branch breaker trip from overcurrent or overtemperature?" Increasing the loads on panel boards, especially those that are running hot or of marginal design, likely will require new load calculations that will determine if a new panel board is needed. At this point in time, I see no reason why the additional source of power, in itself presents a problem.

SWAYNE, R.: The Panel Statement should indicate that this Panel Action includes proposed changes in Proposals 13-66, 13-67, and 13-68.

13-61a Log #CP1302 NEC-P13 **Final Action: Accept**
(690.64(B)(1) Exception)

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal so that the text is in accordance with the NEC Style Manual, and the Panel clarify the Panel Action on this Proposal by adding the word "and" following the end of requirement (d), and commas after requirements (a) through (d) rather than periods.

This action will be considered by the Panel as a Public Comment.

Submitter: Code-Making Panel 13,

Recommendation: Add the following exception after 690.64(B)(1).

Exception: The output of a utility interactive inverter may be connected to a dedicated branch circuit serving permanently connected loads provided:

(a) a load overcurrent protection device is installed to limit the available current to the load(s).

(b) coordination for the load overcurrent device meets the requirements of 240.12.

(c) the line terminals of the load overcurrent device are rated for the combined current of the branch circuit overcurrent device and the utility interactive inverter

(d) the branch circuit disconnect device is marked according to 690.14(C)(2).

(e) the load(s) are connected between the utility interactive inverter and the branch circuit overcurrent device.

Substantiation: This proposal resulted from a concept presented Proposal 13-63. However, the focus of that proposal was cord-connected inverters which are not allowed. The Panel developed this text to make the concept permissible.

Additional text may be required if Proposal 13-64 is accepted; the branch circuit breaker may have to be moved to the opposite end of the panel bus from the utility feed, e.g.,

(f) the branch overcurrent device shall be located according to (690.64(8)(2)).

Panel Meeting Action: Accept

Number Eligible to Vote: 17

Ballot Results: Affirmative: 14 Negative: 2

Ballot Not Returned: 1 Gustafson, R.

Explanation of Negative:

HORNBERGER, B.: This proposal should be rejected. Sources of electrical power to a premise must be connected through a dedicated switch/fuse or circuit breaker at a panel board, to properly manage branch circuit overcurrent protection and for the proper qualified person to control all sources of energy.

STAFFORD, T.: Panel action taken on proposal 13-63 specified why the connection to branch circuits is not allowed. See panel action taken on Proposal 13-63. The same branch circuit connect issues for plug and cord connected inverters apply to permanently installed connections as well.

13-62 Log #2469 NEC-P13 **Final Action: Reject**
(690.64(B)(1) Exception (New))

Submitter: David Zinck, Newburyport Wiring Inspector

Recommendation: Add the following exception:

Exception 1: For A/C modules listed to be cord connected, the point of connection shall be permitted to be by way of a weatherproof receptacle. The receptacle shall be supplied by a separate circuit of equal or greater rating than the A/C module output with a cover complying with 406.8(B), and shall be of the locking type.

Substantiation: A/C modules are currently being installed across the country with direct connections to panelboards through backfed circuit breakers as per 690.64(B)5. One company has had its product tested and listed as a cord connected unit. It was tested by ITS to UL standards (Report #3073899). There are two units available; 1-480W (120 volt) and 1 - 960W (240 Volt). The units work equally well on groundfault protected or non-groundfault protected circuits. Upon loss of normal power either due to power failure or a ground fault tripping, the A/C Module output stops in a couple of milliseconds.

These low wattage units are designed for the residential market. There is no compromise in safety to allow this cord and plug set up to be used as a disconnect as the code allows in other areas. By allowing the twistlock receptacle to be used as a disconnect, the homeowner can have an electrician install the receptacle, then purchase and set up these units themselves.

Many states across the nation have set initiatives for the advancement of "Green" energy. There is a national initiative to have 17 percent of all electricity produced by "green" sources by 2030. I field questions all year long from citizens who want to explore solar and other environmentally friendly sources. I believe units like these are a way to get people involved on a grass roots level with clean power and will help to swell support for things like windmills, trash-to-energy power plants, underwater (tidal and river) production and the like.

Panel Meeting Action: Reject

Panel Statement: Plug and receptacle connections for interconnected power systems would encourage connection of these devices into premise branch circuits. Such a connection may result in overloading a section of the circuit, as the circuit's overcurrent protective device will not see the total current flowing in the circuit. Additionally, UL 1741 requires permanent connections.

Number Eligible to Vote: 17

Ballot Results: Affirmative: 16

Ballot Not Returned: 1 Gustafson, R.

13-63 Log #2470 NEC-P13 **Final Action: Reject**
(690.64(B)(1) Exception No. 2 (New))

Submitter: David Zinck, Newburyport Wiring Inspector

Recommendation: Add the following exception:

Exception 2: For A/C modules listed to be cord connected, the point of connection shall be permitted to be made to the load side of a disconnect for an exterior appliance (such as an air conditioner condenser) which is fed by a separate circuit.

Substantiation: A/C modules are currently being installed across the country with direct connections to panelboards through backfed circuit breakers as per 690.64(B)5. One company has had its product tested and listed as a cord connected unit. It was tested by ITS to UL standards (Report #3073899). There are two units available; 480W (120 volt) and 960W (240 Volt). The units work equally well on groundfault protected or non-groundfault protected circuits. Upon loss of normal power either due to power failure or the shutting off the disconnect, the A/C output from the A/C Module stops in a couple of milliseconds.

These low wattage units are designed for the residential market. Air conditioning condensers are already separate circuits from a dedicated circuit breaker. To require a separate feed from a circuit breaker to another disconnect just for the A/C Module is redundant and a burden to the customer. By allowing this connection at the condenser disconnect, the disconnect will serve two purposes; the required disconnecting means for the condenser, the disconnecting means for the A/C module. Also, these solar panels will be putting out their peak power at the time that the home uses its peak air conditioning so essentially it just helps supplement the power consumed.

Many states across the nation have set initiatives for the advancement of "Green" energy. There is a national initiative to have 17 percent of all electricity produced by "Green" energy. There is a national initiative to have 17 percent of all electricity produced by "green" sources by 2030. I field questions all year long from citizens who want to explore solar and other environmentally friendly sources. I believe units like these A/C modules are an affordable way to get people involved on a grass roots level with clean power and will help swell support for things like windmills, trash-to-energy power plants, underwater (tidal and river) production, large scale solar arrays and the like.

Panel Meeting Action: Reject

Panel Statement: Interconnection of a PV system on a branch circuit will allow an overcurrent to occur without tripping the branch overcurrent protection device. Power sources shall be brought back to the service panel for distribution through the premise wiring. The cord and plug connection is not allowed per Section 400.8.

Number Eligible to Vote: 17

Ballot Results: Affirmative: 16

Ballot Not Returned: 1 Gustafson, R.

13-64 Log #2097 NEC-P13 **Final Action: Accept in Principle**
(690.64(B)(2))

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum

Recommendation: Revise the section as follows:

690.64(B)(2) ~~The sum of the ampere ratings of overcurrent devices in circuits supplying power to a busbar or conductor shall not exceed the rating of the busbar or conductor.~~

~~*Exception: For a dwelling unit, the sum of the ampere ratings of overcurrent devices shall not exceed 120 percent of the rating of the busbar or conductor.*~~

The ampere rating of the backfed PV supply overcurrent /disconnect device shall not exceed the rating of the busbar or conductor when, and only when, the busbar or conductor has the feeder or service connected to only one end.

When the busbar or conductor is not end-fed, the sum of all overcurrent devices supplying the busbar or conductor shall not exceed the rating of the busbar or conductor except in dwelling unit installations where the sum of all overcurrent devices supplying the busbar or conductor shall not exceed 120 percent of the busbar or conductor rating.

Substantiation: The changes proposed for 690.64(B)(2), 690.64(B)(4), and 690.64(B)(6) will clarify the interconnection requirements and make the code requirements for residential (dwelling unit) and commercial installations similar and more easily installed and inspected. The proposal for 690.64(B)(2) establishes the requirement that will limit the PV supply overcurrent devices to a value that is not greater than the rating of the busbar or the conductor. This requirement only applies when that busbar or conductor is fed from one end and would not apply to center fed busbars or busbars or conductors fed from some intermediate point

When a busbar or conductor is fed from one end and a PV system feeds it from the farthest end (the opposite end) as required by the new proposal for 690.64(B)(6), there is no place on the busbar or conductor where any loads may be connected that can draw current from either source that can overload any portion of the busbar. From any point on the busbar or conductor, currents up to the busbar rating may be supplied from either the utility source or the PV source or both. However, the overcurrent devices for each of these sources are limited to the busbar rating and will prevent the busbar between either source and the load from being overloaded

The second paragraph merges the exception into the code text, essentially repeats the existing code, and continues the existing requirements when the busbar is not end fed. All other requirements established by (1) and (3)-(6) will also apply to this situation.

Panel Meeting Action: Accept in Principle

Panel Statement: The intent of this proposal has been met by the changes made in the panel action on Proposal 13-61.

Number Eligible to Vote: 17

Ballot Results: Affirmative: 15 Negative: 1

Ballot Not Returned: 1 Gustafson, R.

Explanation of Negative:

HORNBERGER, B.: Please see my Negative vote comment on 13-61.

13-65 Log #2562 NEC-P13 **Final Action: Accept in Principle**
(690.64(B)(2) Exception No. 2 (New))

Submitter: James Bing, New Energy Options, Inc.

Recommendation: Add new text as follows:

690.64(B)(2)

Exception 2: For other than dwelling units, for utility-interactive inverters that are not capable of dispatching stored energy from external batteries, generators, flywheels or sources other than photovoltaic arrays, and where the existing loads on the feeder or service supplying the busbar or conductor do not exceed 80 percent of the busbar rating as calculated in 220.87, the sum of the ampere ratings of the overcurrent devices shall not exceed 120 percent of the rating of the busbar or conductor.

Substantiation: It is common practice, when designing building electrical distribution, to size the service disconnect means and feeder overcurrent protection at the same level as the ampere rating of the switchgear, panelboards and load centers that they supply. For this reason photovoltaic systems designed for existing commercial and industrial buildings, even if small compared to the size of the building service, are prohibited from being installed without major upgrades to building distribution. This new exception assures the safety of busbars and conductors in switchgear, panelboards and load centers from overloading in two ways. It uses 220.87, Optional Calculations for Determining Existing Loads, to first determine that the maximum demand upon an existing installed busbar or conductor has not exceeded 80 percent of its rating. And second, it limits the exception to only those inverters that are only capable of being supplied by photovoltaic arrays. The power output of a photovoltaic array is by nature a varying, non-periodic source, and is always zero between dusk and dawn. These types of inverters are not capable of dispatching stored energy at a predefined time, thus further decreasing the possibility of overloading the busbar due to coincidence of maximum loads and added capacity from a parallel source supplying the busbar.

Panel Meeting Action: Accept in Principle

Panel Statement: The intent of this proposal has been met by the changes made in the panel action on Proposal 13-61.

Number Eligible to Vote: 17

Ballot Results: Affirmative: 16

Ballot Not Returned: 1 Gustafson, R.

13-66 Log #2079 NEC-P13 **Final Action: Accept in Principle**
(690.64(B)(3))

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum

Recommendation: Revise the Exception as follows:

Exception: Connection shall be permitted to be made to the load side of ground-fault protection, provided that there is ground-fault protection for equipment from all ground-fault current sources. All ground-fault protection devices used with supplies connected to the load-side terminals shall be identified and listed as suitable for backfeeding.

Substantiation: To comply with the first sentence of the exception, some sort of ground-fault equipment must be connected to the output of the utility-interactive inverter. Any such equipment will be backfed by the inverter when it is processing power. Additionally, the existing main ground-fault protection device between the utility service or feeder may be subject to backfeeding. Therefore, the second sentence is required to ensure that all ground-fault devices that may have load-side connections to possible sources are suitable (identified and listed) for backfeeding.

Ground-fault protection devices (5 ma sensing GFCI 15-20 amp circuit breakers, 30 ma sensing 15-60 amp equipment protection breakers, and 15-200 amp feeder protection equipment), will generally be damaged if tripped by a ground fault while being backfed. This damage will disable the ground-fault protection mechanism of the device while still allowing normal operation (circuit breaker operation and current flow). This damage has been confirmed by testing the smaller devices at the Southwest Technology Development Institute and Sandia National Laboratories and by information obtained from manufacturers of the larger equipment. The damage may not be visible or obvious. Ground-fault protection equipment should never be backfed unless the equipment is specifically designed, identified, and listed to allow backfeeding.

Panel Meeting Action: Accept in Principle

Panel Statement: The intent of this proposal has been met by the changes made in the panel action on Proposal 13-61.

Number Eligible to Vote: 17

Ballot Results: Affirmative: 16

Ballot Not Returned: 1 Gustafson, R.

13-67 Log #2098 NEC-P13 **Final Action: Accept in Principle**
(690.64(B)(4))

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum

Recommendation: Revise the section and delete the exception as follows:

~~Equipment containing overcurrent devices in circuits supplying power to a busbar or conductor shall be marked to indicate the presence of all sources.~~

~~*Exception: Equipment with power supplied from a single point of connection.*~~

690.64(B)(4) Equipment containing more than one circuit supplying power to a busbar or conductor shall be marked at the overcurrent device for each supply. The following permanent plaque shall be installed at the PV supply connection or circuit breaker location.

WARNING: THIS PV SUPPLY CONNECTION MUST REMAIN CONNECTED OR INSTALLED AT THIS LOCATION, WHICH IS FARTHEST FROM THE FEEDER OR SERVICE CONNECTION.

Substantiation: The changes proposed for 690.64(B)(2), 690.64(B)(4), and 690.64(B)(6) will clarify the interconnection requirements and make the code requirements for residential (dwelling unit) and commercial installations similar and more easily installed and inspected. Section 690.64(B)(2) establishes the requirement that will limit the PV supply overcurrent device(s) to a value that is not greater than the rating of the busbar or the conductor. This requirement only applies when that busbar or conductor is fed from one end and would not apply to center-fed busbars or busbars or conductors fed from some intermediate point.

When a busbar or conductor is fed from one end and a PV system feeds it from the farthest end (the opposite end) as required by the new proposal for 690.64(B)(6), there is no place on the busbar or conductor where any loads may be connected that can draw current from either source that can overload any portion of the busbar. From any point on the busbar or conductor, currents up to the busbar rating may be supplied from either the utility source or the PV source or both. However, the overcurrent devices for each of these sources are limited to the busbar rating and will prevent the busbar between either source and the load from being overloaded. The exception has been merged into the wording of the revised text.

The permanent plaque required by this proposal will ensure that the PV supply connection or breaker location will not be moved.

Panel Meeting Action: Accept in Principle

Panel Statement: The intent of this proposal has been met by the changes made in the panel action on Proposal 13-61.

Number Eligible to Vote: 17

Ballot Results: Affirmative: 16

Ballot Not Returned: 1 Gustafson, R.

13-68 Log #2080 NEC-P13 **Final Action: Accept in Principle**
(690.64(B)(5))

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum

Recommendation: Revise the section and add the Fine Print Note as follows:

(5) Circuit breakers, if backfed, shall be identified for such operation. Dedicated circuit breakers backfed from listed utility-interactive inverters complying with 690.60 shall not be required to be individually clamped to the panelboard busbars. A front panel shall clamp all circuit breakers to the panelboard busbars. Main circuit breakers connected directly to energized feeders shall ~~also~~ be individually clamped.

FPN. Circuit breakers that are not marked “Line” and “Load” are identified as suitable for backfeeding.

Substantiation: The inclusion of the word “also” is grammatically incorrect. There is no antecedent.

UL Standard 489 is the reference for testing and marking molded-case circuit breakers suitable for backfeeding. The limited distribution of the standard and the allowance for backfeeding based on the absence of a marking is resulting in many circuit breakers being used improperly for backfeeding. Conversely, the absence of the marking causes many inspectors to not allow backfed circuit breakers. Also see the *UL Marking Guide for Molded Case Circuit Breakers.*

Panel Meeting Action: Accept in Principle

Panel Statement: The intent of this proposal has been met by the changes made in the panel action on Proposal 13-61.

Number Eligible to Vote: 17

Ballot Results: Affirmative: 16

Ballot Not Returned: 1 Gustafson, R.

13-69 Log #2099 NEC-P13 **Final Action: Accept in Principle**
(690.64(B)(6) (New))

TCC Action: The Technical Correlating Committee understands that the Action on this Proposal modifies the Panel Action on Proposal 13-61.

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum

Recommendation: Add the new section as follows:

690.64(B)(6) The PV supply overcurrent/disconnect device shall be installed in a panel board or connected to a conductor at the location farthest from the feeder or service connection.

Substantiation: The changes proposed for 690.64(B)(2), 690.64(B)(4), and 690.64(B)(6) will clarify the interconnection requirements and make the code requirements for residential (dwelling unit) and commercial installations similar and more easily installed and inspected. Section 690.64(B)(2) establishes the requirement that will limit the PV supply overcurrent device(s) to a value that is not greater than the rating of the busbar or the conductor. This requirement only applies when that busbar or conductor is fed from one end and would not apply to center-fed busbars or busbars or conductors fed from some intermediate point.

When a busbar or conductor is fed from one end and a PV system feeds it from the farthest end (the opposite end) as required by the new proposal for 690.64(B)(6), there is no place on the busbar or conductor where any loads may be connected that can draw current from either source that can overload any portion of the busbar. From any point on the busbar or conductor, currents up to the busbar rating may be supplied from either the utility source or the PV source or both. However, the overcurrent devices for each of these sources are limited to the busbar rating and will prevent the busbar between either source and the load from being overloaded.

This proposal establishes the location of the PV Supply connection or overcurrent device (typically a circuit breaker in a panel board).

Panel Meeting Action: Accept in Principle

Revise last sentence of 690.64(B) to read

“....provided that either condition (1) or all of conditions (2) through (6) are met.”

Add a new number (1) to 690.64(B) to read as follows:

690.64(B)(1) The PV supply overcurrent/disconnect device shall be installed in a panelboard and positioned farthest from the feeder or service connection.

Renumber existing (1) through (5) to (2) through (6).

Panel Statement: The panel agrees with the intent of the proposal but has revised it as a separate list of items to clarify the language.

Number Eligible to Vote: 17

Ballot Results: Affirmative: 14 Negative: 2

Ballot Not Returned: 1 Gustafson, R.

Explanation of Negative:

HORNBERGER, B.: Please see my Negative vote comment on 13-61.

STAFFORD, T.: The panel action should have been to include the wording “farthest electrically” from the feeder or service connection. The intent of the panel was to provide the best location to add overcurrent protective devices in a panel board such that the maximum protection would be obtained. This is accomplished by placing the device the furthest electrically from feeder and service connections.

13-70 Log #2062 NEC-P13 **Final Action: Accept in Principle**
(690.74)

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University / Rep. PV Industry Forum

Recommendation: Add the following second paragraph to the section:

Flexible, fine-stranded cables shall only be used with terminals, lugs, and connectors that are listed and marked for such use.

Substantiation: PV installations with batteries frequently use flexible, fine-stranded cables for ease of installation. These cables are nearly always installed with terminals that are not listed for use with the cable.

UL Standard 486 A and B requires that connectors, lugs, and terminals that are intended for use with flexible, fine-stranded cables be so marked for use with such cables. Very few connectors and terminals have been listed for such use, and few are so marked. The vast majority of connectors, lugs, and terminals are unsuitable for use with flexible, fine-stranded cables. However, the limited distribution and wording of the standard has resulted in flexible, fine-stranded cables being used improperly with these non-marked connectors, lugs, and terminals. Failures in several widely different industries have been reported.

A similar proposal has been submitted for 110.14(A).

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle

Revise the text by adding the word “devices” after “lugs”

Panel Statement: The panel added the word “devices”, as there may be other devices that are listed for the purpose.

Number Eligible to Vote: 17

Ballot Results: Affirmative: 15 Negative: 1

Ballot Not Returned: 1 Gustafson, R.

NASBY, J.: See my explanation of negative vote on Proposal 13-40.

ARTICLE 692 — FUEL CELL SYSTEMS

13-71 Log #2578 NEC-P13 **Final Action: Accept in Principle**
(692)

Submitter: Timothy M. Croushore, Allegheny Power

Recommendation:

Revise text to read as follows:

ARTICLE 692 Fuel Cell Systems

I. General

692.1 Scope.

This article identifies the requirements for the installation of fuel cell power systems, which ~~may be~~ are either stand-alone or interactive with other electrical power production and distribution network sources ~~and may be~~ with or without electrical energy storage such as batteries. These systems may have ac or dc output for utilization.

692.2 Definitions.

Fuel Cell. An electrochemical system that consumes fuel to produce an electric current. The main chemical reaction used in a fuel cell for producing electric power is not combustion. However, there may be sources of combustion used within the overall fuel cell system such as reformers/fuel processors.

Fuel Cell System. The complete aggregate of equipment used to convert chemical fuel into usable electricity. A fuel cell system typically consists of a reformer, stack, power inverter, and auxiliary equipment.

~~**Interactive System.** A fuel cell system that operates in parallel with and may deliver power to an electrical production and distribution network. For the purpose of this definition, an energy storage subsystem of a fuel cell system, such as a battery, is not another electrical production source.~~

~~**Maximum System Voltage.**~~ The highest fuel cell inverter output voltage between any ungrounded conductors present at accessible output terminals.

Output Circuit. The conductors used to connect the fuel cell system to its electrical point of delivery. In the case of sites that have series- or parallel-connected multiple units, the term *output circuit* also refers to the conductors used to electrically interconnect the fuel cell system(s).

~~**Point of Common Coupling.** The point at which the power production and distribution network and the customer interface occurs in an interactive system. Typically, this is the load side of the power network meter.~~

~~**Stand-Alone System.**~~ A fuel cell system that supplies power independently of an electrical production and distribution network.

692.3 Other Articles.

Wherever the requirements of other articles of this *Code* and Article 692 differ, the requirements of Article 692 shall apply. ~~and, if the system is operated in parallel with a primary source(s) of electricity, the requirements in 705.14, 705.16, 705.32, and 705.43 shall apply~~<u>Fuel Cell systems that are interactive with other electrical power production sources shall follow the requirements of Article 705.</u>

692.4 Installation.

(A) Fuel Cell System. A fuel cell system shall be permitted to supply a building or other structure in addition to any service(s) of another electricity supply system(s).

(B) Identification. A permanent plaque or directory, denoting all electrical power sources on or in the premises, shall be installed at each service equipment location.

692.6 Listing Requirement.

The fuel cell system shall be evaluated and listed for its intended application prior to installation.

II. Circuit Requirements

692.8 Circuit Sizing and Current.

(A) Nameplate Rated Circuit Current. The nameplate(s) rated circuit current shall be the rated current indicated on the fuel cell nameplate(s).

(B) Conductor Ampacity and Overcurrent Device Ratings. The ampacity of the feeder circuit conductors from the fuel cell system(s) to the premises wiring system shall not be less than the greater of (1) nameplate(s) rated circuit current or (2) the rating of the fuel cell system(s) overcurrent protective device(s).

(C) Ampacity of Grounded or Neutral Conductor. If an interactive single-phase, 2-wire fuel cell output(s) is connected to the grounded or neutral conductor and a single ungrounded conductor of a 3-wire system or of a 3-phase, 4-wire wye-connected system, the maximum unbalanced neutral load current plus the fuel cell system(s) output rating shall not exceed the ampacity of the grounded or neutral conductor.

692.9 Overcurrent Protection.

(A) Circuits and Equipment. If the fuel cell system is provided with overcurrent protection sufficient to protect the circuit conductors that supply the load, additional circuit overcurrent devices shall not be required. Equipment and conductors connected to more than one electrical source shall be protected.

(B) Accessibility. Overcurrent devices shall be readily accessible.

692.10 Stand-Alone Systems.

The premises wiring system shall meet the requirements of this *Code* except as modified by 692.10(A), (B), and (C).

(A) Fuel Cell System Output. The fuel cell system output from a stand-alone system shall be permitted to supply ac power to the building or structure disconnecting means at current levels below the rating of that disconnecting means.

(B) Sizing and Protection. The circuit conductors between the fuel cell system(s) output and the building or structure disconnecting means shall be sized based on the output rating of the fuel cell system(s). These conductors shall be protected from overcurrents in accordance with 240.4. The overcurrent protection shall be located at the output of the fuel cell system(s).

(C) Single 120-Volt Nominal Supply. The inverter output of a stand-alone fuel cell system shall be permitted to supply 120 volts, nominal, to single-phase, 3-wire 120/240-volt service equipment or distribution panels where there are no 240-volt loads and where there are no multiwire branch circuits. In all installations, the rating of the overcurrent device connected to the output of the fuel cell system(s) shall be less than the rating of the service equipment. This equipment shall be marked as follows:

WARNING
SINGLE 120-VOLT SUPPLY.
DO NOT CONNECT MULTIWIRE
BRANCH CIRCUITS!

III. Disconnecting Means

692.13 All Conductors.

Means shall be provided to disconnect all current-carrying conductors of a fuel cell system power source from all other conductors in a building or other structure.

692.14 Provisions.

The provisions of 225.31 and 225.33 through 225.40 shall apply to the fuel cell source disconnecting means. The disconnecting means shall not be required to be suitable as service equipment and shall be rated in accordance with 692.17.

692.17 Switch or Circuit Breaker.

The disconnecting means for ungrounded conductors shall consist of readily accessible, manually operable switch(es) or circuit breaker(s).

Where all terminals of the disconnecting means may be energized in the open position, a warning sign shall be mounted on or adjacent to the disconnecting means. The sign shall be clearly legible and shall have the following words or equivalent:

DANGER
ELECTRIC SHOCK HAZARD.
DO NOT TOUCH TERMINALS.
TERMINALS ON BOTH THE LINE AND
LOAD SIDES MAY BE ENERGIZED
IN THE OPEN POSITION.

IV. Wiring Methods

692.31 Wiring Systems.

All raceway and cable wiring methods included in Chapter <u>3</u> of this *Code* and other wiring systems and fittings specifically intended and identified for use with fuel cell systems shall be permitted. Where wiring devices with integral enclosures are used, sufficient length of cable shall be provided to facilitate replacement.

V. Grounding

692.41 System Grounding.

For a fuel cell system output circuit, one conductor of a 2-wire system rated over 50 volts and a neutral conductor of a 3-wire system shall be solidly grounded by either 692.41(A) or 692.41(B).

(A) Stand-Alone Systems. Grounding and bonding shall be in accordance with 250.30.

(B) Other Than Stand-Alone Systems.

(1) Two-Wire Systems. One conductor shall be terminated at the grounded circuit conductor terminal of the premises wiring system.

(2) Three-Wire Systems. The neutral conductor shall be terminated at the grounded circuit conductor terminal of the premises wiring system.

692.44 Equipment Grounding Conductor.

A separate equipment grounding conductor shall be installed.

692.45 Size of Equipment Grounding Conductor.

The equipment grounding conductor shall be sized in accordance with 250.122.

692.47 Grounding Electrode System.

Any supplementary grounding electrode(s) required by the manufacturer shall be connected to the equipment grounding conductor specified in 250.118.

VI. Marking

692.53 Fuel Cell Power Sources.

A marking specifying the fuel cell system, output voltage, output power rating, and continuous output current rating shall be provided at the disconnecting means for the fuel cell power source at an accessible location on the site.

692.54 Fuel Shut-Off.

The location of the manual fuel shut-off valve shall be marked at the location of the primary disconnecting means of the building or circuits supplied.

692.56 Stored Energy.

A fuel cell system that stores electrical energy shall require the following warning sign, or equivalent, at the location of the service disconnecting means of the premises:

WARNING
FUEL CELL POWER SYSTEM CONTAINS
ELECTRICAL ENERGY STORAGE DEVICES.

VII. Connection to Other Circuits

692.59 Transfer Switch.

A transfer switch shall be required in non–grid-interactive systems that use utility grid backup. The transfer switch shall maintain isolation between the electrical production and distribution network and the fuel cell system. The transfer switch shall be permitted to be located externally or internally to the fuel cell system unit. When the utility service conductors of the structure are connected to the transfer switch, the switch shall comply with Article 230, Part V.

692.60 Identified Interactive Equipment.

Only fuel cell systems listed and identified as interactive shall be permitted in interactive systems.

692.61 Output Characteristics.

The output of a fuel cell system operating in parallel with an electric supply system shall be compatible with the voltage, wave shape, and frequency of the system to which it is connected.

FPN: The term *compatible* does not necessarily mean matching the primary source wave shape.

~~**692.62 Loss of Interactive System Power.**~~

~~The fuel cell system shall be provided with a means of detecting when the electrical production and distribution network has become de-energized and shall not feed the electrical production and distribution network side of the point of common coupling during this condition. The fuel cell system shall remain in that state until the electrical production and distribution network voltage has been restored.~~

~~A normally interactive fuel cell system shall be permitted to operate as a stand-alone system to supply loads that have been disconnected from electrical production and distribution network sources.~~

~~**692.64 Unbalanced Interconnections.**~~

~~**(A) Single Phase.** Single-phase interactive fuel cell systems shall not be connected to a 3-phase power system unless the interactive system is so designed that significant unbalanced voltages cannot result.~~

~~**(B) Three Phase.** Three-phase interactive fuel cell systems shall have all phases automatically de-energized upon loss of voltage, or upon unbalance of voltage in one or more phases, unless the interactive system is designed so that significant unbalanced voltages will not result.~~

~~**692.65 Point of Connection.**~~

~~The output of a fuel cell system power source shall be connected as specified in 692.65(A) or 692.65(B).~~

~~**(A) Supply Side.** A fuel cell system power source shall be permitted to be connected to the supply side of the service disconnecting means as permitted in 230.82(6).~~

~~**(B) Load Side.** A fuel cell system power source shall be permitted to be connected to the load side of the service disconnecting means of the other source(s) at any distribution equipment on the premises, provided that all of the following conditions are met:~~

~~(1) Each source interconnection shall be made at a dedicated circuit breaker or fusible disconnecting means.~~

~~(2) The sum of the ampere ratings of overcurrent devices in circuits supplying power to a busbar or conductor shall not exceed the rating of the busbar or conductor.~~

~~*Exception: For a dwelling unit, the sum of the ampere ratings of the overcurrent devices shall not exceed 120 percent of the rating of the busbar or conductor.*~~

~~(3) The interconnection point shall be on the line side of all ground-fault protection equipment.~~

~~(4) Equipment containing overcurrent devices in circuits supplying power to a busbar or conductor shall be marked to indicate the presence of all sources.~~

~~(5) Equipment such as circuit breakers, if backfed, shall be identified for such operation.~~

~~(6) The circuit breaker on the dedicated output of a utility-interactive inverter shall be positioned in the distribution equipment at the opposite (load) end from the input feeder connection or main circuit location. A permanent warning label shall be applied to the distribution equipment with the following, or equivalent:~~

~~WARNING~~
~~FUEL CELL POWER SYSTEM OUTPUT.~~
~~DO NOT RELOCATE THIS CIRCUIT BREAKER.~~

VIII. Outputs Over 600 Volts

692.80 General.

Fuel cell systems with a maximum output voltage over 600 volts ac shall comply with the requirements of other articles applicable to such installations.

Substantiation: This proposal is part of 2 other proposals dealing with interconnecting electric power sources in Article 690, Article 692 and Article 705. This proposal is part of 3 other proposals to place common definitions in Article 100. The purpose of this proposal is to revise Article 692. This work incorporates the equipment that would be listed by Underwriters Laboratory Standard 1741 – Inverters, Converters and Controllers for Use in Independent Power Systems.

The figure in the substantiation section of this proposal shows the common wiring in building systems that should be covered by Article 705. It also shows technology specific wiring that would be covered by Articles 690 and 692. The main purpose of this proposal is to put all interconnection requirements in Article 705 and all technology specific issues in their respective articles.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle

Panel Statement: Refer to panel statement and action on Proposal 13-17.

The panel did not accept the change as recommended in this proposal. The panel concluded that this is a good idea and agreed to some of the recommended duplication of the interconnection issues in Article 705 (Proposal 13-184), but there was insufficient information provided as well as too little industry input to make the proposed change in Article 692. The panel has addressed elements of the issue in Proposal 13-184 (Article 705).

Number Eligible to Vote: 17

Ballot Results: Affirmative: 16

Ballot Not Returned: 1 Gustafson, R.

Comment on Affirmative:

BOWER, W.: I vote affirmative with comment because I agree with the panel action to NOT accept the sweeping change as recommended in this proposal on Article 692. Further, I disagree with the recommended duplication of the interconnection issues in Article 705 (Proposal 17-184) as accepted, without a thorough industry-supported substantiation for each change. The impacts for each technology must be assessed. There was insufficient substantiation provided and little industry input to make the proposed change in Article 690, 692 OR in 705. I believe this change, as it was accepted in principle for Article 705, needs careful public and industry scrutiny.

HORNBERGER, B.: I agree with the panel action to accept in principle, however since the interconnection provisions have been incorporated in Article 705, the parallel redundant requirements for Fuel Cell utility interconnected power inverters should be removed from Article 692.

KRASTINS, K.: See my affirmative with comment on Proposal 13-17.

STAFFORD, T.: This Panel Member agrees with the intent of the submitter that all of the interconnection issues should be addressed in a single article of the NEC. The action taken by the panel is welcomed as a first step to determine a uniform acceptance of interconnection issues within the NEC.

13-72 Log #2857 NEC-P13 **Final Action: Accept**
(692.41)

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal that the intent is to delete the existing text in 692.41 and 692.41(A) and (B) as it appears in the 2005 NEC and replace it with the text in this proposal.

This action will be considered by the Panel as a Public Comment.

Submitter: Kenneth Krastins, Plug Power, Inc. / Rep. US Fuel Cell Council
Recommendation: Replace all of 692.41 with the following:

692.41 System Grounding.

(A) AC Systems. Grounding of ac systems shall be in accordance with 250.20, and 250.30 for stand-alone systems.

(B) DC Systems. Grounding of dc systems shall be in accordance with 250.160.

Substantiation: The submitter recognizes that a similar proposal during the previous code cycle to add references in the NEC for dc grounding of fuel cell systems was rejected by CMP-13 on the basis that the NEC is not a training manual and that this information does already exist elsewhere in the Code. However, this proposal respectfully requests the panel to reconsider that decision based on the following. The 2005 revision to the Code added language to 692.1 indicating that Article 692 applies for fuel cells with both ac and dc outputs. Currently, however, the language under 692.41 pertains to ac outputs only. The language of 692.3 pertaining to other articles of the Code may cause AHJ's to consider that the grounding requirements and provisions provided in 250.160 may not be applicable because of the specific reference in 692.41 to 250.30 but having no such corresponding reference to 250.160 for dc systems.
Panel Meeting Action: Accept
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.
Comment on Affirmative:

SWAYNE, R.: Although this proposal is Accepted, the Section is still incomplete. The Section needs to state that bonding of both ac and dc sides are necessary and that there shall be one grounding electrode for both ac and dc of the premises wiring system.

13-73 Log #3586 NEC-P13 **Final Action: Accept**
(692.41(C) (New))

Submitter: Robert H. Wills, Intergrid, LLC
Recommendation: Add a new section 692.41(C):

<u>(C) Systems with Alternating-Current and Direct Current Grounding Requirements.</u>

<u>When fuel cell power systems have both alternating-current (ac) and direct-current (dc) grounding requirements, the dc grounding system shall be bonded to the ac grounding system. The bonding conductor shall be sized according to 692.45. A single common grounding electrode and grounding bar may be used for both systems in which case the common grounding electrode conductor shall be sized to meet the requirements of both 250.66(ac) and 250.166(dc).</u>

Substantiation: The new section states that bonding between ac and dc grounding systems is required, and that a single grounding electrode and grounding electrode conductor can be used.

The intent of bonding is to hold both ground systems and all equipment, whether ac or dc, at the same potential. As fault current does not run through this bond (the ac and dc grounding systems are separate), a conductor sized the same as an equipment grounding conductor is sufficient to meet this intent. The bonding conductor between the ac and dc grounding systems should not be confused with main or system bonding conductors that are required to carry full fault currents. Both the ac and dc grounding systems will have bonds from the ground system to their respective grounded conductors that are required to be sized according to 250.66(ac) and 250.166(dc).
Panel Meeting Action: Accept
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Gustafson, R.
Comment on Affirmative:

SWAYNE, R.: See Affirmative Comment to Proposal 13-72.

13-74 Log #2855 NEC-P13 **Final Action: Accept in Principle**
(692.65(B)(2))

Submitter: Kenneth Krastins, Plug Power, Inc. / Rep. US Fuel Cell Council
Recommendation: Replace all of 692.65(B)(2), including the exception of that clause, with the following:

The sum of the ampere ratings of overcurrent devices of the utility-interactive inverters supplying power to a busbar or conductor shall not exceed the rating of the busbar or conductor.

Substantiation: Interpretations by AHJs of the current wording could lead to needlessly requiring upgrades of the service panel whenever a fuel cell system is installed. This proposed wording, taken in conjunction with the existing requirement of 692.65(B)(6), provides language for safely implementing the requirement without misinterpretation. Because of the greater clarity provided by this language, the need for the exception is obviated, and thus this submittal also recommends removal of the exception.
Panel Meeting Action: Accept in Principle

Revise entire 692.65 to read as follows:

692.65 Utility-Interactive Point of Connection. The output of a utility-interactive inverter shall be connected as specified in 692.65(A) or 692.65(B).

(A) Supply Side. A utility-interactive inverter shall be permitted to be connected to the supply side of the service disconnecting means as permitted in 230.82(6).

(B) Load Side. A utility-interactive inverter shall be permitted to be connected to the load side of the service disconnecting means of the other source(s) at any distribution equipment on the premises, provided that all of the following conditions of 692.65(B)(1) through 692.65(B)(5) are met:

(1) Dedicated Overcurrent and Disconnect. Each source interconnection shall be made at a dedicated circuit breaker or fusible disconnecting means.

(2) Ground Fault Protection. The interconnection point shall be on the line side of all ground-fault protection equipment.

(3) Marking. Equipment containing overcurrent devices in circuits supplying power to a busbar or conductor shall be marked to indicate the presence of all sources.

(4) Suitable for Back Feed. Equipment such as circuit breakers, if backfed, shall be identified for such operation.

(5) Bus or Conductor Rating. The rating of the bus or conductor to which the utility-interactive inverter breaker or fusible disconnect is connected shall meet all of the conditions in 692.65(B)(5)(a) or 692.65(B)(5)(b).

(a) End Feed Connection. Where the utility-interactive inverter breaker or fusible disconnect is connected in the distribution equipment at the opposite (load) end from the input feeder connection or main circuit location, the bus or conductor rating shall be equal to or larger than the sum of the ampere ratings of all overcurrent devices connecting premise electric power production sources to the bus or conductor. A permanent warning label shall be applied to the distribution equipment with the following or equivalent:

WARNING
ELECTRIC POWER PRODUCTION SOURCE OUTPUT
DO NOT RELOCATE THIS OVERCURRENT DEVICE.

(b) General Connection. Where the utility-interactive inverter breaker or fusible disconnect is not end fed, the bus or conductor rating shall be equal to or larger than the sum of the ampere ratings of overcurrent devices in circuits supplying power to the busbar or conductor.

Exception: For a dwelling unit, the sum of the ampere ratings of the overcurrent devices shall not exceed 120 percent of the rating of the busbar or conductor.

Panel Statement: The panel action should satisfy the intent of the submitter.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 14 Negative: 2
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:

HORNBERGER, B.: This rewording of 692.65 will permit the sum of the overcurrent devices supplying current to a bus or conductor to exceed the ampacity rating of the bus or conductor by 200%. If the bus or conductor is not sized for the loads served, in accordance with article 220, an overload condition may exist on the bus or conductor that would not be detected by any of the overcurrent devices supplying current to the system. In addition, this is a "generic" requirement for utility interactive inverters and not specifically a photovoltaic system issue. Please see recommended rewording as part of my comment on 13-184 to incorporate a reference to article 220 and move the text to article 705.

STAFFORD, T.: The action taken by the panel was not consistent with the intent of the submitter. The submitter's intent was to replace all of 692.65(B)(2), including the exception, with the following: The sum of the ampere ratings of overcurrent devices of the utility-interactive inverters supplying power to a busbar or conductor shall not exceed the rating of the busbar or conductor. The panel action was to completely rewrite 692.65. The action taken at the Panel level does not reflect accurate intentions of the submitted proposal.
Comment on Affirmative:

BOWER, W.: I vote affirmative with comment to address some concerns that have developed after the CMP meetings. There have been concerns about thermal overloading of a panel board with power being fed from both ends. This does not appear to be a problem that comes out of additional power being available, but by marginal designs of the panel boards, the circuit breakers and the like. Some have argued that panel boards will overheat and cause plastic failures or nuisance trips when loads are increased. It seems the increase in loads will cause nuisance trips regardless if more energy is available. The question in the case of increase loads is will the main breaker trip or will a branch breaker trip from overcurrent or overtemperature. Increasing the loads on panel boards, especially those that are running hot or of marginal design, likely will require new load calculations that will determine if a new panel board is needed. At this point in time, I see no reason why the additional source of power, in itself presents a problem.

13-75 Log #2853 NEC-P13 **Final Action: Accept in Principle**
(692.65(B)(3) Exception (New))

Submitter: Kenneth Krastins, Plug Power, Inc. / Rep. US Fuel Cell Council
Recommendation: Add an exception to read:

Exception: Connection shall be permitted to be made to the load side of ground-fault protection, provided that there is ground-fault protection for equipment from all ground-fault current sources. All ground-fault protection devices used with supplies connected to the load-side terminals shall be identified and listed as suitable for backfeeding.

Substantiation: This clause will then be consistent with the rewording of 690.64(B)(3) proposed by the Photovoltaics Industry Forum.
Panel Meeting Action: Accept in Principle

Accept tge exception as proposed but relocate the text to 692.65(B)(2).

Panel Statement: Relocating the text is necessary to make it consistent with the action taken on Proposal 13-74.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 14 Negative: 2
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:

HORNBERGER, B.: Please see my negative vote comment on 13-74.

STAFFORD, T.: See my explanantion of negative vote on Proposal 13-74.

13-76 Log #2854 NEC-P13 **Final Action: Accept in Principle**
(692.65(B)(6))

Submitter: Kenneth Krastins, Plug Power, Inc. / Rep. US Fuel Cell Council
Recommendation: Pluralize the wording of 692.65(B)(6) to cover multiple fuel cells/inverters to read:

The circuit breaker s on the dedicated output s of ~~a~~ utility-interactive inverter s shall be positioned in the distribution equipment at the opposite (load) end from the input feeder connection or main circuit location. A permanent warning label shall be applied to the distribution equipment with the following, or equivalent: WARNING FUEL CELL POWER SYSTEM OUTPUT. DO NOT RELOCATE THIS BREAKER.

Substantiation: This will appropriately permit the connection of more than a single fuel cell (or other DG) system into a breaker panel while still retaining the safety provided by this clause.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel action on Proposal 13-74 should satisfy the intent of the submitter.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 14 Negative: 2
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:

HORNBERGER, B.: Please see my negative vote comment on 13-74.

STAFFORD, T.: See my explanantion of negative vote on Proposal 13-74.

ARTICLE 695 — FIRE PUMPS

13-77 Log #2847 NEC-P13 **Final Action: Reject**
(695)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reported as "Reject" because of the number of technical inconsistencies, style manual issues, and the inclusion of material outside the scope and purpose of Article 695.

It was the action of the Techncial Correlating Committee that this proposal be reconsidered by the panel and that the panel limit the requirements to those within the scope of those necessary for a safe electrical installation. The Techncial Correlating Committee agrees with the negative commenters that much of the material added by the panel is inappropriate for the NEC. The panel should not attempt to recreate NFPA 20 in the NEC. In addition, the panel is directed to address the large number of style manual issues noted in Mr. Nasby's negative comment. This action shall be considered by the panel as a public comment.

Submitter: Dana R. Haagensen, Massachusetts Office of the State Fire Marshal
Recommendation: Revise extracted text from NFPA 20 to reflect 2006 edition revisions. Following is the NFPA 20 - Chapter 9 text as it has been voted on by the NFPA 20 Committee to date.

NFPA 20 - DRAFT

Chapter 9 Electric Drive for Pumps

9.1 General.

9.1.1 This chapter covers the minimum performance and testing requirements of the sources and transmission of electrical power to motors driving fire pumps.

9.1.2 Also covered are the minimum performance requirements of all intermediate equipment between the source(s) and the pump, including the motor(s) but excepting the electric fire pump controller, transfer switch, and accessories (see Chapter 10).

9.1.3 All electrical equipment and installation methods shall comply with NFPA 70, National Electrical Code, Article 695, and other applicable articles.

9.1.4* All power supplies shall be located and arranged to protect against damage by fire from within the premises and exposing hazards.

9.1.5 All power supplies shall have the capacity to run the fire pump on a continuous basis.

9.1.6 All power supplies shall comply with the voltage drop requirements of Section 9.7.

9.2 Normal Power.

9.2.1 An electric motor driven fire pump shall be provided with a normal source of power as a continually available source.

9.2.2 The normal source of power required in 9.2.1 and its routing shall be arranged in accordance with one of the following:

(1) Service connection dedicated to the fire pump installation.

(2) On-site power production facility connection dedicated to the fire pump installation.

(3) A dedicated feeder connection derived directly from the dedicated service to the fire pump installation.

(4) As a feeder connection where all of the following conditions are met:

a. The protected facility is part of a multi-building campus style arrangement.

b. A back-up source of power is provided from a source independent of the normal source of power.

c. It is impractical to supply the normal source of power through arrangement 9.2.2(1), 9.2.2(2), 9.2.2(3) or 9.2.2(5).

d. The arrangement is acceptable to the authority having jurisdiction.

e. The overcurrent protection device(s) in each disconnecting means shall be selectively coordinated with any other supply side overcurrent protective device(s).

(5) A dedicated transformer connection directly from the service meeting the requirements of Article 695 of NFPA 70.

9.2.3 For fire pump installations using the arrangement of 9.2.2(1), 9.2.2(2),9.2.2(3), 9.2.2(5) for the normal source of power, no more than one disconnecting means and associated overcurrent protection device shall be installed in the power supply to the fire pump controller.

9.2.3.1 Where the disconnecting means permitted by 9.2.3 is installed, the disconnecting means shall meet all of the following:

(1) Identified as being suitable for use as service equipment.

(2) Lockable in the closed position.

(3) * Located remote from other building disconnecting means.

(4) * Located remote from other fire pump source disconnecting means.

(5) Marked "Fire Pump Disconnecting Means" in letters that are no less than one inch (25 mm) in height and that can be seen without opening enclosure doors or covers.

9.2.3.2 Where the disconnecting means permitted by 9.2.3 is installed, a placard shall be placed adjacent to the fire pump controller stating the location of this disconnection means and the location of any key needed to unlock the disconnect.

9.2.3.3 Where the disconnecting means permitted by 9.2.3 is installed, the disconnect shall be supervised in the closed position by one of the following methods:

(1) Central station, proprietary or remote station signal device

(2) Local signaling service that will cause the sounding of an audible signal at a constantly attended location

(3) Locking the disconnecting means in the closed position

(4) Sealing of disconnecting means and approved weekly recorded inspections where the disconnecting means are located within fenced enclosures or in buildings under the control of the owner

9.2.3.4 Where the overcurrent protection permitted by 9.2.3 is installed, the overcurrent protection device shall be selected or set to carry indefinitely the sum of the locked-rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full-load current of the associated fire pump accessory equipment.

9.3 Alternate power.

9.3.1 Except for an arrangement described in 9.3.3, at least one alternate source of power shall be provided when the height of the structure is beyond the pumping capacity of the fire department apparatus.

9.3.2* Except for an arrangement described in 9.3.3, at least one alternate source of power shall be provided where the normal source is not reliable.

9.3.3 An alternate source of power is not required where a back-up engine driven or back-up steam turbine driven fire pump is installed in accordance with this standard.

9.3.4 When provided, the alternate source of power shall be supplied from one of the following sources:

(1) A generator installed in accordance with Section 9.8.

(2) One of the sources identified in 9.2.2(1); 9.2.2(2); 9.2.2(3); or 9.2.2(5) when the power is provided independent of the normal source of power.

9.3.5 When provided, the alternate supply shall be arranged so that the power to the fire pump is not disrupted when overhead lines are de-energized for fire department operations.

9.4 Junction Boxes. Where fire pump wiring to or from a fire pump controller is routed through a junction box, the following requirements shall be met.

9.4.1 The junction box shall be securely mounted.

9.4.2* Mounting and installing of a junction box shall not violate the enclosure Type (NEMA) rating of the fire pump controller(s).

9.4.3* Mounting and installing of a junction box shall not violate the integrity of the fire pump controller(s) and shall not affect the Short Circuit Rating of the controller(s).

9.4.4 As a minimum, a National Electrical Manufacturers Association (NEMA) Type 2, dripproof enclosure (junction box) shall be used. The enclosure shall be listed f or the subject to match the fire pump controller enclosure Type rating.

9.4.5 Terminals, junction blocks, splices, and the like, when used, shall be listed.

9.5* Listed Electrical Circuit Protective System to Controller Wiring.

9.5.1* Where single conductors (individual conductors) are used, they shall be terminated in a separate junction box and in accordance with NFPA 70.

9.5.2 Single (individual conductors) shall not enter the fire pump enclosure separately.

9.5.3* Where required by the manufacturer of a listed Electrical Circuit Protective System or by NFPA 70 or by the Listing agency, the raceway between a junction box and the fire pump controller shall be sealed at the junction box end as required and per the instructions of the manufacturer or listing agency.

9.5.4 Standard wiring between junction box and controller is acceptable.

9.6* Raceway Terminations.

9.6.1 Listed conduit hubs shall be used to terminate raceway (conduit) to the fire pump controller.

9.6.2 The NEMA Type rating of the conduit hub(s) shall be at least equal to that of the fire pump controller.

9.6.3 The installation instructions of the manufacturer of the fire pump controller shall be followed.

9.6.4 No alterations to the fire pump controller, other than conduit entry as allowed by NFPA 70, shall be approved by the authority having jurisdiction.

9.7* Voltage Drop.

9.7.1 Unless the requirements of 9.4.2 are met, the voltage at the controller line terminals shall not drop more than 15 percent below normal (controller-rated voltage) under motor-starting conditions.

9.7.2 The requirements of 9.7.1 shall not apply to emergency run mechanical starting. (See 10.5.3.2.)

9.7.3 The voltage at the motor terminals shall not drop more than 5 percent below the voltage rating of the motor when the motor is operating at 115 percent of the full-load current rating of the motor.

9.8 Motors.

9.8.1 General.

9.8.1.1 All motors shall comply with NEMA MG-1, Motors and Generators, shall be marked as complying with NEMADesign B standards, and shall be specifically listed for fire pump service. (See Table 9.8.1.1.)

Table 9.8.1.1 Horsepower and Locked Rotor Current Motor Designation for NEMA Design B Motors

9.8.1.2 The requirements of 9.8.1.1 shall not apply to direct-current, high-voltage (over 600 V), large-horsepower [over 373 kW (500 hp)], single-phase, universal-type, or wound-rotor motors, which shall be permitted to be used where approved.

9.8.1.3 Motors used with variable speed controllers shall additionally meet the applicable requirements of NEMA MG1, Part 31 and shall be marked for inverter duty.

9.8.1.4* The corresponding values of locked rotor current for motors rated at other voltages shall be determined by multiplying the values shown by the ratio of 460 V to the rated voltage in Table 9.8.1.1.

9.8.1.5 Code letters of motors for all other voltages shall conform with those shown for 460 V in Table 9.8.1.1.

9.8.1.6 All motors shall be rated for continuous duty.

9.8.1.7 Electric motor–induced transients shall be coordinated with the provisions of 10.4.3.3 to prevent nuisance tripping of motor controller protective devices.

9.8.1.8 Motors for Vertical Shaft Turbine–Type Pumps.

9.8.1.8.1 Motors for vertical shaft turbine–type pumps shall be dripproof, squirrel-cage induction type.

9.8.1.8.2 The motor shall be equipped with a nonreverse ratchet.

9.8.2 Current Limits.

9.8.2.1 The motor capacity in horsepower shall be such that the maximum motor current in any phase under any condition of pump load and voltage unbalance shall not exceed the motor-rated full-load current multiplied by the service factor.

9.8.2.2 Where the motor is used with a variable speed pressure limiting controller, the service factor shall not be used.

9.8.2.3 The maximum service factor at which a motor shall be used is 1.15.

9.8.2.4 These service factors shall be in accordance with NEMA MG-1, Motors and Generators.

9.8.2.5 General-purpose (open and dripproof) motors, totally enclosed fan-cooled (TEFC) motors, and totally enclosed nonventilated (TENV) motors shall not have a service factor larger than 1.15.

9.8.2.6 Motors used at altitudes above 1000 m (3300 ft) shall be operated or derated according to NEMA MG-1, Motors and Generators, Part 14.

9.8.3 Marking.

9.8.3.1 Marking of motor terminals shall be in accordance with NEMA MG-1, Motors and Generators, Part 2.

9.8.3.2 A motor terminal connecting diagram for multiple lead motors shall be furnished by the motor manufacturer.

9.9 On-Site Standby Generator Systems.

9.9.1 Capacity.

9.9.1.1 Where on-site generator systems are used to supply power to fire pump motors to meet the requirements of 9.3.2, they shall be of sufficient capacity to allow normal starting and running of the motor(s) driving the fire pump(s) while supplying all other simultaneously operated load(s) while meeting the requirements of Section 9.7.

9.9.1.2 A tap ahead of the on-site generator disconnecting means shall not be required.

9.9.2* Power Sources.

9.9.2.1 These power sources shall comply with Section 9.7 and shall meet the requirements of Level 1, Type 10, Class X systems of NFPA 110, Standard for Emergency and Standby Power Systems.

9.9.2.2 The fuel supply capacity shall be sufficient to provide 8 hours of fire pump operation at 100 percent of the rated pump capacity in addition to the supply required for other demands.

9.9.3 Sequencing. Automatic sequencing of the fire pumps shall be permitted in accordance with 10.5.2.5.

9.9.4 Transfer of Power. Transfer of power to the fire pump controller between the normal supply and one alternate supply shall take place within the pump room.

9.9.5* Protective Devices. Where protective devices are installed in the on-site power source circuits at the generator, such devices shall allow instantaneous pickup of the full pump.

Substantiation: The requirements of NFPA 20 are being revised for the 2006 edition, and involves a reformatting of the NFPA 20, Chapter 9 requirements so that they are easier to understand (and easier to extract). The NFPA revision schedule for NFPA 20 was staggered with respect to NFPA 70 so that timely extracts could take place. The NFPA Standards Council has charged the NFPA 20 Technical Committee on Fire Pumps with developing requirements for the reliability and overall arrangement of power supplies for stationary fire pump installations.

Panel Meeting Action: Accept in Principle in Part

Revise portions of Article 695 to read as follows:

Proposal 13-77 -- Revised Numbering

From NFPA-20-2006 Chapter 9 to NFPA-70-2008 Article 695

695.3 Power Source(s) for Electric Motor-Driven Fire Pumps

FPN [Incorporate panel action text on Proposal 13-83] "NFPA 20, Standard for the Installation of Stationary Pumps for Fire Protection, covers characteristics of reliable sources. Also see the cross-reference in Annex X."

(A) Scope. This section covers the minimum performance and testing requirements of the sources and transmission of electrical power to motors driving fire pumps.

(B) Equipment. Also covered are the minimum performance requirements of all intermediate equipment between the source(s) and the pump, including the motor(s) but excepting the electric fire pump controller, transfer switch, and accessories.

FPN: (See Chapter 10 of NFPA 20).

(C) General. All electrical equipment and installation methods shall comply with this code, except as modified by Article 695.

(D) Hazards. All power supplies shall be located and arranged to protect against damage by fire from within the premises and exposing hazards.

FPN Where the power supply involves an on-site power production facility, the protection is required for the facility in addition to the wiring and equipment.

(E) Continuous Duty. All power supplies shall have the capacity to run the fire pump on a continuous basis.

(F) Voltage Drops All power supplies shall comply with the voltage drop requirements of Section 695.9 [was 695.7]

(G) Phase Converters. [Incorporate panel action text on Proposal 13-81.] "Phase converters shall not be permitted to be used for fire pump service."

695.4 Normal Power.

(A) Continuously Available. An electric motor driven fire pump shall be provided with a normal source of power as a continually available source.

(B) Arrangement. The normal source of power required in 695.4(A) and its routing shall be arranged in accordance with one of the following:

(1) Service connection dedicated to the fire pump installation.

(2) On-site power production facility connection dedicated to the fire pump installation.

(3) A dedicated feeder connection derived directly from the dedicated service to the fire pump installation.
(4) As a feeder connection where all of the following conditions are met:
a. The protected facility is part of a multi-building campus style arrangement.
b. A back-up source of power is provided from a source independent of the normal source of power.
c. It is impractical to supply the normal source of power through arrangement 695.4(B)(1), 695.4(B)(2), 695.4(B)(3) or 695.4(B)(4).
d. The arrangement is acceptable to the authority having jurisdiction.
e. The overcurrent protection device(s) in each disconnecting means shall be selectively coordinated with any other supply side overcurrent protective device(s).
(5) A dedicated transformer connection directly from the service meeting the requirements of Article 695.6 [was 695.5].
(C) Connections. For fire pump installations using the arrangement of 695.4(B)(1), 695.4(B)(2),, 695.4(B)(3), 695.4(B)(5) for the normal source of power, no more than one disconnecting means and associated overcurrent protection device shall be installed in the power supply to the fire pump controller.
(D) Disconnecting Means. Where the disconnecting means permitted by 695.4(C) is installed, the disconnecting means shall meet all of the following:
(1) Identified as being suitable for use as service equipment.
(2) Lockable in the closed position.
(3) Located remote from other building disconnecting means.
FPN The disconnecting means should be located such that inadvertent simultaneous operation is not likely.
(4) Located remote from other fire pump source disconnecting means.
FPN The disconnecting means should be located such that inadvertent simultaneous operation is not likely.
(5) Marked "Fire Pump Disconnecting Means" in letters that are no less than one inch (25 mm) in height and that can be seen without opening enclosure doors or covers.
(E) Placard. Where the disconnecting means permitted by 695.4(C) is installed, a placard shall be placed adjacent to the fire pump controller stating the location of this disconnection means and the location of any key needed to unlock the disconnect.
(F) Supervision. Where the disconnecting means permitted by 695.4(C) is installed, the disconnect shall be supervised in the closed position by one of the following methods:
(1) Central station, proprietary or remote station signal device
(2) Local signaling service that will cause the sounding of an audible signal at a constantly attended location
(3) Locking the disconnecting means in the closed position
(4) Sealing of disconnecting means and approved weekly recorded inspections where the disconnecting means are located within fenced enclosures or in buildings under the control of the owner
(G) Overcurrent Protection Where the overcurrent protection permitted by 695.4(C) is installed, the overcurrent protection device shall be selected or set to carry indefinitely the sum of the locked-rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full-load current of the associated fire pump accessory equipment when connected to this power supply. [Incorporate panel action text on Proposal 13-90 which adds a second sentence to existing 695.4(B)(1), Overcurrent Device Selection.] "The next standard overcurrent device shall be used in accordance with 240.6." Existing second sentence becomes third sentence.

695.5 Alternate power.
(A) When Required. Except for an arrangement described in 695.5(c), at least one alternate source of power shall be provided when the height of the structure is beyond the pumping capacity of the fire department apparatus.
(B) Unreliable Source. Except for an arrangement described in 695.5(c), at least one alternate source of power shall be provided where the normal source is not reliable.
FPN [Add entire Annex item from NFPA-20 9.3.2*.] to read as follows: "The conditions identified are conditions that would make the normal source of power be considered not reliable.
(1) NFPA 25 begins to require special undertakings (i.e., fire watches) when a water-based fire protection system is taken out of service for longer than 4 hours. If the normal source power plant has been intentionally shut down for longer than 4 hours in the past, it is reasonable to require a back-up source of power.
(2) The standard does not require that the normal source of power is infallible. NFPA 20 does not intend to require a back-up source of power for every installation using an electric motor driven fire pump. Should the normal source of power fail due to a natural disaster (hurricane) or due to a problem with electric grid management (regional blackout), the fire protection system could be supplied through the fire department connection. However, if the power grid is known to have had problems in the past (i.e., switch failures or animals shorting a substation), it is reasonable to require a back-up source of power.
(3) Fire departments responding to an incident at the protected facility will not operate aerial apparatus near live overhead power lines, without exception. A back-up source of power is required in case this scenario occurs and the normal source of power must be shut off. Additionally, many utility providers will remove power to the protected facility by physically cutting the overhead conductors. If the normal source of power is provided by overhead conductors, which will not be identified, the utility provider could mistakenly cut the overhead conductor supplying the fire pump.
(4) Power disconnection and activated overcurrent protection should only occur in the fire pump controller. The provisions of 9.2.2 for the disconnect switch and overcurrent protection essentially require disconnection and overcurrent protection to occur in the fire pump controller. If unanticipated disconnect switches or overcurrent protection devices are installed in the normal source of power that do not meet the requirements of 9.2.2, the normal source of power must be considered not reliable and a back-up source of power is necessary."
(C) Back-up Pump. An alternate source of power is not required where a back-up engine driven or back-up steam turbine driven fire pump is installed in accordance with this standard.
(D) Alternate Source. When provided, the alternate source of power shall be supplied from one of the following sources:
(1) A generator installed in accordance with Section [695.9]
(2) One of the sources identified in 695.4(B)(1); 695.4(B)(2); 695.4(B)(3); or 695.4(B)(5) when the power is provided independent of the normal source of power.
(E) Overhead Lines. When provided, the alternate supply shall be arranged so that the power to the fire pump is not disrupted when overhead lines are deenergized for fire department operations.

In existing **695.6**, add a new paragraph (I):
(I) Onsite Standby Generator Disconnecting Means. [Incorporate panel action text on Proposal 13-88] "Where the power source is supplied by on-site generator(s), the supply conductors shall connect to a generator disconnecting means dedicated for the purpose of serving the fire pump. The disconnecting means shall be located in a separate enclosure from other generator disconnecting means."

695.7(A)(B) [Note: While this is not extracted material from NFPA 20, it belongs in this section. Therefore, incorporate panel action text on Proposal 13-97 as follows.]
"**Supply Conductors.**
(1) Services and On-Site Power Production Facility. Service conductors and conductors supplied by an on-site power production facility shall be physically routed outside a building(s) and shall be installed as service entrance conductors in accordance with Article 230. Where supply conductors cannot be physically routed outside of buildings, they shall be permitted to be routed through the building(s) where installed in accordance with 230.6(1) or 230.6(2).
(2) Multi-Building Campus Style Complexes. Where a fire pump is wired under the provisions of 695.3(B)(2), all supply conductors on the load side of the service disconnecting means that constitute the normal source of supply to that fire pump shall be physically routed outside a building(s) and shall be installed as outside feeder conductors in accordance with Article 225. Where the feeder conductors cannot be physically routed outside of buildings, they shall be permitted to be routed through the building(s) where installed in accordance with 230.6(1) or 230.6(2).
Exception to (A)(2): Where there are multiple sources of supply with means for automatic connection from one source to the other, the requirement for routing outside of the building(s) shall apply only to those conductors on the load side of that point of automatic connection between sources.
(3) Supervised or On-Site Standby Generator Connections. Fire pump supply conductors on the load side of the final disconnecting means and overcurrent device(s) permitted by 695.4(B) or conductors that connect directly to an on-site generator shall comply with all of the following:
a. Independent Routing. The conductors shall be kept entirely independent of all other wiring.
b. Associated Fire Pump Loads. The conductors shall supply only loads that are directly associated with the fire pump system.
c. Protection from Potential Damage. The conductors shall be protected to resist potential damage by fire, structural failure, or operational accident.
d. Inside a Building. When routed through a building, the conductors shall be installed using one of the following methods:
(1) Be encased in a minimum 50 mm (2 in.) of concrete
(2) Be within an enclosed construction dedicated to the fire pump circuit(s) and having a minimum of a 1-hour fire resistive rating
(3) Be a listed electrical circuit protective system with a minimum 1-hour fire rating
Exception to (3)(d): The supply conductors located in the electrical equipment room where they originate and in the fire pump room shall not be required to have the minimum 1-hour fire separation or fire resistance rating, unless otherwise required by 700.9(D) of this Code.

Delete 695.6(B)
Renumber existing (C) through (H) to become (B) through (G)."

695.8 Voltage Drop. [Was 695.7]
(A) Starting Volgate Drop. [Exemption for Mechanical Operator. See below.] The voltage at the controller line terminals shall not drop more than 15 percent below normal (controller-rated voltage) under motor-starting conditions.

(B) Mechanical Operator. The requirements of 695.8(A) shall not apply to emergency run mechanical starting. [Note: Parenthetical note in NFPA 20 (9.4.2) 2003 Edition is not applicable.]

(C) Running Voltage Drop. The voltage at the motor terminals shall not drop more than 5 percent below the voltage rating of the motor when the motor is operating at 115 percent of the full-load current rating of the motor.

[Note: Motor Requirements not part of 695.]

695.9 On-Site Standby Generator Systems.

(A) Capacity.

(1) Where on-site generator systems are used to supply power to fire pump motors to meet the requirements of 695.5(B), they shall be of sufficient capacity to allow normal starting and running of the motor(s) driving the fire pump(s) while supplying all other simultaneously operated load(s) while meeting the requirements of Section 695.8.

(2) A tap ahead of the on-site generator disconnecting means shall not be required.

(B) Power Sources.

(1) These power sources shall comply with Section 695.8 and shall meet the requirements of Level 1, Type 10, Class X systems of NFPA 110, *Standard for Emergency and Standby Power Systems*.

(2) The fuel supply capacity shall be sufficient to provide 8 hours of fire pump operation at 100 percent of the rated pump capacity in addition to the supply required for other demands.

(C) Sequencing. Automatic sequencing of the fire pumps shall be permitted as a means of meeting the voltage drop requirements of 695.8.

(D) Transfer of Power. Transfer of power to the fire pump controller between the normal supply and one alternate supply shall take place within the pump room.

(E) Protective Devices. Where protective devices are installed in the on-site power source circuits at the generator, such devices shall allow instantaneous pickup of the full pump room load [See NFPA-20-9.6.5] [Note: Same wording as 13-107]

FPN Generator Protective Devices. The subject protective device(s), where used, need to be sized to allow the generator to allow instantaneous pickup of the full pump room load. This includes starting any and all connected fire pumps in the across-the-line (direct on line) full voltage starting mode. This is always the case when the fire pump(s) is running by use of the Emergency Mechanical Operator of [Not applicable here.] (Emergency-Run Mechanical Control at Controller).

Note: (F), (G), and (H) remain unchanged.

695.10 Junction Boxes. Where fire pump wiring to or from a fire pump controller is routed through a junction box, the following requirements shall be met.

(A) Mounting. The junction box shall be securely mounted.

(B) Controller Enclosure Integrity. Mounting and installing of a junction box shall not violate the enclosure Type (NEMA) rating of the fire pump controller(s).

[Note Appendix item from NFPA 20 is not applicable.]

(C) Controller Short Circuit Rating Integrity. Mounting and installing of a junction box shall not violate the integrity of the fire pump controller(s) and shall not affect the Short Circuit Rating of the controller(s).

[Note Appendix item from NFPA 20 is not applicable.]

(D) Type Rating. As a minimum, a National Electrical Manufacturers Association (NEMA) Type 2, dripproof enclosure (junction box) shall be used. The enclosure shall be listed f or the subject to match the fire pump controller enclosure Type rating.

(E) Terminals. Terminals, junction blocks, splices, and the like, when used, shall be listed.

695.11 Listed Electrical Circuit Protective System to Controller Wiring.

(A) Single Conductors. Where single conductors (individual conductors) are used, they shall be terminated in a separate junction box and in accordance with this code.

FPN Cutting slots or rectangular cutouts in a fire pump controller will violate the manufacturer's Enclosure Type rating, and the controller's Short Circuit (Withstand) rating and will void the manufacturer's warrantee. See also 300.20 and Article 322.

(B) Single (individual conductors) shall not enter the fire pump enclosure separately.

(C) Smoke Seal. Where required by the listing of the Electrical Circuit Protective System, the raceway between a junction box and the fire pump controller shall be sealed at the junction box end as required and per the instructions of the manufacturer or listing agency.

FPN When so required, this seal is to prevent flammable gases from entering into the fire pump controller.

(D) Standard wiring between junction box and controller is acceptable.

695.12 Raceway Terminations.

(A) Hubs. Listed conduit hubs shall be used to terminate raceway (conduit) to the fire pump controller.

(B) Type Rating. The NEMA Type rating of the conduit hub(s) shall be at least equal to that of the fire pump controller.

(C) Installation. The installation instructions of the manufacturer of the fire pump controller shall be followed.

(D) Controller Alterations. No alterations to the fire pump controller, other than conduit entry as allowed by this code, shall be approved by the authority having jurisdiction.

Note: The following sections are revised:

Extant 695.6 moves to 695.7	[No change.].
New 695.8 moves to 695.9	[No change.]
New 695.13 moves to 695.10	[Above]
New 695.14 moves to 695.12	[Above]
New 695.15 moves to 695.11	[Above]

Panel Statement: Renumbered to correlate text of NFPA 20 to comply with the NEC Style Manual. The revised text in this proposal incorporates the panel's actions on Proposals 13-81; 13-83; 13-88; 13-90; and 13-97.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 11 Negative: 2

Ballot Not Returned: 1 Gustafson, R.

Explanation of Negative:

NASBY, J.: NEMA disagrees with the rewrite outlined in this proposal. The arrangement of the material introduces new confusion to an Article that was already not clear in its intent. In addition, the revision adds material that is in NFPA 20 and should remain in NFPA 20. The responsibility of the NEC is for the installation requirements for the fire pump. Design requirements related to performance should not be moved to the NEC. An example of this problem is in proposed 695.5(A) to require an alternate source when the pumping capacity is beyond that of fire department apparatus. This is not an installation requirement, but is information that should remain in NFPA 20 only.

In addition, the revisions add a number of Fine Print Notes that are unacceptable and in violation of the NEC Style Manual. Examples of these notes include:

1. 695.4(D)(3) FPN – Contains a recommendation
2. 695.4(D)(4) FPN – Contains a recommendation
3. 695.5(B) FPN – Contains recommendations as well as an attempted interpretation of the requirement
4. 695.9(E) FPN – contains recommendations
5. 695.11(E) FPN – deals with warranty issues and is inappropriate in the NEC and in a FPN

Other technical issues include (but are not limited to):

1. 695.6(I) – does not recognize installations where large generator sets are paralleled and supply switchboards or switchgear that then serves the various connected loads.
2. 695.4(C) – limits the installation to one disconnect between the source and the controller. Should a transfer switch be installed ahead of the controller, another disconnect would not be permitted. This is contrary to typical installation where a remote disconnect is applied at the normal source of supply and then supplies the transfer switch.
3. 695.4(D) – it would appear that the requirement to not locate the disconnecting means in with other equipment has been lost in the revision without any substantiation.
4. 695.4(B)(4)(e) – the requirement for selective coordination creates significant technical concern. It may be impossible to design a system where the overcurrent protection for the fire pump circuit (size very large to carry locked rotor current) could be selectively coordinated with an upstream device that is part of the normal distribution system protection. It may also end up causing the other parts of the distribution system equipment to be oversized to simply accomplish the selectivity requirement. This is not justified or substantiated and decreases safety because of the increase in arc flash hazard.

Other requirements that are inappropriate for the NEC include:

1. 695.9(A)(1) – a direct mandatory reference to NFPA 110, which is prohibited by the NEC Style Manual
2. 695.9(B)(2) – requirements for fuel supply capacity for a generator which is not an NEC installation issue
3. 695.10(D) – A mandatory reference to NEMA Type 2 – which is reference to another standard that is prohibited by the NEC Style Manual.
4. 695.12(D) – is in conflict with the provisions of 90.4
5. 695.3(C) – this material is redundant with 90.3

The complete concept of this revision needs to be addressed in the comment phase with the objective of keeping Article 695 limited to installation requirements necessary for the application of the NEC.

SWAYNE, R.: This proposal should be rejected for many reasons. NFPA 20 has its place and Article 695 has its place, the two should not become one. The Scope of Article 695 covers the installation of power sources and interconnecting units and the installation of switching and control equipment dedicated to fire pump drives. It does not cover performance, maintenance, and testing of the fire pump system. The Scope of NFPA 20 covers minimum performance and testing requirements of the sources and transmission of electric power to motors driving fire pumps. The two scopes are not the same and each is necessary.

The wholesale replacement of one standard by another will leave electricians and Authorities Having Jurisdiction without the guidance necessary to provide safe installations of fire pumps. If it is felt that Article 695 is lacking in some of the requirements that NFPA 20 indicates as being important, then a paragraph by paragraph review should be performed. In this way, there will not be any danger in deleting any of the safe practices that exist today.

As examples of where the proposed action is deficient:

1) Section 695.3(G) prohibits phase converters which was not accepted by NFPA 20 as documented in the substantiation to Proposal 13-81. See Negative Comment on Proposal 13-81.

2) Section 695.4(B)(4)(c) refers to itself as being impractical.

3) Section 695.4(B)(5) refers to "service" whereas the facility does not have to be a campus to have a primary service with a low voltage supply feeding the building or structure.

4) Section 695.4(F)(4) refers to weekly recorded inspections which are proper for NFPA 20, but not for NFPA 70 which is an installation code.

5) Section 695.5(A) is a new requirement that may be enforced by the Fire Marshal, but not by the electrical AHJ.

6) Section 695.5(B) requires an alternate source when the normal source is not reliable without defining "reliable". "Reliable" is not defined in Article 100 and the attempt to define it by the unenforceable FPN is confusing.

7) Section 695.5(B), FPN No. 4 refers to conditions that are not permitted. This may signal the installer that it may not be permitted, but you can do it anyway if you provide an alternate source. This sends the wrong signal.

8) Editorially, "when" should be replaced by "where" in several locations to meet the Style Manual.

9) It is not apparent what is included in Section 695.7(A) and what is in Section 695.7(B).

10) Section 695.7(A)(B)(3) refers to load side of the "service" disconnecting means. A multi-building campus or a facility with a primary service generally does not have a "service" to each of its buildings.

11) Section 695.7(A)(B)(3) refers to disconnecting means and overcurrent devices permitted by Section 695.4(B). Section 695.4(B) does not cover these items.

This proposal is premature and should be rejected. The Proposer should come back with a detailed comparison for consideration.

13-78 Log #2864 NEC-P13 **Final Action: Reject**
(Table 695 (New))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reported as "Reject". The Technical Correlating Committee does not agree with the placement of a cross-reference in the Annex. The objective of the extract identification requirements of the Style Manual make a cross-reference unnecessary.

See the Technical Correlating Committee Note on Proposal 13-77.

Submitter: James S. Nasby, Master Control Systems, Inc.

Recommendation: Consider incorporating new extract Text Cross Reference between NFPA 20 and NFPA 70 Article 695 Extract Text.

Substantiation: This was NFPA-20-2006 Proposal 20-179 Log #98; which had final action Accept in Principle with Substantiation:

Clarify which clauses in NFPA 70-695 are extract text from NFPA 20. Present format of NFPA 70 makes it difficult to know which sections and sentences are extract text. Some proposals and comments have been misdirected. This would also help the NFPA 20 Technical Committee to know which clauses have been extracted into NFPA 70.

With Committee Action:

Change title to read as follows: NFPA 20 Material Extracted by 70 Article 695.

and with COMMITTEE STATEMENT:

Clarifies that the information in NFPA 70 is extracted from NFPA 20.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle

Place text cross reference between NFPA 20 and NFPA 70 Article 695 extract text in an annex.

(cross reference table shown on following pages)

Panel Statement: The panel agrees with the intent of the proposal and will place text cross-reference between NFPA 20 and NFPA 70 Article 695 extract text in an annex.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 12 Negative: 1

Ballot Not Returned: 1 Gustafson, R.

Explanation of Negative:

SWAYNE, R.: Although the concept is commendable, the recommendation is not in a form that can be accepted. The substantiation indicates that the purpose is to show which sections of Article 695 are extracted from NFPA 20. The table provided shows extraneous information. In addition, it indicates that the 2006 edition of NFPA 20 has deleted information that was in Chapter 10 that presently exists in Article 695. The Proposer should come back with a detailed comparison for consideration.

13-79 Log #1774 NEC-P13 **Final Action: Accept in Principle in Part**
(695.1(A) & (B))

TCC Action: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee rejects the Panel Action until the Panel Action has been clarified regarding the deletion of (B)(2) and acceptance of the underlined (4).

The Technical Correlating Committee directs the Panel to clarify the Panel Action relative to the addition of Item 4, associated fire pump accessory equipment, since that equipment appears to be related to mechanical equipment rather than the electrical installation.

This action will be considered by the panel as a public comment.

Submitter: Joseph C. Warren, Joseph C. Warren Electrical Consulting Services

Recommendation: Revise text to read as follows:

695.1 Scope.

(A) Covered. This article covers the installation of the following:

(1) Electric power sources and interconnecting circuits

(2) Switching and control equipment dedicated to fire pump drivers

<u>(3) Pressure maintenance (jockey or makeup) pumps</u>

<u>(4) Associated fire pump accessory equipment</u>

(B) Not Covered. This article does not cover the following:

(1) The performance, maintenance, and acceptance testing of the fire pump system, and the internal wiring of the components of the system

~~(2) Pressure maintenance (Jockey or makeup) pumps~~

Substantiation: We need to state that jockey or makeup pump motors and accessory equipment are covered in Article 695 because it is included in 695.5(A) and (B) and (C)(2) for load calculations, and the very fact that they do exist in job installations.

Panel Meeting Action: Accept in Principle in Part

Delete Item Number 3 of the proposal.

Panel Statement: Jockey pumps are covered by Article 430.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Gustafson, R.

13-80 Log #2856 NEC-P13 **Final Action: Accept**
(695.2)

TCC Action: The Technical Correlating Committee understands that the Panel Action is to only delete the word "either" and change "and/or" to "or" and the remainder of the definition is unchanged.

Submitter: James S. Nasby, Master Control Systems, Inc.

Recommendation: Revise text to read as follows:

~~3.3.10~~ **Fault Tolerant External Control Circuit.** Those control circuits ~~either~~ entering ~~and~~ /or leaving the fire pump controller enclosure, which if broken, disconnected, or shorted will not prevent the controller from starting the fire pump <u>from all other internal or external means</u> and may cause the controller to start the pump under these conditions.

Note: Text Strikeouts (~~Text Strikeouts~~) and <u>Text Underlines</u> are FIM-AAA Committee ROP Actions.

Substantiation: This was NFPA -20-2006 Proposal 20-6 Log #16; Which had final action Accept with Substantiation:

Substantiation: The ungrounding of the CPT secondary has, historically, been the controller manufacturer's predominant practice to comply with NFPA 20 - 10.5.2.6 and NFPA 20-3.3.10.

-and modified by-

NFPA -20-2-2006 Committee Comment 20-?? Log #CC1; which had **Final Action**. Accept with Substantiation:

Substantiation: Coordinates definitions with Article 695 of the NEC.

Note: This same Committee Comment also revised the definitions in NFPA-20 of "On-Site Power Production Facility" and "On-Site Standby Generator" to agree with those already in NFPA -70-2005 695.2

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Gustafson, R.

Comment on Affirmative:

SWAYNE, R.: This action is not consistent with the action on Proposal 13-1 which has a different wording for Article 100. This is the action that should be Accepted because the term being defined is used only as Article 695.

13-81 Log #2860 NEC-P13 **Final Action: Accept**
(695.3)

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal. It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting.
This action will be considered by the Panel as a Public Comment.
Submitter: James S. Nasby, Master Control Systems, Inc.
Recommendation: ~~9.2.1.x~~ **Phase Converters.** Phase converters shall not be permitted to be used for fire pump service.
Substantiation: This was NFPA-20-2006 Proposal 20-71 Log #59; which raised the question and had **Final Action**: Reject with Substantiation:
The users of NFPA 20 need guidance on whether or not the use of phase converters constitutes a reliable source of power. The situation occurs frequently where three-phase power is not available. How is this problem intended to be addressed? Is there a need to list phase converters for fire pump service? Is there a need to regulate how phase reversal will be monitored and annunciated? Users of the standard need answers to these questions.
-and- was modified by Comment 20-?? Log #38 (**Final Action**: APR?) with Substantiation:
Based on the committee statement to the proposal and the negative comment of Mr. Haagensen, we have submitted a comment to include the prohibition of the converters to clarify the issue.
Panel Meeting Action: Accept
Panel Statement: The action correlates and is incorporated into Proposal 13-77.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
SWAYNE, R.: Although the recommendation may appear reasonable, the substantiation does not match the recommendation. This proposal was a NFPA-20-2006 proposal and was REJECTED per the substantiation. The substantiation asks the Panel to determine the requirements and/or limitations on the use of phase converters without providing any substantiation to prohibit their use. I do not believe that the Panel has sufficient information to either permit or prohibit the use of phase converters and NFPA 20 has not done it either.

13-82 Log #2858 NEC-P13 **Final Action: Reject**
(695.3 and possibly 695.4 and 695.5)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reported as "Reject" since the Proposal does not comply with 4.3.3 of the NFPA Regulations Governing Committee Projects.
Submitter: James S. Nasby, Master Control Systems, Inc.
Recommendation: Revise 695.3, 695.4, 695.5, as required to match corresponding text from NFPA-20 Clauses 9.2 and etc.
Substantiation: This was NFPA-20-2006 Proposal 20-69 Log #97; which had **Final Action**: Accept in Principle in Part with Substantiation:
Jurisdictions have a difficult time enforcing the power supply requirements because it is difficult to point to particular provision(s) within the existing Chapter 9 that clearly specifies the intent. For example, there is no link from existing 9.2.1.1 to 9.2.2, 9.2.3, or 9.2.4. There are designers out there that interpret Chapter 9 to permit the use of a reliable standby generator as the normal power source. The rewrite being proposed makes it much clearer what are acceptable power supply arrangements. Secondly, Article 695 of NFPA 70 extracts the effected power supply provisions of NFPA 20. This extract has become less direct over the years as the provisions of NFPA 20 are modified during the various revision cycles. The existing text of NFPA 20 for power supply requirements needs to be made clearer so that no editorial changes are needed by the NEC to extract the material.
In addition to the example concern above, the proposed rewrite clears up some of the following concerns with the existing provisions:
1. Definition of a "reliable" power supply.
2. Which portion of the power supply must be dedicated to the fire pump installation.
3. Confusion on whether the normal supply arrangement is allowed to change based on provisions for back-up power.
4. Confusion with the requirements for using the "campus style" arrangement.
5. Whether more than one back-up source of power is permitted.
6. Lack of direct guidance for over 600 volt services (privately owned transformers), which was the subject of the NFPA Standards Council decision the last revision cycle of NFPA 70.
This were seven Comments which modified the above with **Final Action** of Accept, AAP, APR, or APP.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 13-77, which meets the intent of the submitter.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
SWAYNE, R.: The submitter has not been specific in how the text is to be added, revised, or deleted. This proposal does not meet the requirements of Section 4-3.3 Regulations Governing Committee Projects.

13-83 Log #3366 NEC-P13 **Final Action: Accept in Principle**
(695.3, FPN (New))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the Technical Correlating Committee action on Proposal 13-77. This action will be considered by the Panel as a Public Comment.
Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Massachusetts Electrical Code Advisory Committee
Recommendation: Insert a fine print note ahead of 695.3(A) as follows:
FPN: NFPA 20, Standard for the Installation of Stationary Pumps for Fire Protection, provides information on the characteristics of reliable power sources in Annex A, item A.9.2.4.
Substantiation: The topic of reliability in the context of the allowable power supplies to fire pumps has become one of the most controversial from the standpoint of NEC enforcement, largely because of the expense of providing standby power for this equipment. This is a particularly contentious issue in occupancies that otherwise would not require an on-site generator. Since many rules in Article 695 hinge on the concept of reliability, placing this information in the NEC will provide much needed guidance on this topic.
Panel Meeting Action: Accept in Principle
Revise the proposed FPN in 695.3 as follows:
FPN: NFPA 20, Standard for the Installation of Stationary Pumps for Fire Protection, covers characteristics of reliable sources. Also see the cross-reference in Annex X.
Panel Statement: This action correlates and is incorporated into the panel action on Proposal 13-77.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
SWAYNE, R.: The Proposal is redundant. NFPA 20 is already referenced at the beginning of Article 695 and does not need to be repeated.

13-84 Log #2716 NEC-P13 **Final Action: Reject**
(695.3(A)(3) (New))

Submitter: Dorothy Kellogg, American Chemistry Council
Recommendation: Revise text to read:
695.3(A)(3) In industrial establishments only, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, a fire pump shall be permitted to be supplied by a single feeder from a site-wide power distribution system.
Substantiation: Problem: 695.3(A)(1) permits a fire pump to be supplied from a separate service. NFPA commentary in 2005-NEC Handbook to 695.3 states power may be supplied by "A separate utility service or connection ahead of the main disconnecting means". *NFPA commentary in 2005-NEC-Article 100, definition for "Service" states, "a service can only be supplied by the serving utility. If the electric energy is supplied by other than the serving utility, the supplied conductors and equipment are considered feeders, not a service".* Article 695 does not recognize "feeder" as a reliable power source and requires more than one power source for a fire pump.
Substantiation: Many industrial power systems are similar in size and complexity to municipal or co-operative power companies that do not have power generation capability but are considered the serving utility. These industrial power systems typically include multiple sources of power that can cover large areas and include selective switching arrangements to provide highly reliable power sources that meet or exceed the reliability of the traditional "serving utility". The proposed change recognizes the reliability of the industrial power system for the purpose of fire pump installations.
The approval of this change will provide needed guidance to support the AHJ in approving electric driven fire pump installations in industrial applications.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: A single feeder is not considered a reliable source of power. This is extract material from NFPA 20.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
ELKINS, D.: This proposal should be accepted. This proposal corrects code language which ignores the requirements of large industrial concerns which purchase power at a high voltage such as 69kV. This proposal permits these large industrial concerns to provide service to fire water pumps which is

identical physically to that used by smaller concerns which purchase power at a medium voltage such as 12.47kV. Article 695 permits a fire water pump to be served by a separate utility service or connection ahead of the main service disconnecting means which is not practical for large industrial concerns which purchase power at a high voltage. This proposal adds an exception for these industrial establishments to use facilities identical to those used by smaller facilities which purchase power at a lower voltage. Since power purchased at higher voltage is generally more reliable, this installation is actually more reliable than what is permitted.

Comment on Affirmative:

SWAYNE, R.: This proposal has merit, but lacks conditions for the supply to the feeder. If the feeder is supplied from a double ended substation fed from two separate primary feeders, then the permission for campus-style complexes, as in 695.3(B)(2) should apply.

13-85 Log #3579 NEC-P13 **Final Action: Reject**
(695.3(A)(3) (New))

Submitter: Richard A. Holub, Middletown, DE
Recommendation: Add new text to read:

695.(A)(3): Where redundant fire pumps are installed to protect a facility, and where the power source to each fire pump is independent (or where a diesel fire pump serves as the redundant pump for an electric pump), a single feeder shall be permitted as a reliable source.

Substantiation: Problem: As currently written, the code requires a direct utility connection or on-site production to be considered reliable. Without either of these, multiple power sources are required per Article 695.3(B) for the fire pump to be considered reliable. These multiple sources may improve the reliability of a single fire pump depending on the reliability of the automatic transfer switch and other components used to derive the second source, but another method to reliably supply fire water would be to provide a redundant pump with a single, diverse power source. This would improve reliability beyond what is offered in the current code language. While the Authority Having Jurisdiction may permit this method, specific language should be included in the code to permit such installations as an alternative to the currently mandated methods.

Panel Meeting Action: Reject

Panel Statement: A single feeder is not considered a reliable source of power. Refer to the panel statement on Proposal 13-84. The power supply for a fire pump is within the scope of NFPA 20.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 11 Negative: 2

Ballot Not Returned: 1 Gustafson, R.

Explanation of Negative:

ELKINS, D.: This proposal should be accepted. This proposal corrects code language which does not recognize the increased reliability provided by two fire water pumps fed by independent sources or by an installation with both an electric and a diesel engine driven fire water pump. The proposal with its redundant pumps provides for a much more reliable fire water supply than existing code language which only requires a single pump. The panel statement justifying the rejection ignored this redundant feature of the proposal. The panel statement also stated that "The power supply for a fire pump is within the scope of NFPA 20" which is not consistent with 90.2 "Scope" which does not exclude the power supply to fire water pumps. This panel statement is also not consistent with 695.1(A) which states "This article covers the installation of the following: (1) Electric power sources and interconnecting circuits. (2) Switching and control equipment dedicated to fire pump drivers.

SWAYNE, R.: This proposal has merit. Section 695.3(B) permits two individual sources without reference to whether they are "reliable" or not. The point where these two sources come together would be at an automatic transfer switch. In this proposal, the two sources come together at the redundant pumps output. It should also be noted that in Proposal 13-77 to insert NFPA 20 into section 695, Section 695.5(C) does not require an alternate source when there is an engine driven or steam turbine driven back-up pump.

13-86 Log #2750 NEC-P13 **Final Action: Reject**
(695.3(B)(1))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reported as "Reject" since the Proposal does not comply with 4.3.3 of the NFPA Regulations Governing Committee Projects.

Submitter: David Sroka, Turner Falls, MA
Recommendation: Add a second paragraph "Power Sources."

This would be paragraph 9.6.2 from NFPA 20.

Substantiation: This "Power Source" information is just as important as "Capacity" which is from paragraph 9.6.1 of NFPA 20.

Panel Meeting Action: Accept in Principle

Panel Statement: See Panel action on Proposal 13-77, which should satisfy the intent of the submitter.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 12 Negative: 1

Ballot Not Returned: 1 Gustafson, R.

Explanation of Negative:

SWAYNE, R.: This proposal should be evaluated on its own rather than depending upon the acceptance of Proposal 13-77. This proposal should be Rejected for two reasons. First, Power Sources is the topic of the entire Section 695.3 and should not be a subsection further down in the section. Second, the paragraph reference in NFPA 20 is not related to "Power Source".

13-87 Log #2865 NEC-P13 **Final Action: Reject**
(695.3(B)(1))

Submitter: James S. Nasby, Master Control Systems, Inc.
Recommendation: Revise text to read as follows:

695.3(B)

(1) Generator Capacity. An on-site generator(s) used to comply with this section shall be of sufficient capacity to allow normal starting and running of the motor(s) driving the fire pump(s) while supplying all other simultaneously operated ~~load~~ <u>load(s) while meeting the voltage drop requirements of 695.7.</u> Automatic shedding of one or more optional standby loads in order to comply with this capacity requirement shall be permitted. A tap ahead of the on-site generator disconnecting means shall not be required. The requirements of 430.113 shall not apply.

Note: Text Strikeouts (~~Text Strikeouts~~) and <u>Text Underlines</u> indicate revisions to existing text.

Substantiation: There are frequent and serious field problems under sized gen-sets. Ditto when there are long cable runs from the gen-set. Most gen-set sizing soft ware applications programs do NOT take this requirement into account. In other words, most of these programs are not designed for fire pump applications.

There were no Comments on this Proposal.

Panel Meeting Action: Reject

Panel Statement: The material is already covered in the existing 695.7.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Gustafson, R.

13-88 Log #3617 NEC-P13 **Final Action: Accept in Part**
(695.4(A))

Submitter: John Gill, CRS Engineering
Recommendation: [Add to paragraph]When the power source is supplied by on-site generator(s), the supply conductors shall connect to a generator disconnecting means dedicated for the purpose of serving the fire pump. The disconnecting means shall be located in a separate enclosure from other generator disconnecting means, or in a switchboard or switchgear assembly.

Substantiation: Articles 445 and 700 recognize that a single generator(or mutliple generators operating in parallel) often serve multiple standby systems: emergency, legally-required, or optional. Currently, the language of article 695 is vague as to what point is the "source" when using a generator. The proposed language clarifies the requirements for connection to generators and coordinates them with above-mentioned articles as well as with paragraph 695.3(B)(1). Switchboards and switchgear provide reliable protection and separation of the conductors and overcurrent device from damage when it is not practical to install disconnecting means in a separate switch/breaker enclosure.

Panel Meeting Action: Accept in Part

Change the first word from "When" to "Where", and delete "or in a switchboard or switchgear assembly" at the end of the second sentence.

Panel Statement: This proposal (with the panel's revisions) clarifies Section 695.4 (A) & (B). It would be incorrect to include the proposed revisions as submitted in the proposal because the disconnecting means for the fire pump iis required to be isolated.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Gustafson, R.

Comment on Affirmative:

SWAYNE, R.: The wording is not clear and there could be a misinterpretation of the direction of power flow. An alternative wording, such as "...the supply conductors shall be fed from a generator disconnecting...", would be clearer.

13-89 Log #2739 NEC-P13 **Final Action: Accept in Principle**
(695.4(B))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the Technical Correlating Committee action on Proposal 13-77.

This action will be considered by the Panel as a Public Comment.

Submitter: Jim Pauley, Square D Company
Recommendation: Revise 695.4(B) as shown below to read as follows:

(B) Supervised Connection.

(1) <u>Number of Disconnecting Means.</u>

<u>a. General.</u> A single disconnecting means and associated overcurrent protective device(s) shall be permitted to be installed between ~~a remote~~ <u>the fire pump</u> power source <u>(s)</u> and one of the following:

(1) A listed fire pump controller
(2) A listed fire pump power transfer switch
(3) A listed combination fire pump controller and power transfer switch

b. Feeder Sources. For systems installed under the provisions of 695.3(B)(2) only, ~~such~~ additional disconnecting means and associated overcurrent protective device(s) shall be permitted as required to comply with other provisions of this Code.

c. On-Site Standby Generator. Where an on-site generator is used to supply a fire pump, an additional disconnecting means and associated overcurrent protective device(s) shall be permitted to be located on or at the generator.

(2) Overcurrent Device Selection.

a. General. ~~The overcurrent~~ Overcurrent protective device(s) , other than those installed between the on-site generator and the fire pump controller or fire pump transfer switch, that are unique to the fire pump loads shall be selected or set to carry indefinitely the sum of the locked-rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full-load current of the associated fire pump accessory equipment when connected to this power supply. The requirement to carry the locked-rotor currents indefinitely shall not apply to conductors or devices other than overcurrent devices in the fire pump motor circuit(s).

b. On-Site Standby Generators. Overcurrent protective devices between an on-site standby generator and a fire pump controller shall be selected and sized to allow for instantaneous pickup of the full pump room load, but shall not be larger than the value selected to comply with ~~according to~~ 430.62 to provide short-circuit protection only.

(3) Disconnecting Means. All disconnecting devices ~~and overcurrent protective devices~~ that are unique to the fire pump loads shall comply with items a through d. ~~695.4(B)(1) through (B)(5).~~

a. ~~(2)~~ **Features and Location .** [keep existing 2005 text]

b. ~~(3)~~ **Disconnect Marking.** [keep existing 2005 text]

c. ~~(4)~~ **Controller Marking.** [keep existing 2005 text]

d. ~~(5)~~ **Supervision.** [keep existing 2005 text]

Substantiation: The objective of this proposal is to provide the user with an easier means to find the rules applicable to a supervised disconnect and overcurrent device. The current language of 695.4(B) mixes the following elements in an unclear manner:

1) Number of disconnecting means allowed (B – main paragraph)
2) Overcurrent protection for generator supplied circuits (B – last paragraph)
3) Feeder requirements (B – last paragraph)
4) Overcurrent protection (again) – (B)(1)
5) Disconnecting means features and markings (B)(2), (3), (4) and (5)

The user is left with a few potential conflicts and some gaps to fill. For example, the requirement for generator OCP sizing is in conflict with (B)(1) – which applies. It is unclear whether the "single disconnecting means" requirement includes or excludes a disconnect that may be on the generator itself.

The proposal is an effort to rearrange the material to make it more usable and remove the perceived conflicts. Titles have been provided to better direct the user to the specific rule they are looking for. In the existing text, it is very difficult to even find the requirement for sizing the overcurrent devices between the stand-by gen set and the FP controller because it is buried in a paragraph at the end of 695.4(B) main text, even though the issue deals with OCP sizing which is covered in (B)(1).

Here is a synopsis of the changes:

1) The requirements are split into three basic sets of rules. Those for the number of disconnecting means, those for the overcurrent protection and those for the disconnecting means itself. They are split in this manner to avoid having more than three levels of subdivision which is prohibited in the style manual.

2) Number of disconnecting means is split into the General Requirements and uses the existing text from 695.4 (B). The words "remote" were deleted from the source because it is redundant. All sources are remote unless the electric fire pump generates its own power.

3) The "Feeder Source" provisions that were in the last paragraph of 695.4(B) are now their own sublevel and the text from the existing code is used. The word "such" is deleted because it is no longer needed since the text is in its own identified rule.

4) A new item "c" is added to clarify that the "single disconnecting means" is not intended to prohibit the on-site generator from having its own disconnect. This is a point of confusion today. If you interpret the current language literally, a disconnect would not be permitted downstream of the generator supplied disconnect. The general interpretation today is that the "single disconnecting means" referred to in the main rule is in addition to a disconnect at the generator.

5) Proposed (B)(2) is intended to cover the rules applicable to overcurrent protective devices. The main rule in item "a" is the existing rule requiring that the OCP be sized to carry locked rotor current. The additional underlined wording in this rule is to eliminate the conflict between locked rotor sizing and 430.62 sizing for the generator circuit OCP. In addition the words "that are unique to the fire pump loads" come from the last sentence of 695.4(B) last sentence.

6) New item (B)(2)b is a relocation of the text from the second sentence of existing 695.4(B) last paragraph regarding the sizing of the OCP in the generator circuits. A revision has been made to this text to pick up the requirement in NFPA 20 [9.6.5] that the OCP in the generator circuit be sized to pick up the instantaneous pump room load. However, the maximum sizing of the OCP should still be directed by the reference to 430.62 as in the present code.

7) New item (B)(3) is to pick up all of the rules associated with the Disconnecting Means itself. The main paragraph is the text from the last sentence of the last paragraph of 695.4(B). The text has been modified to remove the reference to overcurrent protection since it is now covered in (B)(2).

8) The existing 695.4(B) (2), (3), (4) and (5) now become items a, b, c and d under new item (3). Since all of these rules deal with the disconnecting means in some manner, this relocation is appropriate. The text from the 2005 NEC remains in all of these sections. The title "Features and Location" was chosen for item "a" because the list of items apply to the features expected of the disconnect and the location of the disconnect.

Panel Meeting Action: Accept in Principle

Panel Statement: The panel action and statement on Proposal 13-77 should satisfy the intent of the submitter.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 12 Negative: 1

Ballot Not Returned: 1 Gustafson, R.

Explanation of Negative:

SWAYNE, R.: This proposal should be evaluated on its own merits rather than depending upon the acceptance of Proposal 13-77. The proposal should be Accepted because the recommendations provide a more logical arrangement of requirements.

13-90 Log #1836 NEC-P13 **Final Action: Accept**
(695.4(B)(1))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the Technical Correlating Committee action on Proposal 13-77.

Technical Correlating Committee understands that the Panel Action was to add a new second sentence in 695.4(B)(1) and the existing second sentence now becomes the third sentence.

This action will be considered by the panel as a public comment.

Submitter: Mark T. Rochon, Mark J. Rochon Master Electrician

Recommendation: Revise as follows:

Overcurrent Device Selection. The overcurrent protective device shall be selected or set to carry indefinitely the sum of the locked rotor current of the fire pump motor(s) and the pressure maintenance pump motor(s) and the full-load current of the associated fire pump accessory equipment when connected to this power supply. The next standard overcurrent device shall be used in accordance with 240.6.

Substantiation: Limitations need to be put in place that any overcurrent device in the access of locked rotor should not be used.

Panel Meeting Action: Accept

Panel Statement: This action correlates and is incorporated into Proposal 13-77.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 11 Negative: 2

Ballot Not Returned: 1 Gustafson, R.

Explanation of Negative:

SWAYNE, R.: The purpose of this section is to set a lower limit on the overcurrent device. As written, the overcurrent device is always required to be larger than the locked rotor currents. This proposal should be Accept in Principle by inserting "permitted to" so that the wording would read "...device shall be permitted to be used...".

ZGONENA, T.: I am not certain 1) what is the intent of the added text and 2) if it accomplishes what the submitter intended.

1) 240.4(B) and (C) already cover the selection of the overcurrent device rating. As such, I am not certain what the added text accomplishes. 240.4(C) permits the overcurrent device rating to be the next higher standard rating per 240.6 provided it does not exceed 800 amperes. The added text seems to amend the 800 ampere limitation in 240.4(C) and allow the higher standard rating in all cases. We do not believe this was the intent of the panel.

2) The submitter's substantiation states: "Limitations need to be put in place that any overcurrent device in the access (we believe he meant "excess") of locked rotor should not be used." This does not correlate with his proposal as allowing the next standard overcurrent device will result in the overcurrent device being rated in excess of the locked rotor current. The proposal accomplishes the opposite of what the substantiation requests.

13-91 Log #3618 NEC-P13 **Final Action: Reject**
(695.4(B)(2)3.)

Submitter: John Gill, CRS Engineering

Recommendation: [Add an exception to item (3)] Supervised disconnecting means may be installed in a separate, dedicated vertical section of a switchboard or switchgear.

Substantiation: The commentary in the 2005 NEC Handbook for Article 700.9(B) recognizes that switchboards provide substantial physical protection and separation of conductors and devices for emergency circuits. Particularly in the case with multiple generators operating in parallel to supply the emergency loads and a fire pump, it is infeasible to have the fire pump disconnecting means in a totally separate enclosure. To do so would actually reduce the

reliability of the supply to the pump since it would remove the pump supply from the common bus array and not take advantage of the redundancy provided by multiple generators. Another example is where multiple or network utility service is provided to a facility with a "main-tie-main" or "primary-alternate source" switchgear configuration. Forcing the pump disconnecting means out of the switchgear reduces the reliability by eliminating the redundancy of the multiple sources.
Panel Meeting Action: Reject
Panel Statement: The present wording is clear. Also, in violation of Section 695.4(B)(2)(3)
Number Eligible to Vote: 14
Ballot Results: Affirmative: 11 Negative: 2
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
ELKINS, D.: This proposal should be accepted in principle using the wording in the recommendation provided by the submitter of Proposal 13-93. See comment on Proposal 13-93.
SWAYNE, R.: This proposal should be Accept in Principle with the words "switchboard or" deleted from the proposed wording. Switchgear construction, as contrasted with switchboard construction per UL Standards, provides for complete physical isolation between vertical sections and is the equivalent of a separate enclosure.

13-92 Log #2347 NEC-P13 **Final Action: Accept**
(695.4(B)(2)(4))

Submitter: Andre R. Cartal, Princeton Borough Building Dept.
Recommendation: Delete "contemporaneous" and replace with "inadvertent operation at the same time would be unlikely".
Substantiation: Use Webster's definition of "contemporaneous". We shouldn't have to take Webster with us to understand the NEC.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-93 Log #3279 NEC-P13 **Final Action: Reject**
(695.4(B)(2)3. Exception)

Submitter: Richard A. Holub, Middletown, DE
Recommendation: Add text to read as follows:
695.4(B)(2)(3) Exception: In industrial establishments only, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, disconnecting means may be located within equipment that feeds loads other than the fire pump as long as the other 3 provisions of 695.4(B)(2) are met.
Substantiation: As currently written, the code prevents the feeder from originating in a switchgear lineup with other disconnects, even when multiple feeders are used as allowed in 695.3(B). This practice has been done within industrial establishments for many years, without incident. Correct labeling, and locking of the disconnect as required in this section prevent s inadvertent opening of the disconnect. As long as the switch gear is protected from damage resulting from a fire or operational incident, and the other requirements are followed, the switchgear should be permitted to feed the fire pump controller as has been done in the past.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: Plant equipment should not interfere with fire pump installation.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 11 Negative: 2
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
ELKINS, D.: This proposal should be accepted. This proposed exception recognizes a method of supplying firewater pumps in industrial concerns which was widely used prior to the 2005 code. The addition of the separate switchgear, cable/bus, six cable terminators and bus connections to meet the "not located within equipment that feeds other loads..." requirement added in 2005 actually lowers the installation's reliability in these industrial installations since additional equipment must be connected to the bus.
SWAYNE, R.: See Negative Comment to Proposal 13-91.

13-94 Log #2749 NEC-P13 **Final Action: Reject**
(695.4(C) (New))

Submitter: David Sroka, Turner Falls, MA
Recommendation: Revise text to read:
"Disconnecting Switch Fuses. A spare set of fuses of the correct rating shall be stored near the switch. A placard indicating the proper type of fuses shall be required."
Substantiation: Reduces downtime. Also, should reduce chance of improper replacement fuses being installed.
Panel Meeting Action: Reject
Panel Statement: Whereas fire pump supply overcurrent devices are only providing short-circuit protection, a blown fuse is an indication of a major electrical failure. Refusing and reclosing onto the fault may cause more damage and will not reduce the "downtime". Replacement fuses can be obtained with the other material needed to repair the electrical damage that caused the fuse to blow.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-95 Log #3551 NEC-P13 **Final Action: Reject**
(695.5(B)(3))

Submitter: Patrick Gaffney, Ronk Electrical Industries, Inc.
Recommendation: Add new text to read:
695(B)(3) Phase Converters. Where the only source of utility power is a single-power source, a phase converter may be utilized as one of the multiple sources of supply to a three-phase fire pump motor. [Note: Change current B(3) to B(4).]
Substantiation: In many instances, fire pumps are being installed where three-phase utility service is not available. Phase converters offer the ability to connect to a utility source as either a primary or back-up source, in addition to a generator (or other source, to provide three-phase power to three-phase fire pump motors.)
Panel Meeting Action: Reject
Panel Statement: Phase converters are not considered reliable sources.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.
Comment on Affirmative:
SWAYNE, R.: It is not apparent that the Panel Statement is technically correct. The Affirmative vote is made to Reject the Proposal because there was insufficient substantiation to determine if a phase converter is or is not reliable. What are the alternatives if three phase power is not available? See Negative Comment to Proposal 13-81.

13-96 Log #988 NEC-P13 **Final Action: Accept**
(695.6(A))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise first sentence:
Supply conductors shall be physically routed outside a building or structure and shall be installed as service ~~entrance~~ conductors in accordance with Part III and Part IV of Article 230.
Substantiation: Edit. Per the FPN to the definition of Service-Entrance Conductors, Underground System, there may be no service-entrance conductors. The Style Manual indicates references should not be made to entire articles.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
SWAYNE, R.: The indicated limitation on which Parts of Article 230 are to be considered is not inclusive of all sections that need to be complied with. Section 230.6 (Conductors Considered Outside the Building) and Section 230.9 (Clearances) are sections that should also apply and they are not in part III or Part IV.

13-97 Log #2740 NEC-P13 **Final Action: Accept in Principle**
(695.6(A) and (B))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the Technical Correlating Committee action on Proposal 13-77.
This action will be considered by the Panel as a Public Comment.
Submitter: Jim Pauley, Square D Company
Recommendation: Revise 695.6(A) as shown below:
~~(A) Service~~ Supply Conductors.
(1) Services and On-Site Power Production Facility. Service conductors and s ~~upply~~ conductors supplied by an on-site power production facility shall be physically routed outside a building(s) and shall be installed as service entrance conductors in accordance with Article 230. Where supply conductors cannot be physically routed outside of buildings, they shall be permitted to be routed through the building (s) where installed in accordance with 230.6(1) or 230.6(2).
(2) Multi-Building Campus Style Complexes. Where a fire pump is wired under the provisions of 695.3(B)(2), ~~this requirement shall apply to~~ all supply conductors on the load side of the service disconnecting means that constitute the normal source of supply to that fire pump shall be physically routed outside a building(s) and shall be installed as outside feeder conductors in accordance

with Article 225. Where the feeder conductors cannot be physically routed outside of buildings, they shall be permitted to be routed through the building(s) where installed in accordance with 230.6(1) or 230.6(2).

Exception to (A)(2) : Where there are multiple sources of supply with means for automatic connection from one source to the other, the requirement for routing outside of the building(s) shall apply only to those conductors on the load side of that point of automatic connection between sources.

(3) Supervised or On-Site Standby Generator Connections. ~~**(B) Circuit Conductors.**~~ Fire pump supply conductors on the load side of the final disconnecting means and overcurrent device(s) permitted by 695.4(B) or conductors that connect directly to an on-site generator shall comply with all of the following:

(1) a. Independent Routing. The conductors shall be kept entirely independent of all other wiring.

(2) b. Associated Fire Pump Loads. ~~They~~ The conductors shall supply only loads that are directly associated with the fire pump system.

(3) c. Protection from Potential Damage. ~~, and they~~ The conductors shall be protected to resist potential damage by fire, structural failure, or operational accident.

(4) d. Inside a Building. When routed through a building, ~~they~~ the conductors shall be installed ~~be permitted to be routed through a building(s)~~ using one of the following methods:

(1) Be encased in a minimum 50 mm (2 in.) of concrete

(2) Be within an enclosed construction dedicated to the fire pump circuit(s) and having a minimum of a 1-hour fire resistive rating

(3) Be a listed electrical circuit protective system with a minimum 1-hour fire rating

Exception to (3)(d) : The supply conductors located in the electrical equipment room where they originate and in the fire pump room shall not be required to have the minimum 1-hour fire separation or fire resistance rating, unless otherwise required by 700.9(D) of this Code.

In addition,

Delete 695.6(B)

Renumber the existing (C) through (H) to become (B) through (G).

Substantiation: The objective of this proposal is intended to rearrange the material in 695.6(A) and (B) to make it clear to the user how the rules apply. The present text mixes rules for service conductors (the first two sentences of 695.5(A)) with feeder rules (last sentence of 695.6(A)) and then has “other conductors” in item (B). This creates confusion because the exception in (A) deals with feeders only (because it applies on the load side of the automatic connection), but is located in a manner that is being interpreted to apply to service conductors.

The rearrangement breaks the paragraph into services, multi-building campus applications and finally supervised connections. The following is a summary of the changes:

1) The wording has been revised to specifically apply (1) to both service conductors and the conductors from an on-site power production facility. This clears up the confusion in the present text where the title says “service conductors”, but the text starts out with “supply conductors”. It would appear that the conductors in question are either service conductors, supply conductors from an on-site supply (which are not service conductors by definition).

2) The campus distribution provision is broken out into its own section and given a title. feeders which are covered in (A)(2) for the campus style distribution permission in 695.3(B)(2) or feeders covered by 695.6(B) which are on the load side of the supervised disconnect. In addition, since these are by definition feeder conductors so a reference has been added to Article 225 to ensure ensure that the wiring methods and installation are covered. Finally, a sentence has been added to allow routing through the building in accordance with 230.6(1) or (2) to parallel the provision for services.

3) The exception is now placed under (A)(2) and is modified to specifically note what it applies to. The wording “for routing outside of the building” has been added to make it clear what is being “excepted” by the exception.

4) The old 695.6(B) now becomes 695.6(A)(3) so that all of the conductor routing rules appear in a single subsection. Text has been added to the main paragraph to make it clear that the provisions not only apply on the load side of the final disconnecting means, but also to the conductors that connect directly to a gen set that has no overcurrent protection. Article 445 would allow a direct connection to the generator if the conductors are sized at 115% of the full load current. Presently it is not clear what should be done with the conductors from a generator. In addition, the revision applies to “direct connection” since the assumption would be that a gen set that has OCP and a disconnect would already be covered by the language “on the load side of the final disconnecting means”.

5) The main paragraph presently contains four separate provisions (independent routing, associated loads, protection from damage and rounting inside a building) that are applicable to these conductors. The revision breaks these elements out into separately numbered items so that they are clearly identified.

6) The exception modified to make it clear that it applies to (3)(d) which covers the 1 hour fire rating issue.

7) 695.6(B) is deleted because it is now part of (A)(3) and the remaining sections are renumbered.

Panel Meeting Action: Accept in Principle

Panel Statement: The panel action incorporated the recommended text into Proposal 13-77. This action correlates with Proposals 13-77, 13-82, and 13-89, which should meet the intent of the submitter.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 12 Negative: 1

Ballot Not Returned: 1 Gustafson, R.

Explanation of Negative:

SWAYNE, R.: The Panel Statement is faulty in that it refers to two proposals for which no action was taken, but action is referred to Proposal 13-77. See Negative Comments on Proposals 13-77 and 13-89.

13-98 Log #2546 NEC-P13 **Final Action: Accept in Principle**
(695.6(B)(2))

Submitter: Kenneth W. Birringer, University of Michigan

Recommendation: Revise text to read as follows:

Be within an enclosed construction dedicated to the fire pump circuit(s) and assembled according to listed details having a minimum of a 1-hour fire resistive rating.

Substantiation: (1) As a reviewer of over two billion dollars worth of new buildings and building renovations in the past three years, I have repeatedly seen installations that indicate a misunderstanding of how to obtain a minimum 1 hour fire resistive rating. Haphazardly slapping two layers of gypsum wallboard over fire pump circuits does not necessarily provide the required fire resistive rating. Requiring the construction to be assembled according to listed details should result in installations that actually have the required rating.

(2) To coordinate better with 700.9(D)(1)(4).

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action on Proposal 13-99 which should satisfy the intent of the submitter.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Gustafson, R.

13-99 Log #3018 NEC-P13 **Final Action: Accept**
(695.6(B)(2))

TCC Action: The Technical Correlating Committee understands that the Panel Action on this Proposal is modified by the Panel action on Proposal 13-100.

Submitter: James Conrad, Tyco Thermal Control

Recommendation: Revise 695(B)(2) as follows:

Be ~~within an enclosed construction~~ protected by a fire-rated assembly listed to achieve a minimum fire rating of 1-hour and dedicated to the fire pump circuit(s). ~~and having a minimum of a 1-hour fire resistive rating.~~

Substantiation: This proposal is to harmonize 695.6(B)(2) with 700.9(D)(4) that requires the enclosure or assembly to be listed. Listed fire-rated assemblies have been tested and are described in the UL Fire Resistance Directory or other Listing Directories.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Gustafson, R.

Comment on Affirmative:

ZGONENA, T.: The TCC needs to be advised that the action on this proposal needs to be correlated with the action on 13-100.

13-100 Log #3017 NEC-P13 **Final Action: Accept**
(695.6(B)(2) & (3))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 13-99.

This action will be considered by the Panel as a Public Comment.

Submitter: James Conrad, Tyco Thermal Control

Recommendation: Revise 695.6(B)(2) & (3) as follows:

(2) Be within an enclosed construction dedicated to the fire pump circuit(s) and having a minimum of a 2 ~~1~~ hour fire resistive rating

(3) Be a listed electrical circuit protective system with a minimum 2 ~~1~~ hour fire rating.

Substantiation: NFPA 72 requires 2-hour survivability of the notification circuits and the interconnecting wiring of the fire command center. To achieve this 2-hour rating you can use 2-hour rated cables, a 2-hour fire-rated enclosure or if permitted by the AHJ the automatic sprinkler system of the building. If an electric driven fire pump is supplying the sprinkler system, then the fire pump circuits should be protected for 2-hours ensuring the operation of the sprinkler system for 2-hours.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 12 Negative: 1

Ballot Not Returned: 1 Gustafson, R.

Explanation of Negative:

SWAYNE, R.: The criteria for notification is not the same as the criteria for operation of a fire pump. Within the one hour time window, the fire department has time to connect to their equipment and then the fire pump operation is not critical. Notification is necessary for a longer time to insure that personnel evacuate the facility. There is insufficient justification to increase the rating from one hour to two hours. If NFPA 20, which is technically qualified to make that judgment, has not required the additional time, then this Panel has no justification for the change.

Comment on Affirmative:

ZGONENA, T.: The TCC needs to be advised that the action on this proposal needs to be correlated with the action on 13-99.

13-101 Log #2986 NEC-P13 **Final Action: Accept in Principle**
(695.6(B)(3))

TCC Action: The Technical Correlating Committee understands that the Panel Action on this Proposal modifies 695.6(B)(3) and the FPN is to be located before the Exception.

Submitter: Robert Konnik, Rockbestos-Suprenant

Recommendation: Add an FPN to 695.6(B)(3) to clarify that the installation of an electrical circuit protective system requires special precautions as follows:

<u>FPN: Electrical circuit protective systems for fire rated cables, require special precautions for installation to maintain circuit integrity ratings, UL Guide information for category FHIT contains information on proper installation requirements to maintain the fire rating, including raceway support, vertical support, testing of boxes, compatibility of pulling lubricants and ground wires, and whether splices are allowable.</u>

Substantiation: There has been some confusion on installation of electrical circuit protective system fire rated cables to maintain fire ratings, UL Guide information was updated to provide useful information to clarify installation requirements.

Panel Meeting Action: Accept in Principle

Revise the proposed fine print note to read as follows:

FPN: UL guide information for electrical circuit protective systems (FHIT) contains information on proper installation requirements to maintain the fire rating.

Panel Statement: The panel revised the proposed FPN so as not to limit to these requirements.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 12 Negative: 1

Ballot Not Returned: 1 Gustafson, R.

Explanation of Negative:

HORNBERGER, B.: The FPN text is non mandatory. By providing the reference to this UL Guide, confusion will be created concerning whether the requirements in the UL Guide are mandatory or not." Manufacturers should provide adequate instructions on the proper installation of the product and installers should not have to refer to the UL Guide card for proper installations. See 110.3

13-102 Log #2593 NEC-P13 **Final Action: Reject**
(695.6(D))

Submitter: Jebediah Novak, Cedar Rapids Electrical JATC

Recommendation: Revise text to read as follows:

"...short circuit only. Where a tap is made to supply a fire pump, the wiring shall be treated as service conductors. ~~in accordance with 230.6.~~

Substantiation: With the change made to this section in the 2005 NEC, the reference to 230.6 is no longer necessary.

Panel Meeting Action: Reject

Panel Statement: The requirements in Section 230.6 shall be complied with. The phrase must not be deleted.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Gustafson, R.

Comment on Affirmative:

STAFFORD, T.: It is recognized that the submitter is trying to prevent repetitious code. It is felt that the duplication in this instance allows for a better understanding of 695.6(D).

13-103 Log #3427 NEC-P13 **Final Action: Accept**
(695.6(D))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: Insert the words "Except for protection of transformer primaries provided in 695.5(C)(2)" at the beginning of the second sentence.

Substantiation: This proposal reverses the panel action that accepted Comment 13-64 in the last cycle. A motion was supposed to have been made at the Annual Meeting to set this action aside, but the previous question was ordered before that motion could be made. The text in question was part of this submitters original rewrite of Article 695 that was accepted almost in its entirety for the 1999 NEC, as Proposal 15-98. The substantiation for that text pointed to required correlation with 695.5(C)(2). The submitter of Comment 13-64 clearly did not understand the context for 695.5(C).

A 695.5(C) transformer is one that is typically rated in megavolt amperes, and used in conjunction with a campus-type distribution for which the fire pump load is a negligible portion of its capacity. This is why 695.5(C) allows these transformers to supply other loads, and why these transformers are protected under the customary rules in 450.3, and the feeders protected per 215.3 [all as covered in 695.5(C)(2)]. To do otherwise is to impair the safety of the entire electrical system during all times when the fire pump is not operating, by over sizing the protection settings. In fact, with respect to feeders the panel action on Comment 13-64 creates a direct conflict between 695.6(D) and 695.5(C)(2). The overcurrent protection rules in 695.5(C)(2) require feeder protection per 215.3; and now 695.6(D) requires feeder conductors to be protected against short circuits only. For a transformer feeder that supplies a multiplicity of non-fire pump loads, that creates the preconditions for fire that the pumps will then have to extinguish.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 12 Negative: 1

Ballot Not Returned: 1 Gustafson, R.

Explanation of Negative:

STAFFORD, T.: It is not believed that the NEC is in error as according to the submitter's substantiation. It is desired that transformer primaries remain covered as specified by 695.5(C)(2).

13-104 Log #1196 NEC-P13 **Final Action: Accept in Part**
(695.6(D) Exception No. 2)

Submitter: Lanny G. McMahill, Phoenix, AZ

Recommendation: Delete Exception No. 2.

Substantiation: The exception makes no sense and conflicts with 695.5(B). Fire pump circuit conductors, service or feeder, are either a direct or supervised connection. A direct connection must comply with 695.6(A) and a supervised connection must comply with 695.6(B). 430.52 is not equivalent protection.

Panel Meeting Action: Accept in Part

Retain Exception No. 2, but at the end of the first paragraph of the exception, delete "or protected in accordance with 430.52."

Panel Statement: The panel agrees with the submitter that 430.52 is not equivalent protection but retained the remainder of the exception.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Gustafson, R.

13-105 Log #2344 NEC-P13 **Final Action: Reject**
(695.6(E))

Submitter: Andre R. Cartal, Princeton Borough Building Dept.

Recommendation: Add "flexible metal conduit".

Substantiation: Flexible metal conduit is commonly installed as a raceway for motor supply conductor and it should be permitted for a fire pump motor. The only flexible raceways presently recognized are the two types of liquidtight flexible conduit.

Panel Meeting Action: Reject

Panel Statement: Pump rooms may have an accumulation of water or have a sprinkler system installed; therefore protection against water intrusion into a raceway is required. Flexible metal conduit is not listed for a wet environment.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Gustafson, R.

13-106 Log #2345 NEC-P13 **Final Action: Reject**
(695.6(E))

Submitter: Andre R. Cartal, Princeton Borough Building Dept.

Recommendation: Add "electrical metallic tubing"

Substantiation: EMT would be permitted to supply the controller, the present restriction on the use of EMT to supply the pump should be removed.

Panel Meeting Action: Reject

Panel Statement: Raceways from the controller to the motor are exposed in the pump room. EMT does not have sufficient mechanical strength to prevent damage to conductors.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Gustafson, R.

13-107 Log #1949 NEC-P13 **Final Action: Accept in Principle**
(695.8 (New))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the Technical Correlating Committee action on Proposal 13-77.

This action will be considered by the Panel as a Public Comment.

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Recommendation: Add text to read as follows:

<u>695.8 Protective Devices. Where protective devices are installed in the onsite power source circuits at the generator, such devices shall allow instantaneous pickup of the full pump room load.</u>

Substantiation: This information is extracted from NFPA 20-2003, paragraph 9.6.5 and should be included in NFPA 70-2008.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel believes that the committee action on Proposal 13-77 accomplishes the intent of the submitter.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
SWAYNE, R.: This proposal should be evaluated on its own merits rather than depending upon the acceptance of Proposal 13-77 and should be Rejected. The requirements of Section 695.4 already require the overcurrent protection to carry the locked rotor currents indefinitely. Carrying locked rotor current is a more severe requirement than "pump room load". Load current is considerably less than locked rotor current.

13-108 Log #2866 NEC-P13 **Final Action: Reject**
(695.8 (New) or new text to 695.6(F))

Submitter: James S. Nasby, Master Control Systems, Inc.
Recommendation: Add a new 695.8 to read as follows:
695.8 Field Connections. No undervoltage, phase loss, frequency sensitive, or other sensor(s) shall be installed that automatically or manually prohibit electrical actuation of the motor contractor.
Or add above new text to 695.6(F).
Substantiation: This was NFPA-20-2006 Proposal 20-94 Log #117; which adds new 10.3.4.6 and which had **Final Action**: Accept in Part and with Substantiation:
Field problems with modifications to controllers. Clearer direction.
This was also NFPA-20-2006 Proposal 20-138 Log #106; which adds new 12.3.5.3.2 and which had **Final Action**: Accept in Principle and with Substantiation:
Field problems with modifications to controllers. Clearer direction.
There were no Comments on these Proposals.
Panel Meeting Action: Reject
Panel Statement: Section 695.14(B) prohibits these devices in the control wiring to the pump. Field connections should be subject to this section.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-109 Log #2848 NEC-P13 **Final Action: Accept in Principle**
(695.13 (New))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the Technical Correlating Committee action on Proposal 13-77.
This action will be considered by the Panel as a Public Comment.
Submitter: James S. Nasby, Master Control Systems, Inc.
Recommendation: Revise text to read as follows:
~~9.3.2.2.6~~ **695.13 Junction Boxes** . Where fire pump wiring to or from a fire pump controller is routed through a junction box, the following requirements shall be met.
~~9.3.2.2.6.1~~ **695.13(A)** The junction box shall be securely mounted. [Note: This clause deleted by FIM-AAA]
~~9.3.2.2.6.2*~~ **695.13(B)** Mounting and installing of a junction box shall not violate the enclosure Type ~~(NEMA~~) rating of the fire pump controller(s).
~~A.9.3.2.2.6.2 See also clause 10.3.3 (Enclosures for Electric Drive Controllers).~~
~~9.3.2.2.6.3*~~ **695.13(C)** Mounting and installing of a junction box shall not violate the integrity of the fire pump controller(s) and shall not affect the Short Circuit Rating of the controller(s).
~~A.9.3.2.2.6.3 See 10.1.2.1, controller short circuit (withstand) rating.~~
~~9.3.2.2.6.4~~ **695.13(C)** As a minimum, a ~~National Electrical Manufacturers Association (NEMA)~~ Type 2, dripproof enclosure (junction box) shall be used. The enclosure shall be listed ~~for the subject~~ <u>to match the fire pump controller enclosure</u> Type rating.
~~9.3.2.2.6.5~~ **695.13(D)** Terminals, junction blocks, splices, ~~and the like~~ , when used, shall be listed.
Or renumber as appropriate.
Note: Text Strikeouts ~~(Text Strikeouts~~) and <u>Text Underlines</u> are FIM-AAA Committee ROP Actions.
Note: There was **<u>no</u>** Public Comments on this Proposal.
Substantiation: A number of fire pump controllers have had very large rectangular cut outs made to them and fitted with flimsy unrated junction boxes for the purposes of terminating cables. This violates both the enclosure Type (NEMA) rating and the controller's withstand (short circuit) rating. This makes the reliability of the controller an unknown factor and also leads to dangerous installations
This was NFPA -20-2006 Proposal 20-76 Log #111 which was final action: Accept in Principle in Part.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel action and statement on Proposal 13-77 should satisfy the intent of the submitter.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
SWAYNE, R.: This proposal should be evaluated on its own merits rather than depending upon the acceptance of Proposal 13-77 and should be Rejected. None of the proposed subsections provide any significant change to what presently exists. Proposed subsection 695.13(A) is already a requirement of this Code in Section 314.23 and does not need to be repeated. Proposed subsections 695.13(B) and 695.13 (C) are unnecessary because doing so, as in the substantiation, would make the installation unacceptable. The second proposed subsection 695.13(C) is problematic. If the controller is required to be NEMA 2, then all of the equipment and wiring should be required to be drip proof, not just junction boxes.

13-110 Log #2852 NEC-P13 **Final Action: Accept in Principle**
(695.14 (New))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the Technical Correlating Committee action on Proposal 13-77.
This action will be considered by the Panel as a Public Comment.
Submitter: James S. Nasby, Master Control Systems, Inc.
Recommendation: Revise text to read as follows:
~~9.3.2.2.8*~~ **695.14 Raceway Terminations.**
~~9.3.2.2.8.1~~ **695.14(A)** Listed conduit hubs shall be used to terminate raceway (conduit) to the fire pump controller.
~~9.3.2.2.8.2~~ **695.14(B)** The ~~NEMA~~ Type rating of the conduit hub(s) shall be at least equal to that of the fire pump controller.
~~9.3.2.2.8.3~~ **695.14(C)** The installation instructions of the manufacturer of the fire pump controller shall be followed.
~~9.3.2.2.8.4~~ **695.14(D)** ~~No alterations~~ <u>Alterations</u> to the fire pump controller <u>shall be approved by the authority having jurisdiction.</u> ~~without the express specific approval of the manufacturer of the controller.~~
~~A.9.3.2.2.8~~ FPN: All fire pump controllers are required to be rated as NEMA (UL) Type 2 as a minimum. Conduit hobs must be also. Controllers rated at higher levels, such as Type 12, Type 4, Type 4X and etc., require correspondingly rated hubs in order for the controller Type rating to be valid. Failing to do so ~~will void the controller's warranty and~~ may cause controller damage or destruction by entry of water into the controller.
Note: Text Strikeouts (~~Text Strikeouts~~) and <u>Text Underlines</u> are FIM-AAA Committee ROP Actions.
Note: There were Comments Logs #19 & #21 on this proposal, both APA, APR or APP. Wording above needs to be verified against to the ROC. The FPN wording was struck.
Substantiation: Field problems, damage and confusion. Many controllers have been ruined by not following the above either at time of installation or after water damage due to not following the above requirements. The resulting loss of fire protection is often lengthy due to having to replace the entire controller or having to rebuild same in the field. The water damage situation is compounded by the fact that more and more pump rooms are sprinklered. Note that clause numbering is based on another submitted proposal. Also, if adopted, this text should also become extract text material for NFPA 70 Article 695.
This was NFPA-20-2006 Proposal 20-78 Log #100; which had **Final Action**: Accept in Principle.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel action and statement on Proposal 13-77 should satisfy the intent of the submitter.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
SWAYNE, R.: This proposal should be evaluated on its own merits rather than depending upon the acceptance of Proposal 13-77 and should be Rejected. The proposed Section 695.14(D) would given an unqualified Authority Having Jurisdiction (AHJ) the authority to accept an installation that neither the manufacturer or the testing agency would do without the appropriate testing. The proposed text in Proposal 13-77, Section 695.12(D) specifically prohibits the AHJ from approving alterations to the fire pump controller. See also Negative Comment on Proposal 13-109.

13-111 Log #2849 NEC-P13 **Final Action: Accept in Principle**
(695.15 (New))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the Technical Correlating Committee action on Proposal 13-77.
This action will be considered by the Panel as a Public Comment.
Submitter: James S. Nasby, Master Control Systems, Inc.
Recommendation: Revise text to read as follows:
~~9.3.2.2.7*~~ **695.15 Listed Electrical Circuit Protective System to Controller Wiring.**

~~9.3.2.2.7.1*~~ **695.15(A)** ~~When used, Type MI (Mineral Insulated) cable~~ Where single conductors (individual conductors) are used, they shall be terminated in a separate junction box and in accordance with NFPA 70. Single (Individual) conductors shall not enter the fire pump enclosure separately.

~~A.9.3.2.2.7.1~~ FPN Cutting slots or rectangular cutouts in a fire pump controller will violate the ~~NEMA~~ Enclosure Type rating, and the controller's Short Circuit (Withstand) rating and will void the manufacturer's warrantee. See also NFPA 70 Articles 300.20 and 322, for example, for further information.

~~9.3.2.2.7.2*~~ **695.15(B)** Where required by the manufacturer of a ~~Listed~~ listed Electrical Circuit Protective System or by NFPA 70 or by the Listing ~~agency~~ , the raceway between a junction box and the fire pump controller shall be sealed at the junction box end as required and per the instructions of the manufacturer ~~or listing agency.~~

~~A.9.3.2.2.7.2~~ FPN When so required, this seal is to prevent flammable gases from entering into the fire pump controller.

Note: Text Strikeouts (~~Text Strikeouts~~) and Text Underlines are FIM-AAA Committee ROP or ROC Actions.

Note: There were Comments Logs #17, #18 & #20 on this proposal, both APA, APR, or APP. Wording above needs to be verified against to the ROC. The FPN wording was struck.

Substantiation: Clarification of field confusion and questions. Except for conductors smaller than #8 AWG, most or all electric drive fire pump controllers inlet terminals are rated and Listed for use with stranded wire and not solid wire. Some Listed Electrical Circuit Protective Systems make use of solid wire and require splicing to regular stranded cables for proper termination in the controller. Note that clause numbering is based on another submitted proposal. Also, if adopted, this text should also become extract text material for NFPA 70 Article 695.

This was NFPA-20-2006 Proposal 20-77 Log #99; which had **Final Action**: Accept in Principle.

Panel Meeting Action: Accept in Principle

Panel Statement: The panel action and statement on Proposal 13-77 should satisfy the intent of the submitter.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 12 Negative: 1

Ballot Not Returned: 1 Gustafson, R.

Explanation of Negative:

SWAYNE, R.: This proposal should be evaluated on its own merits rather than depending upon the acceptance of Proposal 13-77 and should be Rejected. This proposal would prohibit the use of conduit and wire to a controller and only permit cable. The substantiation does not address any problem with conduit and wire but only discusses problems with terminating solid conductors. If the terminations are not listed for use with solid conductors, then doing so would be a violation of this Code by not complying with the listing instructions as required in Section 110.3(B).

ARTICLE 700 — EMERGENCY SYSTEMS

13-112 Log #1450 NEC-P13 **Final Action: Reject**
(700.1, FPN 3)

Submitter: Ryan Jackson, West Valley City, UT

Recommendation: Revise as follows:

700.1 Scope. Remain unchanged.

FPN No. 1: Remain unchanged.

FPN No. 2: Remain unchanged.

FPN No. 3: Emergency systems are ~~generally~~ often installed in places of assembly where artificial illumination is required for safe exiting and for panic control in buildings subject to occupancy by large numbers of persons, such as hotels, theaters, sports arenas, health care facilities, and similar institutions. ~~Emergency system may also provide power for such functions as ventilation where essential to maintain life, fire detection and alarm systems, elevators, fire pumps, public safety communications systems, industrial processes where current interruption would produce serious life safety or health hazards, and similar functions~~ .

FPN No. 4: Remain unchanged.

FPN No. 5: Remain unchanged.

Substantiation: This fine print note in many instances creates havoc. The word "may" that is used seems to give permission to the designer to include any of the equipment listed in the FPN. This is inaccurate, because only equipment that is required to be an emergency load is permitted to be an emergency load. While I find the fine print notes in Articles 700 and 701 quite valuable, this particular fine print note goes a little bit too far.

A companion proposal to delete the FPN in 701.2 is being made to help correlate.

Panel Meeting Action: Reject

Panel Statement: The existing FPN is not mandatory text. The text proposed to be deleted simply points out that loads other than lighting may be "required" to be supplied by such systems.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Gustafson, R.

(Note: Sequence 13-113 was not used)

13-114 Log #688 NEC-P13 **Final Action: Reject**
(700.4(B))

Submitter: James Filippone, Port Authority of NY & NJ

Recommendation: Revise 700.4(B) to read as follows:

Tested Periodically. Systems shall be tested periodically on a schedule acceptable to the authority having jurisdiction to ensure the systems are maintained in operating condition. Systems shall be tested by the building owner at least every five years under maximum load conditions to verify that they still have sufficient capacity and rating.

FPN: Passenger electric elevators and freight electric elevators permitted to carry passengers must be tested in the down direction with 125 percent of their rated load inside the car and freight elevators must be tested with rated load inside the car. See ASME A17.1 Safety Code for Elevators and Escalators for information on which elevators must be capable of operating in the down direction with 125 percent of rated load.

Substantiation: Requiring testing on a 5-year basis under maximum load conditions is reasonable to ensure that these critical systems still have sufficient capacity and rating and are available to emergency responders. Over time the loads that the system must supply can change significantly. Experience indicates that systems that were once sufficient can be no longer sufficient due to added loads. The system is tested under maximum capacity upon installation and the means to test it periodically must be provided. However, testing periodically under maximum load conditions is not specifically required. Information on the required load for elevators is provided for testing purposes.

Panel Meeting Action: Reject

Panel Statement: Testing frequency is not the responsibility of an installation code. The existing text directs the reader to other references or requires an adequate installation to permit testing.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Gustafson, R.

13-115 Log #1630 NEC-P13 **Final Action: Reject**
(700.6)

Submitter: Peter Ramus, Town of Hanover

Recommendation: Add the following text:

Where an outdoor housed generator set is equipped with a readily accessible disconnecting means individually capable of being locked in the open position and the generator set is located within sight of the building or structure supplied, an additional disconnecting means shall not be required where ungrounded conductors serve or pass through the building or structure.

Substantiation: Some AHJs view the generator enclosure as an outer enclosure of the generator disconnect while others require the disconnect handle to be visible from the building. Where gen set enclosures "within sight" of the building are approved, a more practical and efficient layout of equipment can be achieved with no degradation of safety.

In either case, the outdoor gen set is usually not visible from the ATS or generator distribution located within the building. Requiring provisions for lockout at the generator disconnect will provide a higher degree of safety in situations where the only disconnect for an alternate source service is remote and not visible from the equipment served.

Panel Meeting Action: Reject

Panel Statement: Section 700.6 deals with transfer equipment, not disconnecting devices. This is already covered in 700.12(B)(6), 701.11(B)(5), and 702.11.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Gustafson, R.

Comment on Affirmative:

STAFFORD, T.: See my comment to the affirmative on 13-9.

13-116 Log #88 NEC-P13 **Final Action: Reject**
(700.6(A))

Submitter: Paul Hamann, Lake Forest, IL

Recommendation: Delete from 700.6(A) the following text:

" ~~Transfer equipment shall be designed and installed to prevent the inadvertent interconnection of normal and emergency sources of supply in any operation of the transfer equipment.~~ "

Revise 700.6(D) as follows:

(D) Use. ~~Transfer equipment shall supply only emergency loads~~ . If transfer equipment is installed then all emergency loads shall be fed through the transfer equipment.

Substantiation: I have seen designs where the whole building is fed through the transfer equipment. The generator was feeding emergency circuits, standby circuits, optional standby circuits and normal circuits.

Panel Meeting Action: Reject

Panel Statement: The recommended deleted text prohibits "inadvertent interconnection of the normal and emergency sources of supply," not the "loads" as referenced to in the submitter's substantiation. The transfer equipment shall supply only emergency loads in order to maintain emergency system reliability.

In addition, the revision to 700.6(D) may not meet requirements of the Local authority having jurisdiction in all locations.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Gustafson, R.

13-117 Log #2369 NEC-P13 **Final Action: Accept**

(700.6(C)(1) (New))

Submitter: Lawrence A. Bey, Cummins Power Generation

Recommendation: Add a new 700.6(C)(1) as follows:

(1) Automatic transfer switches, rated 600 VAC and below, shall be listed for emergency system use.

Substantiation: A problem can exist under normal operation of the transfer switch where the two power sources are both energized and out-of-phase relative to each other, as is often the case with one utility source and an on-site generator set(s). Typically, both power sources are energized during exercise and test of the generator. When the two power sources are not synchronized, as much as twice rated voltage may be seen across the transfer switch contacts. At twice rated voltage, sustained arcing across the contact air gap may cause a source-to-source short circuit during transfer operation. This potential problem exists unless the transfer switch equipment has been designed and tested to be suitable for switching between out-of-phase power sources (three phase systems displaced by 120 electrical degrees and single phase systems displaced by 180 degrees), or has otherwise been examined and determined to be suitable for switching between out-of-phase power sources.

Unless listed, a problem of uncoordinated overcurrent protection may exist should the transfer switch close into a short circuit. The short circuit fault that cleared the upstream overcurrent device may still be present when the transfer switch operates and closes on the alternate source. A listed transfer switch has been tested to 1) safely withstand a short circuit with contacts closed until the upstream overcurrent clears; and 2) close into short circuit with contacts open. Closing into a short circuit is typically a more severe test than withstand due to arcing and out gassing of contact material as the contacts move together. Transfer switch equipment that has not been tested for closing into a fault may not be adequately protected by the alternate source upstream overcurrent device. Generally this is transfer switch performance that must be established by high current laboratory testing on a complete as-built assembly. The recognized national standard for testing Automatic Transfer Switch Equipment is ANSI/UL 1008.

This proposed requirement as placed under 700.6(C) would specifically apply only to automatic transfer switches. The intent is to not rule out other types of transfer system transfer equipment identified for emergency system use and acceptable to the AHJ under 700.6(A). The proposed requirement would not apply to systems rated above 600 volts, but would apply 600 volts and below where UL Safety Standard 1008 provides ANSI testing specifications.

Panel Meeting Action: Accept

Add as a last sentence to existing 700.6(C) instead of a new (C)(1)

Panel Statement: This places the text in a better position.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 12 Negative: 1

Ballot Not Returned: 1 Gustafson, R.

Explanation of Negative:

ELKINS, D.: This proposal should be rejected. The substantiation describes an engineering error which can occur in misapplication of a transfer switch. As the NEC says in 90.1(C) "This code is not intended as a design specification or an instruction manual for untrained persons." Listing a transfer switch as required in this proposal will not prevent misapplication.

13-118 Log #833 NEC-P13 **Final Action: Accept in Principle**

(700.9)

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal so that the text is in accordance with the NEC Style Manual. This action will be considered by the Panel as a Public Comment.

Submitter: Thomas H. Wood, Cecil B. Wood Inc.

Recommendation: Revise Section 700.9 to read as follows:

II. Circuit Wiring.

700.9 Wiring, Emergency System.

(A) Identification. All boxes and enclosures (including transfer switches, generators, and power panels) for emergency circuits shall be permanently marked so they will be readily identified as a component of an emergency circuit or system.

(B) Distribution. Wiring from an emergency source that supplies a vertical switchboard or individual disconnects with overcurrent protection grouped at one location shall be permitted to serve a combination of emergency, legally required and optional standby systems in accordance with (1) through (3).

(1) Switchboards or individual enclosures shall be permitted to be supplied by a single feeder.

(2) Legally required and optional standby circuits shall not originate from vertical sections or enclosures that supply emergency circuits.

(3) Separate switchboard sections shall be provided for each emergency, legally required, or optional standby system.

(C) ~~(B)~~ Wiring. Wiring of two or more emergency circuits supplied from the same source shall be permitted in the same raceway, cable, box, or cabinet. Wiring from an emergency source or emergency source distribution overcurrent protection to emergency loads shall be kept entirely independent of all other wiring and equipment, unless otherwise permitted in (1) through (4):

(1) Wiring from the normal power source located in transfer equipment enclosures

(2) Wiring supplied from two sources in exit or emergency luminaires (lighting fixtures)

(3) Wiring from two sources in a common junction box, attached to exit or emergency luminaires (lighting fixtures)

(4) Wiring within a common junction box attached to unit equipment, containing only the branch circuit supplying the unit equipment and the emergency circuit supplied by the unit equipment.

Substantiation: The separation of emergency system wiring from all other wiring is required by NEC 700.9, and is clearly understood. Just where the separate emergency, legally required standby, or optional standby systems feeders originate at or near the generator is less well defined. The supply tap box on generators equipped with disconnects with or without overcurrent protection is not generally designed or manufactured for installation of multiple devices to serve separate circuits for emergency loads, fire pumps, legally required standby loads, and optional standby loads, although AHJs have interpreted the mandated separation of wiring to require just that. In addition, such an interpretation does not consider parallel operation of multiple generators, which require some type of distribution to separate the systems downstream of the paralleling bus. The recommended revisions clarify that, for both single generator and parallel generator installations, separation of the circuits served by an emergency generator(s) source may be accomplished using a single feeder from the generator to separately mounted enclosed overcurrent devices or a distribution switchboard that separates emergency circuits in different vertical sections from other loads.

Separately enclosed overcurrent devices or overcurrent devices mounted in separate vertical sections of a distribution switchboard will provide physical separation of the different systems or branches and define that the origin of the emergency, legally required standby, and optional standby systems is at the feeder overcurrent protection device, not the generator terminals.

This proposal was developed by the Task Group directed by the TCC to consider comments 13-6 and 13-71 and if appropriate to develop proposals for the 2008 NEC. The task group consisted of the following: Thomas H. Wood; Chair (Chair NFPA-70, panel 13), Hugh O. Nash; (Chair NFPA 99), Douglas S. Erickson; (Chair NFPA 110), James Costley; and Herb Whittall.

Panel Meeting Action: Accept in Principle

Revise existing section 700.9(B) by adding a new Number (5) to (B) to read as follows:

(5) Wiring from an emergency source shall be permitted to supply any combination of emergency, legally required, or optional loads in accordance with (a), (b) and (c).

(a)From separate sections of a vertical switchboard, with or without a common bus, or from individual disconnects mounted in separate enclosures.

(b)The common bus or separate sections of the switchboard or the individual enclosures shall be permitted to be supplied by single or multiple feeders without overcurrent protection at the source.

(c)Legally required and optional standby circuits shall not originate from the same vertical switchboard section, panelboard enclosure or individual disconnect enclosure as emergency circuits.

Exception to (5) (b). Overcurrent protection shall be permitted at the source or for the equipment, provided the overcurrent protection is selectively coordinated with the down stream overcurrent protection.

Panel Statement: The panel has placed revised text in a new list Item (5) in Section 700.9 (B) to clearly identify that the original separation requirements from the source to the loads or from the source distribution overcurrent protection to the loads is to remain unless modified by (1) – (5).

The revised text will further clarify that it is permitted to supply any combination of emergency, legally required or optional loads from a single feeder or from multiple feeders or from separate vertical sections of a switchboard that are supplied by either a common bus or individually.

The use of an overcurrent protective device at the source or for the equipment is a matter of reliability and design. While the requirements in (5) (b) maintain the highest degree of reliability, the exception to (5) (b) will permit the use of an overcurrent device at the source or for the equipment. The coordination of the overcurrent protection at the source or for the equipment with the downstream overcurrent protection requirement in the exception will maintain the highest degree of reliability possible while allowing protection for conductors and equipment. The revised text in the main paragraph should also make it clear that circuits supplying emergency loads are not to be combined in panelboard enclosures with circuits supplying other loads.

Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:

NASBY, J.: NEMA is voting negative on the panel action because the new text creates additional confusion. This issue stemmed from a misinterpretation made by CMP 13 during the 2005 NEC cycle that implied you could not have a switchboard supplied from a generator that would then supply transfer switches for emergency, legally required and optional systems even though this type of installation was common. The panel is now left trying to resolve that confusion. The panel action does attempts to address part of the issue, but does so in a manner that is confusing. Here are a few of the issues that must be dealt with in order to arrive at an acceptable solution:

1) What is a "vertical switchboard" as stated in (5)(a)? Does that panel mean vertical sections of a switchboard?

2) The text discussing "separate sections" will be easily misinterpreted. The implication to some AHJ's is that there must be physical barriers between sections. Standard switchboards are open between sections. The wording could be improved by stating "From different vertical sections of a switchboard, …"

3) It's unclear what the text is saying in (5)(b). Is the implication that I cannot have a main overcurrent device in the switchboard or at the generator? The text implies that it is simply acceptable to omit overcurrent protection that may be necessary for proper protection.

4) The proposed exception is not suitable for this section of Article 700. 700.9 deals with separation of circuits with the objective of keeping non-emergency circuits from having a physical impact on emergency circuits. The exception related to selective coordination has nothing to do with this objective.

Comment on Affirmative:

SWAYNE, R.: Section 700.9(C)(5)(a) is not a complete sentence as are (b) and (c). A possible addition of "Wiring" at the beginning and "shall be permitted" at the end would correct the English. Also, in the Exception, the word "for" should be replaced with "at" to have the sentence make sense.

13-119 Log #1306 NEC-P13 **Final Action: Reject**
(700.9(B))

Submitter: Barbara Cooper, Peerless Lighting
Recommendation: Revise text to read:

700.9(B) Wiring. Wiring of two or more emergency circuits supplied from the same source shall be permitted in the same raceway, cable, box or cabinet. Wiring from an emergency source or emergency source distribution overcurrent protection to emergency loads shall be kept entirely independent of all other wiring and equipment, unless otherwise permitted in (1) through (4):

(2) Wiring supplied from two sources in <u>single unit</u> exit or emergency luminaires (lighting fixtures), <u>or a linear run of luminaires containing exit or emergency luminaires.</u>

Substantiation: Linear runs of fluorescent luminaires containing emergency sections are common in many installations. Physical separation of the normal and emergency wiring is not always possible due to size of the luminaire and real estate available for wiring; therefore, the only option for feeding emergency sections in a run is to provide separate drops for each emergency section. Adding a drop for each emergency fixture increases the chance of failed connection, it increases the risk of error in field wiring and it increases the possibility of damaging wire insulation. Allowing the emergency wiring harness to be run through non-emergency luminaires in the same raceway does not inherently increase the risk to normal feed circuits. This has been standard practice in this (linear fluorescent lighting) Industry for over thirty years and should be allowed in the revised edition of the NEC.
Panel Meeting Action: Reject
Panel Statement: Mixing of emergency and nonemergency wiring is prohibited except at the emergency luminaire.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-120 Log #2941 NEC-P13 **Final Action: Accept in Principle**
(700.9(B) (New))

Submitter: Rand Veerman, Town of Normal
Recommendation: Add new text as follows:

700.9(B) Distribution. An emergency distribution switchboard supplied by a single feeder or feeders in parallel from alternate power source(s) shall be permitted to supply legally required and optional standby systems from separate sections. The wiring in each section shall only be comprised of those conductors serving that system.

Substantiation: Generators operating in parallel must supply a switchboard containing individual closing breakers for each generator. Individual feeders in accordance with Article 445 supply each closing breaker. Each closing breaker supplies the internal buss array and are operated by sophisticated electronic synchronizing controls.

The overcurrent protection device supplying a transfer switch with a feeder is the source distribution point for determining system class e.g...emergency, legally required, optional standby, not the bushings on the generator. This new additional section should clarify long-standing issues for generator installations from both designers and the inspection community.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel action on Proposal 13-118 should satisfy the intent of the submitter.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-121 Log #3024 NEC-P13 **Final Action: Accept in Principle**
(700.9(D))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 15 for comment.
Submitter: Barry F. O'Connell, Tyco Thermal Controls
Recommendation: Revise 700.9(D) as follows:

(D) Fire protection emergency systems shall meet the additional requirements in 700.9(D)(1) and (D)(2) in assembly occupancies for not less than 1000 persons or in buildings above 23 m (75 ft) in height with any of the following occupancy classes; assembly, educational, residential, detention and correctional, business, and mercantile, <u>and the essential electrical system for hospitals as described in 517.30.</u>

Substantiation: The Code should specifically call for fire protection of the emergency system wiring in hospitals. It is common practice in hospital design. The intent is expressed in 700.1 FPN No. 3:

FPN No. 3: Emergency systems are generally installed in places of assembly where artificial illumination is required for safe exiting and for panic control in buildings subject to occupancy by large numbers of persons, such as hotels, theaters, sports arenas, health care facilities, and similar institutions.
Panel Meeting Action: Accept in Principle

<u>Revise proposed revision to 700.9(D) as follows:</u>

"... ~~and~~ mercantile <u>, and feeders for essential electrical systems for hospitals and health care facilities.</u>

Panel Statement: The proposal was accepted by adding "health care facilities" and deleting the reference to be consistent with the Code format.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 10 Negative: 3
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:

ELKINS, D.: This proposal should be rejected. The proposal in affect adds requirements for Article 517 Health Care Facilities which is handled by Panel 15. This addition creates a correlation problem with the requirements generated by this other panel. It is suggested that this proposal be forwarded to Panel 15 for action within the wording of Article 517.

HORNBERGER, B.: Essential Electrical system requirements for the Health Care industry are the responsibility of Panel 15. The TCC should instruct Panel 15 to reference 700.9(D) in 517.

SWAYNE, R.: Article 517 has requirements for Essential Electrical Systems which are not exactly the same as Emergency Systems. The requirements for hospitals and health care facilities should be confined to Article 517 unless it references other Articles.

13-122 Log #3437 NEC-P13 **Final Action: Accept in Principle**
(700.9(D))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 15 for information.

Submitter: Edward Walton, Draka Cableteq
Recommendation: Add Health Care Facilities to the list of occupancy classes covered by this section.
Substantiation: Omission may lead some to believe it is not required for Health Care.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel action and statement on Proposal 13-121 should satisfy the intent of the submitter.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 10 Negative: 3
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:

ELKINS, D.: See explanation of negative vote on Proposal 13-121.

HORNBERGER, B.: Please see my Negative Vote comment on 13-121.

SWAYNE, R.: See Negative Comment to Proposal 13-121.

13-123 Log #3436 NEC-P13 **Final Action: Reject**
(700.9(D)(1))

Submitter: Edward Walton, Draka Cableteq
Recommendation: Revise Feeder-Circuit Wiring to Emergency Circuit Wiring. Emergency circuit wiring shall meet one of the following conditions.
Substantiation: Currently, the first hazard that might cause emergency wiring circuit failure is only minimized in the area of the feeder circuit and the feeder circuit may be located very close to the generator which leaves a large amount of the emergency wiring unprotected [reference 700.9(C)]. Because this protection applies to large assembly occupancies and buildings with critical egress requirements, it is the responsibility of this code section to adapt this proposal or except wiring other than feeder circuits from the requirements of 700.9(C) Wiring Design and Location.

The stated objection has been potential problems that may be associated with incorporating this requirement beyond feeder circuits. Presently, any one of six different methods may be used to provide this protection. Included are simple routing techniques or the substitution of plastic building wire with circuit integrity building wire (available from several nationally recognized sources). Given these options, I do not know of any branch circuit application that cannot be satisfied with one of the six allowable options.
Panel Meeting Action: Reject
Panel Statement: The level of protection required is warranted of a feeder supplying many emergency circuits. Section IV covers circuits, and does not require such protection. The submitter has not offered technical substantiation to warrant the text revision.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-124 Log #3022 NEC-P13 **Final Action: Accept in Principle**
(700.9(D)(1)(4))

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal so that the text is in accordance with the NEC Style Manual. This action will be considered by the Panel as a Public Comment.
Submitter: James Conrad, Tyco Thermal Control
Recommendation: Revise 700.9(D)(1)(4) as follows:
4) Be protected by a fire-rated assembly listed to achieve a minimum fire rating of 1 hour <u>and dedicated to the emergency wiring circuits.</u>
Substantiation: Although it is already stated in 700.9(B) that the wiring of the emergency system shall be "kept entirely independent" it is a common practice to put the normal and emergency circuits in a fire rated shaft or assembly running through the building. By adding the word "dedicated" to option (4) will make it clear that the fire-rated assembly can only contain the emergency circuits.
Panel Meeting Action: Accept in Principle
Revise proposed wording to read as follows:
<u>...which is dedicated to the emergency wiring circuits.</u>
Panel Statement: Editorial clarification.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
SWAYNE, R.: The Proposal mixes the need to maintain electrical separation with the need for separation. There is no substantiation that a one hour rated enclosure containing both normal and emergency systems is more susceptible to fire. The one hour rating should also be adequate to permit wiring under Article 695 also.

13-125 Log #2985 NEC-P13 **Final Action: Accept in Principle**
(700.9(D)(1)(2), FPN (New))

Submitter: Robert Konnik, Rockbestos-Suprenant
Recommendation: Add an FPN to 700.9(D)(1)(2) to clarify that the installation of an electrical circuit protective system requires special precautions as follows:
<u>FPN: Electrical circuit protective systems for fire rated cables, require special precautions for installation to maintain circuits integrity ratings. IL Guide information for category FHIT contains information on proper installation requirements to maintain the fire rating, including raceway support, vertical support, testing of boxes, compatibility of pulling lubricants and ground wires, and whether splices are allowable.</u>
Substantiation: There has been some confusion on the installation of electrical circuit protective system for fire rated cables to maintain fire ratings. UL Guide information was updated to provide useful information to clarify installation requirements.
Panel Meeting Action: Accept in Principle
See panel action on Proposal 13-101.
Panel Statement: The panel action and statement on Proposal 13-101 should satisfy the intent of the submitter.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
SWAYNE, R.: This proposal should be Accepted in Principle in the same manner that Proposal 13-101 was Accepted in Principle. Proposal 13-101 was for Article 695. This proposal is for Article 700 which covers different wiring.

13-126 Log #3015 NEC-P13 **Final Action: Accept in Principle**
(700.9(D)(3) (New))

Submitter: James Conrad, Tyco Thermal Control
Recommendation: Add new 700.9(D)(3) as follows:
<u>(3) Generator Control Wiring Methods. Control conductors installed between the transfer switch and the emergency generator shall be kept entirely independent of all other wiring and shall meet one of the following conditions:</u>
<u>(1) Be encased in a minimum 50 mm (2 in.) of concrete</u>
<u>(2) Be protected by a fire-rated assembly listed to achieve a minimum fire rating of 1 hour and dedicated to the emergency wiring circuits</u>
<u>(3) Be a listed electrical circuit protective system with a minimum 1-hour fire rating.</u>
Substantiation: The generator start circuit is a critical component of the emergency system and should have the same protection as the feeder-circuit wiring. This same requirement is currently in 695.14(F) to ensure the starting of the generator when used for an alternate source of power.
Panel Meeting Action: Accept in Principle
Accept the proposal in principle but revise proposed new 700.9(D)(3), to read as follows:
<u>(3) Generator Control Wiring. Control conductors installed between the transfer equipment and the emergency generator shall be kept entirely independent of all other wiring and shall meet the conditions of 700.9(D)(1).</u>
Panel Statement: The panel action should meet the intent of the submitter and does not repeat requirements. It also maintains existing approved methods for this protection.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-127 Log #581 NEC-P13 **Final Action: Reject**
(700.12)

Submitter: Richard Pokorny, City of Marshfield, WI / Rep. Wisconsin Chapterof IAEI
Recommendation: Add text to read as follows:
The enclosure of the alternate source of power located outdoors for emergency systems shall be located at least 10 ft from a combustible wall and at least 20 ft from an outdoor electrical transformer or normal power distribution equipment. These dimensions may be reduced by one-half where a noncombustible barrier is installed that extends at least 3 ft beyond each side of the transformer. The height of the barrier shall be at least one foot above the top of the transformer or alternate power source, whichever is higher.
Substantiation: This is a proposal to add wording into the NEC dealing with distance between alternate sources of emergency power and outdoor transformers or distribution equipment. At the present time, there is not any guidance as to an enforceable distance between these units needed to keep portions of building premises wiring systems operational. Under a scenario where either one of these items are having a problem, components of emergency systems needs to be operational. There appears to be a need to keep a safe distance away so that one disaster does not take out the other unit. With real estate prices being so high, areas utilized for transformers and alternate power systems are shrinking to the point that designers are placing these items as close as possible. In many cases, installers are barely meeting safe working clearances required by Article 110 much less looking at how fragile this spacing "safety net" is. An emergency source of power should not be compromised because a portion of a building, an electrical distribution system or a transformer is burning or has another severe problem.

700.12 is vague as it merely states that the "Equipment shall be designed and located to minimize the hazards...". This does not give the AHJ any dimensions to enforce this section of a critical code article.

A good starting point for looking at existing rules would bring ten feet (10 ft or 3.05 meters) to the forefront, as a number of large transformer installation codes require this distance from a combustible building. A fire in the building, exterior distribution equipment or a transformer fire would be less likely to affect a generator or other alternate power source. With this in mind, a legally required standby source of power should also be located at least 3.05 m (10 ft) from a combustible wall. At this point, the logic would be that two components, such as a generator and transformer shall have a 3.05 m (10 ft) safety zone from each other, that does not overlap the other component's zone. Therefore, 6.1 m (20 ft) would be the acceptable distance between the two units. If one is on fire, there would still be a 3.05 m (10 ft) safe zone beyond the conflagration at the other unit that would permit personnel to work on problems with the particular unit that is needed at that time. As designers still want to minimize any spacing requirement, this dimension should be able to be reduced if the design of the area includes a noncombustible assembly. The dimensions and composition of this barrier listed in the proposal are the same as the ones stated in the State of Wisconsin's Public Service Commission - PSC

114 and have proved to be an acceptable standard for transformer placement for many years. I have provided copies of the applicable portion of this document. PSC 114.317 C 2. states this distance requirement from combustible walls. PSC 114.317 D 2. indicates the dimensions for a noncombustible barrier that will allow a reduction to this dimension for cramped building sites.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: Separation requirements may vary from jurisdiction to jurisdiction. The NEC is not intended to be a design manual. No substantiation was provided for the 10 foot distance.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Gustafson, R.

13-128 Log #3079 NEC-P13 **Final Action: Reject**

(700.12)

Submitter: Joseph A. Hertel, Safety and Buildings

Recommendation: In addition to the requirements in 700.12 (intro):

The enclosure of the alternate source of power located outdoors for emergency systems shall be located at least 10 ft from a combustible wall and at least 20 ft from an outdoor electrical transformer or normal power distribution equipment. These dimensions may be reduced by one-half where a noncombustible barrier is installed that extends at least 3 ft beyond each side of the transformer The height of the barrier shall be at least one foot above the top of the transformer or alternate power source, whichever is higher.

Substantiation: NFPA 110 provides specific requirements where a generator used for emergency standby power is located indoors. If it is located outdoors, there is a very general statement in 700.12 to consider the hazards involved. Is there hazard if the emergency generator is located immediately adjacent to the service gear or the utility transformer? This language would provide some degree of reliability to the installation in the event of a catastrophic failure of the normal power supply.

Panel Meeting Action: Reject

Panel Statement: Separation requirements may vary from jurisdiction to jurisdiction. The NEC is not intended to be a design manual. No substantiation was provided for the separation distance. See also panel action and statement on Proposal 13-127.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Gustafson, R.

13-129 Log #539 NEC-P13 **Final Action: Reject**

(700.12(B)(6))

Submitter: Joel A. Rencsok, Electrical Designs Inc.

Recommendation: Delete the words "or pass through" to read as follows:

(6) Outdoor Generator Sets. Where an outdoor housed generator set is equipped with a readily accessible disconnecting means located within sight of the building or structure supplied, an additional disconnecting means shall not be required where ungrounded conductors serve ~~or pass through~~ the building or structure.

Substantiation: See225.31. When this section was added, emergency systems feeder were passing through building to building where the feeder could be taken out of service by a fire in the first building. Indoor generator sets still have to comply with 225.31.

Panel Meeting Action: Reject

Panel Statement: Emergency system feeders passing through another building must meet the requirements of 700.9. Installations meeting this requirement may pass through another building.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Gustafson, R.

13-130 Log #547 NEC-P13 **Final Action: Reject**

(700.12(B)(6), FPN (New))

Submitter: Michael J. Johnston, Plano, TX

Recommendation: Add a new FPN as follows:

(6) Outdoor Generator Sets. Where an outdoor housed generator set is equipped with a readily accessible disconnecting means located within sight of the building or structure supplied, an additional disconnecting means shall not be required where ungrounded conductors serve or pass through the building or structure.

<u>FPN: 250.32(D) provides grounding and bonding requirements for building or structure disconnecting means that are remote from the building or structure.</u>

Substantiation: This proposal is an effort to provide some correlation between the rules in 250.32(D) which provides requirements for grounding and bonding where the building or structure disconnecting means is mounted remote from the building or structure as it would be if it were located on the generator assembly in accordance with this section. A companion proposal is being submitted to 250.32(D) to correlate with the provisions of 700.12(B)(6).

Panel Meeting Action: Reject

Panel Statement: Section 250.32(D) applies and should not have to be referenced. This section of Article 700 is concerned with the need for a disconnect, not grounding.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 12 Negative: 1

Ballot Not Returned: 1 Gustafson, R.

Explanation of Negative:

SWAYNE, R.: This proposal should be Accepted. The purpose of FPNs is to direct the reader to Articles or Sections of this Code that may not be obvious. The grounding and bonding requirements for equipment in separate buildings or structures is not well understood and many questions arise as to correct action. This is a desirable place for this FPN.

13-131 Log #1283 NEC-P13 **Final Action: Reject**

(700.12(B)(6), FPN (New))

Submitter: Mark R. Hilbert, State of New Hampshire

Recommendation: Revise text to read:

(6) Outdoor Generator Sets. Where an outdoor housed generator set is equipped with a readily accessible disconnecting means located within sight of the building or structure supplied, an additional disconnecting means shall not be required where ungrounded conductors serve or pass through the building or structure.

Add a new fine print note to read as follows:

<u>FPN: Section 225.36 provides additional requirements for the suitability of the disconnecting means.</u>

Substantiation: The recommendation for this fine print note is an attempt to identify the requirements of 225.36 for the building disconnecting means, which in this case will be located at the generator, to be "suitable for use as service equipment." Additionally, this FPN will help identify an often overlooked requirement, clarify that even though it is remote to the building, the disconnecting means must be suitable for use as service equipment and that the requirement in 225.36 is not amended by 700.12(B)(6).

Panel Meeting Action: Reject

Panel Statement: The disconnect required in 700.12(B)(6) is not intended to be a service disconnect.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Gustafson, R.

13-131a Log #CP1303 NEC-P13 **Final Action: Accept**

(700.12(D))

Submitter: Code-Making Panel 13,

Recommendation: In 700.12(D), first sentence, change "Where acceptable to the authority having jurisdiction", to "Where approved".

Substantiation: To comply with NEC Manual of Style. The definition of "approved" is defined in Article 100 as "acceptable to the authority having jurisdiction".

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Gustafson, R.

13-132 Log #430 NEC-P13 **Final Action: Reject**

(700.12(F) Exception No. 2 (New))

Submitter: Robert Sogla, Mayer Electric, Local 292 JATC

Recommendation: Add new text as follows:

<u>Exception No. 2: If appropriate lighting in an area is provided from an optional standby system, and all means of egress from that area, then the unit equipment shall be connected to the optional standby system circuit that is providing lighting in those areas. And it shall be provided with a lock-on feature.</u>

Substantiation: When the local utility goes out, many companies have provided power to keep their employees working. Should that source fail, they are without egress lighting if the batteries have since drained. If they were connected to the optional standby system, they would work upon "its" failure, giving them a way out.

Panel Meeting Action: Reject

Panel Statement: This can be an option for the building owner and should not be required.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Gustafson, R.

13-134 Log #3321 NEC-P13 **Final Action: Accept in Principle**
(700.23 (New))

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal so that the text is in accordance with the NEC Style Manual. This action will be considered by the Panel as a Public Comment.
Submitter: Steven R. Terry, ETC
Recommendation: Add a new section to read:
700.23 Dimmer Systems. A dimmer system containing more than one dimmer and Listed for use in emergency systems may be used as a control device for energizing emergency lighting circuits. Providing that all branch circuits fed from the dimmer system cabinet comply with the wiring methods of Article 700, it shall be permissible, upon failure of normal power, for the dimmer system to selectively energize only those branch circuits required to provide a required minimum required emergency illumination.
Substantiation: Dimmer systems Listed for emergency use under UL 924 and containing more than one dimmer are now common. These systems include a method to sense failure of normal power and selectively energize branch circuits fed from the dimmer cabinet using a reliable method, regardless of the setting of control switches or panels normally used to control the dimmer system. This is generically known as "Bypass Mode". Such systems are typically supplied by a feeder that is transferred from normal to emergency power by an upstream UL 1008 Transfer Switch.
These dimmer systems often contain a greater number of branch circuits than those required to maintain minimum emergency illumination levels.
The design and construction of modern dimming systems listed under UL 924 allows a reliable method of selectively energizing branch circuits upon loss of normal power. Clarification is needed to allow such dimming systems to energize only those circuits required for minimum emergency illumination levels, rather than all circuits in the dimmer cabinet.
Panel Meeting Action: Accept in Principle
Revised the submitter's proposed new section to read as follows:
700.23 Dimmer Systems. A dimmer system containing more than one dimmer and listed for use in emergency systems may be used as a control device for energizing emergency lighting circuits. Providing that all branch circuits fed from the dimmer system cabinet comply with the wiring methods of Article 700, it shall be permissible, upon failure of normal power, for the dimmer system to selectively energize only those branch circuits ~~required~~ necessary to provide the ~~a~~ ~~required~~ minimum required emergency illumination.
Panel Statement: The editorial revision clarifies the new text.

13-135 Log #3428 NEC-P13 **Final Action: Reject**
(700.25 and 700.27)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: I. 700.25 Add a fine print note as follows:
FPN: Fuses and circuit breakers for emergency circuit overcurrent protection, where coordinated to ensure selective clearing of fault currents, increase overall reliability of the system.
II. 700.27 Delete this section.
Substantiation: This proposal restores the status of selective coordination coverage in Article 700 to that which existed in the 2002 NEC. The 2005 NEC changes are tantamount to a mandate to use fused protection at all levels of emergency systems and legally required standby systems, including branch circuits. Any doubt as to the intention of this action was surely erased in the March/April issue of *IAEI News* . With the ink barely dry on the 2005 NEC, a major fuse manufacturer announces full distribution of a fusible branch circuit panelboard. When is the last time anyone ever heard of fusible branch-circuit panelboards for sale? The article goes on to explain that of course you could use circuit breakers, but only if the available fault current during the normal connection did not exceed the instantaneous pick-up values for the upstream protective devices. This is one more battle in the probably endless attempts by the branches of the overcurrent device manufacturing segment to manipulate the code making process to influence market share.
The simple fact is there will always be systems that can't be coordinated for both emergency and normal operation. Most engineers agree that coordination under "normal" power is likely more important than coordination under emergency conditions simply because of the amount of loading/circuits involved. One major NEC expert representing a leading circuit breaker manufacturer even noted in this regard that perhaps the only way this could be done with certainty would be with electronic trip CBs and zone selective interlocking (that is, where the upstream protective device response is restrained by the downstream device.) He was prophetic indeed. The September/October issue of *IAEI News* , in an article written by the same fuse manufacturer, in fact by the very submitter of the NEC proposal in 700.27, mentioned this approach as the way to make circuit breakers coordinate for elevators, which labor under a similarly ill advised ukase on selective coordination, also placed in the NEC with no history of loss experience.
There is a more interesting dimension to this problem, however. When you consider ground faults, even when the system is running on the generator it will frequently be impossible to coordinate the levels of protection. This is critical because ground faults are a far more likely source of failures than short circuits. Take a large, heavily loaded feeder, say, 1200A loaded to 1000A, with three 400A subfeeders and a 600A subfeeder originating at a distribution panel. If the 600A subfeeder sees a 800A ground fault, it will likely take out the 1200A main because the other loads that are making it heavily loaded will continue, and the ground fault will push it over the edge. All things being equal, a 600A circuit breaker loaded to 800A (+133%) during the ground fault event will take much longer to trip than a 1200A circuit breaker loaded to 1800A (+150%).
Remember that it is simply not possible to predict how much current will flow during a ground fault, although the worst case can be easily calculated. For many such coordination studies, the worst case for fault duty is the best case for coordination; the best case for fault duty is the worst case for coordination; and coordination for various fault conditions must therefore result in different protective devices under different fault scenarios on the same feeder. The same NEC expert referred to earlier noted that, for these reasons, there may be instances where the only way to coordinate a ground fault is to add ground fault protection, and he correctly noted the confounding fact that 700.26 tries to avoid this outcome.
Panel members should carefully review the substantiation and the comments in the voting on 2005 NEC Comment 13-88, where both NEMA and UL voted against the NEC change that this proposal unwinds. They did not do so lightly. UL lists both fuses and circuit breakers and has no axe to grind, and correctly pointed out that the new language "would most likely exclude the application of circuit breakers in emergency systems." Do we seriously want to continue this burden on the design community? Not one single instance of loss experience was cited to support the changes in Article 700.
Panel Meeting Action: Reject
Panel Statement: This proposal removes the selective coordination requirement from the mandatory text and places it in a nonmandatory FPN. The requirement for selective coordination for emergency system overcurrent devices should remain in the mandatory text. Selective coordination increases the reliability of the emergency system. The current wording of the NEC is adequate. The instantaneous portion of the time current curve is no less important than the long time portion. Selective coordination is achievable with the equipment available now.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 9 Negative: 4
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
ELKINS, D.: This proposal should be accepted in principle. Instead of the FPN proposed by the submitter, it is suggested 700.27 be reworded as follows: "Overcurrent protection system design. Emergency system(s) overcurrent devices shall be applied according to the safety requirements of the specific installation. Issues such as coordination with supply overcurrent devices, reliable availability of spares, varying levels of normal or standby ground-fault levels, and overcurrent device resetting capability should be evaluated to achieve the optimal safe design."
The language adopted in 2005 presupposes safety in all installations is better served by coordination than rapid recovery of power after an outage. The 2005 code language has the effect of requiring the use of fuses in many installations involving retrofits or expansions of existing installations. Fuses cannot be reset after the cause of an outage has been determined and cleared. A spare matching fuse must be available. The 2005 code language ignores services where rapid restoration of power may be more critical to safety than short outages. This requirement limits engineering solutions and goes counter to the stated intention of the code in 90.1(C) that it "is not a design specification."
NASBY, J.: See my explanation of negative vote on Proposal 13-137.
WHITTALL, H.: I wish to change my vote from Affirmative to Negative on Proposals 13-135 through 13-147 and 13-159 through 13-167. These items all deal with selective coordination. I agree with those who feel the wording in the NEC should agree with that in NFPA 110. Selective coordination is something that is nice to have and a design consideration, but should not be a requirement in the NEC. Therefore, Proposals 13-135 and 13-159 should have been Accepted and the others listed would have gone along with them.

ZGONENA, T.: Selective coordination is a design issue, and not a code issue. There is a question of the enforceability of selective coordination. In many cases, selective coordination may exclude the application of circuit breakers in emergency systems.

13-136 Log #3501 NEC-P13 **Final Action: Reject**
(700.26)

Submitter: Jim Pauley, Square D Company
Recommendation: Revise 700.26 as shown:
700.26 Ground Fault Protection of Equipment.
(A) Not Required. ~~The~~ Alternate source s of supply f or emergency systems not covered by (B) shall not be required to have ground-fault protection of equipment with automatic disconnecting means. ~~Ground-fault~~ Indication ~~of the emergency source~~ of a ground-fault shall be provided in accordance ~~per~~ with 700.7(D).
(B) Large Systems. Where the alternate source of supply is 1500kVA or larger and is a solidly grounded wye system with more than 150V to ground, but not exceeding 600 volts phase-to-phase, ground-fault protection of equipment shall be provided in accordance with 230.95 or 215.10 for each disconnect rated 1000 amperes or more.
Substantiation: This proposal has two objectives:
1) Editorially revise the existing 700.26 requirements to make it clear that any alternate source of supply (other than those for large systems as discussed below) is not required to have GFPE with automatic disconnect.
2) The technical change in this proposal is the addition of item (B). This new provision would require GFPE to be installed on large alternate source systems. It is realized that this is different from the conventional wisdom of the past, but the panel likely recognizes that the alternate system of yesterday are not the same of today. There are very large systems being installed for alternate standby. We have recently seen systems that range from 2MW to 8MW in size. These systems not only supply emergency power, but they may also operate in parallel with the utility to provide cogeneration.

Previous thinking was that alternate systems should be exempt from GFPE because the generators would not supply enough current to be of concern relative to equipment burn-down. The view was that it created a more reliable system by deciding to withstand some level of damage of the ground-fault and provide some alarm. With the larger systems, not having GFPE not only creates a significant safety hazard, it also decreases the reliability of the system by using multiple levels of coordinated ground-fault protection.

Large standby generators being employed today typically have zero sequence reactance that is less than that of an equivalent power class transformer. For a minimum of two cycles, the generator will provide more short circuit current than an equivalent transformer. As such, the initial available fault current flow from a phase-to-ground fault can be significant. These two cycles of increased fault can have enough energy to initiate the damage sequence in the faulted equipment. Although the current levels will decrease, the damage escalates because the generator continues to supply significant amounts of current.

At the same time, the generators stator and winding will be subjected to significant thermal stresses and mechanical forces. These can partially damage or permanently damage the generators causing them to shutdown and alternate power is lost completely. Alarm indication of ground-fault is insignificant because there is generally nobody to react to the alarm and even if there is, the damage has already occurred.

The wording of the proposal is to apply the requirements for GFPE from 230.95 and/or 215.10 to an alternate source of supply that is 1500kVA or larger. These systems can deliver current levels that are of a magnitude where equipment damage can continue after the initial fault. GFPE would be applied on disconnecting means rated 1000A or greater on systems 150V to ground or greater. References to 215.10 and 230.95 would pick up the settings and testing requirements as already outlined in those sections.

In summary, it is critical to both safety and reliability of the systems that GFPE be required on these larger systems. Although the previous rule made sense with smaller alternate source systems, it no longer makes technical sense with the increase in the size of these systems.
Panel Meeting Action: Reject
Panel Statement: The submitter has not offered adequate substantiation to require GFPE on emergency systems. The existing text requires indication only but not automatic disconnecting. Automatic disconnecting may be provided but it is not required.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 11 Negative: 2
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
SWAYNE, R.: This proposal has merit for Accept in Principle by its more than adequate substantiation. A ground fault on a 480Y/277 volt, whether Normal or Emergency power supplied, can result in destructive damage and initiate a fire on its own. I would modify the Proposal by relating it to disconnects rated 1000 amperes or more instead of 1500 KVA. In addition, since a generator would not be classified as "service", "Section 240.13" should replace the proposed reference to "Section 230.95".

WHITTALL, H.: I wish to change my vote from Affirmative to Negative on Proposals 13-135 through 13-147 and 13-159 through 13-167. These items all deal with selective coordination. I agree with those who feel the wording in the NEC should agree with that in NFPA 110. Selective coordination is something that is nice to have and a design consideration, but should not be a requirement in the NEC. Therefore, Proposals 13-135 and 13-159 should have been Accepted and the others listed would have gone along with them.

13-137 Log #1950 NEC-P13 **Final Action: Reject**
(700.27)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Delete 700.27.
~~700.27 Coordination.~~
~~Emergency system(s) overcurrent devices shall be selectivity coordinated with all supply side overcurrent protective devices.~~
Substantiation: Selective coordination is recognized as a prudent design consideration for emergency and legally required circuits to maximize the reliability of a power system, however it is not practical, necessary, or even desired to require the selectivity of all overcurrent devices in the system to achieve maximum reliability. This is recognized in NFPA 110. Electrical system designs and demands differ based on the size and occupancy needs. Ensuring the maximum reliabiliy of the electrical system must be determined by the engineering professional for each facility. Although selective coordination sounds like a reasonable requirement on the surface, it can and will drive system design parameters that may make the system less reliable. It will also place restrictions on the design unnecessarily with no added benefit as discussed in IEEE Standard 242. This proposal seeks to delete the requirement for selective coordination in order to ensure that maximum reliability can be designed into the electrical system.

Conflict between NFPA Documents

The International Building Code is adopted across the vast majority of the country. Chapter 27 in IBC specifically requires compliance to NFPA 110 for emergency systems.

The electrical industry has recognized that selective coordination is not always practical or even necessary. The NFPA 110 Technical Committee for Emergency and Standby Power Systems has recognized these limitations as found in paragraph 6.5.1 by requiring the selectivity to be optimized.

"6.5.1 General. The overcurrent protective devices in the EPSS shall be coordinated to optimize selective tripping of the circuit overcurrent protective devices when a short circuit occurs."

The NFPA 110 technical committee further explains why they use the term "optimize" in Annex A.

A.6.5.1 It is important that the various overcurrent devices be coordinated, as far as practicable, to isolate faulted circuits and to protect against cascading operation on short circuit faults. In many systems, however, full coordination is not practicable without using equipment that could be undesirable for other reasons or prohibitively costly. Primary consideration also should be given to prevent overloading of equipment by limiting the possibilities of large current inrushes due to instantaneous reestablishment of connections to heavy loads.

Do I optimize the selectivity or do I coordinate all supply side devices? The NEC and NFPA 110 do not coordinate on this specific topic and industry design documents such as IEEE Standard 242 would support the position of the NFPA 110 technical committee.

Simply not "Practicable"

The implementation of selective coordination is simply not practicable in many instances. The inrush currents for a transformer or the starting current of a motor may drive a large overcurrent device that is not practicable to coordinate with the line side device. IEEE standards also note that in order to obtain a selective coordinated system, the back-up power source which is generally a generator, will be driven closer to the load in the design. Once again, the selectivity requirement is driving a design requirement that may reduce the reliability of the system. NFPA 70B recently published statistics in the annex in support of a new section entitled Reliability-Centered Maintenance. The statistics demonstrate that a major system reliability issue is with the generator starting. Selectivity drives a large single generator rather than distributed smaller generators in the system, such design is directly in opposition of the NFPA 70B statistics when evaluating the entire system for reliability. One design consideration to resolve this reliability issue is to parallel smaller generators. Paralleling multiple generators ensures that I have a power source even if one of the generator sets does not start or is undergoing maintenance. If a generator does not start, the electrical system is not paralyzed due to no power source. Selective coordination is of no use if there is no power for the electrical distribution system to deliver. The requirement for selective coordination, as presently found in the NEC, prohibits solid design consideration that would enhance the reliability of the system.

Selectivity will not enhance performance of the system in specific instances

A review of IEEE documents such as the Buff book or IEEE Standard 242 recognizes that loss of selectivity between two overcurrent devices may have no impact on the system performance. Page 565 in IEEE Standard 242-1986 notes two examples: The first is the primary and secondary protection of a transformer. Requiring selective coordination of the secondary overcurrent is unnecessary where a single main exists on the secondary of the transformer. No reliability is gained by the present restriction in the NEC while placing a design and financial burden on the designer and owner. Another simple example is a load protective device and the next upstream device. Specifically, consider a feeder breaker or fused switch supplying a motor control center. NEC 430.94 requires protection of a motor control center bus by either an integral main or overcurrent device located ahead of the MCC. Based on the size of the motor loads, selectivity will drive the size of the MCC to be larger than necessary where large motors may have been designed into the system to enhance electrical maintenance safety practices. Once again, selective coordination of the feeder and the MCC main overcurrent devices provides no enhancement to the electrical system reliability, but impacts the electrical system design with no added benefit.

Selective coordination of overcurrent protection devices in the system must be addressed by the electrical system design engineer in order to ensure the most reliable electrical system. No data has been presented in the past NEC development cycles that supports selective coordination as a safety or reliability issue existing in the industry. Attempting to govern this performance parameter in the NEC is unnecessary and may reduce the reliability of critical electrical systems as recognized in other industry standards.

Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 13-135.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 9 Negative: 4
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:

ELKINS, D.: This proposal should have been accepted in principle as noted in my explanation of negative vote on Proposal 13-135.

NASBY, J.: The panel failed to address the substantive points of the proposal. A number of issues have been established that must be addressed:

1) There is a material conflict between NFPA 110 and the NEC that creates a dilemma for the system designer. This design conflict within two NFPA documents is not acceptable.

2) A conflict between the text of 700.27 and the definition of selective coordination in Article 100.

3) Numerous industry standards that point to selectivity impacting reliability negatively or without benefit.

4) Unnecessary selective coordination increases overcurrent device size and can unnecessarily increase the arc-flash hazard on the electrical system.

NFPA 110 is a long standing document which recognizes the importance of selective coordination by requiring selective coordination of overcurrent devices to be “optimized”. The International Building Code, adopted by many states, points to NFPA 110 for installing emergency system installations. The NFPA 110 technical committee recognizes selective coordination is prudent to enhance the performance of the electrical system, however, by adding the word “optimized” the committee permits the engineering community to provide the most reliable electrical system.

There is clearly a technical correlation issue between NFPA 110 and the NEC on selective coordination. Furthermore, the definition of selective coordination in article 100 of the NEC requires the “localization of an overcurrent condition to restrict outages to the circuit or equipment affected.” The proposal substantiates that the present rule goes well beyond the definition of localizing an overcurrent condition, by requiring “all” overcurrent devices to be selectively coordinated. No other industry document supports all overcurrent devices being selectively coordinated.

The wording in 700.27 must be revised to align with NFPA 110, the definition of selective coordination, and IEEE standards which recognize selective coordination as not being necessary for “all” overcurrent device as follows:

700.27 Coordination. Selective Coordination of overcurrent protective devices shall be optimized.

WHITTALL, H.: I wish to change my vote from Affirmative to Negative on Proposals 13-135 through 13-147 and 13-159 through 13-167. These items all deal with selective coordination. I agree with those who feel the wording in the NEC should agree with that in NFPA 110. Selective coordination is something that is nice to have and a design consideration, but should not be a requirement in the NEC. Therefore, Proposals 13-135 and 13-159 should have been Accepted and the others listed would have gone along with them.

ZGONENA, T.: See my comments on proposal 13-135.

13-138 Log #2168 NEC-P13 **Final Action: Reject**
(700.27)

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read as follows:

700.27 Coordination. Emergency system(s) overcurrent devices shall be selectively coordinated with all supply side overcurrent protective devices. <u>Series rated combinations as covered in 110.22 and 240.86 shall not be permitted where selective coordination of emergency system overcurrent protective devices is required.</u>

Substantiation: Based on the concept of series rated combinations of overcurrent devices and how they are required to operate, be tested and evaluated, it would seem to be rather difficult to comply with the requirements of this section.

Panel Meeting Action: Reject
Panel Statement: Selective coordination can be achieved with series rated combinations
Number Eligible to Vote: 14

13-141 Log #3302 NEC-P13 **Final Action: Reject**
(700.27)

Submitter: Darrel Miller, LSW Engineers Arizona, Inc.
Recommendation: Delete the following text:
~~700.27 Coordination. Emergency system(s) overcurrent devices shall be selectively coordinated with all supply side overcurrent protective devices.~~
Substantiation: The code paragraph statement "…shall be selectively coordinated with all supply side overcurrent protective devices." is where the problem lies. The inclusion of the word "all" takes issue with the use of circuit breakers (circuit breakers). The majority of the circuit breakers that are used throughout an emergency distribution system are of the molded case type. The main devices are most often the insulated case type.

To anyone performing a coordination study, it is evident the initial two-cycles of a molded case circuit breakers tripping band appears as a "foot" and, where adjustable, only for initial activation amperes.

Circuit breakers utilize a thermal-magnetic or electronic trip devices for operation. The thermal magnetic have limited or no adjustment. The instantaneous band adjustment is all that is offered, moving to a higher initiation level. Circuit breakers that utilize an electronic trip unit can have multiple bands of adjustment, instantaneous, short time pickup and delay, short time I2T in/ out, long time pickup and delay. These features make these breakers much more flexible for coordination, and naturally more expensive. All breaker types, molded or insulated case, and power circuit breakers utilize one of the above trip devices. In some cases, the instantaneous band can be eliminated (turned off) but only when the circuit breakers mechanical strength is great enough to withstand the initial short circuit magnetic forces imposed on it. Only power circuit breakers offer this feature. This is helpful in coordination of larger ampere rated breakers with those downstream. Coordination then becomes a function of trip band adjustments and mechanical strength to withstand short circuit forces.

Coordination occurs at each level (band) of the breaker operation. In reviewing the time current curves you will see that each circuit breaker has a max and a min operational value, an operational band. These values are determined from repeated testing of a particular breaker model, and its response to overcurrent conditions. The result establishes that particular breakers operational range throughout the entire response curve.

To obtain coordination at the initial two-cycle level is to have the ability to turn off the instantaneous trip function of the upstream circuit breaker and even at that, there will be problems coordinating devices of the same frame size. The instantaneous "off" feature is not available in a molded case circuit breaker. The next step up from the molded case circuit breaker is an insulated case design. These models do not generally offer an "instantaneous off" feature. Yet another step up is the power circuit breaker. These are the large units with high interrupting capacities and withstand ratings. A few of these models offer "instantaneous off" features. This type of breaker is not the style commonly used in distributions systems rated 3,000amps or less and almost never on systems rated 120/208volts.

The instantaneous "band of a molded case circuit breaker is less than two-cycles tall and becomes active at a point (fixed or adjustable). This band continues increasing in amps until it hits the maximum short circuit current rating of the breaker. See examples below and attached time current curves.

The instantaneous "band of a molded case circuit breaker is less than two-cycles tall and becomes active at a point (fixed or adjustable). This band continues increasing in amps until it hits the maximum short circuit current rating of the breaker. See examples below and attached time current curves.

Examples:

A. GE model 'THED', 20amp, 480vac:	225amps to 25,000amps
B. GE model 'SFHA', 225amp, 480vac:	550amps to 35,000amps
C. GE model 'SGHA', 400amp, 480vac:	1,000amps to 35,000amps
D. GE model 'SKHA', 800amp, 480vac:	2,000amps to 50,000amps
E. GE model 'SS', 1600amp, 480vac:	2,200amps to 150,000amps
F. GE model 'SS', 2500amp, 480vac:	3,500amps to 100,000amps
G. GE model 'AKR', 3000amp, 480vac:	None. Fault must be over 0.125s in duration.

The present requirement is restrictive in the application of circuit breakers. 100% coordination of circuit breakers can't be achieved. This code section will have to be more specific as to the end result in order to be applied.

Presently fuses are the only overcurrent protective devices that can achieve 100% coordination. Unfortunately, this presents a reduction in reliability. Fuse switches do not simultaneously open all phases in an overcurrent condition. A faulted fuse requires a physical change to restore the faulted condition. In a life safety application a quick reset is important.

This article is not yet ready to be applied. I suggest a phase-in as is being done with other restrictive requirements (unit switches on lighting fixtures) to allow manufactures to provide effective solutions.

Note: Supporting material is available for review at NFPA Headquarters.

13-142 Log #3494 NEC-P13 **Final Action: Reject**
(700.27)

Submitter: Alan Manche, Square D Co.
Recommendation: Delete NEC **700.27 Coordination.**
~~**700.27 Coordination.** Emergency system(s) overcurrent devices shall be selectively coordinated with all supply side overcurrent protective devices.~~
Substantiation: The application of selective coordination is often misunderstood in that it is perceived as being independent of all other electrical design parameters. The seemingly simple misperception is that you just have to pick the correct fuses or circuit breakers to ensure this particular requirement is met. What has not been considered, at least in the NEC, is the impact placed upon the design and reliability of the entire electrical system. My discussion with engineers and our company involvement with coordination studies indicates they do a comprehensive coordination evaluation of emergency systems and maximize the selectivity, unfortunately the requirement placed in the 2005 NEC for requiring full selectivity is driving system design parameters that can impact the reliability in a negative manner by possibly reducing that reliability. The requirement also places a requirement on the system that is unnecessary in various areas of the electrical system.

Other industry standards, such as NFPA 110 and IEEE Standard 242, recognize the need for this latitude in maximizing system reliability and permitting the engineer to selectively coordinate devices that support the isolation of the system as necessary. Electrical system designs and demands differ based on the size and occupancy needs. Ensuring the maximum reliability of the electrical system must be determined by the engineering professional for each facility.

A brief review of other technical committees guidance that have addressed this issue will support the need to delete this requirement. The NFPA 110 committee recognizes the limitations of selective coordination by requiring the selective coordination of the emergency system to be "optimized." They further provide an explanation in the annex of NFPA 110 regarding this subject:

A.6.5.1 It is important that the various overcurrent devices be coordinated, as far as
practicable, to isolate faulted circuits and to protect against cascading operation on short circuit faults. In many systems, however, full coordination is not practicable without using equipment that could be undesirable for other reasons or prohibitively costly. Primary consideration also should be given to prevent overloading of equipment by limiting the possibilities of large current inrushes due to instantaneous reestablishment of connections to heavy loads.

A review of IEEE Standard 242 also provides further explanation that selectivity of overcurrent devices may not provide any further enhancement to reliability, but this requirement in the NEC simply drives an unnecessary burden for these particular areas of the electrical system. An example is where primary and secondary protection is necessary for a transformer. Selectively coordinating the primary and secondary may or may not have any impact on isolating the fault.
The NEC places an unnecessary burden on the electrical system design without any benefit.

The only reason for requiring selective coordination in the NEC is to drive a performance parameter for enhanced reliability of power for the system. Based on this premise, that goal is not accomplished in many instances. Our company supports the design and installation of many critical electrical infrastructures and this requirement can drive a compromise in electrical reliability. The easiest system to recognize this issue is when an alternate power source is utilized. The system design must take into consideration of whether to have a generator located near the point of use or decide that a more reliable power source is paralleling a number of generators in the event one of the independent generators do not start. NFPA 70B does recognize that the reliability of the generator starting is an issue, likely based on poor maintenance practices, but that is the reality of our electrical infrastructure. If the power source does not exist then having a selectivity coordinated system serves no purpose. Selective coordination will drive large single generators and in effect prohibit the paralleling of small generators to establish a more reliable power source. Once again, an example that selective coordination is not independent from the rest of the electrical system design.

The present NEC requirement for selective coordination prohibits solid design considerations that would enhance the reliability of the system. I urge the committee to accept this proposal and delete the requirement for selective coordination on emergency systems. Deleting this requirement will permit the electrical system design engineer to maximize the reliability of the system and remove a restriction placed on the designer that may reduce the reliability of the system.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 13-135.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 9 Negative: 4

Ballot Not Returned: 1 Gustafson, R.

Explanation of Negative:

ELKINS, D.: This proposal should have been accepted in principle as noted in my explanation of negative vote on Proposal 13-135.

NASBY, J.: See my explanation of negative vote on Proposal 13-137.

WHITTALL, H.: I wish to change my vote from Affirmative to Negative on Proposals 13-135 through 13-147 and 13-159 through 13-167. These items all deal with selective coordination. I agree with those who feel the wording in the NEC should agree with that in NFPA 110. Selective coordination is something that is nice to have and a design consideration, but should not be a requirement in the NEC. Therefore, Proposals 13-135 and 13-159 should have been Accepted and the others listed would have gone along with them.

ZGONENA, T.: See my comments on proposal 13-135.

13-143 Log #3525 NEC-P13 **Final Action: Reject**
(700.27)

Submitter: Darrel Miller, LSW Engineers Arizona, Inc.

Recommendation: Add:

Coordination shall be defined as three-cycle minimum separation between tripping bands and shall not apply during the first 3 cycles.

Substantiation: The code paragraph statement "...shall be selectively coordinated with all supply side overcurrent protective devices." is where the problem lies. The inclusion of the word "all" takes issue with the use of circuit breakers (circuit breakers). The majority of the circuit breakers that are used throughout an emergency distribution system are of the molded case type. The main devices and most often the insulated case type.

To anyone performing a coordination study, it is evident the initial three-cycles of a molded case circuit breakers tripping band appears as a "foot" and, where adjustable, only for initial activation amperes.

Circuit breakers utilize a thermal-magnetic or electronic trip devices for operation. The thermal magnetic have limited or no adjustment. The instantaneous band adjustment is all that is offered, moving to a higher initiation level. Circuit breakers that utilize an electronic trip unit can have multiple bands of adjustment, instantaneous, short time pickup and delay, sort time I2T in/out, long time pickup and delay. These features make these breakers much more flexible for coordination, and naturally more expensive. All breaker types, molded or insulated case, and power circuit breaker utilize one of the above trip devices. In some cases, the instantaneous band can be eliminated (turned off) but only when the circuit breakers mechanical strength is great enough to withstand the initial short circuit magnetic forces imposed on it. Only power circuit breakers offer this feature. This is helpful in coordination of larger ampere rated breakers with those downstream. Coordination then becomes function of trip band adjustments and mechanical strength to withstand short circuit forces.

Coordination occurs at each level (band) of the breaker operation. In reviewing the time current curves you will see that each circuit breaker has a max and a min operational value, an operational band. These values are determined from repeated testing of a particular breaker model, and its response to overcurrent conditions. The results establish that particular breakers operational range throughout the entire response curve.

To obtain coordination at the initial three-cycle level is to have the ability to turn off the instantaneous trip function of the upstream circuit breaker and even at that, there will be problems coordinating devices of the same frame size. The instantaneous "off" feature is not available in a molded case circuit breaker. The next step up from the molded case circuit breaker is an insulated case design. These models do not generally offer an "instantaneous off" feature. Yet another step up is the power circuit breaker. These are the large units with high interrupting capacities and withstand ratings. A few of these models offer "instantaneous off" features. This type of breaker is not the style commonly used in distributions systems rated 3,000 amps or less and almost never on systems rated 120/208 volts.

The instantaneous band of a molded circuit breaker is less than three-cycles tall and becomes active at a point (fixed or adjustable). This band continues increasing in amps until it hits the maximum short circuit current rating of the breaker. See examples below and time current curves.

Examples:

A. GE model "THED", 20 amp, 480vac: 225 amps to 25,000 amps
B. GE model "SFHA", 225 amp, 480vac: 550 amps to 35,000 amps
C. GE model "SGHA", 400 amp, 480vac: 1,000 amps to 35,000 amps
D. GE model "SKHA", 800 amp, 480vac 2,000 amps to 50,000 amps
E. GE model "SS", 1600 amp, 480vac: 2,200 amps to 150,000 amps
F. GE model "SS", 2500 amp, 480vac: 3,500 amps to 100,000 amps
G. GE model "AKR", 3000 amp, 480vac: None. Fault must be over 0.125s in duration

The present requirement is restrictive in the application of circuit breakers. 100% coordination of circuit breakers can't be achieved. This code section will have to be more specific as to the end result in order to be applied.

Presently, fuses are the only overcurrent protective devices that can achieve 100% coordination. Unfortunately, this presents a reduction in reliability. Fuse switches do not simultaneously open all phases in an overcurrent condition. A faulted fuse requires a physical change to restore the faulted condition. In a life safety application, a quick reset is important. Using fuses at all levels throughout the distribution system is impractical. I5 could be equated to a return to an archaic design. Certainly you can recollect your father fumbling around in the dark to replace the screw in "Buss" fuse at the power panel of your home in the 1960's. This is what we would be retuning to at the branch circuit level if fuses are required to coordinate down to that level.

This article is not yet ready to be applied. I suggest modifying the text to further define the term coordination or using a "phase-in" approach as is being done with other restrictive requirements (unit switches on lighting fixtures) thus allowing manufactures to provide effective solutions that work.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 13-135.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 11 Negative: 2

Ballot Not Returned: 1 Gustafson, R.

Explanation of Negative:

WHITTALL, H.: I wish to change my vote from Affirmative to Negative on Proposals 13-135 through 13-147 and 13-159 through 13-167. These items all deal with selective coordination. I agree with those who feel the wording in the NEC should agree with that in NFPA 110. Selective coordination is something that is nice to have and a design consideration, but should not be a requirement in the NEC. Therefore, Proposals 13-135 and 13-159 should have been Accepted and the others listed would have gone along with them.

ZGONENA, T.: See my comments on proposal 13-135.

13-144 Log #3624 NEC-P13 **Final Action: Reject**
(700.27)

Submitter: Jon Ross, Smith Seckman Reid, Inc.

Recommendation: Emergency system(s) overcurrent protective devices shall be coordinated to optimize selective tripping of the circuit overcurrent protective devices and minimize the extent of interruption to the electrical system due to abnormal current caused by overload and/or short circuits.

Substantiation: The current wording of 701.18 implies complete and absolute coordination of devices. To achieve this, many upstream overcurrent devices will have to be selected to permit higher let-thru energy which will compromise efforts in certain situations to limit the arc-flash potential and equipment damage. In addition it will limit the use of several circuit breaker products currently in use on the market today. This will reduce the ability to achieve the recommendation in NFPA 99.4.4.1.1.2(2) "achieving the fastest possible restoration of any given circuit(s) after clearing a fault". The proposed wording would also bring the requirement for coordination in NFPA 70, 110 & 99 into agreement.

Panel Meeting Action: Reject

Panel Statement: Selective coordination is currently required, and the panel disagrees with the word "optimized".

Number Eligible to Vote: 14

Ballot Results: Affirmative: 10 Negative: 3

Ballot Not Returned: 1 Gustafson, R.

Explanation of Negative:

NASBY, J.: See my explanation of negative vote on Proposal 13-137.

WHITTALL, H.: I wish to change my vote from Affirmative to Negative on Proposals 13-135 through 13-147 and 13-159 through 13-167. These items all deal with selective coordination. I agree with those who feel the wording in the NEC should agree with that in NFPA 110. Selective coordination is something that is nice to have and a design consideration, but should not be a requirement in the NEC. Therefore, Proposals 13-135 and 13-159 should have been Accepted and the others listed would have gone along with them.

ZGONENA, T.: See my comments on proposal 13-135.

13-145 Log #3667 NEC-P13 **Final Action: Reject**
(700.27)

Submitter: Douglas Humme, CHPA Consulting Engineers

Recommendation: Replace all text of the paragraph 700.27 after the title Coordination with the following:

The overcurrent protective devices in the emergency system shall be coordinated to optimize selective tripping of the circuit overcurrent protective devices when a short circuit occurs.

Substantiation: NFPA 110-2002 is cited in Fine Print Note 5 of Rule 700.1 in the NEC. The 2005 NEC Rule 700.27 conflicts with NFPA 110. My proposal uses the language of NFPA 110 Rule 6.5.1 to harmonize the NEC with NFPA 110.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 13-144.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 9 Negative: 4

Ballot Not Returned: 1 Gustafson, R.

Explanation of Negative:

ELKINS, D.: This proposal should have been accepted in principle as noted in my explanation of negative vote on Proposal 13-135.

NASBY, J.: See my explanation of negative vote on Proposal 13-137.

WHITTALL, H.: I wish to change my vote from Affirmative to Negative on Proposals 13-135 through 13-147 and 13-159 through 13-167. These items all deal with selective coordination. I agree with those who feel the wording in the NEC should agree with that in NFPA 110. Selective coordination is something that is nice to have and a design consideration, but should not be a requirement in the NEC. ZGONENA, T.: See my comments on proposal 13-135.

13-146 Log #2560 NEC-P13 **Final Action: Reject**
(700.27, FPN (New))

Submitter: Greg Batie, Sparling / Rep. Electric League of the Pacific Northwest-Code Committee
Recommendation: Add a FPN as follows:

FPN: This requirement can be accomplished by choice of overcurrent protective devices and their ratings or settings at 0.1 seconds and longer.
Substantiation: The requirement for selective coordination in new articles 700.27 and 701.18 will result in more reliable emergency systems but selective coordination is not always possible for all fault current levels when protection is provided by molded case circuit breakers. As seen in the examples provided of typical circuit breaker curves, there is typically some overlap between curves in the instantaneous region below 0.1 seconds.

As documented in the provided references, the majority of faults are not bolted three phase faults. The typical fault involves a lower level line-to-ground fault. This
line -to-ground fault can escalate to a three phase arcing fault, however, this arcing fault is lower than the three phase bolted fault. Therefore, the lower level fault is often low enough to allow selective coordination in the instantaneous region between the upstream and downstream breakers. Therefore, selective coordination in the instantaneous region should not be of a concern. Establishing 0.1 seconds and longer as the level for evaluating selective coordination will ignore the overlap of the instantaneous region. This represents the real world. The addition of this FPN will also eliminate confusion about these new articles prohibiting the use of standard molded case circuit breakers for Emergency and Legally Required Standby Systems. The addition of this FPN will also eliminate confusion on how to apply this requirements to existing installations without having to replace existing switchboards and breakers that are not presently fully coordinated. Note that the Florida Agency for Healthcare Administration (ACHA) has settled at the 0.1 second coordination requiremetrns since about 2002.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The instantaneous portion of the time current curve is no less important than the long time portion.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 11 Negative: 2
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:

WHITTALL, H.: I wish to change my vote from Affirmative to Negative on Proposals 13-135 through 13-147 and 13-159 through 13-167. These items all deal with selective coordination. I agree with those who feel the wording in the NEC should agree with that in NFPA 110. Selective coordination is something that is nice to have and a design consideration, but should not be a requirement in the NEC. ZGONENA, T.: See my comments on proposal 13-135.

13-147 Log #3668 NEC-P13 **Final Action: Reject**
(700.27 Exception (New))

Submitter: Dorothy Kellogg, American Chemistry Council
Recommendation: Add an exception to read as follows:

Exception: the use of molded case circuit breakers which coordinate in the non-instantaneous trip range shall be permitted where restoration of power is as important or more important than the risk of loss of power due to miscoordination.
Substantiation: Problem: The emergency system overcurrent device coordination requirement added during the last code cycle will force the use of fuses in installations where manufacturer tested coordinating circuit breakers are not available or are no longer available to match upstream/downstream devices due to obsolescence. Application of fuses may lower the needed availability of emergency power in installation where rapid restoration of power is as important or more important than a brief outage.

Substantiation: The ability to retrofit manufacture tested coordinating circuit breakers will often not be possible when modifying existing systems forcing the use of fuses which may not be available when needed to restore emergency power. The code change made requiring coordination without regard to other risks may force installations which increase the risk of more extended outages which may have higher consequence than shorter outages, or may result in unsafe practices such as using incorrectly sized available fuses in place of the needed fuse to quickly restore power to emergency systems when the correct fuse is not available. The user should be able to use engineering judgment to decide whether coordination or rapid restoration of power is more critical in a specific installation. This change to the code has the effect of eliminating the use of normal molded case circuit breakers in these systems.
Panel Meeting Action: Reject
Panel Statement: Selective coordination increases the reliability of the emergency system. When quick restoration of power is important, it is the responsibility of the system designer to meet the Code.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 10 Negative: 3
Ballot Not Returned: 1 Gustafson, R.

ARTICLE 701 — LEGALLY REQUIRED STANDBY SYSTEMS

13-148 Log #1451 NEC-P13 **Final Action: Reject**
(701.2, FPN)

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise as follows:

701.2 Definition.

Legally Required Standby Systems. Those systems required and so classed as legally required standby by municipal, state, federal, or other codes or by any governmental agency having jurisdiction. These systems are intended to automatically supply power to selected loads (other than those classed as emergency systems) in the event of failure of the normal source

~~FPN: Legally required standby systems are typically installed to serve loads, such as heating and refrigeration systems, communications systems, ventilation and smoke removal systems, sewage disposal, lighting systems, and industrial processes, that when stopped during any interruption of the normal electrical supply could create hazards of hamper rescue or fire fighting operations.~~
Substantiation: This proposal is being made in an effort to correlate my proposal to edit FPN No. 3 in 700.1.
Panel Meeting Action: Reject
Panel Statement: The existing FPN helps the reader understand the loads typically connected to legally required systems.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-149 Log #687 NEC-P13 **Final Action: Reject**
(701.5(B))

Submitter: James Filippone, Port Authority of NY & NJ
Recommendation: Revise 701.5(B) to read:

Systems shall be tested periodically on a schedule and in a manner acceptable to the authority having jurisdiction to ensure the systems are maintained in operating condition. <u>Systems shall be tested by the building owner at least every five years under maximum load conditions to verify that they still have sufficient capacity and rating.</u>

<u>FPN: Passenger electric elevators and freight electric elevators permitted to carry passengers must be tested in the down direction with 125 percent of their rated load inside the car and freight elevators must be tested with rated load inside the car. See ASME A17.1 Safety Code for Elevators and Escalators for information on which elevators must be capable of operating in the down direction with 125 percent of rated load.</u>
Substantiation: Requiring testing on a 5-year basis under maximum load conditions is reasonable to ensure that these critical systems shall have sufficient capacity and rating and are available to emergency responders. Over time the loads that the system must supply can change significantly. Experience indicates that systems that were once sufficient are no longer sufficient due to added loads. The system is tested under maximum capacity upon installation and the means to test it periodically must be provided. However, testing periodically under maximum load conditions is not specifically required. Information on the required load for elevators is provided for testing purposes.
Panel Meeting Action: Reject
Panel Statement: Testing frequency is not the responsibility of an installation code. Section 701.5 defers this responsibility to the authority having jurisdiction (AHJ).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-150 Log #2368 NEC-P13 **Final Action: Accept in Principle**
(701.7(C)(1) (New))

Submitter: Lawrence A. Bey, Cummins Power Generation
Recommendation: Add a new 701.7(C)(1) as follows:
(1) Automatic transfer switches, rated 600 VAC and below, shall be listed for legally required standby system use.
Substantiation: A problem can exist under normal operation of the transfer switch where the two power sources are both energized and out-of-phase relative to each other, as is often the case with one utility source and an on-site generator set(s). Typically, both power sources are energized during exercise and test of the generator. When the two power sources are not synchronized, as much as twice rated voltage may be seen across the transfer switch contacts. At twice rated voltage, sustained arcing across the contact air gap may cause a source-to-source short circuit during transfer operation. This potential problem exists unless the transfer switch equipment has been designed and tested to be suitable for switching between out-of-phase sources (three phase systems displaced by 120 electrical degrees and single phase systems displaced by 180 degrees), or has otherwise been examined and determined to be suitable for switching between out-of-phase power sources.

Unless listed, a problem of uncoordinated overcurrent protection may exist should the transfer switch close into a short circuit. The short circuit fault that cleared the upstream overcurrent device may still be present when the transfer switch operates and closes on the alternate source. A listed transfer switch has been tested to 1) safely withstand a short circuit with contacts closed until the upstream overcurrent clears; and 2) close into short circuit with contacts open. Closing into a short circuit is typically a more severe test than withstand due to arcing and out gassing of contact material as the contacts move together. Transfer switch equipment that has not been tested for closing into a fault may not be adequately protected by the alternate source upstream overcurrent device. Generally this is transfer switch performance that must be established by high current laboratory testing on a complete as-built assembly. The recognized national standard for testing Automatic Transfer Switch Equipment is ANSI/UL 1008.

This proposed requirement as placed under 701.7(C) would specifically apply only to automatic transfer switches. The intent is to not rule out other types of transfer system transfer equipment identified for standby system use and acceptable to the AHJ under 701.7(A). The proposed requirement would not apply to systems rated above 600 volts, but would apply 600 volts and below where UL Safety Standard 1008 provides ANSI testing specifications.
Panel Meeting Action: Accept in Principle
Revise proposal to add text to existing 701.7(C) as follows:
Automatic transfer switches, rated 600 VAC and below, shall be listed for legally required standby system use.
Panel Statement: The panel's revision is editorial in nature.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-151 Log #582 NEC-P13 **Final Action: Reject**
(701.11)

Submitter: Richard Pokorny, City of Marshfield, WI / Rep. Wisconsin Chapterof IAEI
Recommendation: Add text to read as follows:
The enclosure of the alternate source of power located outdoors for legally required standby systems shall be located at least 10 ft from a combustible wall and at least 20 ft from an outdoor electrical transformer or normal power distribution equipment. These dimensions may be reduced by one-half where a noncombustible barrier is installed that extends at least 3 ft beyond each side of the transformer. The height of the barrier shall be at least one foot above the top of the transformer or alternate power source, whichever is higher.
Substantiation: This is a proposal to add wording to the NEC dealing with distance between alternate sources of legally required standby power and outdoor transformers or distribution equipment. At the present time, there is not any guidance as to an enforceable distance between these units needed to keep portions of building premises wiring systems operational. Under a scenario where either one of these items are having a problem, components of legally required standby systems needs to be operational. There appears to be a need to keep a safe distance away so that one disaster does not take out the other unit. With real estate prices being so high, areas utilized for transforms and alternate power systems are shrinking to the point that designers are placing these items as close as possible. In many cases, installers are barely meeting safe working clearances required by Article 110 much less looking at how fragile this spacing “safety net” is. A legally required standby source of power should not be compromised because a portion of a building, an electrical distribution system or a transformer is burning or has another severe problem.

700.11 is vague as it merely states that the: “Consideration should be given to the location or design, or both, of all equipment to minimize the hazards that might cause failure...”. This does not give the AHJ any dimensions to enforce this section of a critical code article.

A good starting point for looking at existing rules would bring ten feet (10 ft or 3.05 meters) to the forefront, as a number of large transformer installation codes require this distance from a combustible building. A fire in the building, exterior distribution equipment or a transformer fire would be less likely to affect a generator or other alternate power source. With this in mind, a legally required standby source of power should also be located at least 3.05 m (10 ft) from a combustible wall. At this point the logic would be that two components, such as a generator and transformer shall have a 3.05 m (10 ft) safety zone from each other, that does not overlap the other component's zone. Therefore, 6.1 m (20 ft) would be the acceptable distance between the two units. If one is on fire, there would still be a 3.05 m (10 ft) safe zone beyond the conflagration at the other unit that would permit personnel to work on problems with the particular unit that is needed at that time. As designers still want to minimize any spacing requirement, this dimension should be able to be reduced if the design of the area includes a noncombustible assembly. The dimensions and composition of this barrier listed in the proposal are the same as the ones stated in the State of Wisconsin's Public Service Commission - PSC 114 and have proved to be an acceptable standard for transformer placement for many years. I have provided copies of the applicable portion of this document. PSC 114.317 C 2. states this distance requirement from combustible walls. PSC 114.317 D 2. indicates the dimensions for a noncombustible barrier that will allow a reduction to this dimension for cramped building sites.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 13-127.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-152 Log #3080 NEC-P13 **Final Action: Reject**
(701.11)

Submitter: Joseph A. Hertel, Safety and Buildings
Recommendation: In addition to the requirements in 701.11 (intro):
The enclosure of the alternate source of power located outdoors for emergency systems shall be located at least 10 ft from a combustible wall and at least 20 ft from an outdoor electrical transformer or normal power distribution equipment. These dimensions may be reduced by one-half where a noncombustible barrier is installed that extends at least 3 ft beyond each side of the transformer The height of the barrier shall be at least one ft above the top of the transformer or alternate power source, whichever is higher.
Substantiation: NFPA 110 provides specific requirements where a generator used for emergency standby power is located indoors. If it is located outdoors, there is a very general statement in 701.11 to consider the hazards involved. Is there hazard if the emergency generator is located immediately adjacent to the service gear or the utility transformer? This language would provide some degree of reliability to the installation in the event of a catastrophic failure of the normal power supply.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on proposal 13-127.

13-154 Log #548 NEC-P13 **Final Action: Reject**
(701.11(B)(5), FPN (New))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Add a new FPN as follows:
(5) Outdoor Generator Sets. Where an outdoor housed generator set is equipped with a readily accessible disconnecting means located within sight of the building or structure supplied, an additional disconnecting means shall not be required where ungrounded conductors serve or pass through the building or structure.
<u>FPN: 250.32(D) provides grounding and bonding requirements for building or structure disconnecting means that are remote from the building or structure.</u>

Substantiation: This proposal is an effort to provide some correlation between the rules in 250.32(D) which provides requirements for grounding and bonding where the building or structure disconnecting means is mounted remote from the building or structure as it would be if it were located on the generator assembly in accordance with this section. A companion proposal is being submitted to 250.32(D) to correlate with the provisions of 701.11(B)(5).
Panel Meeting Action: Reject

13-155 Log #1284 NEC-P13 **Final Action: Reject**
(701.11(B)(5), FPN (New))

Submitter: Mark R. Hilbert, State of New Hampshire
Recommendation: Revise text to read:
(5) Outdoor Generator Sets. Where an outdoor housed generator set is equipped with a readily accessible disconnecting means located within sight of the building or structure supplied, an additional disconnecting means shall not be required where ungrounded conductors serve or pass through the building or structure.
Add a new fine print note to read as follows:
<u>FPN: Section 225.36 provides additional requirements for the suitability of the disconnecting means.</u>
Substantiation: The recommendation for this fine print note is an attempt to identify the requirements of 225.36 for the building disconnecting means, which in this case will be located at the generator, to be “suitable for use as service equipment.” Additionally, this FPN will help identify an often overlooked requirement, clarify that even though it is remote to the building, the disconnecting means must be suitable for use as service equipment and that the requirement in 225.36 is not amended by 701.11(B)(5).
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 13-131.

Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-156 Log #892 NEC-P13 **Final Action: Accept in Principle**
(701.11(D))

Submitter: Noel Williams, Noel Williams Consulting
Recommendation: Revise 701.11(D) as follows:
“Where acceptable to the authority having jurisdiction as a <u>legally required standby</u> source of power, an additional service shall be permitted.” (Remainder unchanged).
Substantiation: This entire section should more closely match the organization of 700.12(D), but at a minimum, it should reinforce the requirement in 701.11 for a second source and state clearly that the second source must be suitable as a standby source similar to the way this rule applies in 700.12.
Panel Meeting Action: Accept in Principle
Revise proposed revision to read as follows:
Separate Service. Where approved, a separate service shall be permitted as a legally required source of standby power. This service…….
Panel Statement: The proposal has been reworded for readability and for compliance with the NEC Manual of Style. The word “approved” is defined as “acceptable to the authority having jurisdiction” in Article 100.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-157 Log #1162 NEC-P13 **Final Action: Reject**
(701.11(E))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Change “normal” to “all other systems” in the last sentence.
Substantiation: There is no definition for normal service. Optional standby systems provided by a generator may be the “normal” source of power. 695.4(B)(2)(4) requires fire pump disconnect means to be remote from other service disconnect means including other fire pump systems; 700.12(D) requires service conductors (in service disconnects) to be remote from other service conductors. Subsection (D) requires separation from any other service (which includes disconnect means).
Panel Meeting Action: Reject
Panel Statement: Changing the word “normal” to “all other systems” would add confusion. It is understood what the normal main disconnect is.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-158 Log #3502 NEC-P13 **Final Action: Reject**
(701.17)

Submitter: Jim Pauley, Square D Company
Recommendation: Revise 701.17 as shown:
701.17 Ground Fault Protection of Equipment.
<u>(A) Not Required.</u> ~~The~~ Alternate source <u>s of supply</u> for legally required standby systems <u>not covered by (B)</u> shall not be required to have ground-fault protection of equipment.
<u>(B) Large Systems.</u> <u>Where the alternate source of supply is 1500kVA or larger and is a solidly grounded wye system with more than 150V to ground, but not exceeding 600 volts phase-to-phase, ground-fault protection of equipment shall be provided in accordance with 230.95 or 215.10 for each disconnect rated 1000 amperes or more.</u>
Substantiation: This is a companion proposal to 700.26 to revise the requirements for GFPE. There are two objectives with this proposal:
1) Editorially revise the existing 701.17 to create an (A) and (B) sections. The language of item (A) is revised from the current rule to recognize that the may be multiple sources of supply and to reference the new proposed (B).
2) The technical change in this proposal is the addition of item (B). This new provision would require GFPE to be installed on large alternate source systems. It is realized that this is different from the conventional wisdom of the past, but the panel likely recognizes that the alternate system of yesterday are not the same of today. There are very large systems being installed for alternate standby. We have recently seen systems that range from 2MW to 8MW in size. These systems not only supply legally required power, but they may also operate in parallel with the utility to provide cogeneration.
Previous thinking was that alternate systems should be exempt from GFPE because the generators would not supply enough current to be of concern relative to equipment burn-down. The view was that it created a more reliable system by deciding to withstand some level of damage of the ground-fault and provide some alarm. With the larger systems, not having GFPE not only creates a significant safety hazard, it also decreases the reliability of the system by using multiple levels of coordinated ground-fault protection.
Large standby generators being employed today typically have zero sequence reactance that is less than that of an equivalent power class transformer. For a minimum of two cycles, the generator will provide more short circuit current than an equivalent transformer. As such, the initial available fault current flow from a phase-to-ground fault can be significant. These two cycles of increased fault can have enough energy to initiate the damage sequence in the faulted equipment. Although the current levels will decrease, the damage escalates because the generator continues to supply significant amounts of current.
At the same time, the generators stator and winding will be subjected to significant thermal stresses and mechanical forces. These can partially damage or permanently damage the generators causing them to shutdown and alternate power is lost completely.
The wording of the proposal is to apply the requirements for GFPE from 230.95 and/or 215.10 to an alternate source of supply that is 1500kVA or larger. These systems can deliver current levels that are of a magnitude where equipment damage can continue after the initial fault. GFPE would be applied on disconnecting means rated 1000A or greater on systems 150V to ground or greater. References to 215.10 and 230.95 would pick up the settings and testing requirements as already outlined in those sections.
In summary, it is critical to both safety and reliability of the systems that GFPE be required on these larger systems. Although the previous rule made sense with smaller alternate source systems, it no longer makes technical sense with the increase in the size of these systems.

13-159 Log #1946 NEC-P13 **Final Action: Reject**
(701.18)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Delete 701.18
~~701.18 Coordination~~
~~Legally required standby system(s) overcurrent devices shall be selectively coordinated with all supply side overcurrent protective devices.~~
Substantiation: Selective coordination is recognized as a prudent design consideration for emergency and legally required circuits to maximize the reliability of a power system, however it is not practical, necessary, or even desired to require the selectivity of all overcurrent devices in the system to achieve maximum reliability. This is recognized in NFPA 110. Electrical system designs and demands differ based on the size and occupancy needs. Ensuring the maximum reliabiliy of the electrical system must be determined by the engineering professional for each facility. Although selective coordination sounds like a reasonable requirement on the surface, it can and

will drive system design parameters that may make the system less reliable. It will also place restrictions on the design unnecessarily with no added benefit as discussed in IEEE Standard 242. This proposal seeks to delete the requirement for selective coordination in order to ensure that maximum reliability can be designed into the electrical system.

Conflict between NFPA Documents

The International Building Code is adopted across the vast majority of the country. Chapter 27 in IBC specifically requires compliance to NFPA 110 for emergency systems.

The electrical industry has recognized that selective coordination is not always practical or even necessary. The NFPA 110 Technical Committee for Emergency and Standby Power Systems has recognized these limitations as found in paragraph 6.5.1 by requiring the selectivity to be optimized.

"6.5.1 General. The overcurrent protective devices in the EPSS shall be coordinated to optimize selective tripping of the circuit overcurrent protective devices when a short circuit occurs."

The NFPA 110 technical committee further explains why they use the term "optimize" in Annex A.

A.6.5.1 It is important that the various overcurrent devices be coordinated, as far as practicable, to isolate faulted circuits and to protect against cascading operation on short circuit faults. In many systems, however, full coordination is not practicable without using equipment that could be undesirable for other reasons or prohibitively costly. Primary consideration also should be given to prevent overloading of equipment by limiting the possibilities of large current inrushes due to instantaneous reestablishment of connections to heavy loads.

Do I optimize the selectivity or do I coordinate all supply side devices? The NEC and NFPA 110 do not coordinate on this specific topic and industry design documents such as IEEE Standard 242 would support the position of the NFPA 110 technical committee.

Simply not "Practicable"

The implementation of selective coordination is simply not practicable in many instances. The inrush currents for a transformer or the starting current of a motor may drive a large overcurrent device that is not practicable to coordinate with the line side device. IEEE standards also note that in order to obtain a selective coordinated system, the back-up power source which is generally a generator, will be driven closer to the load in the design. Once again, the selectivity requirement is driving a design requirement that may reduce the reliability of the system. NFPA 70B recently published statistics in the annex in support of a new section entitled Reliability-Centered Maintenance. The statistics demonstrate that a major system reliability issue is with the generator starting. Selectivity drives a large single generator rather than distributed smaller generators in the system, such design is directly in opposition of the NFPA 70B statistics when evaluating the entire system for reliability. One design consideration to resolve this reliability issue is to parallel smaller generators. Paralleling multiple generators ensures that I have a power source even if one of the generator sets does not start or is undergoing maintenance. If a generator does not start, the electrical system is not paralyzed due to no power source. Selective coordination is of no use if there is no power for the electrical distribution system to deliver. The requirement for selective coordination, as presently found in the NEC, prohibits solid design consideration that would enhance the reliability of the system.

Selectivity will not enhance performance of the system in specific instances

A review of IEEE documents such as the Buff book or IEEE Standard 242 recognizes that loss of selectivity between two overcurrent devices may have no impact on the system performance. Page 565 in IEEE Standard 242-1986 notes two examples: The first is the primary and secondary protection of a transformer. Requiring selective coordination of the secondary overcurrent is unnecessary where a single main exists on the secondary of the transformer. No reliability is gained by the present restriction in the NEC while placing a design and financial burden on the designer and owner. Another simple example is a load protective device and the next upstream device. Specifically, consider a feeder breaker or fused switch supplying a motor control center. NEC 430.94 requires protection of a motor control center bus by either an integral main or overcurrent device located ahead of the MCC. Based on the size of the motor loads, selectivity will drive the size of the MCC to be larger than necessary where large motors may have been designed into the system to enhance electrical maintenance safety practices. Once again, selective coordination of the feeder and the MCC main overcurrent devices provides no enhancement to the electrical system reliability, but impacts the electrical system design with no added benefit.

Selective coordination of overcurrent protection devices in the system must be addressed by the electrical system design engineer in order to ensure the most reliable electrical system. No data has been presented in the past NEC development cycles that supports selective coordination as a safety or reliability issue existing in the industry. Attempting to govern this performance parameter in the NEC is unnecessary and may reduce the reliability of critical electrical systems as recognized in other industry standards.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 13-135.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 10 Negative: 3

Ballot Not Returned: 1 Gustafson, R.

Explanation of Negative:

NASBY, J.: The panel failed to address the substantive points of the proposal. A number of issues have been established that must be addressed:

1) There is a material conflict between NFPA 110 and the NEC that creates a dilemma for the system designer. This design conflict within two NFPA documents is not acceptable.

2) A conflict between the text of 701.18 and the definition of selective coordination in Article 100.

3) Numerous industry standards that point to selectivity impacting reliability negatively or without benefit.

4) Unnecessary selective coordination increases overcurrent device size and can unnecessarily increase the arc-flash hazard on the electrical system.

NFPA 110 is a long standing document which recognizes the importance of selective coordination by requiring selective coordination of overcurrent devices to be "optimized". The International Building Code, adopted by many states, points to NFPA 110 for installing emergency system installations. The NFPA 110 technical committee recognizes selective coordination is prudent to enhance the performance of the electrical system, however, by adding the word "optimized" the committee permits the engineering community to provide the most reliable electrical system.

There is clearly a technical correlation issue between NFPA 110 and the NEC on selective coordination. Furthermore, the definition of selective coordination in article 100 of the NEC requires the "localization of an overcurrent condition to restrict outages to the circuit or equipment affected." The proposal substantiates that the present rule goes well beyond the definition of localizing an overcurrent condition, by requiring "all" overcurrent devices to be selectively coordinated. No other industry document supports all overcurrent devices being selectively coordinated.

The wording in 701.18 must be revised to align with NFPA 110, the definition of selective coordination, and IEEE standards which recognize selective coordination as not being necessary for "all" overcurrent device as follows:

701.18 Coordination. Selective Coordination of overcurrent protective devices shall be optimized.

WHITTALL, H.: I wish to change my vote from Affirmative to Negative on Proposals 13-135 through 13-147 and 13-159 through 13-167. These items all deal with selective coordination. I agree with those who feel the wording in the NEC should agree with that in NFPA 110. Selective coordination is something that is nice to have and a design consideration, but should not be a requirement in the NEC. Therefore, Proposals 13-135 and 13-159 should have been Accepted and the others listed would have gone along with them.

ZGONENA, T.: See my comments on proposal 13-135.

13-160 Log #2167 NEC-P13 **Final Action: Reject**
(701.18)

Submitter: Michael J. Johnston, Plano, TX

Recommendation: Revise text to read as follows:

701.18 Coordination. Legally required standby system(s) overcurrent devices shall be selectively coordinated with all supply side overcurrent protective devices. <u>Series rated combinations as covered in 110.22 and 240.86 shall not be permitted where selective coordination of legally required standby system overcurrent protective devices is required.</u>

Substantiation: Based on the concept of series rated combinations of overcurrent devices and how they are required to operate, be tested and evaluated, it would seem to be rather difficult to comply with the requirements of this section.

Panel Meeting Action: Reject

13-163 Log #2561 NEC-P13 **Final Action: Reject**
(701.18)

Submitter: Greg Batie, Sparling / Rep. Electric League of the Pacific Northwest-Code Committee
Recommendation: Add a FPN as follows:
FPN: This requirement can be accomplished by choice of overcurrent protective devices and their ratings or settings at 0.1 seconds and longer.
Substantiation: The requirement for selective coordination in new articles 700.27 and 701.18 will result in more reliable emergency systems but selective coordination is not always possible for all fault current levels when protection is provided by molded case circuit breakers. As seen in the examples provided of typical circuit breaker curves, there is typically some overlap between curves in the instantaneous region below 0.1 seconds.
As documented in the provided references, the majority of faults are not bolted three phase faults. The typical fault involves a lower level line-to-ground fault. This
line -to-ground fault can escalate to a three phase arcing fault, however, this arcing fault is lower than the three phase bolted fault. Therefore, the lower level fault is often low enough to allow selective coordination in the instantaneous region between the upstream and downstream breakers. Therefore, selective coordination in the instantaneous region should not be of a concern. Establishing 0.1 seconds and longer as the level for evaluating selective coordination will ignore the overlap of the instantaneous region. This represents the real world. The addition of this FPN will also eliminate confusion about these new articles prohibiting the use of standard molded case circuit breakers for Emergency and Legally Required Standby Systems. The addition of this FPN will also eliminate confusion on how to apply this requirements to existing installations without having to replace existing switchboards and breakers that are not presently fully coordinated. Note that the Florida Agency for Healthcare Administration (ACHA) has settled at the 0.1 second coordination requiremetrns since about 2002.
Note: Supporting material is available for review at NFPA Headquarters.

13-165 Log #3495 NEC-P13 **Final Action: Reject**
(701.18)

Submitter: Alan Manche, Square D Co.
Recommendation: Delete NEC **701.18 Coordination.**
~~**700.27 Coordination.** Legally required standby system(s) overcurrent devices shall be selectively coordinated with all supply side overcurrent protective devices.~~
Substantiation: The application of selective coordination is often misunderstood in that it is perceived as being independent of all other electrical design parameters. The seemingly simple misperception is that you just have to pick the correct fuses or circuit breakers to ensure this particular requirement is met. What has not been considered, at least in the NEC, is the impact placed upon the design and reliability of the entire electrical system. My discussion with engineers and our company involvement with coordination studies indicates they do a comprehensive coordination evaluation of legally required systems and maximize the selectivity, unfortunately the requirement placed in the 2005 NEC for requiring full selectivity is driving system design parameters that can impact the reliability in a negative manner by possibly reducing that reliability. The requirement also places a requirement on the system that is unnecessary in various areas of the electrical system.
Other industry standards, such as NFPA 110 and IEEE Standard 242, recognize the need for this latitude in maximizing system reliability and permitting the engineer to selectively coordinate devices that support the isolation of the system as necessary. Electrical system designs and demands differ based on the size and occupancy needs. Ensuring the maximum reliability of the electrical system must be determined by the engineering professional for each facility.
A brief review of other technical committees guidance that have addressed this issue will support the need to delete this requirement. The NFPA 110 committee recognizes the limitations of selective coordination by requiring the selective coordination of the emergency system to be "optimized." They further provide an explanation in the annex of NFPA 110 regarding this subject:
A.6.5.1 It is important that the various overcurrent devices be coordinated, as far as
practicable, to isolate faulted circuits and to protect against cascading operation on short circuit faults. In many systems, however, full coordination is not practicable without using equipment that could be undesirable for other reasons or prohibitively costly. Primary consideration also should be given to prevent overloading of equipment by limiting the possibilities of large current inrushes due to instantaneous reestablishment of connections to heavy loads.
A review of IEEE Standard 242 also provides further explanation that selectivity of overcurrent devices may not provide any further enhancement to reliability, but this requirement in the NEC simply drives an unnecessary burden for these particular areas of the electrical system. An example is where primary and secondary protection is necessary for a transformer. Selectively coordinating the primary and secondary may or may not have any impact on isolating the fault.
The NEC places an unnecessary burden on the electrical system design without any benefit.

The only reason for requiring selective coordination in the NEC is to drive a performance parameter for enhanced reliability of power for the system. Based on this premise, that goal is not accomplished in many instances. Our company supports the design and installation of many critical electrical infrastructures and this requirement can drive a compromise in electrical reliability. The easiest system to recognize this issue is when an alternate power source is utilized. The system design must take into consideration of whether to have a generator located near the point of use or decide that a more reliable power source is paralleling a number of generators in the event one of the independent generators do not start. NFPA 70B does recognize that the reliability of the generator starting is an issue, likely based on poor maintenance practices, but that is the reality of our electrical infrastructure. If the power source does not exist then having a selectivity coordinated system serves no purpose. Selective coordination will drive large single generators and in effect prohibit the paralleling of small generators to establish a more reliable power source. Once again, an example that selective coordination is not independent from the rest of the electrical system design.

The present NEC requirement for selective coordination prohibits solid design considerations that would enhance the reliability of the system. I urge the committee to accept this proposal and delete the requirement for selective coordination on legally required standby systems. Deleting this requirement will permit the electrical system design engineer to maximize the reliability of the system and remove a restriction placed on the designer that may reduce the reliability of the system.

13-166 Log #3623 NEC-P13 **Final Action: Reject**
(701.18)

Submitter: Jon Ross, Smith Seckman Reid, Inc.

Recommendation: Legally required standby system(s) overcurrent protective devices shall be coordinated to optimize selective tripping of the circuit overcurrent protective devices and minimize the extent of interruption to the electrical system due to abnormal current caused by overload and/or short circuits.

Substantiation: The current wording of 701.18 implies complete and absolute coordination of devices. To achieve this, many upstream overcurrent devices will have to be selected to permit higher let-thru energy which will compromise efforts in certain situations to limit the arc-flash potential and equipment damage. In addition it will limit the use of several circuit breaker products currently in use on the market today. This will reduce the ability to achieve the recommendation in NFPA 99.4.4.1.1.2(2) "achieving the fastest possible restoration of any given circuit(s) after clearing a fault". The proposed wording would also bring the requirement for coordination in NFPA 70, 110 & 99 into agreement.

Explanation of Negative:

NASBY, J.: See my explanation of negative vote on Proposal 13-159.

WHITTALL, H.: I wish to change my vote from Affirmative to Negative on Proposals 13-135 through 13-147 and 13-159 through 13-167. These items all deal with selective coordination. I agree with those who feel the wording in the NEC should agree with that in NFPA 110. Selective coordination is something that is nice to have and a design consideration, but should not be a requirement in the NEC. Therefore, Proposals 13-135 and 13-159 should have been Accepted and the others listed would have gone along with them.

ZGONENA, T.: See my comments on proposal 13-135.

13-167 Log #2717 NEC-P13 **Final Action: Reject**
(701.18 Exception (New))

Submitter: Dorothy Kellogg, American Chemistry Council

Recommendation: Revise text to read:

Exception: The use of molded case circuit breakers which coordinate in the non-instantaneous trip range shall be permitted where restoration of power is as important or more important than the risk of loss of power due to mis-coordination.

Substantiation: Problem: The emergency system overcurrent device coordination requirement added during the last code cycle will force the use of fuses in installations where manufacturer tested coordinating circuit breakers are not available or are no longer available to match upstream/downstream devices due to obsolescence. Application of fuses may lower the needed availability of emergency power in installation where rapid restoration of power is as important or more important than a brief outage.

Substantiation: The ability to retrofit manufacture tested coordinating circuit breakers will often not be possible when modifying existing systems forcing the use of fuses which may not be available when needed to restore emergency power. The code change made requiring coordination without regard to other risks may force installations which increase the risk of more extended outage which may have higher consequence than shorter outages, or may result in unsafe practices such as using incorrectly sized available fuses in place of the needed fuse to quickly restore power to emergency systems when the correct fuse is not available. The user should be able to use engineering judgment to decide whether coordination or rapid restoration of power is more critical in a specific installation. This change to the Code has the effect of eliminating the use of normal molded case circuit breakers in these systems.

Panel Meeting Action: Reject

Panel Statement: See the panel action and statement on Proposal 13-147.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 10 Negative: 3

Ballot Not Returned: 1 Gustafson, R.

Explanation of Negative:

ELKINS, D.: This proposal should be accepted in principle. Instead of the exception proposed by the submitter, it is suggested 701.18 be reworded as follows: "Overcurrent protection system design. Legally required standby system(s) overcurrent devices shall be applied according to the safety requirements of the specific installation. Issues such as coordination with supply overcurrent devices, reliable availability of spares, varying levels of normal or standby ground-fault levels, and overcurrent device resetting capability should be evaluated to achieve the optimal safe design."

The language adopted in 2005 presupposes safety in all installations is better served by coordination than rapid recovery of power after an outage. The 2005 code language has the effect of requiring the use of fuses in many installations involving retrofits or expansions of existing installations. Fuses cannot be reset after the cause of an outage has been determined and cleared. A spare matching fuse must be available. The 2005 code language ignores services where rapid restoration of power may be more critical to safety than short outages. This requirement limits engineering solutions and goes counter to the stated intention of the code in 90.1(C) that it "is not a design specification".

WHITTALL, H.: I wish to change my vote from Affirmative to Negative on Proposals 13-135 through 13-147 and 13-159 through 13-167. These items all deal with selective coordination. I agree with those who feel the wording in the NEC should agree with that in NFPA 110. Selective coordination is something that is nice to have and a design consideration, but should not be a requirement in the NEC. Therefore, Proposals 13-135 and 13-159 should have been Accepted and the others listed would have gone along with them.

ZGONENA, T.: See my comments on proposal 13-135.

ARTICLE 702 — OPTIONAL STANDBY SYSTEMS

13-168 Log #2741 NEC-P13 **Final Action: Accept in Principle**
(702.5)

TCC Action: It was the action of the Technical Correlating Committee that further consideration be given to the comment expressed in the voting and "with a or b" should be revised to read "with (a) or (b)".

The Technical Correlating Committee directs that the Action on this Proposal be rewritten to comply with 4.1.1 of the NEC Style Manual.

These actions will be considered by the Panel as a Public Comment.

Submitter: Jim Pauley, Square D Company

Recommendation: Revise NEC 702.5 as shown below.

702.5 Capacity and Rating.

(A) Available Short Circuit Current. Optional standby system equipment shall be suitable for the maximum available ~~fault~~ short-circuit current at its terminals.

(B) System Capacity. The calculations of load on the standby source shall be made in accordance with Article 220 of by another method that is acceptable to the authority having jurisdiction.

(1) Manual Transfer Equipment. Where manual transfer equipment is used an optional standby system shall have adequate capacity and rating for the supply of all equipment intended to be operated at one time. The user of the optional standby system shall be permitted to select the load connected to the system.

(2) Automatic Transfer Equipment. Where automatic transfer equipment is used, an optional standby system comply with a or b.

(a) Full Load. The standby source shall be capable of supplying the full load that is transferred by the automatic transfer equipment.

(b) Load Management. Where a system is employed that will automatically manage the connected load, the standby source shall have a capacity sufficient to supply the maximum load that will be connected by the load management system.

Substantiation: Due to the recent natural disasters the increase in generator installations has grown significantly. At a number of IAEI meetings in 2005, the question has been asked about what to do for the size of an optional standby source that uses automatic transfer. It appears that automatic transfer equipment is being installed with generators that have a capacity that is much smaller than the total load (typically an entire panelboard) being transferred. There has been significant disagreement about how the NEC treats these automatic transfer situations.

The objective of this proposal is to try and address a number of concerns that have been raised by both inspectors and installers. Of primary concern has been that in an automatic transfer application, the user may not be available to "select the loads" that will be supplied. This defeats the intent of the automatic transfer and renders the system somewhat useless.

The proposal does the following:

1. Rearranges the existing 702.5 text to split up the paragraph and provide headings that will make it easier for the code user.
2. Create an "Available Short Circuit Current" heading and moves the sentence about adequate ratings for fault current to this new heading. In addition, the term "fault current" is replaced with "short circuit current" to make it consistent with the rest of the code.
3. System capacity is now split into Manual Transfer and Automatic Transfer applications. In addition text has been added to indicate how the load is to be calculated. For instance if you are including the branch circuits in a home that supply part of the general lighting load, how do you do that calculation. The most logical approach is to use Article 220 and the new language makes that clear. However, it is recognized that a number of jurisdictions are allow recorded load measurements and similar information to be used to provide the capacity. The new text would allow other methods that are acceptable to the AHJ.
4. For manual transfer, the existing language is used to simply require that the supply be adequate to supply the equipment intended to be connected at one time. It also retains the existing permission for the user to be able to select the loads that will be connected.
5. For automatic transfer, new language is provided to address the concerns raised in the field about the user not be available to select the supplied loads. In the automatic situation, there are a couple of options. Item "a" provides and option where you size the standby supply to pick up the entire load that is being transferred. The typical application in this case is where a small generator is connected to a new subpanel with a set number of critical loads. Under normal power the subpanel is supplied by the normal source. When the power fails, the subpanel is transferred to the generator source.

Item "b" is intended to allow a system where some of the load in a larger panel may be shed in order to reduce the loading to an adequate level to be supplied by the standby source. We allow this in larger applications of 700 and 701, so it makes sense here.

Article 702 has become very popular because of the number of outages that have occurred in the country. This proposal updates the requirements to installations that have become more common.

Panel Meeting Action: Accept in Principle

Accept the proposal as submitted except revise (B) as proposed to read as follows:

(B) System Capacity. The calculations of load on the standby source shall be made in accordance with Article 220 or by another approved method.

Panel Statement: The editorial revision conforms to NEC Manual of Style and corrects a typographical error.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Gustafson, R.

Comment on Affirmative:

SWAYNE, R.: In Section 702.5(B)(2), editorially add the word "shall" after "system" to complete the sentence structure.

13-169 Log #2983 NEC-P13 **Final Action: Accept in Principle**
(702.5)

Submitter: James S. Gillespie, Brannon & Gillespie, LLC

Recommendation: Revise text as follows:

An optional standby system shall have adequate capacity and rating that complies with one of the following:

(1) For the supply of all equipment intended to be operated at one time. Optional standby system equipment shall be suitable for the maximum available fault current at its terminals. The user of the optional standby system shall be permitted to select the load connected to the system.

(2) Load calculated based on Article 220.

Substantiation: Some AHJs take the requirement of the existing rule to mean that connected load at 100%. This does not work, especially for dwelling units. For "whole house" generators, this can mean in effect that the generator could have to be sized larger than the calculated service disconnect and wire size, which does not make any sense. How can it be justified that a generator has to be able to carry more load than the building service?

Panel Meeting Action: Accept in Principle

Panel Statement: See the panel action and statement on Proposal 13-168.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Gustafson, R.

13-170 Log #3145 NEC-P13 **Final Action: Accept in Principle**
(702.5)

Submitter: Dale Rooney, Municipality of Anchorage

Recommendation: Add a new last sentence to read:

Where an automatic transfer switch is used without automatic load shedding the installation shall have adequate capacity for the calculated load being supplied or the maximum demand per 220.87(1).

Substantiation: The last sentence of this section seems to allow the use of an automatic transfer switch in such a way that it may transfer in an overloaded condition. This will, at best, turn it into a manual transfer switch (lighten the load and restart the generator) and at worst could result in damage to the equipment.

This was actually done on the residence of a family which included children with medical needs.

Panel Meeting Action: Accept in Principle

Panel Statement: See the panel action and statement on Proposal 13-168.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Gustafson, R.

13-171 Log #3597 NEC-P13 **Final Action: Accept in Principle**
(702.5)

Submitter: Joe McCann, City of Coral Springs

Recommendation: Revise as follows:

702.5 Capacity and Rating. An optional standby system shall have adequate capacity and rating for the supply of all equipment intended to be operated at one time when operated automatically . Optional standby system equipment shall be suitable for the maximum fault current at its terminals. The use of the optional standby system shall be permitted to select the load connected to the system when manually transferred .

Substantiation: Generators are being installed permanently that cannot possibly pickup the total connected load of the residence or business. When power goes off and no one is home, there is no way to shift the load. The connected load is picked up by a generator. Say a 5 kW on a 200 A service with a connected load of 170 amps actual submitted this way in plan review.

Panel Meeting Action: Accept in Principle

Panel Statement: See the panel action and statement on Proposal 13-168

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Gustafson, R.

13-172 Log #3276 NEC-P13 **Final Action: Accept in Principle**
(702.5(A) (New))

Submitter: Leonard F. Devine, Jr., Palm Beach County Plan Review

Recommendation: Add text to read as follows:

702.50(A) Capacity and Rating. An optional standby system shall have adequate capacity and rating for the supply of all equipment intended to be operated at any one time. *To calculate the load when utilizing an automatic transfer switch for individual dwelling units or commercial installation, calculations by any of the excepted methods in Article 220 may be used including 220.87, at peak demand periods during the year to determine the load to be imposed on the generator.*

Substantiation: There is a tendency to just throw any size generator at a problem without taking into consideration what the load is that may be imposed on the generator, or not taking into consideration 702.3, which states that you shall comply with other applicable code articles. By separating the paragraph into sections, this will provide greater clarity.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action and statement on Proposal 13-168.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-173 Log #3277 NEC-P13 **Final Action: Accept in Principle**
(702.5(B) (New))

Submitter: Leonard F. Devine, Jr., Palm Beach County Plan Review
Recommendation: Add text to read as follows:
702.5(B) Terminal Fault Current. Optional standby system equipment shall be suitable for the maximum available current at its terminals
Substantiation: By separating the second sentence out 502.5, this should provide better meaning to this section.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action and statement on Proposal 13-168.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-174 Log #3278 NEC-P13 **Final Action: Accept in Principle**
(702.5(C))

Submitter: Leonard F. Devine, Jr., Palm Beach County Plan Review
Recommendation: Add text to read as follows:
702.5(C) User selection. The user of the optional standby system shall be permitted to select the load connected to the system, at any time a manual transfer switch is utilized or pre-select the load through an optional standby panel sized for the generator capacity when an automatic transfer switch is utilized. Load shedding may also be utilized to limit the load on a generator to prevent overloading the generator and its components.
Substantiation: The problem is that retail outlets, manufacturers, and contractors are advertising some of their generators as whole house generators, when in fact some of these generators will not carry the full loads that may be imposed upon them. There are cases where these generators are being installed at homes that have individuals on life support equipment and in the event of generator failure due to overloading would not be able to supply power for the life support equipment.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action and statement on Proposal 13-168.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-175 Log #2563 NEC-P13 **Final Action: Accept**
(702.6)

Submitter: Paul Schnackenberg, Gen/Tran Corporation
Recommendation: Delete the following text:
~~Transfer equipment located on the load side of branch circuit protection, shall be permitted to contain supplementary overcurrent protection having an interrupting rating sufficient for the available fault current that the generator can deliver. The supplementary overcurrent devices shall be part of a listed transfer equipment.~~
Substantiation: In 2000, UL changed the 1008 standard and effectively disallowed the use of supplementary overcurrent devices, using the reasoning that branch circuit rated breakers were necessary between the generator and the individual loads. (We used 4 million of these supplementary devices from 1982 to 2000 without a single incident but were forced to change our design because of this ruling by UL.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-176 Log #2751 NEC-P13 **Final Action: Reject**
(702.6)

Submitter: Jonathan R. Althouse, Michigan State University
Recommendation: Add a new last paragraph to 702.6 to read as follows:
<u>A transfer switch located on the supply side of the service disconnecting means shall be rated as suitable for use as service equipment, and shall be sized in accordance with 230.79. A transfer switch shall be permitted to serve as the service disconnecting means if installed in accordance with the provisions of 230 Part VI and 230 Part VII.</u>
Substantiation: Standby power transfer switches have been installed on the supply side of the service disconnecting means across the country without problems provided they are installed sufficient to handle the load and are listed. There are many transfer switches installed that are not listed and they can be a problem. It is not likely a problem will occur if there is some type of overcurrent protection located down line from the transfer switch. Where there have been problems, there are most likely serious code violations. There needs to be a provision that permits a transfer switch to be located on the outside of a building or structure between the meter and the service disconnect which is usually inside. Most listed transfer switches do not have provisions for overcurrent protection and the issue seems to be 230.91. There needs to be a clear statement of what constitutes a safe installation.
Panel Meeting Action: Reject
Panel Statement: Where a transfer switch suitable for service equipment is installed ahead of an existing service, the transfer switch becomes the service disconnect and grounding requirements in the previous service disconnect change to feeder panel requirements. Because of this, the proposed change is not necessary.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
FLACH, G.: This proposal should be accepted. The Code is not very clear on the location of the transfer switch. There are UL listed transfer switches that are marked “Suitable for Use as Service Equipment”. But, there are no clear cut rules that allow them or indicate that they can be used as a service disconnect. With onsite generators being installed outdoors, a practical location for the transfer switch is also outdoors.

13-177 Log #2770 NEC-P13 **Final Action: Reject**
(702.6)

Submitter: Truman C. Surbrook, Michigan State University
Recommendation: Add a new paragraph to 702.6 as follows:
<u>Listed transfer equipment rated not over 200 amperes shall be permitted to be located on the supply side of the service disconnecting means for an electrical supply operating at not over 250 volts nominal, and shall be suitable for the prevailing conditions.</u>
Substantiation: This new paragraph is sufficiently limiting that it will generally only apply in the case of single-family dwellings, small commercial buildings, and farms. It would be a rare occurrence for such an installation to pose a hazard if the switch is opened under load. The service panel with overcurrent protection is generally located within a few feet of the transfer equipment. Not permitting the transfer equipment to be located on the outside of a building between the meter and the service panel, such as a single-family dwelling, is an unnecessary limiting burden often leading to unsafe alternative installations that are not inspected. Though there may have been a few cases where a problem arose, this procedure has worked safely for years and should be permitted to continue.
Panel Meeting Action: Reject
Panel Statement: Not all transfer equipment is suitable for use as service equipment.
See also the panel action and statement on Proposal 13-176.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-178 Log #3196 NEC-P13 **Final Action: Reject**
(702.6 Exception)

Submitter: Timothy M. Croushore, Allegheny Power
Recommendation: Please revise the exception to 702.6 for temporary connection of portable generators without transfer equipment. The exception should read as follows:
<u>*Exception: Connection of a portable generator without transfer equipment shall be permitted as provided in 590.8.*</u>
Substantiation: The purpose of this change is to revise the exception to conform in accordance with the scope of Article 702 with respect to temporary installations. A companion proposal to Article 590 was submitted to create a new section 590.8. New Section 590.8 is proposed to read as follows:
<u>590.8 Portable Generators. Temporary connection of a portable generator shall be permitted to supply permanent premises wiring where conditions of maintenance and supervision ensure that only qualified persons service the installation and where the normal supply is physically isolated by a lockable disconnecting means or by disconnection of the normal supply conductors.</u>
Putting temporary requirements for generators in Article 590 bring all of the other provisions such as time constraints and wiring methods of Article 590 for this application.
Panel Meeting Action: Reject
Panel Statement: The existing exception to 702.6 contains the appropriate text.

Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
HORNBERGER, B.: This proposal should have been accepted. According to the scope of Article 702, the requirements of that Article are for optional standby systems that are permanently installed in their entirety and not for temporary installations. The specific requirements for temporary installations in 590.2, 590.3, and 590.4 should cover the temporary connection of portable generators.
The new Article 590.8 as originally proposed properly deals with the "temporary connection of portable generators", and has additional requirements that are not covered under the provisions of Article 702.

13-179 Log #496 NEC-P13 **Final Action: Reject**
(702.10(A))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise as follows:
702.10 Portable Generator Grounding.
(A) Grounded Separately Derived System. Where a portable optional standby source is used as a separately derived system, it shall be grounded by connecting the grounded conductor of the system to a grounding electrode in accordance with 250.30 (A) .
Substantiation: The system is not "grounded" to a grounding electrode it is grounded by being "connected to a" grounding electrode. This proposal is an effort to clarify the use of the term grounded in this particular section. The proposal is not intended to change the requirements or meaning of the rule, just provided an editorial correction. Grounded separately derived systems are covered in 250.30(A) and ungrounded separately derived systems are covered in 250.30(B).
Panel Meeting Action: Reject
Panel Statement: The proposed change and the substantiation given is unclear and, as proposed, will preclude the use of an ungrounded system.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
SWAYNE, R.: This Proposal should be Accepted. The present wording of Section 702.10(A) requires that a portable generator used as a separately derived system for an optional standby system be grounded and an ungrounded system, therefore, is not permitted. The Submitter is correct in stating that you do not "ground" but rather "connect" to a grounding electrode.

13-180 Log #549 NEC-P13 **Final Action: Reject**
(702.11, FPN (New))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Add a new FPN as follows:
702.11 Outdoor Generator Sets. Where an outdoor generator set is equipped with a readily accessible disconnecting means located within sight of the building or structure supplied, an additional disconnecting means shall not be required where ungrounded conductors serve or pass through the building or structure.
FPN: 250.32(D) provides grounding and bonding requirements for building or structure disconnecting means that are remote from the building or structure.
Substantiation: This proposal is an effort to provide some correlation between the rules in 250.32(D) which provides requirements for grounding and bonding where the building or structure disconnecting means is mounted remote from the building or structure as it would be if it were located on the generator assembly in accordance with this section. A companion proposal is being submitted to 250.32(D) to correlate with the provisions of 702.11.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 13-130.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-181 Log #1285 NEC-P13 **Final Action: Reject**
(702.11, FPN (New))

Submitter: Mark R. Hilbert, State of New Hampshire
Recommendation: Revise text to read:
702.11 Outdoor Generator Sets. Where an outdoor housed generator set is equipped with a readily accessible disconnecting means located within sight of the building or structure supplied, an additional disconnecting means shall not be required where ungrounded conductors serve or pass through the building or structure.
Add a new fine print note to read as follows:
FPN: Section 225.36 provides additional requirements for the suitability of the disconnecting means.
Substantiation: The recommendation for this fine print note is an attempt to identify the requirements of 225.36 for the building disconnecting means, which in this case will be located at the generator, to be "suitable for use as service equipment." Additionally, this FPN will help identify an often overlooked requirement, clarify that even though it is remote to the building, the disconnecting means must be suitable for use as service equipment and that the requirement in 225.36 is not amended by 702.11.
Panel Meeting Action: Reject
Panel Statement: See the panel action statement on Proposal 13-131.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-182 Log #689 NEC-P13 **Final Action: Reject**
(702.12)

Submitter: James Filippone, Port Authority of NY & NJ
Recommendation: Add the following:
702.12 Tests. When optional standby systems provide power to elevators the building owner shall test them upon installation and subsequently at least every five years under maximum load conditions to verify that they still have sufficient capacity and rating. A written record shall be kept of all such tests. The authority having jurisdiction shall be notified prior to each test to afford them the opportunity to witness the tests.
FPN: Passenger electric elevators and freight electric elevators permitted to carry passengers must be tested in the down direction with 125 percent of their rated load inside the car and freight elevators must be tested with rated load inside the car. See ASME A17.1 Safety Code for Elevators and Escalators for information on which elevators must be capable of operating in the down direction with 125 percent of rated load.
Substantiation: Requiring testing on a 5-year basis under maximum load condition is reasonable to ensure that the elevators are available to emergency responders. Many elevators are provided with optional standby systems. Over time the loads that the system must supply can change significantly. Experience indicates that systems that were once sufficient are no longer sufficient due to added loads. The system needs to be tested under maximum capacity upon installation and periodically afterwards.
Information on the required load for elevators is provided for testing purposes.
Panel Meeting Action: Reject
Panel Statement: See Panel Action and Statement on Proposal 13-114.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-183 Log #3275 NEC-P13 **Final Action: Reject**
(702.13 (New))

Submitter: Leonard F. Devine, Jr., Palm Beach County Plan Review
Recommendation: Add text to read as follows:
702.13 Disconnect. Where the requirements of 702.11 cannot be complied with, an additional disconnect that complies with 225.3(A) and 225.36 shall be installed.
Substantiation: With the number of hurricanes and the explosion of the generator installations advertised as whole house generators, it has become quite clear that there is not a consensus of opinion as to how the generators are to be installed. The installers, manufacturers and the enforcement community are not in agreement. I believe that better direction needs to be supplied in Article 702. This should help to make it clearer as to how the disconnect needs to be handled.
Panel Meeting Action: Reject
Panel Statement: Section 702.11 is a permissive clause. It is unclear what is meant by "can't be complied with" when compliance is not required.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

ARTICLE 705 — INTERCONNECTED ELECTRIC POWER PRODUCTION SOURCES

13-184 Log #2581 NEC-P13 **Final Action: Accept in Principle in Part (705)**

TCC Action: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting.
The Technical Correlating Committee directs that the Action on this Proposal be rewritten to comply with the NEC Style Manual.
This action will be considered by the Panel as a Public Comment.
Submitter: Timothy M. Croushore, Allegheny Power
Recommendation:
Revise text to read as follows:

ARTICLE 705 Interconnected Electric Power Production Sources

I General

705.1 Scope.

This article covers installation of one or more electric power production sources operating in parallel with a primary source(s) of electricity.

FPN: Examples of the types of primary sources are a utility supply, on-site electric power source(s), or other sources.

705.2 Definition.

*****NOTES – not part of NEC text: MOVE the revised definition of Interactive System TO Article 100. Move Definitions of Hybrid System, and Point of Common Coupling from Article 690 to 705.**

~~**Interactive System.** An electric power production system that is operating in parallel with and capable of delivering energy to an electric primary source supply system.~~

Hybrid System. A system comprised of multiple power sources. These power sources may include photovoltaic, wind, micro-hydro generators, engine-driven generators, and others, but do not include electrical power production and distribution network systems. Energy storage systems such as batteries, flywheels, or superconducting magnetic storage equipment, do not constitute a power source for the purpose of this definition.

Utility-Interactive Inverter Output Circuit. The conductors between the utility-interactive inverter and the service equipment or another electric power production source, such as a utility, for electrical production and distribution network.

Point of Common Coupling. The point at which the power production and distribution network and the customer interface occurs in an interactive system. Typically, this is the load side of the power network meter.

705.3 Other Articles.

Interconnected electric power production sources shall comply with this article and also with the applicable requirements of the articles in Table 705.3.

Table 705.3 Other Articles

Equipment/System	Article
Generators	445
Emergency systems	700
Legally required standby systems	701
Optional standby systems	702

~~*Exception No. 1: Installation of solar photovoltaic systems operated as interconnected power sources shall be in accordance with Article 690.*~~

~~*Exception No. 2: Installation of fuel cell systems operated as interconnected power sources shall be in accordance with Article 692.*~~

705.10 Directory.

A permanent plaque or directory, denoting all electrical power sources on or in the premises, shall be installed at each service equipment location and at locations of all electric power production sources capable of being interconnected.

Exception: Installations with large numbers of power production sources shall be permitted to be designated by groups.

705.12 Point of Connection.

The outputs of electric power production systems shall be interconnected at the premises service disconnecting means beyond the point of common coupling.

(A) Integrated Electric System. The outputs shall be permitted to be interconnected at a point or points elsewhere on the premises where the system qualifies as an integrated electric system and incorporates protective equipment in accordance with all applicable sections of Article 685.

(B) General. The outputs shall be permitted to be interconnected at a point or points elsewhere on the premises where all of the following conditions are met:

(1) The aggregate of nonutility sources of electricity has a capacity in excess of 100 kW, or the service is above 1000 volts.

(2) The conditions of maintenance and supervision ensure that qualified persons service and operate the system.

(3) Safeguards, documented procedures, and protective equipment are established and maintained.

705.14 Output Characteristics.

The output of a generator or other electric power production source operating in parallel with an electric supply system shall be compatible with the voltage, wave shape, and frequency of the system to which it is connected.

FPN: The term *compatible* does not necessarily mean matching the primary source wave shape.

705.16 Interrupting and Short-Circuit Current Rating.

Consideration shall be given to the contribution of fault currents from all interconnected power sources for the interrupting and short-circuit current ratings of equipment on interactive systems.

705.20 Disconnecting Means, Sources.

Means shall be provided to disconnect all ungrounded conductors of an electric power production source(s) from all other conductors.

705.21 Disconnecting Means, Equipment.

Means shall be provided to disconnect power production equipment, such as utility interactive inverters or transformers associated with a power production source, from all ungrounded conductors of all sources of supply. Equipment intended to be operated and maintained as an integral part of a power production source exceeding 1000 volts shall not be required to have a disconnecting means.

705.22 Disconnect Device.

The disconnecting means for ungrounded conductors shall consist of a manually or power operable switch(es) or circuit breaker(s) with the following features:

(1) Located where readily accessible

(2) Externally operable without exposing the operator to contact with live parts and, if power operable, of a type that can be opened by hand in the event of a power supply failure

(3) Plainly indicating whether in the open (off) or closed (on) position

(4) Having ratings not less than the load to be carried and the fault current to be interrupted

(5) Capable of being locked in the open (off) position

For disconnect equipment energized from both sides, a marking shall be provided to indicate that all contacts of the disconnect equipment may be energized.

FPN No. 1: In parallel generation systems, some equipment, including knife blade switches and fuses, is likely to be energized from both directions. See 240.40.

FPN No. 2: Interconnection to an off-premises primary source could require a visibly verifiable disconnecting device.

705.30 Overcurrent Protection.

Conductors shall be protected in accordance with Article 240. Equipment and conductors connected to more than one electrical source shall have a sufficient number of overcurrent devices located so as to provide protection from all sources.

(A) Generators. Generators shall be protected in accordance with 445.12.

(B) Solar Photovoltaic Systems. Solar photovoltaic systems shall be protected in accordance with Article 690.

(C) Transformers. Overcurrent protection for a transformer with a source(s) on each side shall be provided in accordance with 450.3 by considering first one side of the transformer, then the other side of the transformer, as the primary.

(D) Fuel Cell Systems. Fuel cell systems shall be protected in accordance with Article 692.

705.32 Ground-Fault Protection.

Where ground-fault protection is used, the output of an interactive system shall be connected to the supply side of the ground-fault protection.

Exception: Connection shall be permitted to be made to the load side of ground-fault protection, provided that there is ground-fault protection for equipment from all ground-fault current sources.

705.40 Loss of Primary Source.

Upon loss of primary source, an electric power production source shall be automatically disconnected from all ungrounded conductors of the primary source and shall not be reconnected until the primary source is restored.

Exception: A listed Utility Interactive Inverter shall be permitted to automatically cease exporting power upon loss of primary source and shall not be required to automatically disconnect all ungrounded conductors from the primary source.. A listed Utility Interactive Inverter shall be permitted to automatically or manually resume exporting power to the utility once the primary source is restored.

FPN No. 1: Risks to personnel and equipment associated with the primary source could occur if an utility interactive electric power production source can operate as an intentional island. Special detection methods are~~can be~~ required to determine that a primary source supply system outage has occurred and whether there should be automatic disconnection. When the primary source supply system is restored, special detection methods can be required to limit exposure of power production sources to out-of-phase reconnection.

FPN No. 2: Induction-generating equipment on systems with significant capacitance can become self-excited upon loss of primary source and experience severe overvoltage as a result.

705.42 Unbalanced Interconnections.

A 3-phase electric power production source shall be automatically disconnected from all ungrounded conductors of the interconnected systems when one of the phases of that source opens. This requirement shall not be applicable to an electric power production source providing power for an emergency or legally required standby system.

Exception: A listed Utility Interactive Inverter shall be permitted to automatically cease exporting power when one of the phases of the source opens and shall not be required to automatically disconnect all ungrounded conductors from the primary source. A listed Utility Interactive Inverter shall be permitted to automatically or manually resume exporting power to the utility once all phases of the source is restored.

705.43 Synchronous Generators.

Synchronous generators in a parallel system shall be provided with the necessary equipment to establish and maintain a synchronous condition.

705.50 Grounding.

Interconnected electric power production sources shall be grounded in accordance with Article 250.

Exception: For direct-current systems connected through an inverter directly to a grounded service, other methods that accomplish equivalent system protection and that utilize equipment listed and identified for the use shall be permitted.

II. Utility Interactive Inverters

705.60 Circuit Sizing and Current.

(A) Calculation of Maximum Circuit Current. The maximum current for the specific circuit shall be calculated in accordance with 705.60 (A)(1) through (A)(2).

(1) Inverter Source Circuit Currents. The maximum current shall be the sum of the rated short-circuit currents of the inverter input circuits multiplied by 125 percent.

(2) Inverter Output Circuit Current. The maximum current shall be the inverter continuous output current rating.

(B) Ampacity and Overcurrent Device Ratings. Inverter system currents shall be considered to be continuous.

(1) Sizing of Conductors and Overcurrent Devices. The circuit conductors and overcurrent devices shall be sized to carry not less than 125 percent of the maximum currents as calculated in 705.60(A). The rating or setting of overcurrent devices shall be permitted in accordance with 240.4(B) and (C).

Exception: Circuits containing an assembly, together with its overcurrent device(s), that is listed for continuous operation at 100 percent of its rating shall be permitted to be utilized at 100 percent of its rating.

(2) Internal Current Limitation. Overcurrent protection for inverter output circuits with devices that internally limit the current from the inverter output circuit shall be permitted to be rated at less than the value calculated in 705.60 (B)(1). This reduced rating shall be at least 125 percent of the limited current value. Inverter output circuit conductors shall be sized in accordance with 705.60(B)(1).

Exception: An overcurrent device in an assembly listed for continuous operation at 100 percent of its rating shall be permitted to be utilized at 100 percent of its rating.

705.65 Overcurrent Protection.

(A) Circuits and Equipment. Inverter source circuit, inverter output circuit, and storage battery circuit conductors and equipment shall be protected in accordance with the requirements of Article 240. Circuits connected to more than one electrical source shall have overcurrent devices located so as to provide overcurrent protection from all sources.

Exception: An overcurrent device shall not be required for circuit conductors sized in accordance with 705.60 (B) and located where one of the following apply:

(a) There are no external sources such as parallel-connected source circuits, batteries, or backfeed from inverters.

(b) The short-circuit currents from all sources do not exceed the ampacity of the conductors.

FPN: Possible backfeed of current from any source of supply, including a supply through an inverter into the inverter output circuit and inverter source circuits, is a consideration in determining whether adequate overcurrent protection from all sources is provided for conductors and modules.

(B) Power Transformers. Overcurrent protection for a transformer with a source(s) on each side shall be provided in accordance with 450.3 by considering first one side of the transformer, then the other side of the transformer, as the primary.

Exception: A power transformer with a current rating on the side connected toward the inverter power source, not less than the short-circuit output current rating of the inverter, shall be permitted without overcurrent protection from that source.

(C) Inverter Source Circuits. Branch-circuit or supplementary-type overcurrent devices shall be permitted to provide overcurrent protection in inverter source circuits. The overcurrent devices shall be accessible but shall not be required to be readily accessible.

Standard values of supplementary overcurrent devices allowed by this section shall be in one ampere size increments, starting at one ampere up to and including 15 amperes. Higher standard values above 15 amperes for supplementary overcurrent devices shall be based on the standard sizes provided in 240.6(A).

(D) Direct-Current Rating. Overcurrent devices, either fuses or circuit breakers, used in any dc portion of a utility interactive inverter power system shall be listed for use in dc circuits and shall have the appropriate voltage, current, and interrupt ratings.

(E) Series Overcurrent Protection. In series-connected strings of two or more modules, a single overcurrent protection device shall be permitted.

705.70 Utility-Interactive Inverters Mounted in Not-Readily-Accessible Locations. Utility-interactive inverters shall be permitted to be mounted on roofs or other exterior areas that are not readily accessible. These installations shall comply with (1) through (4):

(1) A direct-current disconnecting means shall be mounted within sight of or in the inverter.

(2) An alternating-current disconnecting means shall be mounted within sight of or in the inverter.

(3) The alternating-current output conductors from the inverter and an additional alternating-current disconnecting means for the inverter shall comply with 705.22.

(4) A plaque shall be installed in accordance with 705.10.

705.80 Utility Interactive Power Systems Employing Energy Storage.

Utility Interactive power systems employing energy storage shall also be marked with the maximum operating voltage, including any equalization voltage and the polarity of the grounded circuit conductor.

705.82 Hybrid Systems.

Hybrid Systems shall be permitted to be interconnected at the point-of common coupling with utility-interactive inverters.

705.85 Identified Interactive Equipment.

Only inverters and ac modules listed and identified as utility interactive shall be permitted in interactive systems.

705.90 Loss of Interactive System Power.

An inverter or an ac module in a utility interactive system shall automatically de-energize its output to the connected electrical production and distribution network upon loss of voltage in that system and shall remain in that state until the electrical production and distribution network voltage has been restored.

A normally utility interactive inverter shall be permitted to operate as a stand-alone system to supply loads that have been disconnected from electrical production and distribution network sources.

705.95 Ampacity of Neutral Conductor.

If a single-phase, 2-wire inverter output is connected to the neutral and one ungrounded conductor (only) of a 3-wire system or of a 3-phase, 4-wire wye-connected system, the maximum load connected between the neutral and any one ungrounded conductor plus the inverter output rating shall not exceed the ampacity of the neutral conductor.

705.100 Unbalanced Interconnections.

(A) Single Phase. Single-phase inverters for hybrid systems and ac modules in interactive hybrid systems shall not be connected to 3-phase power systems unless the interconnected system is designed so that significant unbalanced voltages cannot result.

(B) Three Phase. Three-phase inverters and 3-phase ac modules in interactive systems shall have all phases automatically de-energized upon loss of, or unbalanced, voltage in one or more phases unless the interconnected system is designed so that significant unbalanced voltages will not result.

Substantiation: This proposal is part of 2 other proposals dealing with interconnecting electric power sources in Article 690, Article 692 and Article 705. This proposal is part of 3 other proposals to place common definitions in Article 100. The purpose of this proposal is to revise Article 705. This work incorporates the equipment that would be listed by Underwriters Laboratory Standard 1741 - Inverters, Converters and Controllers for Use in Independent Power Systems.

The figure in the substantiation section of this proposal shows the common wiring in building systems that should be covered by Article 705. The main purpose of this proposal is to put all interconnection requirements in Article 705 and all technology specific issues in their respective articles.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle in Part

1. Move the definition of Interactive System to Article 100.

Interactive System. An electric power production system that is operating in parallel with and capable of delivering energy to an electric primary source supply system.

2. Revise text to read as follows:

ARTICLE 705 Interconnected Electric Power Production Sources

I General

705.1 Scope. This article covers installation of one or more electric power production sources operating in parallel with a primary source(s) of electricity. FPN: Examples of the types of primary sources are a utility supply, on-site electric power source(s), or other sources.

705.**2 Definitions.**

~~**Interactive System.** An electric power production system that is operating in parallel with and capable of delivering energy to an electric primary source supply system.~~

Hybrid System. A system comprised of multiple power sources. These power sources may include photovoltaic, wind, micro-hydro generators, engine-driven generators and others. but do not include electrical power production and distribution network systems. Energy storage systems such as batteries, flywheels. or superconducting magnetic storage equipment. do not constitute a power source for the purpose of this definition.

Utility-Interactive Inverter Output Circuit. The conductors between the utility interactive inverter and the service equipment or another electric power production source. such as a utility. for electrical production and distribution network. Point of Common Coupling. The point at which the power production and distribution network and the customer interface occurs in an interactive system. Typically, this is the load side of the power network meter.

705.3 Other Articles. Interconnected electric power production sources shall comply with this article and also with the applicable requirements of the articles in Table 705.3.

Table 705.3 Other Articles

Equipment/System	Article
Generators	445
Emergency systems	700
Legally required standby systems	701
Optional standby systems	702

Exception No. 1: Installation of solar photovoltaic systems operated as interconnected power sources shall be in accordance with Article 690.
Exception No. 2: Installation of fuel cell systems operated as interconnected power sources shall be in accordance with Article 692.

705.4 Equipment Approval. All equipment shall be approved for the intended use. Interconnection systems shall be listed and identified for interconnection service.

705.10 Directory. A permanent plaque or directory, denoting all electrical power sources on or in the premises, shall be installed at each service equipment location and at locations of all electric power production sources capable of being interconnected. Exception: Installations with large numbers of power production sources shall be permitted to be designated by groups.

705.12 Point of Connection. The outputs of electric power production systems shall be interconnected as specified in either (A), (B), or (C):

(A) Integrated Electric Systems. The outputs shall be permitted to be interconnected at a point or points elsewhere on the premises where the system qualifies as an integrated electric system and incorporates protective equipment in accordance with all applicable sections of Article 685.

(B) Greater than 100kW. The outputs shall be permitted to be interconnected at a point or points elsewhere on the premises where all of the following conditions are met:

(1) The aggregate of non-utility sources of electricity has a capacity in excess of 100 kW, or the service is above 1000 volts.

(2) The conditions of maintenance and supervision ensure that qualified persons service and operate the system.

(3) Safeguards, documented procedures, and protective equipment are established and maintained.

(C) Less than or equal to 100 kW. The output of an interactive power source with a capacity of less than or equal to 100kW shall be connected as specified in either (1) or (2):

(1) Supply Side A photovoltaic power source shall be permitted to be connected to the supply side of the service disconnecting means as permitted in 230.82(6).

(2) Load Side A photovoltaic power source shall be permitted to be connected to the load side of the service disconnecting means of the other source(s) at any distribution equipment on the premises, provided that all of the following conditions are met:

(a) Each source interconnection shall be made at a dedicated circuit breaker or fusible disconnecting means.

(b) The sum of the ampere ratings of overcurrent devices in circuits supplying power to a busbar or conductor shall not exceed the rating of the busbar or conductor.

Exception: For a dwelling unit, the sum of the ampere ratings of the overcurrent devices shall not exceed 120 percent of the rating of the busbar or conductor.

(c) The interconnection point shall be on the line side of all ground-fault protection equipment.

Exception: Connection shall be permitted to be made to the load side of ground-fault protection, provided that there is ground-fault protection for equipment from all ground-fault current sources.

(d) Equipment containing overcurrent devices in circuits supplying power to a busbar or conductor shall be marked to indicate the presence of all sources.

Exception: Equipment with power supplied from a single point of connection.

(e) Circuit breakers, if backfed, shall be identified for such operation. Dedicated circuit breakers backfed from listed utility-interactive inverters complying with 690.60 shall not be required to be individually clamped to the panelboard busbars. A front panel shall clamp all circuit breakers to the panelboard busbars. Main circuit breakers connected directly to energized feeders shall also be individually clamped.

705.14 Output Characteristics.

The output of a generator or other electric power production source operating in parallel with an electric supply system shall be compatible with the voltage, wave shape, and frequency of the system to which it is connected. FPN: The term compatible does not necessarily mean matching the primary source wave shape.

705.16 Interrupting and Short-Circuit Current Rating.
Consideration shall be given to the contribution of fault currents from all interconnected power sources for the interrupting and short-circuit current ratings of equipment on interactive systems.

705.20 Disconnecting Means, Sources.
Means shall be provided to disconnect all ungrounded conductors of an electric power production source(s) from all other conductors.

705.21 Disconnecting Means, Equipment. Means shall be provided to disconnect power production equipment, such as utility interactive inverters or transformers associated with a power production source, from all ungrounded conductors of all sources of supply. Equipment intended to be operated and maintained as an integral part of a power production source exceeding 1000 volts shall not be required to have a disconnecting means.

705.22 Disconnect Device.
The disconnecting means for ungrounded conductors shall consist of a manually or power operable switch(es) or circuit breaker(s) with the following features:
(1) Located where readily accessible
(2) Externally operable without exposing the operator to contact with live parts and if power operable, of a type that can be opened by hand in the event of a power supply failure
(3) Plainly indicating whether in the open (or closed (on) position
(4) Having ratings not less than the load to be cared and the fault current to be interrupted

For disconnect equipment energized from both sides, a marking shall be provided to indicate that all contacts of the disconnect equipment may be energized.
FPN No. 1: In parallel generation systems, some equipment, including knife blade switches and fuses, is likely to be energized from both directions. See 240.40.
FPN No. 2: Interconnection to an off-premises primary source could require a visibly verifiable disconnecting device.

705.30 Overcurrent Protection.
Conductors shall be protected in accordance with Article 240. Equipment and conductors connected to more than one electrical source shall have a sufficient number of overcurrent devices located so as to provide protection from all sources.
~~**(A) Generators**. Generators shall be protected in accordance with 445.12.~~
(A) Solar Photovoltaic Systems. Solar photovoltaic systems shall be protected in accordance with Article 690.
(B) Transformers. Overcurrent protection for a transformer with a source(s) on each side shall be provided in accordance with 450.3 by considering first one side of the transformer, then the other side of the transformer, as the primary.
(C) Fuel Cell Systems. Fuel cell systems shall be protected in accordance with Article 692.

705.32 Ground-Fault Protection.
Where ground-fault protection is used, the output of an interactive system shall be connected to the supply side of the ground-fault protection.
Exception: Connection shall be permitted to be made to the load side of ground-fault protection, provided that there is ground-fault protection for equipment from all ground-fault current sources.

705.40 Loss of Primary Source.
Upon loss of primary source, an electric power production source shall be automatically disconnected from all ungrounded conductors of the primary source and shall not be reconnected until the primary source is restored. *Exception: A listed Utility Interactive Inverter shall be permitted to automatically cease exporting power upon loss of primary source and shall not be required to automatically disconnect all ungrounded conductors from the primary source. A listed Utility Interactive Inverter shall be permitted to automatically or manually resume exporting power to the utility once the primary source is restored.*
FPN No. 1: Risks to personnel and equipment associated with the primary source could occur if an utility interactive electric power production source can operate as an intentional island. Special detection methods are required to determine that a primary source supply system outage has occurred and whether there should be automatic disconnection. When the primary source supply system is restored special detection methods can be required to limit exposure of power production sources to out-of-phase reconnection.
FPN No. 2: Induction-generating equipment on systems with significant capacitance can become self-excited upon loss of primary source and experience severe overvoltage as a result.
A normally utility interactive inverter shall be permitted to operate as a stand-alone system to supply loads that have been disconnected from electrical production and distribution network sources.

705.42 ~~Unbalanced Connections~~ Loss of Three-Phase Primary Source.
A 3-phase electric power production source shall be automatically disconnected from all ungrounded conductors of the interconnected systems when one of the phases of that source opens. This requirement shall not be applicable to an electric power production source providing power for an emergency or legally required standby system.
Exception: A listed Utility Interactive Inverter shall be permitted to automatically cease exporting power when one of the phases of the source ovens and shall not be required to automatically disconnect all ungrounded conductors from the primary source. A listed Utility Interactive Inverter shall be permitted to automatically or manually resume exporting power to the utility once all phases of the source is restored.

705.50 Grounding.
Interconnected electric power production sources shall be grounded in accordance with Article 250.
Exception: For direct-current systems connected through an inverter directly to a grounded service, other methods that accomplish equivalent system protection and that utilize equipment listed and identified for the use shall be permitted.

II. Utility Interactive Inverters

705.60 Circuit Sizing and Current.
(A) Calculation of Maximum Circuit Current. The maximum current for the specific circuit shall be calculated in accordance with 705.60 (A) (1) though (A)(2).
(1) Inverter Source Circuit Currents. The maximum current shall be ~~the sum of the rated short-circuit currents of the inverter input circuits multiplied by 125 percent~~ the maximum rated input current of the inverter.
(2) Inverter Output Circuit Current. The maximum current shall be the inverter continuous output current rating.
(B) Ampacity and Overcurrent Device Ratings. Inverter system currents shall be considered to be continuous.
(1) Sizing of Conductors and Overcurrent Devices. The circuit conductors and overcurrent devices shall be sized to carry not less than 125 percent of the maximum currents as calculated in 705.60(A). The rating or setting of overcurrent devices shall be permitted in accordance with 240.4(B) and(C).
Exception: Circuits containing an assembly together with its overcurrent device(s) that is listed for continuous operation at 100 percent of its rating shall be permitted to be utilized at 100 percent of its rating.
~~(2) Internal Current Limitation. Overcurrent protection for inverter output circuits with devices that internally limit the current from the inverter output circuit shall be permitted to be rated at less than the value calculated in 705.60 (0)(1). This reduced rating shall be at least 125 percent of the limited current value. Inverter output circuit conductors shall be sized in accordance with 705.60(O)(1).~~
~~*Exception: An overcurrent device in an assembly listed for continuous operation at 100 percent of its rating shall be permitted to be utilized at 100 percent of its rating.*~~

705.65 Overcurrent Protection.
(A) Circuits and Equipment. Inverter input ~~source~~ circuits, inverter output circuit and storage battery circuit conductors and equipment shall be protected in accordance with the requirements of Article 240. Circuits connected to more than one electrical source shall have overcurrent devices located so as to provide overcurrent protection from all sources. *Exception: An overcurrent device shall not be required for circuit conductors sized in accordance with 705.60(B) and located where one of the following apply:*
(a) There are no external sources such as parallel-connected source circuits, batteries. or backfeed from inverters.
(b) The short-circuit currents from all sources do not exceed the ampacity of the conductors.
FPN: Possible backfeed of current from any source of supply. including a supply through an inverter into the inverter output circuit and inverter source circuits. is a consideration in determining whether adequate overcurrent protection from all sources is provided for conductors and modules.
(B) Power Transformers. Overcurrent protection for a transformer with a source(s) on each side shall be provided in accordance with 450.3 by considering first one side of the transformer. then the other side of the transformer. as the primary.
Exception: A power transformer with a current rating on the side connected toward the inverter power source not less than the short-circuit output current rating of the inverter shall be permitted without overcurrent protection from that source.
(C) Inverter Source Circuits. Branch-circuit or supplementary-type overcurrent devices shall be permitted to provide overcurrent protection in inverter source circuits. The overcurrent devices shall be accessible but shall not be required to be readily accessible. Standard values of supplementary overcurrent devices allowed by this section shall be in one ampere size increments. staring at one ampere up to and including 15 amperes. Higher standard values above 15 amperes for supplementary overcurrent devices shall be based on the standard sizes provided in 240.6(A).

(D) Direct-Current Rating. Overcurrent devices. either fuses or circuit breakers. used in any dc portion of a utility interactive inverter power system shall be listed for use in dc circuits and shall have the appropriate voltage, current. and interrupt ratings.
(E) Series Overcurrent Protection. In series-connected strings of two or more modules. a single overcurrent protection device shall be permitted.

705.70 Utility-Interactive Inverters Mounted in Not-Readily-Accessible Locations. Utility-interactive inverters shall be permitted to be mounted on roofs or other exterior areas that are not readily accessible. These installations shall comply with (1) through (4):
(1) A direct-current disconnecting means shall be mounted within sight of, or in the inverter.
(2) An alternating-current disconnecting means shall be mounted within sight of, or in the inverter.
(3) The alternating-current output conductors from the inverter and an additional alternating-current disconnecting means for the inverter shall comply with 705.22.
(4) A plaque shall be installed in accordance with 705.10.

705.80 Utility Interactive Power Systems Employing Energy Storage. Utility Interactive power systems employing energy storage shall also be marked with the maximum operating voltage including any equalization voltage and the polarity of the grounded circuit conductor.

705.82 Hybrid Systems.
Hybrid Systems shall be permitted to be interconnected ~~at the point-of common coupling~~ with utility-interactive inverters.

~~**705.85 Identified Interactive Equipment**~~.
~~Only inverters and ac modules listed and identified as utility interactive shall be permitted in interactive systems.~~

~~**705.90 Loss of Interactive System Power.**~~
~~An inverter or an ac module in a utility interactive system shall automatically deenergize its output to the connected electrical production and distribution network upon loss of voltage in that system and shall remain in that state until the electrical production and distribution network voltage has been restored.~~
~~A normally utility-interactive inverter shall be permitted to operate as a stand-alone system to supply loads that have been disconnected from electrical production and distribution network sources.~~

705.95 Ampacity of Neutral Conductor.
If a single-phase 2-wire inverter output is connected to the neutral and one ungrounded conductor (only) of a 3-wire system or of a 3-phase 4-wire wye-connected system, the maximum load connected between the neutral and anyone ungrounded conductor plus the inverter output rating shall not exceed the ampacity of the neutral conductor.

705.100 Unbalanced Interconnections.
(A) Single Phase. Single-phase inverters for hybrid systems and ac modules in interactive hybrid systems shall not be connected to 3-phase power systems unless the interconnected system is designed so that significant unbalanced voltages cannot result.
(B) Three Phase. Three-phase inverters and 3-phase ac modules in interactive systems shall have all phases automatically de-energized upon loss of. or unbalanced. voltage in one or more phases unless the interconnected system is designed so that significant unbalanced voltages will not result.

III. Generators

705.130 Overcurrent Protection.
Conductors shall be protected in accordance with Article 240. Equipment and conductors connected to more than one electrical source shall have a sufficient number of overcurrent devices located so as to provide protection from all sources.
Generators shall be protected in accordance with 445.12.

705.143 Synchronous Generators.
Synchronous generators in a parallel system shall be provided with the necessary equipment to establish and maintain a synchronous condition.

The overall scheme adopted in addressing proposals 13-17, 13-71 and 13-184 was to accept "in principle" proposals 13-17 (regarding Article 690, Photovoltaics) and 13-71 (Fuel Cells), but to leave the indicated sections on interactive systems in these Articles to ensure that is no unforeseen negative impact could arise. The "Accept in Principle" allows public comment which could include suggestions for removing this redundant text.

Note: The proposed changes to Article 705 from Panel Action 13-185 have also been included in this proposal. The involve the addition of 705.4, and 705.22.

This proposal to change Article 705 was accepted with the following modifications:

1/ The two exceptions at the end of 705.3 Other Articles were retained as Articles 690 and 692 as these Articles contain installation information that is specific to their own technologies.

2/ Article 705-12. The 2005 language for Point of Connection from Article 690 was added as a third alternative to 705(A) and (B). Note: These should be modified according to the results of Panel Actions on Proposals 13-63 through 13-69.

3/ Article 705-22 Disconnect Device. The proposed requirement for a lockable disconnect was deleted as this is typically specified in Area EPS operating practices. (IEEE 1547 requires the following: "When required by the Area EPS operating practices, a readily accessible, lockable, visible-break isolation device shall be located between the Area EPS and the DR unit.")

4/ The title of 705.42 was changed from "Unbalanced Interconnections" to "705.42 Loss of Three-Phase Primary Source" as the title " Unbalanced Interconnections" is used again as the title for 705.100, and also this new title better describes the contents of the Article.

5/ A new Division III. Generators was added to allow these the very different technologies of rotating machines and inverters to be addressed separately. Article 705. 705.43 Synchronous Generators was renumbered to 705.143 and moved to the generator division. A section was added for Generator Overcurrent Protection and this topic was removed from 705.30 which was then renumbered.

6/ 705-60(A)(1) – was changed from a method peculiar to photovoltaics to the inverter input current rating.

7/ 705-60(B)(2) was deleted as it originally applied to photovoltaic (dc) output circuits and thus in inapplicable for inverter output circuits.

8/ "705.85 Identified Interactive Equipment." Was deleted as it is covered by the new section 705.4 and the text was not inclusive of rotating machines: " Only inverters and ac modules listed and identified as utility interactive shall be permitted in interactive systems"

9/ Proposed Article 705.90 Loss of Interactive System Power was deleted (apart from the last sentence) as it duplicated 705.40 Loss of Primary Source. The last sentence of 705.90 regarding stand-alone operation was moved to 705.40.

10/ 705.65(A) – the word "source" was changed to "input".

Panel Statement: The overall scheme adopted in addressing Proposals 13-17, 13-71, and 13-184 was to accept "in principle" proposals 13-17 (regarding Article 690, Photovoltaics) and 13-71 (Fuel Cells) but to leave the indicated sections on interactive systems in these articles to ensure that no unforeseen negative impact could arise. The accept in principle allows public comment, which could include suggestions for removing this redundant text.
Note: The proposed changes to Article 705 from Panel Action 13-185 have also been included in this proposal. They involve the addition of 705.4, and 705.22.
This proposal to change Article 705 was accepted with the following modifications:
1. The two exceptions at the end of 705.3 Other Articles were retained as Articles 690 and 692, as these articles contain installation information that is specific to their own technologies.
2. Article 705-12. The 2005 language for point of connection from Article 690 was added as a third alternative to 705(A) and (B). Note: These should be modified according to the results of panel actions on Proposals 13-63 through 13-69.
3. Article 705-22 Disconnect Device. The proposed requirement for a lockable disconnect was deleted, as this is typically specified in Area EPS operating practices. (IEEE 1547 requires the following: "When required by the Area EPS operating practices, a readily accessible, lockable, visible-break isolation device shall be located between the Area EPS and the DR unit.")
4. The title of 705.42 was changed from "Unbalanced Interconnections" to "705.42 Loss of Three-Phase Primary Source," as the title " Unbalanced Interconnections" is used again as the title for 705.100 and this new title better describes the contents of the Article.
5. A new Division III. Generators was added to allow these the very different technologies of rotating machines and inverters to be addressed separately. Article 705. 705.43 Synchronous Generators was renumbered to 705.143 and moved to the generator division. A section was added for Generator Overcurrent Protection and this topic was removed from 705.30, which was then renumbered.
6. 705-60(A)(1) – was changed from a method peculiar to photovoltaics to the inverter input current rating.
7. 705-60(B)(2) was deleted, as it originally applied to photovoltaic (dc) output circuits and thus is inapplicable for inverter output circuits.

8. "705.85 Identified Interactive Equipment." Was deleted, as it is covered by the new section 705.4 and the text was not inclusive of rotating machines: " Only inverters and ac modules listed and identified as utility interactive shall be permitted in interactive systems."

9. Proposed Article 705.90 Loss of Interactive System Power was deleted (apart from the last sentence) as it duplicated 705.40 Loss of Primary Source. The last sentence of 705.90 regarding stand-alone operation was moved to 705.40.

10. 705.65(A) – the word "source" was changed to "input".

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15

Ballot Not Returned: 1 Gustafson, R.

Comment on Affirmative:

BOWER, W.: I vote affirmative with comment because I believe the panel action to accept in principle in part was an effort to get the proposal to the industry and the public, but that substantiation was absent. The sweeping change as recommended in this proposal on Article 705 needs careful study. I disagree with the recommended duplication of the interconnection issues in Article 705, as accepted, WITHOUT a thorough industry-supported substantiation for each change. I commend the proposer for his efforts and it appears that most changes are correct, but the impacts for each technology must be assessed. There was little or no substantiation provided and little industry input to make the linked proposed changes in Article 690, 692 OR in 705. I believe this change, accepted in principle for 705 is timely, but that it now needs careful public and industry scrutiny.

HORNBERGER, B.: **I agree with the panel action to accept in principle, however two sections of the Article 705 rewrite by the panel should be revised. Section 705.12 should be reworded as shown below to incorporate changes accepted in <u>690.64(B)(2)</u> and <u>692.65(B)(2)</u> , and generalized for Utility Interactive Inverters. Also revise Section 705.22, as shown below, to re-instate the requirement for a "Lockable Disconnect" for the AC output circuits. This disconnect is essential to provide positive and visible confirmation that an interconnected power source has no possible method to backfeed electrical energy into a system which has been de-energized for maintenance or to meet the needs of emergency first response personnel.**

705.12 Point of Connection . The output of an interconnected electric power source shall be connected as specified in 692.65(A), (B), (C), <u>or (D).</u>

(A) Supply Side. Any interconnected electric power source shall be permitted to be connected at the premises service disconnecting means, beyond the point of common coupling.

(B) Integrated Electric Systems. The outputs shall be permitted to be interconnected at a point or points elsewhere on the premises where the system qualifies as an integrated electric system and incorporates protective equipment in accordance with all applicable sections of Article 685.

(C) Greater Than 100 KW The outputs shall be permitted to be interconnected at a point or points else where on the premises where all of the following conditions are met:

(1) The aggregate of non-utility sources of electricity has a capacity in excess of 100 KW, or the service is above 1,000 Volts.

(2) The conditions of maintenance and supervision ensure that qualified persons service and operate the system.

(3) Safeguards, documented procedures, and protective equipment are established and maintained.

(D) Utility Interactive Inverters rated less than 100 KW The output of a utility interactive inverter power source with a capacity of less than or equal to 100 KW shall be permitted to be connected as specified in either 705.12(D)(1) or 705.12(D)((2)

(1) Load Side. A utility-interactive inverter shall be permitted to be connected to the load side of the service disconnecting means of the other source(s) at any distribution equipment on the premises, provided that all of the following conditions of 705.12(D)(1)(a) through 705.12(D)(1)(e) are met:

(a) Dedicated Overcurrent and Disconnect. Each source interconnection shall be made at a dedicated circuit breaker or fusible disconnecting means.

(b) Ground Fault Protection. The interconnection point shall be on the line side of all ground-fault protection equipment.

(c) Marking. Equipment containing overcurrent devices in circuits supplying power to a busbar or conductor shall be marked to indicate the presence of all sources.

(d) Suitable for Back Feed. Equipment such as circuit breakers, if backfed, shall be identified for such operation.

(e) Bus or Conductor Rating. The rating of the bus or conductor to which the utility-interactive inverter breaker or fusible disconnect is connected shall meet all of the conditions in 705.12(D)(1)(e)(1) or 705.12(D)(1)(e)(2)

(1) End Feed Connection. Where the utility-interactive inverter breaker or fusible disconnect is connected in the distribution equipment at the opposite (load) end from the input feeder connection or main circuit location, the bus or conductor rating shall be equal to or larger than the sum of the ampere ratings of all overcurrent devices connecting premise electric power production sources to the bus or conductor. <u>The bus or conductor rating shall have been sized for the loads connected, in accordance with Article 220</u> . A permanent warning label shall be applied to the distribution equipment with the following or equivalent:

WARNING

ELECTRIC POWER PRODUCTION SOURCE OUTPUT

DO NOT RELOCATE THIS OVERCURRENT DEVICE.

(2) General Connection. Where the utility-interactive inverter breaker or fusible disconnect is not end fed, the bus or conductor rating shall be equal to or larger than the sum of the ampere ratings of overcurrent devices in circuits supplying power to the busbar or conductor. Exception: For a dwelling unit, the sum of the ampere ratings of the overcurrent devices shall not exceed 120 percent of the rating of the busbar or conductor.

705.22 Disconnect Device

The disconnecting means for ungrounded conductors shall consist of a manually or power operable switch or circuit breaker with the following features:

(1) Located where readily accessible

(2) Externally operable without exposing the operator to contact with live parts and if power operable, of a type that can be opened by hand in the event of a power supply failure.(3) Plainly indicating whether in the open (on) or closed (off) position

(4) Having ratings not less than the load to be carried and the fault current to be interrupted

<u>(5) Lockable in the open position</u>

KRASTINS, K.: See my affirmative with comment on Proposal 13-17.

PASTERNACK, S.: On panel rewrite, typo in 705.42 Exception: ovens=open

STAFFORD, T.: While I do agree with the submitter's intention and the panel's action, I have some comments directed at the modifications made to the proposal.

Note 1 – With the additional language placed in Article 705, I feel the two exceptions noted could be eliminated.

Note 2 – The text associated with Note 2 in the rewrite does not match what had happened in the proposals mentioned, (13-63 to 13-69) which refers you to 13-61. The text as proposed in 13-61 is different text than what is shown in this panel statement.

Note 3 – I don't agree with deleting the requirement for a lockable disconnect. This requirement is becoming standard language in multiple Articles throughout the NEC. See my affirmative comment on 13-9.

The changes made by this proposal and others like 13-17 and 13-71 are indicative of a distributed energy industry asking to be part of the NEC as well. The recommended changes that are removed from Articles 690 and 692 do not belong just to those forms of distributed energy and should be placed in Article 705. At the same time I do not like redundant code and with accepting 13-184 we should remove the same wording from Article 690 and 692.

SWAYNE, R.: This Proposal, in principle needs to be Accepted in Principle because it represents a significant improvement in the present text. There are, however, numerous editorial and technical corrections that need to be made. In order to insure that this Proposal is not totally rejected, I am voting in the Affirmative with the expectation that there will be Public Comments to make the needed corrections. Some of the items that need further consideration are:

1) In Section 705.4, "systems" are not listed but "equipment" is.

2) No explanation has been given for deleting "Generators" from Section 705.30(A).

3) In Section 705.40, it is not evident what a "normally utility interactive system" is. Why is "normally" needed?

4) In Section 705.70(3), Section 705.22 does not apply to "alternating current output conductors from the inverter".

5) In Section 705.95, the use of the word "neutral" is used in place of the term "grounded conductor". If the intention is that the neutral conductor and not necessarily the grounded conductor be sized appropriately, then a distinction should be made.

6) In Section 705.130, "a sufficient number" is superfluous and unnecessary to convey the requirement.

ZGONENA, T.: More input is needed from the DG industries that will be impacted by Article 705 to ensure it addresses the nuances of the various DG products.

13-185 Log #470 NEC-P13 **Final Action: Accept in Principle in Part (705.4, 705.22 and Annex A)**

Submitter: James M. Daley, Facilities Electrical Consulting Services / Rep. ASCO Power Technologies

Recommendation: The following is proposed to be submitted to NFPA 70 Code Making Panel 13:

705 Interconnected Electric Power Production Sources

Change: Add Article 705.4:

705.4 Equipment Approval. All equipment shall be approved for the intended use.

Interconnection systems shall be listed and identified for interconnection service. Alternatively, an interconnection system comprising a compilation of assembled components may be considered as listed where all components of the interconnection system are listed and identified as recognized components for the specific function they serve in the interconnection system.

705.22 Disconnect Device
Change: Add text
(1) Located where readily accessible
Appendix A
Change: Add Interconnection System to listing of standards with UL 1741 as the applicable standard.
Substantiation: The following rational is proposed to be submitted with this proposed Code revision.
Rational:
The proposed revision is consistent with the requirements of the NEC in general. (e.g. Article 700.3, 701.4)
It is necessary to expand the description of what is acceptable because many interconnection systems are site specific and would be comprised of recognized components suitable for the intended use.
Background:
The Electric Power System (EPS) has been deregulated. This allows the interconnection of Distributed Resources (DR) (distributed generation) with the EPS. This action lead to a proliferation of sources seeking interconnection with the EPS. Electric utility companies, EPS System operators, Federal and State Regulators, manufacturers, designers and users are seeking a consistent and dependable process that can assure the safe and proper electrical installation of DR. Given that the point of common coupling of the sources is on the user's side of the electric meter, the interconnection system falls under the jurisdiction of the National Electric Code, NFPA 70 (NEC).
The parties concerned are seeking a means of assuring that interconnection systems are safe and suitable for use without having to test and evaluate each and every installation. It is recognized that the NEC addresses this issue of assurance by Art. 90.7 Examination of Equipment for Safety. Art. 110.2 Approval and Art 110.3 Examination, Identification, installation and Use of Equipment provide the basis for assurance that equipment is suitable for its intended use.
In 2003 ANSI/IEEE Std 1547 Standard for Interconnecting Distributed Resources with Electric Power Systems was published. This standard was developed by a committee of both technical and operating interests from utility companies, EPS system operators, manufacturers and users numbering in excess of 300. When approved, the balloting pool consisted of 230 balloters. Recognizing the expertise of the committee that produced this standard, EPS system operators, State and Federal regulatory Commissions have been adopting this standard as a requirement for assuring suitability for service of interconnections systems. Equipment manufacturers are embracing this standard as the definitive requirement to meet acceptability for service.
In June of 2003, IEEE established a working group to develop IEEE P1547.1 Standard for Conformance Test Procedures for Equipment Interconnecting Distributed Resources with Electric Power Systems . That working group was comprised of over 80 members having the same demographics as that of ANSI/IEEE 1547. This proposed standard achieved an affirmative ballot from a balloting pool of 118 balloters. The standard was approved by the Standards Board of IEEE at its meeting on June 9, 2005 and published on July 1, 2005. It will have been available in print July 21, 2005.
UL Standard 1741, DRAFT REQUIREMENTS FOR THE PROPOSED SECOND EDITION OF THE STANDARD FOR INVERTERS, CONVERTERS, AND CONTROLLERS FOR USE WITH INDEPENDENT POWER SOURCES, UL 1741 has been expanded in scope to include all interconnection technologies. In a harmonization effort, UL 1741 is in the process of being revised to include all of the requirements of IEEE 1547.1 in addition to the fundamental UL standard requirements for safety. Therefore the loop will have been closed assuring that, when issued, listed and identified by UL or other Nationally Recognized Testing Laboratories (NRTL) having listing services, equipment for interconnection of DR will be approved for its intended use.
At a stakeholders meeting at NEMA Headquarters on April 14, 2005, stakeholders from utility companies, state and federal regulatory commissions and manufacturers met to address the certification task for interconnection systems for suitability of use. Among the concerns is how does the regulator, utility interest, system operator or other interested party determine that a particular interconnection system submittal is suitable for its intended use. The manufacturers suggested that since this equipment would be in the jurisdiction of the NEC, the NEC had an existing infrastructure to assure safety and suitability. That infrastructure includes the Authority Having Jurisdiction, electrical inspector, who looks for appropriate listing and identification. It was indicated that listing included follow-up inspection service at the point of manufacture to confirm that the products being shipped were in compliance with the listing requirements.
A task will be undertaken to explore the preparation and presentation of training materials explaining the requirements, listing and identification of the interconnection system for the Authorities Having Jurisdiction. As an initial consideration, such materials would likely be made available for continuing education purposes for organizations such as the International Association of Electrical Inspectors, IAEI seminars.
Having been made aware of this infrastructure, the stakeholders concluded that the jurisdiction of the NEC was a suitable means to assure safety of the interconnection systems. It was agreed that Code Making Panel #13 would be petitioned to add verbiage to Art 705 to specifically address the interconnection system. To wit, the proposed changes to add Art 705.4 and Art 705.22 are presented herein.
Summary:
Utility companies and System operators are concerned for the safety of their personnel, reliability of their system and quality of power delivered. State and Federal regulators are concerned with standardizing and expediting the DR interconnection process. Manufacturers are concerned with a uniform set of requirements. Users are concerned with assurance that the installed system is safe and compliant. The foundation for meeting these interests exist in UL 1741 as proposed. What remains to be achieved is a jurisdictional inspection process that assures that only qualified equipment is used. This is within the normal scope of the National Electrical Code. The proposed changes herein will provide that assurance.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle in Part
Add new Article 705.4:
705.4 Equipment Approval. All equipment shall be approved for the intended use. Interconnection systems shall be listed and identified for interconnection service.
705.22 Disconnect Device
Insert the word "readily":
(1) Located where readily accessible
Annex A
Change: Change the title of UL 1741 from "Inverters, Converters and Controllers for use in Independent Power Systems" to "Inverters, Converters, Controllers and Interconnection System Equipment for Use With Distributed Energy Resources".
Panel Statement: The panel accepted the first sentence.
The panel did not accept the second sentence "Alternatively, an interconnection system comprising a compilation of assembled components may be considered as listed where all components of the interconnection system are listed and identified as recognized components for the specific function they serve in the interconnection system," as a compilation of components would not necessarily meet the requirements for interconnection systems unless tested as a complete system. In addition, the submitterr gave no technical substantiation for this part of the proposal.
The panel accepted the change from "accessible" to"readily accessible," as this is the same language that is used in Articles 690 and 692, and is also a part of the change proposed in Panel Action 13-184 (to incorporate the relevant parts of 690 and 692 into 705).
UL1741 is already listed in Annex (not Appendix) A; however, the title has changed since the 2005 Code cycle, and so that change should be made. "Interconnection System" could not be used as a title, as this is a list of standards and their own titles.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Gustafson, R.

13-186 Log #1243 NEC-P13 **Final Action: Accept**
(705.22)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Add: (5) Simultaneous disconnect of all ungrounded conductors of the circuit.
Substantiation: Edit. This is a standard Code requirement for disconnecting means.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Gustafson, R.
Comment on Affirmative:
STAFFORD, T.: See my comment to the affirmative on 13-9.

13-187 Log #1256 NEC-P13 **Final Action: Accept**
(705.30)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Change "Article 240" to "240.4".
Substantiation: Edit. To conform to Style Manual
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 14 Negative: 1
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
ZGONENA, T.: The text should remain as is. The reference to 240 is correct as there are numerous appropriate sections in 240, not just 240.4. For example, 240.5, 240.92, 240.100, and 240.101.
Comment on Affirmative:
SWAYNE, R.: The proposed change should change "Article 240" to "Section 240.4". Consistent with this editorial change, editorially need to change "Article 690" to "Section 690.9" in (B) and change "Article 692" to "Section 692.9" in (C).

13-188 Log #903 NEC-P13 **Final Action: Reject**
(705.52(5))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Add new text as follows:
(5) Simultaneous disconnection of all ungrounded conductors of the circuit controls.
Substantiation: Edit. This feature should be specified, as in other Code sections.
Panel Meeting Action: Reject
Panel Statement: There is no 705.52.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Gustafson, R.

ARTICLE 720 — CIRCUITS AND EQUIPMENT OPERATING AT LESS THAN 50 VOLTS

3-132 Log #952 NEC-P03 **Final Action: Accept in Principle**
(720.2)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:
Installations operating at less than 50 volts, direct current or alternating current, as covered elsewhere in this Code. ~~Articles 411, 517, 550, 551, 552, 650, 669, 690, and 725, and 760~~ shall not be required to comply with this article.
Substantiation: To comply with Style Manual requirements.
Panel Meeting Action: Accept in Principle
Change the text in 720.2 to add various sections and Parts to the text to read as follows:
720.2 Other Articles
Direct current or alternating current installations operating at less than 50 volts, as covered in 411.1 through 411.7, Part VI of Article 517, Part II of Article 551, Parts II and III and 552.60(B) of Article 552, 650.1 through 650.8, 669.1 through 669.9, Parts I and VIII of Article 690, Parts I and III of Article 725, or Parts I and III of Article 760, shall not be required to comply with this article.
Panel Statement: These references should remain so that compliance is not necessary for the referenced articles and sections so each pertinent section and Part was inserted to comply with Section 4.1.1 of the NEC Style Manual. Article 550 was deleted since there wasn't a reference to mobile and manufactured home systems operating at less than 50 volts.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-133 Log #993 NEC-P03 **Final Action: Accept in Principle**
(720.3)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Installations coming within the scope of this article and installed in hazardous (classified) locations shall also comply with ~~the appropriate provisions of Article 500 through 517.~~ <u>other applicable articles of this Code.</u> Alternatively, delete this section.
Substantiation: Edit. To comply with the Style Manual. Already covered by 90.3.
Panel Meeting Action: Accept in Principle
Change the existing text in 720.3 by deleting the word "coming" and adding the phrase "for hazardous locations in other applicable articles of this Code" to read as follows:
720.3 Hazardous (Classified) Locations
Installations within the scope of this article and installed in hazardous (classified) locations shall also comply with the appropriate provisions for hazardous (classified) locations in other applicable articles of this Code.
Panel Statement: The word "coming" was deleted since it was superfluous to the text. The phrase "for hazardous locations in other applicable articles in this Code" was added for clarity.

Substantiation: This proposal was developed by a Task Group consisting of CMP-3 members Ray Keden, Robert Walsh, Ron Maassen, Mark Ode, Tom Guida and Chair Richard Owen.

The Task Group was formed to look at held Comment 3-108, which suggested a new parallel numbering system for Articles 725 and 760. As a result of several conference calls and by work outside the calls, the Task Group unanimously approved the proposal as shown. The Task Group attempted as much as was possible to correlate the numbering of the two articles, as well as a similar numbering sequence for those related sections in Chapter 8 for overall correlation, while leaving adequate room between sections for future additions. It was impossible to renumber the two articles exactly, since some sections could not be moved without changing their intent. One example of this is newly renumbered Sections 725.52 covering Class 1 circuits extending beyond one building and 760.32 covering both power limited fire alarm and non-power-limited fire alarm circuits extending beyond one building, which both address the same thing, but the numbering could not be the same without changing the intent of these sections due to their location in their respective articles.

There is a companion proposal to this one for Article 760.

Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-138 Log #226 NEC-P03 **Final Action: Accept in Principle**
(725 and 760)

NOTE: The following proposal consists of Comment 3-108 on Proposal 3-126 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 3-126 was:

Renumber the sections within Articles 725, 760, 770, 800, 820 & 830 as shown on the following table [Table shown on following pages]. For information, the following are pro forma rewrites of the Articles assuming that the individual proposals are accepted.

CMP 16 TG Draft Proposals Inserted into ARTICLE 725 Class 1, Class 2, and Class 3 Remote-Control, Signaling, and Power-Limited Circuits

I. General

725.1 Scope.

This article covers remote-control, signaling, and power-limited circuits that are not an integral part of a device or appliance.

FPN: The circuits described herein are characterized by usage and electrical power limitations that differentiate them from electric light and power circuits; therefore, alternative requirements to those of Chapters 1 through 4 are given with regard to minimum wire sizes, derating factors, overcurrent protection, insulation requirements, and wiring methods and materials.

725.2 Definitions.

For purposes of this article, the following definitions apply.

Abandoned Class 2, Class 3, and PLTC Cable. Installed Class 2, Class 3, and PLTC cable that is not terminated at equipment and not identified for future use with a tag.

Class 1 Circuit. The portion of the wiring system between the load side of the overcurrent device or power-limited supply and the connected equipment. The voltage and power limitations of the source are in accordance with 725.21.

Class 2 Circuit. The portion of the wiring system between the load side of a Class 2 power source and the connected equipment. Due to its power limitations, a Class 2 circuit considers safety from a fire initiation standpoint and provides acceptable protection from electric shock.

Class 3 Circuit. The portion of the wiring system between the load side of a Class 3 power source and the connected equipment. Due to its power limitations, a Class 3 circuit considers safety from a fire initiation standpoint. Since higher levels of voltage and current than Class 2 are permitted, additional safeguards are specified to provide protection from an electric shock hazard that could be encountered.

725.3 Other Articles.

Circuits and equipment shall comply with the articles or sections listed in 725.3(A) through (F). Only those sections of Article 300 referenced in this article shall apply to Class 1, Class 2, and Class 3 circuits.

(A) Number and Size of Conductors in Raceway. Section 300.17.
(B) Spread of Fire or Products of Combustion. Section 300.21. The accessible portion of abandoned Class 2, Class 3, and PLTC cables shall not be permitted to remain.
(C) Ducts, Plenums, and Other Air-Handling Spaces. Section 300.22 for Class 1, Class 2, and Class 3 circuits installed in ducts, plenums, or other space used for environmental air. Type CL2P or CL3P cables shall be permitted for Class 2 and Class 3 circuits.

(D) Hazardous (Classified) Locations. Articles 500 through 516 and Article 517, Part IV, where installed in hazardous (classified) locations.

(E) Cable Trays. Article 392, where installed in cable tray.

(F) Motor Control Circuits. Article 430, Part VI, where tapped from the load side of the motor branch-circuit protective device(s) as specified in 430.72(A).

725.7Access to Electrical Equipment Behind Panels Designed to Allow Access.

Access to electrical equipment shall not be denied by an accumulation of wires and cables that prevents removal of panels, including suspended ceiling panels.

725.8 Mechanical Execution of Work.
Class 1, Class 2, and Class 3 circuits shall be installed in a neat and workmanlike manner. Cables and conductors installed exposed on the outer surface of ceiling and sidewalls shall be supported by structural components of the building in such a manner that the cable or conductors will not be damaged by normal building use. Such cables shall be attached to structural components by straps, staples, hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also conform with 300.4(D).

725.9 Class 1, Class 2, and Class 3 Circuit Grounding.

Class 1, Class 2, and Class 3 circuits and equipment shall be grounded in accordance with Article 250.

725.10 Class 1, Class 2, and Class 3 Circuit Identification.
Class 1, Class 2, and Class 3 circuits shall be identified at terminal and junction locations, in a manner that prevents unintentional interference with other circuits during testing and servicing.

725.11 Safety-Control Equipment.

(A) Remote-Control Circuits. Remote-control circuits for safety-control equipment shall be classified as Class 1 if the failure of the equipment to operate introduces a direct fire or life hazard. Room thermostats, water temperature regulating devices, and similar controls used in conjunction with electrically controlled household heating and air conditioning shall not be considered safety-control equipment.

(B) Physical Protection. Where damage to remote-control circuits of safety control equipment would introduce a hazard, as covered in 725.11(A), all conductors of such remote-control circuits shall be installed in rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, electrical metallic tubing, Type MI cable, Type MC cable, or be otherwise suitably protected from physical damage.

725.15 Class 1, Class 2, and Class 3 Circuit Requirements.

A remote-control, signaling, or power-limited circuit shall comply with the following parts of this article:

(1) Class 1 Circuits, Parts I and II

(2) Class 2 and Class 3 Circuits, Parts I and III

II. Class 1 Circuits

725.21 Class 1 Circuit Classifications and Power Source Requirements.

Class 1 circuits shall be classified as either Class 1 power-limited circuits where they comply with the power limitations of 725.21(A) or as Class 1 remote-control and signaling circuits where they are used for remote control or signaling purposes and comply with the power limitations of 725.21(B).

(A) Class 1 Power-Limited Circuits. These circuits shall be supplied from a source that has a rated output of not more than 30 volts and 1000 volt-amperes.

(1) Class 1 Transformers. Transformers used to supply power-limited Class 1 circuits shall comply with Article 450.

(2) Other Class 1 Power Sources. Power sources other than transformers shall be protected by overcurrent devices rated at not more than 167 percent of the volt-ampere rating of the source divided by the rated voltage. The overcurrent devices shall not be interchangeable with overcurrent devices of higher ratings. The overcurrent device shall be permitted to be an integral part of the power supply.

To comply with the 1000 volt-ampere limitation of 725.21(A), the maximum output (VA_{max}) of power sources other than transformers shall be limited to 2500 volt-amperes, and the product of the maximum current (I_{max}) and maximum voltage (V_{max}) shall not exceed 10,000 volt-amperes. These ratings shall be determined with any overcurrent-protective device bypassed.

VA_{max} is the maximum volt-ampere output after one minute of operation regardless of load and with overcurrent protection bypassed, if used. Current-limiting impedance shall not be bypassed when determining VA_{max}.

I_{max} is the maximum output current under any noncapacitive load, including short circuit, and with overcurrent protection bypassed, if used. Current-limiting impedance should not be bypassed when determining I_{max}. Where a current-limiting impedance, listed for the purpose or as part of a listed product, is used in combination with a stored energy source, for example, storage battery, to limit the output current, I_{max} limits apply after 5 seconds.

V_{max} is the maximum output voltage regardless of load with rated input applied.

(B) Class 1 Remote-Control and Signaling Circuits. These circuits shall not exceed 600 volts. The power output of the source shall not be required to be limited.

725.23 Class 1 Circuit Overcurrent Protection.

Overcurrent protection for conductors 14 AWG and larger shall be provided in accordance with the conductor ampacity, without applying the derating factors of 310.15 to the ampacity calculation. Overcurrent protection shall not exceed 7 amperes for 18 AWG conductors and 10 amperes for 16 AWG.

Exception: Where other articles of this Code permit or require other overcurrent protection.

FPN: For example, see 430.72 for motors, 610.53 for cranes and hoists, and 517.74(B) and 660.9 for X-ray equipment.

725.24 Class 1 Circuit Overcurrent Device Location.

Overcurrent devices shall be located as specified in 725.24(A) through (E).
(A) Point of Supply. Overcurrent devices shall be located at the point where the conductor to be protected receives its supply.
(B) Feeder Taps. Class 1 circuit conductors shall be permitted to be tapped, without overcurrent protection at the tap, where the overcurrent device protecting the circuit conductor is sized to protect the tap conductor.
(C) Transformer Taps. Class 1 circuit conductors 14 AWG and larger that are tapped from the load side of the overcurrent-protective device(s) of a controlled light and power circuit shall require only short-circuit and ground-fault protection and shall be permitted to be protected by the branch-circuit overcurrent protective device(s) where the rating of the protective device(s) is not more than 300 percent of the ampacity of the Class 1 circuit conductor.
(D) Primary Side of Transformer. Class 1 circuit conductors supplied by the secondary of a single-phase transformer having only a 2-wire (single-voltage) secondary shall be permitted to be protected by overcurrent protection provided on the primary side of the transformer, provided this protection is in accordance with 450.3 and does not exceed the value determined by multiplying the secondary conductor ampacity by the secondary-to-primary transformer voltage ratio. Transformer secondary conductors other than 2 wire shall not be considered to be protected by the primary overcurrent protection.
(E) Input Side of Electronic Power Source. Class 1 circuit conductors supplied by the output of a single-phase, listed electronic power source, other than a transformer, having only a 2-wire (single voltage) output for connection to Class 1 circuits shall be permitted to be protected by overcurrent protection provided on the input side of the electronic power source, provided this protection does not exceed the value determined by multiplying the Class 1 circuit conductor ampacity by the output-to-input voltage ratio. Electronic power source outputs, other than 2 wire (single voltage), shall not be considered to be protected by the primary overcurrent protection.

725.25 Class 1 Circuit Wiring Methods.

Installations of Class 1 circuits shall be in accordance with Article 300 and the other appropriate articles in Chapter 3.
Exception No. 1: The provisions of 725.26 through 725.28 shall be permitted to apply in installations of Class 1 circuits.
Exception No. 2: Methods permitted or required by other articles of this Code shall apply to installations of Class 1 circuits.

725.26 Conductors of Different Circuits in the Same Cable, Cable Tray, Enclosure, or Raceway.

Class 1 circuits shall be permitted to be installed with other circuits as specified in 725.26(A) and (B).

(A) Two or More Class 1 Circuits. Class 1 circuits shall be permitted to occupy the same cable, cable tray, enclosure, or raceway without regard to whether the individual circuits are alternating current or direct current, provided all conductors are insulated for the maximum voltage of any conductor in the cable, cable tray, enclosure, or raceway.

(B) Class 1 Circuits with Power Supply Circuits. Class 1 circuits shall be permitted to be installed with power supply conductors as specified in 725.26(B)(1) through (B)(4).
(1) In a Cable, Enclosure, or Raceway. Class 1 circuits and power supply circuits shall be permitted to occupy the same cable, enclosure, or raceway only where the equipment powered is functionally associated.
(2) In Factory- or Field-Assembled Control Centers. Class 1 circuits and power supply circuits shall be permitted to be installed in factory- or field-assembled control centers.
(3) In a Manhole. Class 1 circuits and power supply circuits shall be permitted to be installed as underground conductors in a manhole in accordance with one of the following:

(1) The power-supply or Class 1 circuit conductors are in a metal-enclosed cable or Type UF cable.
(2) The conductors are permanently separated from the power-supply conductors by a continuous firmly fixed nonconductor, such as flexible tubing, in addition to the insulation on the wire.
(3) The conductors are permanently and effectively separated from the power supply conductors and securely fastened to racks, insulators, or other approved supports.

(4) In cable trays, where the Class 1 circuit conductors and power-supply conductors not functionally associated with them are separated by a solid fixed barrier of a material compatible with the cable tray, or where the power-supply or Class 1 circuit conductors are in a metal-enclosed cable.

725.27 Class 1 Circuit Conductors.

(A) Sizes and Use. Conductors of sizes 18 AWG and 16 AWG shall be permitted to be used, provided they supply loads that do not exceed the ampacities given in 402.5 and are installed in a raceway, an approved enclosure, or a listed cable. Conductors larger than 16 AWG shall not supply loads greater than the ampacities given in 310.15. Flexible cords shall comply with Article 400.

(B) Insulation. Insulation on conductors shall be suitable for 600 volts. Conductors larger than 16 AWG shall comply with Article 310. Conductors in sizes 18 AWG and 16 AWG shall be Type FFH-2, KF-2, KFF-2, PAF, PAFF, PF, PFF, PGF, PGFF, PTF, PTFF, RFH-2, RFHH-2, RFHH-3, SF-2, SFF-2, TF, TFF, TFFN, TFN, ZF, or ZFF. Conductors with other types and thicknesses of insulation shall be permitted if listed for Class 1 circuit use.

725.28 Number of Conductors in Cable Trays and Raceway, and Derating.

(A) Class 1 Circuit Conductors. Where only Class 1 circuit conductors are in a raceway, the number of conductors shall be determined in accordance with 300.17. The derating factors given in 310.15(B)(2)(a) shall apply only if such conductors carry continuous loads in excess of 10 percent of the ampacity of each conductor.

(B) Power-Supply Conductors and Class 1 Circuit Conductors. Where power-supply conductors and Class 1 circuit conductors are permitted in a raceway in accordance with 725.26, the number of conductors shall be determined in accordance with 300.17. The derating factors given in 310.15(B)(2)(a) shall apply as follows:

(1) To all conductors where the Class 1 circuit conductors carry continuous loads in excess of 10 percent of the ampacity of each conductor and where the total number of conductors is more than three

(2) To the power-supply conductors only, where the Class 1 circuit conductors do not carry continuous loads in excess of 10 percent of the ampacity of each conductor and where the number of power-supply conductors is more than three

(C) Class 1 Circuit Conductors in Cable Trays. Where Class 1 circuit conductors are installed in cable trays, they shall comply with the provisions of 392.9 through 392.11.

725.29 Circuits Extending Beyond One Building.

Class 1 circuits that extend aerially beyond one building shall also meet the requirements of Article 225.

III. Class 2 and Class 3 Circuits

725.41 Power Sources for Class 2 and Class 3 Circuits.

(A) Power Source. The power source for a Class 2 or a Class 3 circuit shall be as specified in 725.41(A)(1), (2), (3), (4), or (5):

FPN No. 1: Figure 725.41 illustrates the relationships between Class 2 or Class 3 power sources, their supply, and the Class 2 or Class 3 circuits.

FPN No. 2: Table 11(A) and Table 11(B) in Chapter 9 provide the requirements for listed Class 2 and Class 3 power sources.

(1) A listed Class 2 or Class 3 transformer

(2) A listed Class 2 or Class 3 power supply

(3) Other listed equipment marked to identify the Class 2 or Class 3 power source

Exception: Thermocouples shall not require listing as a Class 2 power source.

FPN: Examples of other listed equipment are as follows:

(1) A circuit card listed for use as a Class 2 or Class 3 power source where used as part of a listed assembly

(2) A current-limiting impedance, listed for the purpose, or part of a listed product, used in conjunction with a non–power-limited transformer or a stored energy source, for example, storage battery, to limit the output current

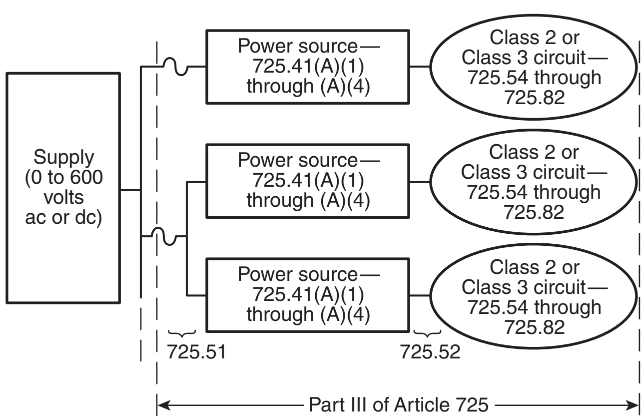
(3) A thermocouple

(4) Listed information technology (computer) equipment limited power circuits.

FPN: One way to determine applicable requirements for listing of information technology (computer) equipment is to refer to UL 1950-1995, *Standard for Safety of Information Technology Equipment, Including Electrical Business Equipment.* Typically such circuits are used to interconnect information technology equipment for the purpose of exchanging information (data).

(5) A dry cell battery shall be considered an inherently limited Class 2 power source, provided the voltage is 30 volts or less and the capacity is equal to or less than that available from series connected No. 6 carbon zinc cells.

(B) Interconnection of Power Sources. Class 2 or Class 3 power sources shall not have the output connections paralleled or otherwise interconnected unless listed for such interconnection.



725.42 Circuit Marking.

The equipment shall be durably marked where plainly visible to indicate each circuit that is a Class 2 or Class 3 circuit.

725.51 Wiring Methods on Supply Side of the Class 2 or Class 3 Power Source.

Conductors and equipment on the supply side of the power source shall be installed in accordance with the appropriate requirements of Chapters 1 through 4. Transformers or other devices supplied from electric light or power circuits shall be protected by an overcurrent device rated not over 20 amperes.

Exception: The input leads of a transformer or other power source supplying Class 2 and Class 3 circuits shall be permitted to be smaller than 14 AWG, but not smaller than 18 AWG if they are not over 12 in. (305 mm) long and if they have insulation that complies with 725.27(B).

725.52 Wiring Methods and Materials on Load Side of the Class 2 or Class 3 Power Source.
Class 2 and Class 3 circuits on the load side of the power source shall be permitted to be installed using wiring methods and materials in accordance with either 725.52(A) or (B).

(A) Class 1 Wiring Methods and Materials. Installation shall be in accordance with 725.25.

Exception No. 1: The derating factors that are given in 310.15(B)(2)(a) shall not apply.

Exception No. 2: Class 2 and Class 3 circuits shall be permitted to be reclassified and installed as Class 1 circuits if the Class 2 and Class 3 markings required in 725.42 are eliminated and the entire circuit is installed using the wiring methods and materials in accordance with Part II, Class 1 circuits.

FPN: Class 2 and Class 3 circuits reclassified and installed as Class 1 circuits are no longer Class 2 or Class 3 circuits, regardless of the continued connection to a Class 2 or Class 3 power source.

(B) Class 2 and Class 3 Wiring Methods. Conductors on the load side of the power source shall be insulated at not less than the requirements of 725.71 and shall be installed in accordance with 725.54 and 725.61.

Exception No. 1: As provided for in 620.21 for elevators and similar equipment.

Exception No. 2: Other wiring methods and materials installed in accordance with the requirements of 725.3 shall be permitted to extend or replace the conductors and cables described in 725.71 and permitted by 725.52(B).

725.54 Installation of Conductors and Equipment in Cables, Compartments, Cable Trays, Enclosures, Manholes, Outlet Boxes, Device Boxes, and Raceways for Class 2 and Class 3 Circuits.
Conductors and equipment for Class 2 and Class 3 circuits shall be installed in accordance with 725.55 through 725.58.

725.55 Separation from Electric Light, Power, Class 1, Non–Power-Limited Fire Alarm Circuit Conductors, and Medium Power Network-Powered Broadband Communications Cables.

(A) General. Cables and conductors of Class 2 and Class 3 circuits shall not be placed in any cable, cable tray, compartment, enclosure, manhole, outlet box, device box, raceway, or similar fitting with conductors of electric light, power, Class 1, non–power-limited fire alarm circuits, and medium power network-powered broadband communications circuits unless permitted by 725.55(B) through (J).

(B) Separated by Barriers. Class 2 and Class 3 circuits shall be permitted to be installed together with Class 1, non–power-limited fire alarm and medium power network-powered broadband communications circuits where they are separated by a barrier.

(C) Raceways Within Enclosures. In enclosures, Class 2 and Class 3 circuits shall be permitted to be installed in a raceway to separate them from Class 1, non–power-limited fire alarm and medium power network-powered broadband communications circuits.

(D) Associated Systems Within Enclosures. Class 2 and Class 3 circuit conductors in compartments, enclosures, device boxes, outlet boxes, or similar fittings shall be permitted to be installed with electric light, power, Class 1, non–power-limited fire alarm, and medium power network-powered broadband communications circuits where they are introduced solely to connect the equipment connected to Class 2 and Class 3 circuits, and where (1) or (2) applies:

(1) The electric light, power, Class 1, non–power-limited fire alarm, and medium power network-powered broadband communications circuit conductors are routed to maintain a minimum of 6 mm (0.25 in.) separation from the conductors and cables of Class 2 and Class 3 circuits.

(2) The circuit conductors operate at 150 volts or less to ground and also comply with one of the following:

a. The Class 2 and Class 3 circuits are installed using Type CL3, CL3R, or CL3P or permitted substitute cables, provided these Class 3 cable conductors extending beyond the jacket are separated by a minimum of 6 mm (0.25 in.) or by a nonconductive sleeve or nonconductive barrier from all other conductors.

b. The Class 2 and Class 3 circuit conductors are installed as a Class 1 circuit in accordance with 725.21.

(E) Enclosures with Single Opening. Class 2 and Class 3 circuit conductors entering compartments, enclosures, device boxes, outlet boxes, or similar fittings shall be permitted to be installed with Class 1, non–power-limited fire alarm and medium power network-powered broadband communications circuits where they are introduced solely to connect the equipment connected to Class 2 and Class 3 circuits. Where Class 2 and Class 3 circuit conductors must enter an enclosure that is provided with a single opening, they shall be permitted to enter through a single fitting (such as a tee), provided the conductors are separated from the conductors of the other circuits by a continuous and firmly fixed nonconductor, such as flexible tubing.

(F) Manholes. Underground Class 2 and Class 3 circuit conductors in a manhole shall be permitted to be installed with Class 1, non–power-limited fire alarm and medium power network-powered broadband communications circuits where one of the following conditions is met:

(1) The electric light, power, Class 1, non–power-limited fire alarm and medium power network-powered broadband communications circuit conductors are in a metal-enclosed cable or Type UF cable.

(2) The Class 2 and Class 3 circuit conductors are permanently and effectively separated from the conductors of other circuits by a continuous and firmly fixed nonconductor, such as flexible tubing, in addition to the insulation or covering on the wire.

(3) The Class 2 and Class 3 circuit conductors are permanently and effectively separated from conductors of the other circuits and securely fastened to racks, insulators, or other approved supports.

(G) Article 780. Class 2 and Class 3 conductors as permitted by 780.6(A) shall be permitted to be installed in accordance with Article 780.

(H) Cable Trays. Class 2 and Class 3 circuit conductors shall be permitted to be installed in cable trays, where the conductors of the electric light, Class 1, and non–power-limited fire alarm circuits are separated by a solid fixed barrier of a material compatible with the cable tray or where the Class 2 or Class 3 circuits are installed in Type MC cable.

(I) In Hoistways. In hoistways, Class 2 or Class 3 circuit conductors shall be installed in rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, liquidtight flexible nonmetallic conduit, or electrical metallic tubing. For elevators or similar equipment, these conductors shall be permitted to be installed as provided in 620.21.

(J) Other Applications. For other applications, conductors of Class 2 and Class 3 circuits shall be separated by at least 50 mm (2 in.) from conductors of any electric light, power, Class 1 non–power-limited fire alarm or medium power network-powered broadband communications circuits unless one of the following conditions is met:

(1) Either (a) all of the electric light, power, Class 1, non–power-limited fire alarm and medium power network-powered broadband communications circuit conductors or (b) all of the Class 2 and Class 3 circuit conductors are in a raceway or in metal-sheathed, metal-clad, non–metallic-sheathed, or Type UF cables.

(2) All of the electric light, power, Class 1 non–power-limited fire alarm, and medium power network-powered broadband communications circuit conductors are permanently separated from all of the Class 2 and Class 3 circuit conductors by a continuous and firmly fixed nonconductor, such as porcelain tubes or flexible tubing, in addition to the insulation on the conductors.

725.56 Installation of Conductors of Different Circuits in the Same Cable, Enclosure, or Raceway.

(A) Two or More Class 2 Circuits. Conductors of two or more Class 2 circuits shall be permitted within the same cable, enclosure, or raceway.

(B) Two or More Class 3 Circuits. Conductors of two or more Class 3 circuits shall be permitted within the same cable, enclosure, or raceway.

(C) Class 2 Circuits with Class 3 Circuits. Conductors of one or more Class 2 circuits shall be permitted within the same cable, enclosure, or raceway with conductors of Class 3 circuits, provided that the insulation of the Class 2 circuit conductors in the cable, enclosure, or raceway is at least that required for Class 3 circuits.

(D) Class 2 and Class 3 Circuits with Communications Circuits.

(1) Classified as Communications Circuits. Class 2 and Class 3 circuit conductors shall be permitted in the same cable with communications circuits, in which case the Class 2 and Class 3 circuits shall be classified as communications circuits and shall be installed in accordance with the requirements of Article 800. The cables shall be listed as communications cables or multipurpose cables.

(2) Composite Cables. Cables constructed of individually listed Class 2, Class 3, and communications cables under a common jacket shall be permitted to be classified as communications cables. The fire resistance rating of the composite cable shall be determined by the performance of the composite cable.

(E) Class 2 or Class 3 Cables with Other Circuit Cables. Jacketed cables of Class 2 or Class 3 circuits shall be permitted in the same enclosure or raceway with jacketed cables of any of the following:

(1) Power-limited fire alarm systems in compliance with Article 760

(2) Nonconductive and conductive optical fiber cables in compliance with Article 770

(3) Communications circuits in compliance with Article 800

(4) Community antenna television and radio distribution systems in compliance with Article 820

(5) Low-power, network-powered broadband communications in compliance with Article 830

725.57 Installation of Circuit Conductors Extending Beyond One Building.

Where Class 2 or Class 3 circuit conductors extend beyond one building and are run so as to be subject to accidental contact with electric light or power conductors operating over 300 volts to ground, or are exposed to lightning on interbuilding circuits on the same premises, the requirements of the following shall also apply:

(1) Sections 800.10, 800.12, 800.13, 800.31, 800.32, 800.33, and 800.40 for other than coaxial conductors

(2) Sections 820.10, 820.33, and 820.40 for coaxial conductors

725.58 Support of Conductors.

Class 2 or Class 3 circuit conductors shall not be strapped, taped, or attached by any means to the exterior of any conduit or other raceway as a means of support. These conductors shall be permitted to be installed as permitted by 300.11(B)(2).

725.61 Applications of Listed Class 2, Class 3, and PLTC Cables.

Class 2, Class 3, and PLTC cables shall comply with any of the requirements described in 725.61(A) through (F).

(A) Plenum. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CL2P or CL3P. Abandoned cables shall not be permitted to remain. Listed wires and cables installed in compliance with 300.22 shall be permitted.

(B) Riser. Cables installed in risers shall be as described in any of (1), (2), or (3):

(1) Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type CL2R or CL3R. Floor penetrations requiring Type CL2R or CL3R shall contain only cables suitable for riser or plenum use. Abandoned cables shall not be permitted to remain.

(2) Other cables as covered in Table 725.61 and other listed wiring methods as covered in Chapter 3 shall be installed in metal raceways or located in a fireproof shaft having firestops at each floor.

(3) Type CL2, CL3, CL2X, and CL3X cables shall be permitted in one- and two-family dwellings.

FPN: See 300.21 for firestop requirements for floor penetrations.

(C) Cable Trays. Cables installed in cable trays outdoors shall be Type PLTC. Cables installed in cable trays indoors shall be Types PLTC, CL3P, CL3R, CL3, CL2P, CL2R, and CL2.

FPN: See 800.55(D) for cables permitted in cable trays.

(D) Hazardous (Classified) Locations. Cables installed in hazardous locations shall be as described in 725.61(D)(1) through (D)(4).

(1) Type PLTC. Cables installed in hazardous (classified) locations shall be Type PLTC. Where the use of Type PLTC cable is permitted by 501.4(B), 502.4(B), and 504.20, the cable shall be installed in cable trays, in raceways supported by messenger wire, or otherwise adequately supported and mechanically protected by angles, struts, channels, or other mechanical means. The cable shall be permitted to be directly buried where the cable is listed for this use.

(2) Nonincendive Field Wiring. Wiring for Class 2 circuits as permitted by 501.4(B)(3) shall be permitted.

(3) Thermocouple Circuits. Conductors in Type PLTC cables used for Class 2 thermocouple circuits shall be permitted to be any of the materials used for thermocouple extension wire.

(4) In Industrial Establishments. In industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons service the installation, and where the cable is not subject to physical damage, Type PLTC cable that complies with the crush and impact requirements of Type MC cable and is identified for such use shall be permitted as open wiring between cable tray and utilization equipment in lengths not to exceed 15 m (50 ft). The cable shall be supported and protected against physical damage using mechanical protection such as dedicated struts, angles, or channels. The cable shall be supported and secured at intervals not exceeding 1.75 m (6 ft).

(E) Other Wiring Within Buildings. Cables installed in building locations other than those covered in 725.61(A) through (D) shall be as described in any of (1) through (6). Abandoned cables in hollow spaces shall not be permitted to remain.

(1) Type CL2 or CL3 shall be permitted.

(2) Type CL2X or CL3X shall be permitted to be installed in a raceway or in accordance with other wiring methods covered in Chapter 3.

(3) Cables shall be permitted to be installed in nonconcealed spaces where the exposed length of cable does not exceed 3 m (10 ft).

(4) Listed Type CL2X cables less than 6 mm (0.25 in.) in diameter and listed Type CL3X cables less than 6 mm (0.25 in.) in diameter shall be permitted to be installed in one- and two-family dwellings.

(5) Listed Type CL2X cables less than 6 mm (0.25 in.) in diameter and listed Type CL3X cables less than 6 mm (0.25 in.) in diameter shall be permitted to be installed in nonconcealed spaces in multifamily dwellings.

(6) Type CMUC undercarpet communications wires and cables shall be permitted to be installed under carpet.

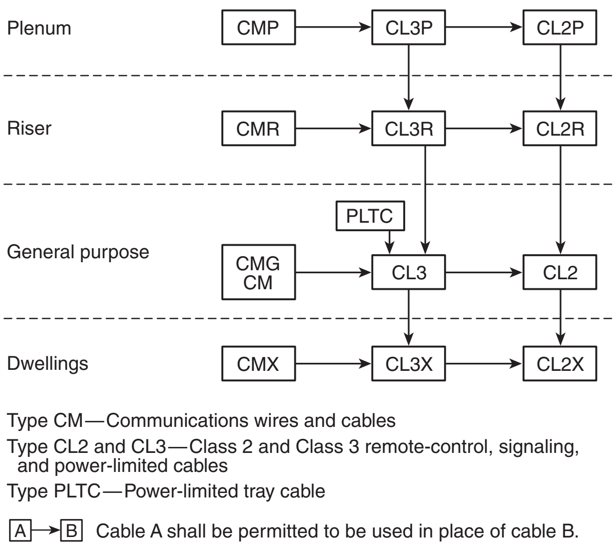
(F) Cross-Connect Arrays. Type CL2 or CL3 conductors or cables shall be used for cross-connect arrays.

(G) Class 2 and Class 3 Cable Uses and Permitted Substitutions. The uses and permitted substitutions for Class 2 and Class 3 cables listed in Table 725.61 shall be considered suitable for the purpose and shall be permitted.

FPN: For information on Types CMP, CMR, CH, and CMX cables, see 800.82.

Table 725.61 Cable Uses and Permitted Substitutions

Cable Type	Use	References	Permitted Substitutions
CL3P	Class 3 plenum cable	725.61(A)	CMP
CL2P	Class 2 plenum cable	725.61(A)	CMP, CL3P
CL3R	Class 3 riser cable	725.61(B)	CMP, CL3P, CMR
CL2R	Class 2 riser cable	725.61(B)	CMP, CL3P, CL2P, CMR, CL3R
PLTC	Power-limited tray cable	725.61(C) and (D)	
CL3	Class 3 cable	725.61(B), (E), and (F)	CMP, CL3P, CMR, CL3R, CMG, CM, PLTC
CL2	Class 2 cable	725.61(B), (E), and (F)	CMP, CL3P, CL2P, CMR, CL3R, CL2R, CMG, CM, PLTC, CL3
CL3X	Class 3 cable, limited use	725.61(B) and (E)	CMP, CL3P, CMR, CL3R, CMG, CM, PLTC, CL3, CMX
CL2X	Class 2 cable, limited use	725.61(B) and (E)	CMP, CL3P, CL2P, CMR, CL3R, CL2R, CMG, CM, PLTC, CL3, CL2, CMX, CL3X



VI. Listing Requirements

725.82 Class 2, Class 3, and Type PLTC Cables. Class 2, Class 3, and Type PLTC cables installed as wiring within buildings shall be listed in accordance with 725.83(A) through (G) and shall be marked in accordance with 725.82(H).

(A) Types CL2P and CL3P. Types CL2P and CL3P plenum cables shall be marked as Type CL2P or CL3P respectively, and be listed as suitable for use in ducts, plenums, and other space used for environmental air and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.

FPN: One method of defining low smoke-producing cable is by establishing an acceptable value of the smoke produced when tested in accordance with NFPA 262-1999, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces, to a maximum peak optical density of 0.5 and a maximum average optical density of 0.15. Similarly, one method of defining fire-resistant cables is by establishing a maximum allowable flame travel distance of 1.52 m (5 ft) when tested in accordance with the same test.

(B) Types CL2R and CL3R. Types CL2R and CL3R riser cables shall be marked as Type CL2R or CL3R respectively, and be listed as suitable for use in a vertical run in a shaft or from floor to floor and shall also be listed as having fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.

FPN: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the cables pass the requirements of ANSI/UL 1666-1997, Test for Flame Propagation Height of Electrical and Optical-Fiber Cable Installed Vertically in Shafts.

(C) Types CL2 and CL3. Types CL2 and CL3 cables shall be marked as Type CL2 or CL3 respectively, and be listed as suitable for general-purpose use, with the exception of risers, ducts, plenums, and other space used for environmental air and shall also be listed as being resistant to the spread of fire.

FPN: One method of defining resistant to the spread of fire is that the cables do not spread fire to the top of the tray in the vertical tray flame test in ANSI/UL 1581-1991, Reference Standard for Electrical Wires, Cables and Flexible Cords.

Another method of defining resistant to the spread of fire is for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing the CSA vertical flame test for cables in cable trays, as described in CSA C22.2 No. 0.3-M-1985, Test Methods for Electrical Wires and Cables.

(D) Types CL2X and CL3X. Types CL2X and CL3X limited-use cables shall be marked as Type CL2X or CL3X respectively, and be listed as being suitable for use in dwellings and for use in raceway and shall also be listed as being resistant to flame spread.

FPN: One method of determining that cable is resistant to flame spread is by testing the cable to the VW-1 (vertical-wire) flame test in ANSI/UL 1581-1991, Reference Standard for Electrical Wires, Cables and Flexible Cords.

(E) Type PLTC. Type PLTC nonmetallic-sheathed, power-limited tray cable shall be listed as being suitable for cable trays and shall consist of a factory assembly of two or more insulated conductors under a nonmetallic jacket. The insulated conductors shall be 22 AWG through 12 AWG. The conductor material shall be copper (solid or stranded). Insulation on conductors shall be suitable for 300 volts. The cable core shall be either (1) two or more parallel conductors, (2) one or more group assemblies of twisted or parallel conductors, or (3) a combination thereof. A metallic shield or a metallized foil shield with drain wire(s) shall be permitted to be applied either over the cable core, over groups of conductors, or both. The cable shall be listed as being resistant to the spread of fire. The outer jacket shall be a sunlight- and moisture-resistant nonmetallic material.

Exception No. 1: Where a smooth metallic sheath, continuous corrugated metallic sheath, or interlocking tape armor is applied over the nonmetallic jacket, an overall nonmetallic jacket shall not be required. On metallic-sheathed cable without an overall nonmetallic jacket, the information required in 310.11 shall be located on the nonmetallic jacket under the sheath.

Exception No. 2: Conductors in PLTC cables used for Class 2 thermocouple circuits shall be permitted to be any of the materials used for thermocouple extension wire.

FPN: One method of defining resistant to the spread of fire is that the cables do not spread fire to the top of the tray in the vertical tray flame test in ANSI/UL 1581-1991, Reference Standard for Electrical Wires, Cables and Flexible Cords.

Another method of defining resistant to the spread of fire is for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing the CSA vertical flame test for cables in cable trays, as described in CSA C22.2 No. 0.3-M-1985, Test Methods for Electrical Wires and Cables.

(F) Class 2 and Class 3 Cable Voltage Ratings. Class 2 cables shall have a voltage rating of not less than 150 volts. Class 3 cables shall have a voltage rating of not less than 300 volts.

(G) Class 3 Single Conductors. Class 3 single conductors used as other wiring within buildings shall not be smaller than 18 AWG and shall be Type CL3. Conductor types described in 725.27(B) that are also listed as Type CL3 shall be permitted.

FPN: One method of defining resistant to the spread of fire is that the cables do not spread fire to the top of the tray in the vertical tray flame test in ANSI/UL 1581-1991, Reference Standard for Electrical Wires, Cables and Flexible Cords.

Another method of defining resistant to the spread of fire is for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing the CSA vertical flame test for cables in cable trays as described in CSA C22.2 No. 0.3-M-1985, Test Methods for Electrical Wires and Cables.

(H) Marking. Cables shall be marked in accordance with 310.11(A)(2), (3), (4), and (5). Voltage ratings shall not be marked on the cables.

FPN: Voltage markings on cables may be misinterpreted to suggest that the cables may be suitable for Class 1 electric light and power applications.

Exception: Voltage markings shall be permitted where the cable has multiple listings and a voltage marking is required for one or more of the listings.

Submitter: Stanley D. Kahn, Tri-City Electric Co., Inc.

Recommendation: Renumber Articles 725, 760, 770, 800, 820 and 830 as shown in the table. [Table shown on following pages]

Substantiation: The NEC Technical Correlating Committee action on proposal 3-126 was:

"The Technical Correlating Committee directs the chairs of Code-Making Panels 3 and 16 to establish a small task group to consider the sequential numbering proposed by this and similar proposals. With the numbering as accepted, the addition of a new rule to any article would result in renumbering everything following that section. The task group should consider using a larger range of numbers to allow for future expansion of the articles. The task group can develop comments to accomplish this numbering."

The task group members are:

Jim Brunssen- CMP 16

Paul Casparro- CMP 3

Sandy Egesdal- CMP 3

Stanley Kahn- CMP 16

Stanley Kaufman- CMP 16

Mark Ode- CMP 3

Implementation of the renumbering scheme in the attached table will allow ample room for insertion of future sections.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel actions on Proposals 3-137 and 3-211. In both proposals, a Panel 3 Task Group studied Article 725 and 760 for the 2008 NEC and provided an updated version of the renumbering of Articles 725 and 760 based on the NEC TCC assignment to reformat and renumber these articles. The other articles in the proposal (770, 800, 820, 830) are not under the perview of CMP3.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-139 Log #2361 NEC-P03 **Final Action: Reject**

(725.2. Abandoned Class 2, Class 3, and PLTC Cable)

Submitter: John H. Schmidt, ABC Television Network

Recommendation: In the definition for Abandoned Class 2, Class 3 and PLTC Cable, after the words "and not identified for future use with a tag" add the new text "or in a database."

Substantiation: In modern large systems, cables are often identified with a number at each end, and the function of the cable is listed in a database referencing that number. This database should be adequate to identify cables for future use.

Panel Meeting Action: Reject

Panel Statement: Certainly, a computer database can be used to catalogue cables and their potential future use, but the definition provides the information that an abandoned cable is a cable that is disconnected and not identified for future use by a tag. A cable that is disconnected but identified with a physical tag is not abandoned. A database would not be able to be physically attached to the cable as an identification means for that cable. A database may or may not be available at time of use or need.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

Explanation of Negative:

PACE, D.: The panel should have accepted this proposal. The intent of the existing wording "identified for future use with a tag" is simply to indicate there are future plans for the cable and that it is not abandoned in place with no intention of future use, left behind because of the cost of removing it. I see no difference in identifying the cable through the use of a tag vs the use of a number on the cable that refers back to a document somewhere that contains additional information about the cable, the installation, future plans, etc. The tag that is now required is certainly not large enough to contain all this informatin, thus it will most likely indicate a reference to a drawing or other document that contains the additional information. At the very least, the present text does not prohibit the tag information from referring the reader to another document that would have additional information. Using a member on the cable that is linked to a document with further information should be an acceptable way to meet this requirement.

3-140 Log #2688 NEC-P03 **Final Action: Reject**

(725.2. Abandoned Class 2, Class 3, and PLTC Cable)

Submitter: Charles M. Trout, Maron Electric Co. Inc.

Recommendation: Revise 725.2 Abandoned Class 2, Class 3, and PLTC cable that is not terminated at equipment and not identified for future use with a tag which is of a material impervious to the deleterious effects of temperature and dampness. The tag shall be resistant to the effects of gnawing by rodents. The tag shall contain the following information:

(1) Date tag was installed.

(2) Date of intended use of disconnected cable.

(3) Drawing or file number containing information relating to intended future use of disconnected cable.

The date of intended use of disconnected cable shall not exceed 90 days from date of disconnection.

Substantiation: Abandoned cables are a growing problem in the industry. These cables are left for others to deal with when present users discontinue their operation. Understanding this problem, the removal of abandoned cables, is required by Articles 640, 645, 725, 760, 770, 800, 820 and 830. 725.3(B) requires the removal of abandoned Class 2, Class 3, and PLTC cables. Tagging of cables intended for future use without a method of ensuring the intention of future use invites tagging of cables to avoid the responsibility of their proper removal.

Panel Meeting Action: Reject

Panel Statement: The proposed recommendation to require a tag resistant to rodents, the date the disconnected cable is intended to be used, the drawing number intended for the future use of the cable, and the 90-day restriction is too restrictive. These cables are often installed at the time of initial installation as spare cables that can be used as future employee expansion deems necessary or as a cable becomes unusable for one reason or another. For example, assume there is a control or signaling installation that requires 200 low voltage cables or conductors in a raceway. Only 180 cables or conductors are needed at the present time. The other 20 cables are spare cables. It would not be feasible to install only 180 cables or conductors and then, when an expansion or repair is necessary, to pull all 180 cables out of the raceway to install 20 more in 6 months to a year.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-141 Log #3026 NEC-P03 **Final Action: Accept**

(725.2. Abandoned Class 2, Class 3, and PLTC Cable)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council

Recommendation: 725.2 Definitions.

Abandoned Class 2, Class 3, and PLTC Cable. Installed Class 2, Class 3, and PLTC cable that is not terminated at equipment and not identified for future use with a tag.

Keep this definition unchanged for consistency.

Substantiation: The definitions of abandoned cable in every article should be identical. The relevant articles are: 640, 645, 725, 760, 770, 800, 820 and 830. The definitions at articles 640 and 725 are already correct as follows:

640.2: Abandoned Audio Distribution Cable. Installed audio distribution cable that is not terminated at equipment and not identified for future use with a tag.

725.2: Abandoned Class 2, Class 3, and PLTC Cable. Installed Class 2, Class 3, and PLTC cable that is not terminated at equipment and not identified for future use with a tag.

The additional wording in this definition causes confusion. Proposals are being made to make changes to the definitions in articles 770, 800, 820 and 830, and to add a general definition into article 645 and into article 100.

Panel Meeting Action: Accept

Panel Statement: While the recommendation is not to change the definition for abandoned cables in 725.2, the substantiation incorrectly states that all abandoned cable definitions in all other articles should be the same as the one in 725.2. Each article has different requirements for what constitutes an abandoned cable. Some applications require that a connector be installed along with an identification tag on the cable, whereas others, such as the one for Article 725 require only that the cable not be terminated at equipment and an identification tag be installed for it to not be considered to be abandoned.

3-142 Log #3441 NEC-P03 **Final Action: Reject**
(725.2, 725.11, 725.15, 725.21, 725.22)

Submitter: David Wechsler, The Dow Chemical Company
Recommendation: Redefine Class I as a single wiring method by taking the actions shown below:

Revise 725.2 definition per the NFPA style manual to eliminate a design requirement from a definition as follows:

725.2 Class 1 Circuit. The portion of the wiring system between the load side of the overcurrent device or power-limited supply and the connected equipment. ~~The voltage and power limitations of the source are in accordance with 725.21.~~

Delete the entire 725.11.

Revise 725.15 as follows:

725.15 Class 1, Class 2, and Class 3 Circuit Requirements. Class 1 circuits shall comply with Parts I and II of this Article. Class 2 and Class 3 Circuits shall comply with Parts I and III of this Article. ~~A remote control, signaling, or power limited circuits shall comply with the following parts of this article:~~

~~(1) Class 1 Circuits: Parts I and II~~

~~(2) Class 2 and Class 3 Circuits: Parts I and III~~

Revise 725.21 as shown below:

725.21 Class 1 Circuit Classifications ~~and Power Source Requirements~~ . Class 1 circuits shall be classified as either Class 1 power-limited circuits where they comply with the power limitations of 725.21(A) or as Class 1 Non-Power Limited ~~remote control and signaling circuits~~ where they ~~are used for remote-control or signaling purposes and~~ comply with the power limitations of 725.21(B).

Retain existing 725.21(A).

Revise 725.21(B) as shown below:

(B) Class 1 Non-Power Limited ~~Remote Control and Signaling~~ Circuits. These circuits shall not exceed 600 volts. The power output of the source shall not be required to be limited.

Add new 725.22 as follows:

725.22 Class I Transformers and Power Sources.

(1) Class 1 Transformers. Transformers used to supply power-limited Class 1 circuits shall comply with the applicable sections within Parts I and II of Article 450.

(2) ~~Other~~ Class 1 Power Sources. Power sources other than transformers shall be protected by overcurrent devices rated at not more than 167 percent of the volt-ampere rating of the source divided by the rated voltage. The overcurrent devices shall not be interchangeable with overcurrent devices of higher ratings. The overcurrent device shall be permitted to be an integral part of the power supply. [Note: continue with existing paragraph through "...load with rated input applied".]

Revise 725.28 as indicated below:

725.28 ~~Number of~~ Conductors in Raceways ~~Cable Trays and Raceway, and Derating~~ .

(A) Class 1 Circuit Conductors. Where only Class 1 circuit conductors are in a raceway, the number of conductors shall be determined in accordance with 300.17. The derating factors given in 310.15(B)(2)(a) shall apply only if such conductors carry continuous loads in excess of 10 percent of the ampacity of each conductor.

(B) Power-Supply Conductors and Class 1 Circuit Conductors. Where power-supply conductors and Class 1 circuit conductors are permitted in a raceway in accordance with 725.26, the number of conductors shall be determined in accordance with 300.17. The derating factors given in 310.15(B)(2)(a) shall apply as follows:

(1) To all conductors where the Class 1 circuit conductors carry continuous loads in excess of 10 percent of the ampacity of each conductor and where the total number of conductors is more than three.

(2) To the power-supply conductors only, where the Class 1 circuit conductors do not carry continuous loads in excess of 10 percent of the ampacity of each conductor and where the number of power-supply conductors is more than three.

~~(C) Class 1 Circuit Conductors in Cable Trays. Where Class 1 circuit conductors are installed in cable trays, they shall comply with the provisions of 392.9 through 392.11.~~

Add new 725.29 as follows:

725.29 Conductors in Cable Trays.

(A) Class 1 Circuit Conductors in Cable Trays. Where Class 1 circuit conductors are installed in cable trays, they shall comply with the provisions of 392.9 through 392.11.

Renumber 725.29, 725.33 as indicated below:

725.33 ~~725.29~~ Circuits Extending Beyond One Building.

Substantiation: Over the years, Article 725 and companion Articles like 760 and 800 have been revised with an objective of retaining degrees of consistent language and format. Additionally, revisions have been made to either correct or modify requirements demonstrated as being undesirable or unclear. One aspect of this has been the use of the terms power-limited and non-power limited. An aspect preventing Parts I and II from being revised has been the concept of remote-control circuits. Under today's current technology the quite literal understanding of the phrase "failure of the equipment to operate introduces a direct fire or life hazard" would cause may control, alarm and emergency systems all to be considered as Class I circuits when in fact few have been so designated. For example, the entire concept of a circuit integrity cable (CI) is grounded upon being able to operate to prevent loss of life or a direct hazard, but they are not Class 1 circuits. The entire technology movement with process control logic solves with SIL 3 Safety Instrumented Systems, intelligent emergency and security alarm systems all have moved into what was long ago the domain of Class 1 circuits. This is no longer true and the changes made reflect these conditions. Again aligning with the concepts in other Articles, such as 760, power limited and non-power limited concepts have been introduced so that the circuit applications can still be utilized under the appropriate design applications. Because of the inter-dependency of these clauses, these suggested changes are proposed under a single proposal for action.

Panel Meeting Action: Reject
Panel Statement: No technical substantiation has been provided for these suggested changes. There are many Class 1 circuits that are being used as remote control circuits for equipment. For example, a control device located remotely from a motor and supplied from a separate power source or a separate overcurrent protective device from the motor is a remote controlled motor circuit. Section 430.72(A), last sentence, provides this reference by sending the installer to 725.23 or the Notes for Tables 11A or 11B for overcurrent protection of these remote control circuits. This same remote control function would apply to power supplying a photocell connected to a lighting controller where the control coil is supplied by a separate 15- or 20-ampere circuit. Deleting remote control and signaling from Article 725 would affect literally thousands of common applications now covered by Article 725 without any technical substantiation for this suggested change.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:

PACE, D.: The panel should have accepted this proposal.

I do not believe the submitter's intent was to delete remote control and signaling from Article 725, rather he changed some words to better align with similar concepts in other articles so the applications can still be utilized under the appropriate design application. The wording chosen by the submitter does not delete these applications, rather replaces those words with more general terms that still would allow for the intent of the existing text, and at the same time allowing better application of the requirements.

3-143 Log #1371 NEC-P03 **Final Action: Reject**
(725.3)

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Delete reference to 300.17

725.3 Other Articles.

Circuits and equipment shall comply with the articles or sections listed in 725.3(A) through 725.3(G). Only those sections of Article 300 referenced in this article shall apply to Class 1, Class 2, and Class 3 circuits.

~~(A) Number and Size of Conductors in Raceway. Section 300.17.~~

(A) Spread of Fire or Products of Combustion. Section 300.21. The accessible portion of abandoned Class 2, Class 3, and PLTC cables shall be removed.

(B ~~C~~) Ducts, Plenums, and Other Air-Handling Spaces. Class 1, Class 2, and Class 3 circuits installed in ducts, plenums, or other space used for environmental air shall comply with 300.22. Type CL2P or CL3P cables and plenum signaling raceways shall be permitted for Class 2 and Class 3 circuits installed in other spaces used for environmental air.

(C ~~D~~) Hazardous (Classified) Locations. Articles 500 through 516 and Article 517, Par IV, where installed in hazardous (classified) locations.

(D ~~E~~) Cable Trays. Article 392, where installed in cable tray.

(E ~~F~~) Motor Control Circuits. Article 430, Part VI, where tapped from the load side of the motor branch-circuit protective device(s) as specified in 430.72(A).

(F ~~G~~) Instrumentation Tray Cable. See Article 727.

Substantiation: Raceway fill for limited energy circuits is a design issue, not a safety issue. Class I circuits may be a safety issue, but the raceway fill requirements for them are already spelled out in section 725.25, as they should be. The functionality of Class II and Class III circuits is not within the purpose of the NEC, and therefore the raceway fill provisions should not be required.
Panel Meeting Action: Reject
Panel Statement: Deleting this reference to 300.17 would not only affect Class 2 circuits but it would affect Class 3 circuits. The definition of Class 3 Circuit states that, due to its power limitations, a Class 3 circuit considers safety from a fire initiation standpoint. The definition further states that since higher levels of voltage and current than those permitted for Class 2 circuits are often utilized, additional safeguards are specified to provide protection from electric shock. The raceway fill requirements in 300.17 provide limitations on the number of Class 3 conductors that can be installed. Exceeding the fill capacity of a raceway can cause stretching of the conductors and insulation with permanent damage to the insulation, thus constituting a potential shock hazard.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-144 Log #1372 NEC-P03 **Final Action: Reject**
(725.3)

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Delete text concerning abandoned cables
725.3 Other Articles.
Circuits and equipment shall comply with the articles or sections listed in 725.3(A) through 725.3(G). Only those sections of Article 300 referenced in this article shall apply to Class 1, Class 2, and Class 3 circuits.
(A) Number and Size of Conductors in Raceway. Section 300.17.
(B) Spread of Fire or Products of Combustion. Section 300.21. ~~The accessible portion of abandoned Class 2, Class 3, and PLTC cables shall be removed.~~
(C) Ducts, Plenums, and Other Air-Handling Spaces. Class 1, Class 2, and Class 3 circuits installed in ducts, plenums, or other space used for environmental air shall comply with 300.22. Type CL2P or CL3P cables and plenum signaling raceways shall be permitted for Class 2 and Class 3 circuits installed in other spaces used for environmental air.
(D) Hazardous (Classified) Locations. Articles 500 through 516 and Article 517, Part IV, where installed in hazardous (classified) locations.
(E) Cable Trays. Article 392, where installed in cable tray.
(F) Motor Control Circuits. Article 430, Part VI, where tapped from the load side of the motor branch-circuit protective device(s) as specified in 430.72(A).
(G) Instrumentation Tray Cable. See Article 727.
Substantiation: The NEC is an installation standard, not a maintenance standard. Because of this, this rule should not be a part of the NEC. Furthermore, this provision does not accomplish its intent, as the *Code* is not a retroactive document. To require abandoned cables to be removed is similar to requiring facilities to update their receptacles to the new GFCI provision every three years. With that said, the only time this rule applies is when an installer creates an abandoned cable. Also, this provision does not fall within the purpose of the NEC 90.1(A). The NEC is concerned with the hazards created from the use of electricity…this rule seems to imply that a cable with a voltage applied to it is safe, but a cable with no voltage applied to it is dangerous.
This proposal is also being made to 760.3(A), 770.3(A), 800.3(C), 820.3(A) and 830.3(A).
Panel Meeting Action: Reject
Panel Statement: This is not a retroactive requirement, since the abandoned cable either must be marked at the time it is disconnected or it must be removed. Removal of discontinued conductors is not new to the Code.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-145 Log #3108 NEC-P03 **Final Action: Reject**
(725.3)

Submitter: Donald Hall, Corning Cable Systems
Recommendation: Revise text to read as follows:
725.3 Other Articles.
Circuits and equipment shall comply with the articles or sections listed in 725.3(A) through 725.3(G). Only those sections of Article 300 referenced in this article shall apply to Class1, Class 2, and Class 3 circuits.
(B) Spread of Fire or Products of Combustion. 300.21shall apply. ~~The accessible portion of a~~ Abandoned Class 2, Class 3, and PLTC cables shall be removed.
Also, add the following FPN to 725.3(B):
<u>FPN: ANSI/NECA/BICSI 568-2001, Standard for Installing Commercial Building Telecommunications Cabling, and other industry standards provide recommended cable installation practices which facilitate the eventual removal of cables as they become abandoned.</u>
Substantiation: Abandoned cable should be removed to reduce unnecessary accumulation of fuel load and promote electrical safety. It is not reasonable or necessary to install cables in a manner that prevents their eventual removal.
The proposed FPN will provide useful information to architects, system designers, and installers to help minimize the cost and inconvenience of removing abandoned cable.
Panel Meeting Action: Reject
Panel Statement: Requiring inaccessible portions of a cable to be removed could mean damaging building finish and demolition or destruction of the building to remove abandoned cable, which is unrealistic to require. There is no added benefit to the user of the NEC in adding this fine print note since the removal of cable in accordance with 725.3(B) is already a requirement. The relevant portions of the suggested document in the FPN have not been provided for informational purposes. With regard to the addition of the FPN, the panel refers to 90.1(C): The Code is not for untrained personnel and is not an instruction manual.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-146 Log #2805 NEC-P03 **Final Action: Reject**
(725.3(B))

Submitter: Harold C. Ohde, IBEW #134
Recommendation: Revise text to read as follows:
725.3 Other Articles. No change.
(A) Number and Size of Conductors in Raceway. No change.
(B) Spread of Fire or Products of Combustion. ~~Section~~ 300.21 <u>shall apply</u> . ~~The accessible portion of abandoned Class 2, Class 3, and PLTC cables shall be removed.~~
Substantiation: The requirements for removal of abandoned Class 2, Class 3, and PLTC cables would be better suited in appropriate code section within Article 725. I have submitted another proposal that would move the abandoned Class 2, Class 3, and PLTC cables requirements to 725.8 - Mechanical Execution of Work. The abandoned Class 2, Class 3, and PLTC cables requirements are out of place in 725.3 - Other articles. The requirements are not part of another Article as they are part of Article 725 and are located within Article 725.
The addition of the words "shall apply" would incorporate language that is consistent with 800.3, 820.3 and 830.3.
Similar proposals have been submitted for 640.3, 760.3, 770.3, 800.3, 820.3, and 830.3 to revise these sections as well.
Panel Meeting Action: Reject
Panel Statement: Moving this text to a new section without this restriction would make this a requirement for every location within a building. There has been no substantiation provided to expand this requirement beyond hollow spaces, vertical shafts and air-handling areas. The concern of 300.21 is the spread of fire and products of combustion in hollow spaces, vertical shafts, and ventilation and air-handling ducts caused by electrical installations. Removing the accessible portion of the cable seems to fit very well within 300.21 and should remain in Section 725.3(B) as a means of reducing unnecessary electrical products in these areas.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 11 Negative: 2
Explanation of Negative:
CASPARRO, P.: This proposal should have been accepted. This proposal was submitted not to interfere with the intent of 300.21, but rather locate all abandoned cable requirements in one code section located in Part I - General. Having the requirements in a central section in Part I - General would eliminate confusion or concerns in regards to the removal of abandoned requirements.
EGESDAL, S.: See my Explanation of Negative for Proposal 3-148.

3-147 Log #3003 NEC-P03 **Final Action: Reject**
(725.3(B))

Submitter: Marcelo M. Hirschler, GBH International
Recommendation: Revise text to read as follows:
725.2 Definitions.
Abandoned Class 2, Class 3, and PLTC Cable. Installed Class 2, Class 3, and PLTC cable that is not terminated at equipment and not identified for future use with a tag.
725.3 Other Articles.
Circuits and equipment shall comply with the articles or sections listed in 725.3(A) through 725.3(G). Only those sections of Article 300 referenced in this article shall apply to Class 1, Class 2, and Class 3 circuits.
(B) Spread of Fire or Products of Combustion. Section 300.21. ~~The accessible portion of abandoned~~ <u>Abandoned</u> Class 2, Class 3, and PLTC cables shall be removed. <u>Removal of abandoned cables shall not damage the building structure or finish and shall not compromise the performance of adjacent wiring systems or components.</u>
Substantiation: This comment recommends a change in wording to ensure that abandoned cables are removed and to prevent confusion in future. There have been multiple proposals that would permit some cables to remain in "inaccessible spaces". This is not conducive to safe electrical practice; this the key change is the elimination of the words "the accessible portion of".
If the intent of the code-making panel was to clarify that removal of cable should not be done if such removal would damage the building, which is obviously not the intent, a second sentence can be added stating that removal of abandoned cables shall not be performed if it would damage the building structure or finish or in any way compromise the functional performance of any other wiring systems or components. This would be accomplished by the optional added sentence.
Consistent wording on removal of abandoned cables is being proposed for sections: 640.3, 725.3, 770.3, 770.154, 800.3, 800.154, 820.3, 820.154 and 830.3.
For information, see the relevant definitions in the NEC.
Accessible (as applied to equipment). Admitting close approach; not guarded by locked doors, elevation, or other effective means.
Accessible (as applied to wiring methods). Capable of being removed or exposed without damaging the building structure or finish or not permanently closed in by the structure or finish of the building.
Accessible, Readily (Readily Accessible). Capable of being reached quickly for operation, renewal, or inspections without requiring those to whom ready

access is requisite to climb over or remove obstacles or to resort to portable ladders, and so forth.

Concealed. Rendered inaccessible by the structure or finish of the building. Wires in concealed raceways are considered concealed, even though they may become accessible by withdrawing them.

Isolated (as applied to location). Not readily accessible to persons unless special means for access are used.

Panel Meeting Action: Reject

Panel Statement: This proposed change would make it a requirement that removal of abandoned cable never damage the building finish or compromise adjacent wiring systems or components. This expectation is unrealistic. If the building owner wants to take a ceiling down to access and remove abandoned cables, the NEC should not and cannot restrict this action. In regard to the removal of accessible cable, the panel refers to the definition of Accessible as it applies to wiring methods.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-148 Log #2386 NEC-P03 **Final Action: Reject**

(725.3(B) and 725.17 (new))

Submitter: Allen C. Weidman, The Society of the Plastics Industry, Inc.

Recommendation: Move the abandoned cable requirements from 725.3(B) to new 725.17.

(B) Spread of Fire or Products of Combustion. Section 300.21. ~~The accessible portion of abandoned Class 2, Class 3, and PLTC cables shall be removed.~~

Abandoned Cables . The accessible portion of abandoned Class 2, Class 3, and PLTC cables shall be removed.

Substantiation: This change is editorial. The requirement to remove abandoned cables applies to Article 725, not other articles.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 3-146.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

Explanation of Negative:

EGESDAL, S.: This proposal should be accepted. The removal of abandoned cable should be in its own section to make it clear that the requirements applies to Parts I, II and III of Article 725. Presently, the removal of abandoned cable in 725.3(B) applies when 300.21 is required to be referenced. Additionally, 725.3 identifies requirements in “Other Articles” that apply. The removal of abandoned cable applies to Article 725, not 300.21.

The 2002 NEC had the removal of abandoned cable requirements in Sections 725.3(B), 725.61(A), Plenums; 725.61(B), Risers; and 725.61(E), Other Wiring in Buildings. As 725.3(B) would supposedly cover all the Parts of Article 725, the requirements were removed from 725.61(A), (B), and(C) in an effort to simplify the NEC. As a former member of Panel 16, I know the intent of the requirements in Article 725 (2002 edition) was to require removal of abandoned cable, regardless of where the cable was installed in a building. The Panel should reconsider the proposals that recommend moving the requirements for removal of abandoned cable to its own section in Part I of Article 725.

3-149 Log #3294 NEC-P03 **Final Action: Accept in Principle**

(725.3(C))

Submitter: Sanford Egesdal, Egesdal Associates PLC

Recommendation: Revise 725.3(C) to read as follows:

(C) Ducts, Plenums, and Other Air-Handling Spaces. Class 1, Class 2, and Class 3 circuits installed in ducts, plenums, or other space used for environmental air shall comply with 300.22. ~~Type CL2P or CL3P cables and plenum signaling raceways shall be permitted for Class 2 and Class 3 circuits installed in other spaces used for environmental air.~~

Exception to (C): As permitted in Section 725.61(A).

Substantiation: This proposal corrects an error made by CMP 16 during the 2002 code cycle. Changing the exception to positive text caused an inadvertent technical change. Changing the second sentence to an exception provides requirements parallel to those found in Articles 760, and 770.

Section 725.3(b) from the 1999 NEC follows:

“(b) Ducts, Plenums, and Other Air-Handling Spaces. Section 300-22, where installed in ducts or plenums or other space used for environmental air.

Exception to (b): As permitted in Section 725-61(a).”

Section 760.3(B) from the 2005 NEC follows:

“(B) Ducts, Plenums, and Other Air-Handling Spaces. Section 300.22, where installed in ducts or plenums or other spaces used for environmental air.

Exception: As permitted in 760.30(B)(1) and (B)(2) and 760.61(A).”

Section 770.3(B) from the 2005 NEC follows:

“(B) Ducts, Plenums, and Other Air-Handling Spaces. The requirements of 300.22 for electric wiring shall also apply to installations of optical fiber cables and raceways where they are installed in ducts or plenums or other space used for environmental air.

Exception: As permitted in 770.154(A).”

Panel Meeting Action: Accept in Principle

Revise 725.3(C) to read as follows:

(C) Ducts, Plenums, and Other Air-Handling Spaces. Class 1, Class 2, and Class 3 circuits installed in ducts, plenums, or other space used for environmental air shall comply with 300.22. ~~Type CL2P or CL3P cables and plenum signaling raceways shall be permitted for Class 2 and Class 3 circuits installed in other spaces used for environmental air.~~

Exception: Type CL2P or CL3P cables and plenum signaling raceways shall be permitted for Class 2 and Class 3 circuits installed in other spaces used for environmental air in accordance with Section 725.61(A).

Panel Statement: The Panel has relocated the existing text as an exception without modifying the intent and has provided the exception as a complete sentence as required by the NEC Manual of Style.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-150 Log #1179 NEC-P03 **Final Action: Reject**

(725.3(D) and (E))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Delete.

Substantiation: Already covered by 90.3.

Panel Meeting Action: Reject

Panel Statement: References to these articles are necessary since there are specific requirements in these other articles that affect the requirements in Article 725. For example, PLTC cable requirements in Part III of Article 725 would apply, unless amended by the text in Article 501. Without this tie from Article 725 to Article 501, the supplemented or modified information in Article 501 would not necessarily apply to Article 725 low voltage wiring.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-151 Log #872 NEC-P03 **Final Action: Reject**

(725.3(G))

Submitter: Michael J. Timpanaro, Lake County Building Services

Recommendation: Add new text to read:

(G) Circuits for control of irrigation shall comply with the minimum cover requirements of 300.5. (Table 300.5 Column 5).

Substantiation: Typically, irrigation circuits are Class 2. Since 725.3 requires: “Only those sections of Article 300 referenced in this article shall apply to Class 1, Class 2, and Class 3 circuits,” it is necessary to provide uniformity between 725.3 and the minimum cover requirements for irrigation circuits referenced in Table 300.5, column 5.

Panel Meeting Action: Reject

Panel Statement: This new subsection referencing Table 300.5 is unnecessary, since Class 1 circuit installations in accordance with 725.25 already deal with Part I of Article 300 and Class 2 and 3 do not require burial depths based on Table 300.5. The panel also notes that the submitter has added subparagraph (G) and subparagraph (G) already exists.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-152 Log #680 NEC-P03 **Final Action: Reject**

(725.8)

Submitter: Jamie McNamara, Hastings, MN

Recommendation: Revise as follows:

725.8 Mechanical Execution of Work. …….

The installation shall also conform with 300.4(D) and 300.11.

Substantiation: To harmonize with the requirements in articles 770, 800, 820 and 830.

Panel Meeting Action: Reject

Panel Statement: Section 725.25 requires Class 1 wiring methods to comply with Part I of Article 300, including 300.4 as necessary. However, since Part I of Article 725 applies to Class 2 and 3 circuits, there was no technical substantiation provided in the proposal to require Class 2 and 3 cables to comply with Section 300.11. In fact, there was no technical substantiation provided with the panel action in Proposal 16-81 in the 2005 NEC ROP to justify adding this requirement to Section 800.6 (later changed to 800.24). Both negative votes made note of this addition and the second negative vote stated that Panel 16 had no technical data to show that a safety problem existed to warrant this change. The one affirmative vote for this suggested change stated he did not agree that requiring compliance with 300.11 is appropriate for small cable systems. This same issue applies here.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 11 Negative: 2

Explanation of Negative:

CASPARRO, P.: I believe that the submitter raises a valid concern. All of the other articles that he listed in his substantiation have the requirement to be installed as 300.11. The panel statement says that there were some dissenting votes on Panel 16 when this requirement went into Article 800, but the fact is it is now a part of Article 800. These Class 2 and 3 cables are no less a danger than the cables in other articles where 300.11 is a requirement.

The fact is that if the reference to 300.11 does not exist; when a ceiling installer works on a ceiling and notices that there are cables attached to the ceiling support wires they usually remove the cables from the ceiling support wires which leaves them on the ceiling pads. This leaves the cables unsupported and makes other equipment in the suspended ceiling space inaccessible.

OWEN, S.: I believe that the submitter was correct in requesting this proposed change to Articles 770, 800, 820, and 830.

In general, I believe that all electrical wiring systems of any type, for any electrical installation, should comply with the requirements of 300.11 (unless a specific situation related to a specific section of the NEC would require or permit otherwise). I do not have facts and figures to support my long held belief (based on field installations), that compliance with 300.11 is very important to a safe electrical installation, however, the fact that 300.11 exists illustrates that it is important for safe electrical installations.

3-153 Log #893 NEC-P03 **Final Action: Reject**
(725.8)

Submitter: Noel Williams, Noel Williams Consulting
Recommendation: Revise 725.8 as follows:

"...Cables and conductors installed exposed ~~on the surface of ceilngs and sidewalls~~ shall be supported in such a manner...The installation shall also conform to 300. 4 ~~(D)~~ and 300.11 ." (Other portions to remain unchanged.)
Substantiation: Current cable support rules apply only to cables exposed to view (on surfaces). Cables above ceilings are "exposed" as defined, but such cables are only required to be "neat and workmanlike." All of 300.4 should apply. 300.4(D) is only for cables run parallel to framing. 300.11 should apply as it does in 640.6.
Panel Meeting Action: Reject
Panel Statement: The use of the word "exposed" was to recognize that exposed cables that are installed horizontally on framing members are more apt to be damaged than those cables installed through framing members or otherwise protected inside a drop ceiling or similar application.
There is no substantiation provided that justifies requiring remote control, signaling, and power-limited cables of smaller sizes to be supported separate from the ceiling wires. This is a different issue from raceways containing power conductors being connected to ceiling wires. Where ceiling wires were used to support these raceways, the ceiling runners were often pulled higher, thus causing a problem with the entire drop ceiling appearance. The ceiling contractor would often simply pop the raceway clips off the ceiling wire. This caused improper support of the raceways and potential damage that was possibly hazardous.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13
Comment on Affirmative:

AYER, L.: The wording of 725.8 is a result of the 2002 code cycle. The text was changed to notify the user of the code that cables are required to be supported and secured differently below ceilings and sidewalls as compared to cables installed in the void spaces above an accessible ceiling. To require low-energy low-hazard thermostat cables to be supported above an accessible ceiling to the same requirements of exposed cables below the ceiling that could be damaged would not be appropriate.

The addition of 300.11 would also be considered excessive. Some installations may have 10 feet of space between the dropped ceiling and the structure above. To require an independent support wire when adding a few low voltage Class 2 or 3 cables would be costly and burdensome with no apparent benefit. There has been no technical substantiation provided that low voltage cabling is causing a problem with existing or new ceiling grids. Power wiring was moved to independent support wires due to actual problems that were occurring with dropped ceilings.

3-154 Log #1373 NEC-P03 **Final Action: Reject**
(725.8)

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Delete requirement to comply with 300.4(D)

725.8 Mechanical Execution of Work.

Class 1, Class 2, and Class 3 circuits shall be installed in a neat and workmanlike manner. Cables and conductors installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be supported by straps, staples, hangers, or similar fittings designed and installed so as not to damage the cable. ~~The installation shall also conform with 300.4(D).~~
Substantiation: There is no reason to protect limited energy circuits from accidental contact with nails or screws. Limited energy circuits are considered to be inherently safe from a fire and electric shock perspective, hence the allowances of lesser wiring methods and allowances for open splicing with out boxes. The protection of these circuits is a design and/or performance issue, not a safety issue. The requirement found in the existing *Code* text does not fit into the purpose of the NEC, as addressed in 90.1(A).
Panel Meeting Action: Reject
Panel Statement: This section applies to Class 1, Class 2, and Class 3. The statement in the substantiation that there is no reason to protect limited energy circuits is incorrect. Class 1 circuits can be limited energy circuit at 30 volts and 1000 VA but there is also up to 33 amps in regular current available in the circuit. In addition, the definition of a Class 3 circuit states that, due to its power limitations, a Class 3 circuit considers safety from a fire initiation standpoint. The definition further states that since higher levels of voltage and current from those permitted for Class 2 circuits are often utilized, additional safeguards are specified to provide protection from electric shock. Both limited energy Class 1 circuits and Class 3 circuits can be a shock hazard and must be protected accordingly.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-155 Log #1374 NEC-P03 **Final Action: Reject**
(725.8)

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Add "Cable Ties" to the list of supporting methods

725.8 Mechanical Execution of Work.
Class 1, Class 2, and Class 3 circuits shall be installed in a neat and workmanlike manner. Cables and conductors installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be supported by straps, staples, hangers, cable ties, or similar fittings designed and installed so as not to damage the cable. The installation shall also conform with 300.4(D).
Substantiation: This is being proposed in an effort to create uniform language with the chapter three cable wiring method support sections, specifically, 230.30(A), 330.30(A) and 334.30. Similar proposals are also being made to sections: 640.6, 760.8, 770.24, 800.24, 820.24 and 830.24
Panel Meeting Action: Reject
Panel Statement: It is not acceptable to use a cable tie to serve as a sole support for a cable when there is no spacing requirement provided for the distance between supports.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 9 Negative: 4
Explanation of Negative:

AYER, L.: Cable ties should be added to 725.8 as proposed by the submitter. These support devices have been used for years without hazard even though they are not mentioned in this section. Adding this wording is just to notify users of the code that Class I, Class 2 and Class 3 cables can be supported by this device. The panel's substantiation that cable ties cannot be used since there is no spacing requirement provided between supports does not make sense. There has never been spacing requirements when supporting control cables on straps, staples and hangers. To allow a thermostat cable to be supported by a strap, but not a cable tie, is not logical. The rejection of this proposal will cause confusion since cable ties will be allowed to support low-energy cables above a dropped ceiling but not below.

EASTER, L.: Unspecified strap staples, hangers and similar fittings are in this section to provide required support without prescribed spacing intervals. The Code Making Panel has not seen it necessary to prescribe maximum spacing intervals for cables covered by Article 725. UL 1565 provides requirements for listed cable ties intended for primary support of flexible conduits and cables in accordance with the NEC. Such cable ties must have a minimum loop tensile strength rating of 23 kg (50 lbs) or greater. NEMA believes that the panel action should be changed to Accept in Principle. Accept the proposed addition in the third sentence but add the following new fourth sentence: "Cable ties that provide primary support for such cables shall have a minimum loop tensile strength to 23 kg (50 lbs)."

PACE, D.: The panel should have accepted the proposal.

The existing text says "or similar fittings" leaving the list of support means open to other methods other than those listed. The use of cable ties or other methods is not prohibited by the existing text. Other parts of the NEC contain adequate requirements relating to issues such as the items being suitable for the service, adequate support distances, and being such that the cable is not subject to damage. The panel statement is not sufficient justification to reject including cable ties to the list in the existing text. If properly selected and installed, cable ties are a suitable means of support.

SANDERS, M.: Class 1, Class 2 and Class 3 Remote- Control, Signaling, and Power- Limited circuits typically involve the use of cables that are of lighter weight. FPN to 725.1 Scope clearly indicates that "These circuits described herein are characterized by usage and electric power limitation...".

Members of the IEEE Standards Coordinating Committee 18, responsible for formulating IEEE directed vote, did not indicate any problems with using cable ties for support. Currently, there are no spacing requirements provided in 725.8 for other allowable wiring support methods such as straps, staples, hangers, or similar fittings. Experience has proven that workmanship recognizes where undue sags or spacing between cable ties occur and additional straps, hangers or cables ties are then easily added as the need rises.

Comment on Affirmative:

CASPARRO, P.: While the submitter is correct in stating that cable ties are allowed in the other articles that he cites; all of the other articles that allow the use of cable ties as a means of support also contain a requirement for spacing between supports. It was pointed out in the panel discussion that a 100 foot run of cable with a tie wrap at each end would be allowed by the proposed text, this is certainly not acceptable.

EGESDAL, S.: This proposal should have been rejected by referring to the NFPA Standards Council directive on NFPA 90A. Cable ties are often used in plenums. UL Categories ZODZ and DWFV cover cable ties and other hardware listed as suitable for use in air handling spaces in accordance with Section 300.22(C) and (D) of the National Electrical Code.

3-156 Log #3050 NEC-P03 **Final Action: Reject**
(725.8)

Submitter: Harold C. Ohde, IBEW #134

Recommendation: Revise 725.8 as follows:

725.8 Mechanical Execution of Work

(A) Neat and Workmanlike Manner. Class 1, Class 2, Class 3, and PLTC equipment, cables and circuits shall be installed in a neat and workmanlike manner.

(B) Installation of Class 1, Class 2, Class 3. Class 1, Class 2, Class 3 cables and conductors installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the Class 1, Class 2, Class 3 cables will not be damaged by normal building use. Such cables shall be secured by listed straps, staples, hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also comply with 300.4(D) and 300.11 .

FPN: Accepted industry practices are described in ANSI/NECA/BICSI 568-2001, *Standard for Installing Commercial Building Telecommunications Cabling*, and other ANSI-approved installation standards.

(C) **Abandoned Class 1, Class 2, Class 3, and PLTC Cables.** Abandoned Class 1, Class 2, Class 3, and PLTC cables shall be removed.

FPN: Accepted industry practices are described in ANSI/NECA/BICSI 568-2001, *Standard for Installing Commercial Building Telecommunications Cabling*, and other ANSI- approved standards which provide cable installation that facilitates the removal of abandoned cables.

Substantiation: This proposal revises this section into a practical working tool which will assist in making 725.8 a clear, usable and enforceable code. Each first level subdivision contains a code rule that requires action and the required action has been presented in clear, usable and enforceable manner.

In the electrical industry, the electrician, contractor and AHJ have been taught the importance and significance of the concept of mechanical execution of work. I am an electrical instructor who teaches this important concept to the people involved. This is one of the basis for 90.1(A) which serves as the purpose of this Code. The Code's purpose is to provide a safe installation from hazards arising from the use of electricity.

The revised text in 725.8(A) will require all Class 1, Class 2, Class 3, and PLTC equipment, cables and circuits to be installed in a neat and workmanlike manner.

725.8(B) is an editorial change with additional language to require the means of securing and supporting to be listed for the purpose. The inclusion of "and 300.11" will provide the same installation requirements that can be found be in 640.3, 770.24, 800.24, 820.24 and 830.24. The wording "and 300.11" was accepted by both CMP 12 and CMP 16 for the 2005 NEC edition.

The addition of 725.8(C) would replace the requirement that was in 725.3(B). It makes sense to have the requirements of both the installation of cable and the removal of cable in the same Code section. This would provide the proper guidance to everyone involved. The installer, contractor and the AHJ would gain from this revised section as the rules are centrally located in one Code section. If Class 2, Class 3, and PLTC cable is installed properly then the removal of Class 2, Class 3, and PLTC cables should be no problem if it is not needed anymore or abandoned. The proposed FPN will provide useful guidance and information to everyone involved regarding correct installation practices which would facilitate the removal of the cable as well.

Similar proposals have been submitted for 640.6, 760.8, 770.24, 800.24, 820.24, and 830.24.

Panel Meeting Action: Reject

Panel Statement: Class 1, Class 2, and Class 3 equipment is already required specifically to be installed in a neat and workmanlike manner by 110.12, so inserting it here is unnecessary.

Requiring listed straps, staples, and other supporting means for Class 2 and Class 3 cables is not necessary as long as the support mechanism can be accomplished without harming the cable. Section 725.25 already provides the link to the appropriate wiring methods used for the Class 1 circuit.

The requirement in Section 725.8 to apply Section 300.11 to Class 1, Class 2, and Class 3 circuits is not necessary. Section 725.25 requires Class 1 wiring methods to comply with Part I of Article 300, including 300.4 as necessary. However, since Part I of Article 725 applies to Class 2 and 3 circuits, there was no technical substantiation provided in the proposal to require Class 2 and 3 cables to comply with Section 300.11. In fact, there was no technical substantiation provided with the panel action in Proposal 16-81 in the 2005 NEC ROP to justify adding this requirement to Section 800.6 (later changed to 800.24). Both negative votes made note of this addition, and the second negative vote stated that Panel 16 had no technical data to show that a safety problem existed to warrant this change. The one affirmative vote for this suggested change stated he did not agree that requiring compliance with 300.11 is appropriate for small cable systems. This same issue applies here.

In Section 725.3(B), the concern of 300.21 is the spread of fire and products of combustion in hollow spaces, vertical shafts, and ventilation and air-handling ducts caused by electrical installations. Removing the accessible portion of the cable seems to fit very well within 300.21 and should remain in Section 725.3(B) as a means of reducing unnecessary electrical products in these areas. There is no added benefit to the user of the NEC in adding these fine print notes since the removal of cable in accordance with 725.3(B) is already a requirement.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

Explanation of Negative:

CASPARRO, P.: This proposal should have been accepted in part. In the submitter's substantiation, he revised and restructured 725.8 into a practical working tool for all involved. This would have significant impact and provide guidance for the contractor, the installer and the AHJ. This would provide good and sound code that is easy to enforce.

The FPNs that follow 725.8(B) and 725.8(C) provide no guidance nor any added benefit to the user of the code, therefore, should be deleted.

3-157 Log #2219 NEC-P03 **Final Action: Reject**
(725.11(B))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 7 for information.

Submitter: Kyle Cope, Prysmian Cables and Systems

Recommendation: Revise as follows:

"...rigid nonmetallic conduit, electrical metallic tubing. Type MI cable, Type PA cable , Type MC cable, or be otherwise suitably protected from physical damage."

Substantiation: Statement of problem: Material technology advancements now allow for cable designs that provide improved mechanical damage protection. i.e., crush and impact, over standard Type MC cable without sacrificing flame performance properties. The characteristics achieved using traditional metallic components can now be realized using polymeric materials. The use of polymeric materials also provides the opportunity for lighter and smaller diameter cables.

Substantiation for Proposal: Type PA has been proposed as a new type (Article 3XX) and should be included in this list (725.11(B)) as it offers enhanced mechanical benefits as an alternate to Type MC cable. See test data provided. A UL Fact-Finding study comparing the subject cable to type MC is ongoing at the time of proposal submittal. This data will be forwarded once the study is complete.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: This cable and the acceptance of a special article covering this type of cable is under the jurisdiction of panel 7 and must first be accepted by panel 7 before it is included in the NEC. In addition, the UL Fact Finding Report should be submitted as part of the substantiation for acceptance of the cable to help determine the acceptability and the installation criteria for the cable.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-158 Log #2650 NEC-P03 **Final Action: Reject**
(725.16)

Submitter: Robert W. Jensen, dbi / Rep. BICSI, A Telecommunications Association

Recommendation: Move to a new section:

725.16 Abandoned Cables. The accessible portion of abandoned Class 2, Class 3, and PLTC cables shall be removed.

Remove wording in 725.3(B) "The accessible portion of Class 2, Class 3, and PLTC cables shall be removed."

Substantiation: The title of Section 725.3 is "Other Articles". The requirement for the removal of abandoned cables is not in another article; it is in Article 725. It is out of place in section 725.3. This proposal will move it to a new section of Article 725.

Panel Meeting Action: Reject

Panel Statement: See the panel statement in Proposal 3-146. This particular recommendation would include removal of these cables even where installed in a raceway and no substantiation has been provided.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

Explanation of Negative:

EGESDAL, S.: See my Explanation of Negative for Proposal 3-148.

3-159 Log #1990 NEC-P03 **Final Action: Accept in Principle**
(725.26)

Submitter: Neil F. LaBrake, Jr., Niagara Mohawk, a National Grid Company / Rep. Edison Electric Institute-Electric Light & Power Group
Recommendation: Add the words "Power-Limited" in various places of Article 725.26(A) & (B) and add a new Section 725.26(C) as follows (additions underlined):
725.26 Conductors of Different Circuits in the Same Cable, Cable Tray, Enclosure, or Raceway. Class 1 circuits shall be permitted to be installed with other circuits as specified in 725.26(A), (B), <u>and (C).</u>
(A) Two or More Class 1 <u>Power-Limited</u> Circuits. Class 1 <u>power-limited</u> circuits shall be permitted to occupy the same cable, cable tray, enclosure, or raceway without regard to whether the individual circuits are alternating current or direct current, provided all conductors are insulated for the maximum voltage of any conductor in the cable, cable tray, enclosure, or raceway.
(B) Class 1 <u>Power-Limited</u> Circuits with Power Supply Circuits. Class 1 <u>power-limited</u> circuits shall be permitted to be installed with power supply conductors as specified in 725.26(B)(1) through (B)(4).
(1) In a Cable, Enclosure or Raceway. Class 1 <u>power-limited</u> circuits and power supply circuits shall be permitted to occupy the same cable, enclosure, or raceway only where the equipment powered is functionally associated.
(2) In Factory- or Field-Assembled Control Centers. Class 1 <u>power-limited</u> circuits and power supply circuits shall be permitted to be installed in factory- or field-assembled control centers.
(3) In a Manhole. Class 1 <u>power-limited</u> circuits and power supply circuits shall be permitted to be installed as underground conductors in a manhole in accordance with one of the following:
(1) The power-supply or Class 1 <u>power-limited</u> circuit conductors are in a metal enclosed cable or Type UF cable.
(2) The conductors are permanently separated from the power-supply conductors by a continuous firmly fixed nonconductor, such as flexible tubing, in addition to the insulation on the wire.
(3) The conductors are permanently and effectively separated from the power supply conductors and securely fastened to racks, insulators, or other approved supports.
(4) In Cable Trays. In cable trays, where the Class 1 <u>power-limited</u> circuit conductors and power-supply conductors not functionally associated with them are separated by a solid fixed barrier of a material compatible with the cable tray, or where the power-supply or Class 1 <u>power-limited</u> circuit conductors are in a metal-enclosed cable.
<u>**(C) Class 1 Remote-Control and Signaling Circuits with Power Supply Circuits.** Class 1 remote-control and signaling circuits, and power supply circuits shall be permitted to occupy the same cable, enclosure, cable tray, raceway or manhole, provided the insulation on all such conductors is suitable for the maximum voltage present.</u>
Substantiation: There is confusion in the industry concerning Class I circuits. The current rule allows the mixing of 30 Volt power limited circuits with 600 Volt remote control circuits. At the same time, the rule prohibits running most 600 volt lighting circuits within that same cable, cable tray, enclosure, or raceway.

There is a level of safety associated with the power limited circuit. On the other hand, the non power limited circuit is just as deadly as a branch circuit of equal voltage. This proposed rule change addresses that difference. It allows 600 Volt Class 1 circuits to be run with other 600 Volt circuits, while placing appropriate restrictions on the installation of 30 Volt maximum circuits. Thus, a level of safety is assigned to the 30 Volt circuit that cannot be assumed for the 600 Volt circuit. Changing the rule as proposed will make Article 725.26 similar to 725.21 in that there are many requirements shown to assure the safety level of the power limited circuit (in paragraph A) while allowing (in paragraph B), the non power limited circuit which has no similar level of safety. This concept is similar to the provisions of 300.3 (C)(1) which allow conductors of circuits rated 600 volts, nominal or less to occupy the same equipment wiring enclosure, cable or raceway. This proposal does not apply to Class 2 and Class 3 circuits.

Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-160 Log #821 NEC-P03 **Final Action: Accept in Principle**
(725.26(B)(4))

Submitter: Richard P. Owen, St. Paul, MN
Recommendation: Revise text to read as follows:
(4) In Cable Trays. ~~In cable trays, where the Class 1 circuit conductors and power-supply conductors not functionally associated with them are separated by a solid fixed barrier of a material compatible with the cable tray, or where the power-supply or Class 1 circuit conductors are in a metal-enclosed cable.~~ <u>Multi-conductor Type TC, Type AC, Type MC, or Type MI cables shall be permitted to be installed in cable trays without barriers where all conductors in the cables are insulated at 600 volts or greater.</u>
Substantiation: This Proposal is the result of the work of a Task Group that was directed by the Technical Correlating Committee to study the issues of Section 725.26(B) (4). This Task Group consisted of: Steven Owen, Paul Casparro, David Weschler, Robert Walsh, Mark Ode and Richard Owen, Chair.

Comment 3-165 in the 2005 NEC cycle questioned the restriction of requiring a solid fixed barrier between Class 1 circuit conductors and power conductors that were not functionally associated where installed in a cable tray. Many cable trays are open with conductors more exposed to possible damage than raceways and this requirement for separation within raceways has been in the NEC since before the 1951 Code.
This issue was discussed at length by the Task Group and it was pointed out that this restriction was primarily limited to individual conductors and, if the conductors were installed in a multiconductor TC cable or in a metal-enclosed cable, this extra protection would provide the separation necessary to limit the possibility of a short circuit between Class 1 and power conductors from affecting the operation and safety of other non-related circuits. The Task Group was unanimous in its support of the proposal for the 2008 NEC cycle of removing the existing text in 725.26(B)(4) and replacing it with the new text permitting multiconductor TC cable, Type AC, Type MC, or Type MI in a cable tray.

The Task Group agreed that by requiring Class 1 circuits to be installed with a minimum 600-volt insulation in multiconductor TC cable, Type AC, or Type MC cable that an equivalent level of mechanical and electrical protection could be achieved without requiring a permanent barrier in the cable tray.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
(4) In Cable Trays. ~~In cable trays, where the Class 1 circuit conductors and power-supply conductors not functionally associated with them are separated by a solid fixed barrier of a material compatible with the cable tray, or where the power-supply or Class 1 circuit conductors are in a metal-enclosed cable.~~ <u>In cable trays Class 1 circuit conductors and power-supply conductors, within multiconductor Type AC, Type MC, Type MI or Type TC cables shall be permitted to be installed in a cable tray without barriers where all the conductors in the cables are insulated at 600 volts.</u>
Panel Statement: The issue at hand was potential damage to power and Class 1 circuit conductors in a cable tray where the Class 1 circuit conductors were not functionally associated with other power circuits, thus affecting the operation and safety of the other non-related circuits. Providing the separation of different wiring methods in a cable tray, if the Class 1 and the power conductors are not functionally associated, would seem to satisfy the submitter's intent without making sweeping changes to the remainder of this section, which has been relatively the same since the 1951 NEC.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-161 Log #3367 NEC-P03 **Final Action: Accept in Principle**
(725.26(B)(4))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Massachusetts Electrical Code Advisory Committee
Recommendation: Revise to read as follows:
(4) In Cable Trays. In cable trays, where (1) the power-supply conductors are run in wiring methods listed in Table 392.3(A), or where (2) the power supply conductors are run as single conductors as covered in 392.3(B)(1) and all Class 1 circuit conductors not functionally associated with them are separated by a solid fixed barrier of a material compatible with the cable tray, or where the Class 1 circuit conductors are in a metal-enclosed cable.
Substantiation: Cable trays are not supposed to be raceways; they are intended to be a mechanical support for cabled wiring methods. As such, the presence of a Class 1 control cable next to a multiconductor power cable, whether or not functionally related, should not provoke a code objection, any more than one would object to the same power cable secured to a wall with the same control cable run next to it, with identical spacing. Nevertheless, the 2005 NEC prohibits this application.

The only time the functional relationship limitation should come into play is when the cable tray actually functions as some sort of raceway, and that only occurs where the industrial/single conductor option is in use. This proposal limits the application of the separation requirement to the sole cable tray application that is comparable to the 725.26(B)(1) limitation. In so doing it removes a major source of expense without making any change in terms of public safety. Although it is distressingly true that cable trays have a long history of misuse, that is no reason to disqualify reasonable proposals that offer substantial benefits to Code users who abide by its terms.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 3-160.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-162 Log #3626 NEC-P03 **Final Action: Accept in Principle**
(725.26(B)(4))

Submitter: David Wechsler, The Dow Chemical Company
Recommendation: Change Section 725.26(B) (4) by deleting the text in [ ] and replacing it with the text shown below (without brackets)

(4) In Cable Trays. [In cable trays, where the Class 1 circuit conductors and power-supply conductors not functionally associated with them are separated by a solid fixed barrier of a material compatible with the cable tray, or where the power-supply or Class 1 circuit conductors are in a metal-enclosed cable.] Multi-conductor Type TC, Type AC, Type MC, or Type MI cables shall be permitted to be installed in cable trays without barriers where all conductors in the cables are insulated at 600 volts or greater.

Substantiation: In the 1999 NEC ROP, Proposal 16-54 Log 2493, stated that field experience had shown that there was often a total intermixing of all Class I circuits with electric light, power where cable trays were used as a wiring method. This proposal further suggested that the then current section did not appear to address cable tray as a wiring method, resulting in its "intent being missed in both the design and construction phases of a project" and the "prohibited intermixing can only be inferred". The text which appears as the current 725.26 (B)(4) was the resultant action. This action was challenged by a number of comments and proposals since this change was made; an example of which is Comment 3-165 in the 2005 NEC Cycle.

As clarification cable trays are defined as being support system and unlike a raceway they are not addressed as "wiring method". The cables which may be used in a cable tray, such as Type TC, are wiring methods. This may be a difficult concept to understand because cable trays are an article found in Chapter 3 "Wiring methods and materials" and the NEC does not define "wiring methods". Further in 392.3 (A) the Code states "Wiring Methods. The wiring methods in Table 392.3(A) shall be permitted to be installed in cable tray systems under the conditions described in their respective articles and sections." and this clearly separates the tray from the wiring method consideration. Because cable trays have not been considered the same as raceways, the rules have been different. Article 725 has permitted Class I circuits cables to be mixed with electric light and power cables in cable trays without an additional restriction of requiring a solid fixed barrier between Class 1 circuits and electric light and power cables.

This issue of the solid barrier for cable trays was discussed at length by an NFPA NEC Task Group. That Task Group supported the above revised text and noted in that substantiation that by revising the text to address what was actually meant, that is requiring Class 1 circuits to be installed with a minimum 600-volt insulation in multiconductor Type TC cable, Type AC cable, Type MC cable, or Type MI cable that an equivalent level of mechanical and electrical protection would be achieved without requiring a permanent barrier in the cable tray.

(725.26(B)(4) Exception (New))

Submitter: Paul E. Guidry, Fluor Enterprises, Inc.

Recommendation: Add text to read as follows:

725.26(B)(4). Exception: Where all cables in the cable tray have insulation suitable for 600V, listed multiconductor Type AC, TC, MC and MI cables shall be allowed to be installed together without barriers regardless of function.

Substantiation: The reason for maintaining functionally associated power and control in raceways and enclosures seems to be based on the conductors being a single conductor type. Type AC, TC, MI and MC cables are constructed and listed to be installed in close proximity to one another without the use of barriers. The additional protective coverings over the conductor insulation should allow cables that aren't functionally associated to be installed in the same tray without the use of barriers.

Panel Meeting Action: Accept in Principle

3-164 Log #3293 NEC-P03 **Final Action: Reject**

(725.30 (New))

Submitter: Sanford Egesdal, Egesdal Associates PLC

Recommendation: Add new 725.30, as shown below.

725.30 Multiconductor Class 1 Cables.

Multiconductor Class 1 cables that meet the requirements of 725.81 shall be permitted to be used on remote-control, signaling, and power-limited circuits operating at 150 volts or less and shall be installed in accordance with 725.30(A) and 725.30(B).

(A) Class 1 Wiring Method. Multiconductor Class 1 circuit cables shall be installed in accordance with 725.30(A)(1), (A)(2), and (A)(3).

(1) Exposed or Fished in Concealed Spaces. In raceway or exposed on surface of ceiling and sidewalls or fished in concealed spaces. Cable splices or terminations shall be made in listed fittings, boxes, enclosures, fire alarm devices, or utilization equipment. Where installed exposed, cables shall be adequately supported and installed in such a way that maximum protection against physical damage is afforded by building construction such as baseboards, door frames, ledges, and so forth. Where located within 2.1 m (7 ft) of the floor, cables shall be securely fastened in an approved manner at intervals of not more than 450 mm (18 in.).

(2) Passing Through a Floor or Wall. In metal raceway or rigid nonmetallic conduit where passing through a floor or wall to a height of 2.1 m (7 ft) above the floor unless adequate protection can be afforded by building construction such as detailed in 725.30(A)(1) or unless an equivalent solid guard is provided.

(3) In Hoistways. In rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, liquidtight flexible nonmetallic conduit, or electrical metallic tubing where installed in hoistways.

Exception: As provided for in 620.21 for elevators and similar equipment.

(B) Applications of Listed Class 1 Cables. The use of Class 1 circuit cables shall comply with 725.30(B)(1) through (B)(4).

(1) Ducts and Plenums. Multiconductor Class 1 circuit cables, Types CL1P, CL1R, and CL1, shall not be installed exposed in ducts or plenums.

FPN: See 300.22(B).

(2) Other Spaces Used for Environmental Air. Cables installed in other spaces used for environmental air shall be Type CL1P.

Exception No. 1: Types CL1R and CL1 cables installed in compliance with 300.22(C).

Exception No. 2: Other wiring methods in accordance with 300.22(C).

Exception No. 3: Type CL1P-CI cable shall be permitted to be installed to provide a 2-hour circuit integrity rated cable.

(3) Riser. Cables installed in vertical runs and penetrating more than one floor or cables installed in vertical runs in a shaft shall be Type CL1R. Floor penetrations requiring Type CL1R shall contain only cables suitable for riser or plenum use.

Exception No. 1: Type CL1 or other cables that are specified in Chapter 3 encased in metal raceway.

Exception No. 2: Type CL1 cables located in a fireproof shaft having firestops at each floor.

FPN: See 300.21 for firestop requirements for floor penetrations.

Exception No. 3: Type CL1R-CI cable shall be permitted to be installed to provide a 2-hour circuit integrity rated cable.

(4) Other Wiring Within Buildings. Cables installed in building locations other than the locations covered in 725.30(B)(1), (B)(2), and (B)(3) shall be Type CL1.

Exception No. 1: Other wiring methods in compliance with Chapter 3.

Exception No. 2: Type CL1P or Type CL1R cables shall be permitted.

Exception No. 3: Type CL1-CI cable shall be permitted to be installed to provide a 2-hour circuit integrity rated cable.

Substantiation: The proposal provides a Class 1 cable to permit more effective installation methods. Section 725.52(A) permits Class 2 and Class 3 circuits to be "reclassified" as Class 1 circuits. Presently, this means the reclassified circuits would be installed in raceway. Having a Class 1 cable would permit the same installation method using a robust cable and overcurrent protection on every conductor, as required by 725.23.

Here is an application example, based on Article 760: Assume a listed fire alarm panel is also listed for smoke control. The smoke control system could have a damper operator being controlled by a non-power-limited circuit, and the damper having end switches being monitored by a power-limited circuit. These two circuits would require separate cables and/or raceways, or reclassify the power-limited circuit to a non-power-limited circuit, and then run both circuits in the same cable or raceway.

Here's an application example of the same system, based on Article 725: Assume a temperature control panel is also listed for smoke control. [Note: In this case, the temperature control system gets the control signal from a listed fire alarm panel.] The temperature control system could have a damper operator being controlled by a Class 1 circuit, and the damper end switches being monitored by a Class 2 circuit. This part of the smoke control system would require the Class 1 circuit to be installed in raceway, and the Class 2 circuit to be installed in a separately run cable or separately run raceway. If the Class 2 circuit was reclassified as a Class 1 circuit, both could be run in the same raceway. If this proposal is accepted, both circuits could be installed in the same cable.

Access control systems run multiple circuits to each door that is controlled: card reader, request-to-exit, door contact, and door strike. If the door strike power requirements exceed Class 2 limit, it is a Class 1 circuit and required to be installed in raceway. It would be an installation convenience to reclassify all circuits to Class 1 and install using a multiconductor Class 1 cable, or install all circuits in the same raceway. If the door just described was connected to a fire alarm system, with the strike being "fail-safe," a non-power-limited fire alarm cable (raceway optiona) could control the door strike.

As other systems, such as temperature control, security, and access control continue to be combined with fire alarm systems, it makes sense to have parallel wiring method for similar circuits. "Section 760.26(A) Class 1 with NPLFA Circuits. Class 1 and non–power-limited fire alarm circuits shall be permitted to occupy the same cable, enclosure, or raceway…".

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided any technical substantiation that a Listed Class 1 multiconductor cable exists and the proposal references a cable meeting the requirements in a proposed 725.81. This section does not

exist, in the 2005 NEC. In addition, a fact finding report should be submitted as part of the substantiation for acceptance of the cable to help determine the acceptability and the installation criteria for the cable.

3-166 Log #1485 NEC-P03 **Final Action: Reject**
(725.41)

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise as follows:
~~725.41 Power Sources for Class 2 and Class 3 Circuits.~~
~~(A) Class 2 Power Source. The power source for a Class 2 or a Class 3 circuit shall be as specified in 725.41(A)(1), (A)(2), (A)(3), (A)(4), or (A)(5):~~
~~FPN No. 1: Figure 725.41 illustrates the relationships between Class 2 or Class 3 power sources, their supply, and the Class 2 or Class 3 circuits.~~
~~FPN No. 2: Table 11(A) and Table 11(B) in Chapter 9 provide the requirements for listed Class 2 and Class 3 power-sources.~~
~~(1) A listed Class 2 or Class 3 transformer.~~
~~(2) A listed Class 2 or Class 3 power supply.~~
~~(3) Other listed equipment marked to identify the Class 2 or Class 3 power source.~~
~~Exception No. 1: thermocouples shall not require listing as a Class 2 power source.~~
~~Exception No. 2: Limited power circuits of listed equipment where these circuits have energy levels rated at or below the limits established in Chapter 9, Table 11(A) and Table 11(B).~~
~~FPN: examples of other listed equipment are as follows:~~
~~(1) A circuit card listed for use as a Class 2 or Class 3 power source where used as part of a listed assembly~~
~~(2) A current-limiting impedance, listed for the purpose, or part of a listed product, used in conjunction with a nonpower-limited transformer or a stored energy source, for example, storage battery, to limit the output current.~~
~~(3) A thermocouple~~
~~(4) Limited voltage/current or limited impedance secondary communications circuits of listed industrial control equipment.~~
~~(4) Listed information technology (computer) equipment limited power circuits.~~
~~FPN: One way to determine applicable requirements for listing of information technology (computer) equipment is to refer to UL 1950-1995, Standard for Safety of Information Technology Equipment, Including Electrical Business Equipment. Typically such circuits are used to interconnect information technology equipment for the purpose of exchanging information (data).~~
~~(5) A dry cell battery shall be considered an inherently limited Class 2 power source, provided the voltage is 30 volts or less and the capacity is equal to or less than that available from series connection No. 6 carbon zinc cells.~~
~~(B) Interconnection of Power Sources. Class 2 or Class 3 power sources shall not have the output connections paralleled or otherwise interconnected unless listed for such interconnection.~~
~~Figure 725.41 Class 2 and Class 3 Circuits.~~
Revise to read:
725.41 Power Sources for Class 2 and Class 3 Circuits.
(A) Class 2 Power Source. The power source for a Class 2 circuit shall be as specified in 725.41(A)(1), (A)(2), (A)(3), (A)(4), or (A)(5):
FPN No. 1: Figure 725.41 illustrates the relationships between Class 2 power sources, their supply, and the Class 2 circuits.
FPN No. 2: Table 11(A) and Table 11(B) in Chapter 9 provide the requirements for listed Class 2 power sources.
(1) A listed Class 2 transformer.
(2) A listed Class 2 power supply.
(3) Other listed equipment marked to identify the Class 2 power source.
Exception No. 1 to (3): Thermocouples shall not require listing as a Class 2 power source.
Exception No. 2 to (3): Limited power circuits of listed equipment where these circuits have energy levels rated at or below the limits established in Chapter 9, Table 11(A) and Table 11(B).
FPN: Examples of other listed equipment are as follows:
(1) A circuit card listed for use as a Class 2 power source where used as part of a listed assembly.
(2) A current-limiting impedance, listed for the purpose, or part of a listed product, used in conjunction with a nonpower-limited transformer or a stored energy source, for example, storage battery, to limit the output current.
(3) A thermocouple
(4) Limited voltage/current or limited impedance secondary communications circuit of listed industrial control equipment.
(4) Listed information technology (computer) equipment limited power circuits.
FPN; One way to determine applicable requirements for listing of information technology (computer) equipment is to refer to UL 1950-1995, Standard for Safety of Information Technology Equipment, Including Electrical Business Equipment. Typically such circuits are used to interconnect information technology equipment for the purpose of exchanging information (data).
(5) A dry cell battery shall be considered an inherently limited Class 2 power source, provided the voltage is 30 volts or less and the capacity is equal to or less than that available from series connected No. 6 carbon zinc cells.
(B) Class 3 Power Source. The power source for a Class 3 circuit shall be as specified in 725.41(B)(1), (B)(2), (B)(3), or (B)(4):
FPN No. 1: Figure 725.41 illustrates the relationships between Class 3 power sources, their supply, and the Class 3 circuits.
FPN No. 2: Table 11(A) and Table 11(B) in Chapter 9 provide the requirements for listed Class 3 power sources.
(1) A listed Class 3 transformer.
(2) A listed Class 3 power supply.
(3) Other listed equipment marked to identify the Class 3 power source.
Exception to (3): Limited power circuits of listed equipment where these circuits have energy levels rated at or below the limits established in Chapter 9, Table 11(A) and Table 11(B).
FPN: Examples of other listed equipment are as follows:
(1) A circuit card listed for use as a Class 3 power source where used as part of a listed assembly.
(2) A current-limiting impedance, listed, for the purpose, or part of a listed product, used in conjunction with a nonpower-limited transformer or a stored energy source, for example, storage battery to limit the output current.
(4) Limited voltage/current or limited impedance secondary communications circuits of listed industrial control equipment.
(4) Listed information technology (computer) equipment limited power circuits.
FPN: One way to determine applicable requirements for listing of information technology (computer) equipment is to refer to UL 1950-1995, Standard for Safety of Information Technology equipment including electrical business equipment. Typically, such circuits are used to interconnect information technology equipment for the purpose of exchanging information (data).
(C) Interconnection of Power Sources. Class 2 or Class 3 power sources shall not have the output connections paralleled or otherwise interconnected unless listed for such interconnection. Figure 725.41 Class 2 and Class 3 Circuits.
Substantiation: The intent of this change is simply to clarify the fact that a Class 3 power supply is not suitable for a Class 2 circuit. As written, the code is vague on this. The existing language of the section makes the code user think that any of the items of 725.41(A)(1), (A)(3) can be used to create a Class 2 or a Class 3 circuit. This obviously is not the case, and, therefore, the code should be clearer on the topic.
Panel Meeting Action: Reject
Panel Statement: Section 90.1(C) makes it very clear that the NEC is not an instruction manual for untrained personnel. The 1993 and previous Codes included in Tables (a) and (b) Section 725.31 so the user could seemingly build a Class 2 or Class 3 power supply or transformer. This was changed in the 1996 NEC when the panel moved these tables to Chapter 9 as Tables 11(A) and 11(B) and required Class 2 and 3 power sources to be listed as can now be seen in 725.41 in the 2005 NEC. Power sources will not be listed for both Class 2 and 3 at the same time, so the suggested separation in text in 725.41 is unnecessary.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-167 Log #2298 NEC-P03 **Final Action: Accept**
(725.41(A)(4), FPN)

Submitter: Thomas J. Burke, Jr., Underwriters Laboratories
Recommendation: Revise the FPN of Section: 725.41(A)(4) to read:
(4) Listed information technology (computer) equipment limited power circuits.
FPN: One way to determine applicable requirements for listing of information technology (computer) equipment is to refer to UL ~~1950 1995~~ 60950-1-2003, *Standard for Safety of Information Technology Equipment*, ~~*Including Electrical Business Equipment.*~~ Typically such circuits are used to interconnect information technology equipment for the purpose of exchanging information (data),
Substantiation: UL 60950-1 has replaced UL 1950 for safety of information technology equipment (ITE). The title of the Standard also has been revised. However, the same requirements remain for circuits powered by a Limited Power Source (LPS).

Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-168 Log #3442 NEC-P03 **Final Action: Reject**
(725.55(G))

Submitter: David Wechsler, The Dow Chemical Company
Recommendation: Revise the text by inclusion of the underlined text to the existing as follows:
(G) Closed-Loop and Programmed Power Distribution. Class 2 and Class 3 conductors shall be permitted to be installed in accordance with <u>780.6(B)</u> .
Substantiation: 780(A) deals only with cables and not conductors. The current text would have conductors and cables treated identically. Clearly, the construction and design of a cable are sufficiently different from a conductor so as not to permit the seemingly interchangeability and the total disregard for the differences between these wiring methods as the current code text would permit.
Panel Meeting Action: Reject
Panel Statement: The present wording is correct. Section 780.6(A) covers hybrid cables, and Section 780.6(B) covers the conductors in the cable when they are to be terminated.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
PACE, D.: The panel should have accepted this proposal.
As stated by the submitter, the existing text can be interpreted as unclear as to the treatment of conductors vs cables. If the submitter's suggested text change is not acceptable to the panel, this issue should be addressed in some manner that would be acceptable.

3-169 Log #3 NEC-P03 **Final Action: Accept**
(725.56(D)(1))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 16 for information.
Submitter: Stanley Kaufman, CableSafe, Inc.
Recommendation: Revise as follows:
(1) Classified as Communications Circuits. Class 2 and Class 3 circuit conductors shall be permitted in the same cable with communications circuits, in which case the Class 2 and Class 3 circuits shall be classified as communications circuits and shall be installed in accordance with the requirements of Article 800. The cables shall be listed as communications cables ~~or multipurpose cables~~ .
Substantiation: Panel 16 eliminated multipurpose cables in the last code cycle and succeeded in removing most references to multipurpose cables. This is a cleanup proposal to remove the remaining traces.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-170 Log #1292 NEC-P03 **Final Action: Reject**
(725.56(E))

Submitter: Gerald Lee Dorna, Belden CDT. Inc.
Recommendation: Revise text to read:
(E) Class 2 or Class 3 Cables with Other Circuit Cables. Jacketed cables of Class 2 or Class 3 circuits shall be permitted in the same enclosure <u>, cable tray</u> or raceway with jacketed cables of any of the following:
(1) Power-limited fire alarm systems in compliance with Article 760
(2) Nonconductive and conductive optical fiber cables in compliance with Article 770
(3) Communications circuits in compliance with Article 800
(4) Community antenna television and radio distribution systems in compliance with Article 820
(5) Low-power, network-powered broadband communications in compliance with Article 830
Substantiation: Obviously, cables that can be safely installed in the same raceway or enclosure can also be safely installed in the same cable tray. Stating that these cables are allowed "in the same cable tray" will avoid having the user assume that they are not permitted to be installed together in the same cable tray. It clarifies the use in the Code. Article 770, in section 770.133(B), has text similar to that proposed here. This is one of five similar proposals that are being submitted for Articles 725, 760, 800, 820 and 830.
Panel Meeting Action: Reject
Panel Statement: The submitter's statement that cables that can be safely installed in the same raceway or cable can also safely be installed in the same cable tray is incorrect. Raceway is a type of wiring method that has to meet construction requirements to allow easy insertion and removal, and provide a smooth interior to avoid damaging the cable. Cable trays provide a support system for specific wiring methods. Jacketed cables can be supported by a cable tray in accordance with Article 392.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 11 Negative: 2
Explanation of Negative:
AYER, L.: 725.56(E) permits a jacketed Class 2 or Class 3 cable to be installed in the same raceway or enclosure with other Class 2 or Class 3 jacketed cables. These type cables are different from normal power wiring and Class 1 circuits because of their low-energy characteristics which eliminates almost any fire and shock hazard. I would agree with the submitter's substantiation that if low-voltage low-energy cables can be safely installed together in the same enclosure or raceway then surely they can coexist in a cable tray.
PACE, D.: The panel should have accepted this proposal.
Cable trays also have to meet certain requirements relating to placement and prevention of damage, and I do not believe this is the primary issue here. The issue is whether or not permitting these cables together would pose a concern and the existing text indicates that there would not be a concern. If placing them together is not a concern, then what or where they are placed together is not a concern either.

3-171 Log #2521 NEC-P03 **Final Action: Reject**
(725.61)

Submitter: Sanford Egesdal, Egesdal Associates PLC
Recommendation: Add the following sentence to 725.61, to read as follows:
Class 2, Class 3, and PLTC cables shall comply with the requirements described in 725.61(A) through 725.61(H). <u>Types CL250 or CL350 very-low-smoke cable shall be permitted to be installed meet requirements for very-low-smoke producing characteristics, low potential heat release, and low flame spread characteristics.</u>
Substantiation: NFPA 13-2002 has requirements for installation of sprinklers where a concealed space has combustible loading. The proposed very-low-smoke producing cables have a heat release that is significantly lower than combustible plenum cable listed using NFPA 262-2002, *Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces* .
The 2003 International Mechanical Code (IMC), 602.2.1 requires a smoke developed index less than 25 and a smoke developed index less than 50 for materials in plenums.
The Fine Print Note provides guidance to system designers, installers, and code officials. Over the past few decades, there has been a significant increase in the quantity of combustible cables installed in concealed spaces (hollow spaces and HVAC system spaces).
NFPA 13-2002, Installation of Sprinkler Systems, requires installation of a sprinkler system in concealed spaces where combustible loading is present. Because other NFPA documents reference NFPA 13, it is important for correlation for the NEC to include a pointer to NFPA 13. The following requirements are from NFPA 13-2002:
"8.14.1.5 Localized Protection of Exposed Combustible Construction or Exposed Combustibles. In concealed spaces having exposed combustible construction, or containing exposed combustibles, in localized areas, the combustibles shall be protected as follows:
(1) If the exposed combustibles are in the vertical partitions or walls around all or a portion of the enclosure, a single row of sprinklers spaced not over 12 ft (3.7 m) apart nor more than 6 ft (1.8 m) from the inside of the partition shall be permitted to protect the surface. The first and last sprinklers in such a row shall not be over 5 ft (1.5 m) from the ends of the partitions.
(2) If the exposed combustibles are in the horizontal plane, the area of the combustibles shall be permitted to be protected with sprinklers on a light hazard spacing. Additional sprinklers shall be installed no more than 6 ft (1.8 m) outside the outline of the area and not more than 12 ft (1.8 m) on center along the outline. When the outline returns to a wall or other obstruction, the last sprinkler shall not be more than 6 ft (1.8 m) from the wall or obstruction."
"8.14.1.2.1 Noncombustible and limited combustible concealed spaces with no combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum."
The definition of combustible, from NFPA 5000 is:
"3.3.340.2 Combustible (Material). A material that, in the form in which it is used and under the conditions anticipated, will ignite and burn; a material that does not meet the definition of noncombustible or limited-combustible."
During the 2005 NEC code cycle, the proposed Fine Print Note was added to 800.154(A). Because communications cables are permitted to substitute for Class 2 and Class 3 circuit cables, it is important to have parallel requirements in both NEC Sections. Additionally, the Fine Print Note applies to all concealed spaces.
In July of 2004, an appeal to the NFPA Standards Council requested deletion of the Fine Print Note to 800.154(A), prior to publication of the 2005 NEC. The appeal was denied.
There is a companion proposal for the listing and marking of Type CL250 and CL350.

Panel Meeting Action: Reject

Panel Statement: The added text does not belong in the main paragraph as proposed, and the panel is unsure of the appropriate location for this material. As submitted, the proposal could apply to plenum applications.

The panel is acting on this and other proposals related to wire and cable in plenum and other air-handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"[S]o as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

In addition the submitter's substantiation makes reference to an FPN that does not appear in the recommendation.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

Comment on Affirmative:

EGESDAL, S.: As submitter of this proposal, I agree with the part of the Panel Statement indicating the proposed text would have been more appropriate in another section, such as 725.61(E), Other wiring Within Buildings.

However, the Panel is in error by stating that the proposed Types CL250 or CL350 could be used in a plenum. Section 725.61(A) requires a Type CL2P or CL3P cable. The proposed cable does not have a "P" in the marking. So, clearly, referencing the NFPA 90A directive on NFPA 90A is in error.

3-172 Log #2200 NEC-P03 **Final Action: Reject**
(725.61 and 725.82)

Submitter: Frank Peri, Communications Design Corporation

Recommendation:

In 725.61 revise and re-letter the existing section (A) to (B) and introduce a new (A) as shown below. Also revise (G) as shown below. Re-letter the remaining sections, (B) to (C), (C) to (D) etc.

(A)Air Ducts. Cables installed in air ducts shall be Type CL2D or CL3D and shall be associated with the air distribution system and shall be as short as practicable. Types CL2D, CL3D, CL2P, CL3P, CL2, CL3, CL2X and CL3X cables installed in raceway that is installed in compliance with 300.22(B) shall also be permitted.

(B~~A~~) Plenum. Cables installed in ~~ducts,~~ plenums~~,~~ and other space~~s~~ used for environmental air shall be Types CL2D, CL3D, CL2P or CL3P. Listed wires and cables installed in compliance with 300.22 shall be permitted. Listed plenum signaling raceways shall be permitted to be installed in other space~~s~~ used for environmental air as described in 300.22(C). Only Type~~s~~ CL2D, CL3D, CL2P or CL3P cable shall be permitted to be installed in these raceways.

(H~~G~~) Class 2 and Class 3 Cable Substitutions. The substitutions for Class 2 and Class 3 cables listed in Table 725.61 shall be permitted. Where substitute cables are installed, the wiring requirements of Article 725, Parts I and III, shall apply.

FPN: For information on Types CMD, CMP, CMR, CM, and CMX cables, see 800.179.

Table 725.61 Cable Substitutions

Cable Type	Permitted Substitutions
CL3P	CMD, CL3D CMP
CL2P	CMD, CL3D, CL2D, CMP, CL3P
CL3R	CMD, CL3D, CMP, CL3P, CMR
CL2R	CMD, CL3D, CL2D, CMP, CL3P, CL2P, CMR, CL3R
PLTC	
CL3	CMD, CL3D,CMP, CL3P, CMR, CL3R, CMG, CM, PLTC
CL2	CMD, CL3D, CL2D, CMP, CL3P, CL2P, CMR, CL3R, CL2R, CMG, CM, PLTC, CL3
CL3X	CMD, CL3D, CMP, CL3P, CMR, CL3R, CMG, CM, PLTC, CL3, CMX
CL2X	CMD, CL3D, CL2D,CMP, CL3P, CL2P, CMR, CL3R, CL2R, CMG, CM, PLTC, CL3, CL2, CMX, CL3X

In 725.82 revise and re-letter the existing section (A) to (B) and introduce a new (A) as shown below. Revise section (L) as show. Re-letter the remaining sections, (B) to (C), (C) to (D) etc.

(A)Types CL2D and CL3D. Types CL2D and CL3D class 2 and class 3 air duct cables shall be listed as suitable for use in air ducts and shall be rated for continuous use at 121ºC. Types CL2D and CL3D class 2 and class 3 air duct cables shall also be listed as having a low potential heat value, low flame spread characteristics, and very low smoke-producing characteristics.

FPN: One method of defining a low potential heat cable is establishing an acceptable value of potential heat when tested in accordance with NFPA 259, *Standard Test Method for Potential Heat of Building Materials*, to a maximum potential heat value not exceeding 8141 kJ/kg (3500 BTU/lb). One method of defining low flame spread cable is establishing an acceptable value of flame spread when tested in accordance with NFPA 255, *Standard Method of Test of Surface Burning Characteristics of Building Materials*, to a maximum flame spread index of 25, with the cable unslit (intact) and slit. Similarly, one method of defining very low smoke-producing cable is establishing an acceptable value when tested in accordance with NFPA 255, *Standard Method of Test of Surface Burning Characteristics of Building Materials*, to maximum smoke developed index of 50, with the cable unslit (intact) and slit. These test methods and resultant values correlate with the requirements of NFPA 90A-2002, *Standard for the Installation of Air-Conditioning and Ventilating Systems* for materials installed in ducts and plenums. *For additional testing information see Underwriters Laboratories Subject 2424, Outline of Investigation For Cable Marked Limited Combustible.*

(B~~A~~) Types CL2P and CL3P. Types CL2P and CL3P plenum cable shall be listed as being suitable for use in ~~ducts,~~ plenums~~,~~ and other space for environmental air and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.

FPN: One method of defining low smoke-producing cable is by establishing an acceptable value of the smoke produced when tested in accordance with NFPA 262-2002, *Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces*, to a maximum peak optical density of 0.5 and a maximum average optical density of 0.15. Similarly, one method of defining fire-resistant cables is by establishing a maximum allowable flame travel distance of 1.52 m (5 ft) when tested in accordance with the same test.

(M~~L~~) Marking. Cables shall be marked in accordance with 310.11A(2), (A)(3), (A)(4), and (A)(5) and Table 725.82. Voltage ratings shall not be marked on the cables.

FPN: Voltage markings on cables may be misinterpreted to suggest that the cables may be suitable for Class 1 electric light and power applications.

Exception: Voltage markings shall be permitted where the cable has multiple listings and a voltage marking is required for one or more of the listings.

Table 725.82 Cable Marking

Cable Marking	Type
CL3D	Class 3 air duct cable
CL2D	Class 2 air duct cable
CL3P	Class 3 plenum cable
CL2P	Class 2 plenum cable
CL3R	Class 3 riser cable
CL2R	Class 2 riser cable
PLTC	Power-limited tray cable
CL3	Class 3 cable
CL2	Class 2 cable
CL3X	Class 3 cable, limited use
CL2X	Class 2 cable, limited use

FPN: Class 2 and Class 3 cable types are listed in descending order of fire resistance rating, and Class 3 cables are listed above Class 2 cables because Class 3 cables can substitute for Class 2 cables.

Substantiation: Summary

This proposal is submitted to accomplish four things:

1) Change the code to not allow the dangerous practice of using air ducts as a cable pathway.

2) Code recognition that there may be instances where a small amount of in-duct cable is necessary for air handling equipment, dampers, security, temperature control, fire protection, etc.

3) Establish minimum requirements for flame spread, smoke, and potential heat for in-duct (CL2D, CL3D, FPLP, OFND, OFCD, CMD and CATVD) cables used in this special hazard space.

4) Include air duct "D" cables as permissible substitute for plenum "P" cables for installation in ceiling cavity and raised floor plenums (other space used for environmental air).

This proposal correlates with a TIA that I submitted for NFPA 90A-2002, *Standard for the Installation of Air-Conditioning and Ventilating Systems.* Similar proposals have been submitted for Articles 725, 760, 770, 800 and 820.

The substantiation for the TIA is shown below:

"This TIA is being submitted in accordance with Section 5 of the *2005 NFPA REGULATIONS GOVERNING COMMITTEE PROJECTS.* In particular, it addresses a hazard meeting the criteria of section 5-2(d), which states:

(d) The proposed TIA intends to offer to the public a benefit that would lessen a recognized (known) hazard or ameliorate a continuing dangerous condition or situation.

The purpose of this TIA is to address the dangerous practice of installing combustible communications/data cables in air ducts.

NFPA 90A-2002 does not have explicit requirements for electrical wiring in air ducts. While there is a need for some limited amount of wiring in air ducts where the function of the wiring is associated with the function of the air handling system, use of air duct instead of an electrical raceway for routing wiring unassociated with the air handling system is a dangerous practice. It introduces unlimited quantities of combustible cable into an air handling system and thus unacceptability increases the potential for the spread of fire and smoke through the air distribution system.

This TIA would greatly reduce the amount of wiring in air ducts by only permitting wiring and raceways associated with the air distribution system and also requiring that they be as short as practicable. It would require that the wiring and nonmetallic raceway in the ducts have the appropriate temperature rating for hot air ducts; NFPA 90A permits the supplied air to be at 121 o C (250 o F). The permitted wiring and nonmetallic raceway would be required to have initial flame spread and smoke requirements identical to those for supplementary materials in an air duct (flame spread index =25, smoke developed index =50). In addition to these initial requirements, there are slitting and ageing requirements to assure that the cables installed in air ducts meet the flame spread, smoke and potential heat requirements equivalent to those for limited combustible materials. Essentially they would be required to be listed to the UL 2424.

Combustible plenum cable is unsuitable and dangerous for this application. Typically, combustible plenum cable has a temperature rating of 60 o C, which is significantly less that the 121 o C air permitted in the air duct. Furthermore, according to Fire Protection Research Foundation tests, these cables can have smoke developed index (SDI) of up to 850. This SDI is an order of magnitude greater than permitted for supplementary materials installed in an air duct.

It is essential that these requirements be adopted now in NFPA 90A."

Section 725.61(A) in the 2005 NEC permits unlimited amounts of Types CL2P and CL3P cables in air ducts. While there is a need for some limited amount of wiring in air ducts where the function of the wiring is associated with the function of the air handling system, use of an air duct instead of an electrical raceway for routing wiring unassociated with the air handling system is a dangerous practice. It introduces unlimited quantities of combustible cables into an air handling system and thus unacceptability increases the potential for the spread of fire and smoke through the air distribution system.

This proposal would greatly reduce the amount of wiring in air ducts by only permitting wiring associated with the air duct and as short as practicable. It would require that the wiring in the ducts have the appropriate temperature rating for hot air ducts; NFPA 90A-2002, *Standard for the Installation of Air-Conditioning and Ventilating Systems,* permits the supplied air to be at 121^{o} C (250^{o} F). The permitted wiring would be required to have flame spread and smoke requirements identical to those in NFPA 90A-2002 section 4.3.3.1 for supplementary materials in an air duct (flame spread index =25, smoke developed index =50). Essentially they would be required to be listed to the UL 2424, *Outline of Investigation For Cable Marked Limited Combustible* (copy attached) .

"P" type plenum cables are unsuitable and dangerous for this application. Typically, they have a temperature rating of 60^{o} C, which is significantly less that the 121 o C air permitted in the air duct. Furthermore, according to Fire Protection Research Foundation tests (copy attached), these cables can have smoke developed index (SDI) of up to 850. This SDI is an order of magnitude greater than permitted for supplementary materials installed in an air duct.

"D" type air duct cables will meet the NFPA 90A listing requirements for use in ceiling cavity and raised floor plenums (other space used for environmental air) and therefore will be able to safely substitute for "P" type plenum cables. "D" type air duct cables have approximately 1/20 the smoke production of "P" type plenum cables.

In order to be consistent with the applications of plenum cable, this proposal will also prohibit the installation of plenum communications raceways in air ducts.

The cable substitution table and figure have been revised to permit air duct cables to substitute for plenum cables since air duct cables are superior cables. "D" type air duct cables also meet the requirements in NFPA 90A for use in ceiling cavity plenums and raised floor plenums (other space used for environmental air).

Some of the applications that require the installation of cables in air ducts are fire alarm (Article 760), temperature sensing and control (Article 725), security (Articles 725 and 820) and communications (Article 800). Optical fiber cables (Article 770) could be used in place of copper conductor cables. Communications cables are permitted to substitute for Class 2 & 3, fire alarm and CATV cables. I am submitting similar proposals for each of these articles.

Note: Supporting Material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"[S]o as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-173 Log #3247 NEC-P03 **Final Action: Reject**

(725.61(A))

Submitter: Frank Peri, Communications Design Corporation

Recommendation: Revise 725.61(A), as shown.

(A) Plenums. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CL2D, CL3D, CL2P or CL3P. Listed wires and cables installed in compliance with 300.22 shall be permitted. Listed plenum signaling raceways shall be permitted to be installed in other spaces used for environmental air as described in 300.22(C). Only Type CL3D, CL2D, CL2P or CL3P cable shall be permitted to be installed in these raceways.

Substantiation: The purpose of this proposal is to correlate with NFPA 5000-2006. NFPA 5000-2006, recently issued by the NFPA Standards Council, incorporates extracted plenum requirements from NFPA 90A-2002. Consequently, the plenum requirements in NFPA 5000-2006 are identical to the ceiling cavity plenum requirements in NFPA 90A-2002. This proposal provides listing requirements for a cable with characteristics that complies with the NFPA 90A-2002, 4.3.10.2.6: requirements for limited combustible materials exposed to the airflow. This proposal provides a listing and marking for a cable that complies with the NFPA 90A-2002, 4.3.10.2.6.1: a requirement for a listed limited combustible cable with a maximum smoke developed index of 50. The proposed cable meets the NFPA Standards Council's directive to not identify cable as "limited combustible," because it is not a building construction material. The cable name and listing requirements meets guidance from the NFPA Standards Council to identify cable characteristics in terms of flame spread index, smoke developed index, and potential heat release.

As compared to a combustible plenum cable that is listed using NFPA 262, air duct cable is a much "safer" cable. Air duct cable provides users with an opportunity to significantly reduce the potential hazard from smoke during a fire emergency. Additionally, the much lower potential heat release of air duct cable provides much lower combustible loading than found in combustible plenum cable listed using NFPA 262.

Air duct cables are available on the market today. Presently, there is air duct cable available to meet the plenum installation requirements in Articles 725, 760, 770, and 800. Unfortunately, the only marking available in the NEC is for a combustible plenum cable. The NEC decides what marking is permitted, and listing organizations correlate. That is, it would be inappropriate for a listing organization to mark cable with a "Type XXX" that is not published in the NEC.

Panel Meeting Action: Reject

Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air-handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"[S]o as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-174 Log #2370 NEC-P03 **Final Action: Reject**
(725.61(A), FPN (New))

Submitter: Allen C. Weidman, The Society of the Plastics Industry, Inc.
Recommendation: Add the following Fine Print Note to 725.61(A).
FPN: See 8.14.1 of NFPA 13-2002, *Installation of Sprinkler Systems* , for requirements for sprinklers in concealed spaces containing exposed combustibles.
Substantiation:
The Fine Print Note provides guidance to system designers, installers, and code officials. Over the past few decades, there has been a significant increase in the quantity of combustible cables installed in concealed spaces (hollow spaces and HVAC system spaces).

NFPA 13, Installation of Sprinkler Systems, requires installation of a sprinkler system where combustible loading is present. Because other NFPA documents reference NFPA 13, it is important for correlation for the NEC to include a pointer to NFPA 13. The following requirements are from NFPA 13-2002:

"8.14.1.5 Localized Protection of Exposed Combustible Construction or Exposed Combustibles. In concealed spaces having exposed combustible construction, or containing exposed combustibles, in localized areas, the combustibles shall be protected as follows:

(1) If the exposed combustibles are in the vertical partitions or walls around all or a portion of the enclosure, a single row of sprinklers spaced not over 12 ft (3.7 m) apart nor more than 6 ft (1.8 m) from the inside of the partition shall be permitted to protect the surface. The first and last sprinklers in such a row shall not be over 5 ft (1.5 m) from the ends of the partitions.

(2) If the exposed combustibles are in the horizontal plane, the area of the combustibles shall be permitted to be protected with sprinklers on a light hazard spacing. Additional sprinklers shall be installed no more than 6 ft (1.8 m) outside the outline of the area and not more than 12 ft (1.8 m) on center along the outline. When the outline returns to a wall or other obstruction, the last sprinkler shall not be more than 6 ft (1.8 m) from the wall or obstruction."

"8.14.1.2.1 Noncombustible and limited combustible concealed spaces with no combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum."

The definition of combustible, from NFPA 5000 is:

"3.3.340.2 Combustible (Material). A material that, in the form in which it is used and under the conditions anticipated, will ignite and burn; a material that does not meet the definition of noncombustible or limited-combustible."

During the 2005 NEC code cycle, the proposed Fine Print Note was added to 800.154(A). Because Type CMP cable is permitted to substitute for Type CL2P and Type CL3P cables, it is important to have parallel requirements in both NEC Sections.

In July of 2004, an appeal to the NFPA Standards Council requested deletion of the Fine Print Note to 800.154(A), prior to publication of the 2005 NEC. The appeal was denied in Standards Council Decision 04-7-1-z-cc, copy provided

Note: Supporting material is available for review at NFPA Headquarters..
Panel Meeting Action: Reject
Panel Statement: The recommended fine print note referencing ducts, plenums, and other spaces for environmental air does not address an installation issue since the word "concealed" has a different definition in Article 100 related to wiring methods. "Concealed" in Article 100 of the NEC means rendered inaccessible by the structure or finish of the building.
The panel is acting on this and other proposals related to wire and cable in plenum and other air-handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 which states, in pertinent part, as follows:
"[S]o as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."
This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

(725.61(B)(1))

Submitter: Stanley Kaufman, CableSafe, Inc.
Recommendation: Revise as follows:
(1) Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type CL2R or CL3R. Floor penetrations requiring Type CL2R or CL3R shall contain only cables suitable for riser or plenum use. Listed riser signaling raceways and listed plenum signaling raceways shall be permitted to be installed in vertical riser runs in a shaft from floor to floor. Only Type CL2R, CL3R, CL2P, or CL3P cables shall be permitted to be installed in these raceways.
Substantiation: Plenum raceways should be permitted to substitute for riser and general purpose raceways just as plenum cable is permitted to substitute for riser and general purpose cables.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-176 Log #2 NEC-P03 **Final Action: Accept**
(725.61(C))

Submitter: Stanley Kaufman, CableSafe, Inc.
Recommendation: Revise as follows:
(C) Cable Trays. Cables installed in cable trays outdoors shall be Type PLTC. Cables installed in cable trays indoors shall be Types PLTC, CL3P, CL3R, CL3, CL2P, CL2R, and CL2.

Listed general-purpose signaling raceways , listed riser signaling raceways and listed plenum signaling raceways shall be permitted for use with cable trays.

FPN: See 800.133(B) for cables permitted in cable trays.
Substantiation: The proposed text mentions all the signaling raceways explicitly so it is clear that all of these raceways are permitted in cable trays.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-177 Log #367 NEC-P03 **Final Action: Reject**
(725.61(D)(4))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise text as follows:
"3: In industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, and where the cable is not subject to ~~physical~~ damage, Type PLTC cable that complies with the crush and impact requirements of Type MC cable and is identified for such use...".
Substantiation: Use of the word "physical" is superfluous–the intent is obvious given the context. (I leave it to the CMP whether you want to get more specific naming some source of damage such as "blows or abrasion." I also leave it to you whether you want to consider updating the other language, supporting AHJs e.g., ~~industrial~~ premises where the Authorities Having Jurisdiction are satisfied that ...).

Submitting proposals removing the adjective "physical" may strike people as about as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every unnecessary instance, as I am attempting to do, we actually cut the NEC down by up to oh, maybe a quarter-page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.

Second, the unneeded use of "physical" not only is poor writing–look at William Zinsser's classic, On Writing Well–but is silly, and reflects a bit poorly on the Code process. When references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."
Panel Meeting Action: Reject
Panel Statement: In Webster's Dictionary, the word "physical" is used with "environment" to pertain to material things. "Physical" is used throughout the NEC as a descriptive adjective to the noun "damage." While the submitter feels the word "physical damage" is superfluous, the word "physical" seems to provide a certain emphasis and a further description where combined into the phrase "physical damage." This phrase tends to draw more attention than just "damage." In addition, physical damage provides a description of thermal and mechanical damage where the damage can be readily identified, such as a raceway that has been physically damaged versus damage from ultraviolet light where the raceway may be more brittle and thus can be easily damaged physically by impact to the raceway. Chemicals or heat can cause unseen damage to electrical components that can eventually lead to physical damage at a later time. This phrase is used in the NEC Style Manual in 3.2.5.5 as an acceptable method to describe physical damage.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-178 Log #1290 NEC-P03 **Final Action: Accept in Principle**
(725.61(D)(4))

Submitter: Gerald Lee Dorna, Belden CDT. Inc.
Recommendation: Revise text to read:
(4) In Industrial Establishments. In industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons

service the installation, and where the cable is not subject to physical damage, Type PLTC cable ~~that complies with the crush and impact requirements of Type MC cable and is identified for such use~~ shall be permitted to be ~~exposed~~ run between the cable tray and utilization equipment or device. The cable shall be continuously supported and protected against physical damage using mechanical protection such as dedicated struts, angles, or channels. The cable shall be secured at intervals not exceeding 1.8 m (6 ft).

Substantiation: If the cable is "protected against physical damage using mechanical protection such as dedicated struts, angles, or channels" as stated in Article 725.61(D)(4), there is no need for the cable to additionally have to meet the crush and impact requirements of Type MC cable.

I also changed the word "exposed" to "run" because again if the cable is protected as stated above it really is not exposed.

I have also put in a proposal to Article 727.4(5) & (6) to combine (5) & (6) so as to have the same wording. Therefore, PLTC and ITC will have the same wording.

Panel Meeting Action: Accept in Principle

Panel Statement: The panel considers this to be an exposed installation in accordance with the definition of Exposed in Article 100. There is no substantiation for eliminating the crush and impact tests for the non-armored cables.

Also, see panel action and statement on Proposal 3-179.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-179 Log #2719 NEC-P03 **Final Action: Accept in Principle**
(725.61(D)(4))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 7 for information.

Submitter: Dorothy Kellogg, American Chemistry Council

Recommendation: Revise text of section as follows:

725.61 Applications of Listed Class 2, Class 3, and PLTC Cables.

(D) Hazardous (Classified) Locations.

(4) In Industrial Establishments. In industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons service the installation and where the cable is not subject to physical damage, Type PLTC cable that complies with the crush and impact requirements of Type MC cable and is identified for such use shall be permitted to be exposed. ~~between the cable tray and utilization equipment or device.~~ The cable shall be ~~continuously~~ supported and protected against physical damage using mechanical protection such as ~~dedicated~~ struts, angles, or channels. The cable shall be secured at intervals not exceeding 1.8 m (6 ft).

Substantiation: There are three different installation methods for Type TC, Type PLTC and Type ITC. All of these cables are permitted to be installed as Exposed Routing (ER) when the cable is listed as ER. The installation requirements should be similar to reduce confusion in field. A similar proposal is being submitted for Articles 725 and 727 in an effort to align the installation methods.

There are no technical reasons to limit this installation method to only between a cable tray and utilization equipment or device. Cables listed for ER installations are a stronger cable, capable of withstanding more abuse than cables not listed for use in ER installations.

Panel Meeting Action: Accept in Principle

Revise 725.61(D)(4) to read as follows:

(4) In Industrial Establishments. In industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type PLTC cable shall be permitted in accordance with either (a) or (b).

(a) Type PLTC cable, with a metallic sheath or armor in accordance with 725.82(E), shall be permitted to be installed exposed. The cable shall be continuously supported and protected against physical damage using mechanical protection such as dedicated struts, angles, or channels. The cable shall be secured at intervals not exceeding 1.8 m (6ft).

(b) Type PLTC cable, without a metallic sheath or armor, that complies with the crush and impact requirements of Type MC cable and identified for such use with the marking PLTC-ER, shall be permitted to be installed exposed. The cable shall be continuously supported and protected against physical damage using mechanical protection such as dedicated struts, angles, or channels. The cable shall be secured at intervals not exceeding 1.8 m (6 ft).

Panel Statement: The panel concurs that Types TC, PLTC, and ITC should have similar if not identical installation methods. The panel also recognizes that TC cable is primarily limited to use in cable trays and raceways and that this limitation does not apply to PLTC and ITC cables. Also, Type TC cable is limited to constructions with a nonmetallic jacket and does not have metallic sheathed or armored designs. The revised wording accepts the submitter's position that this cable does not need to be limited for use only from cable tray to equipment. The revised wording also acknowledges that the armored or sheathed designs are inherently suitable for this application and do not need special marking. The UL Standard for Power Limited Circuit Cable was recently revised to replace the "open wiring" wording to "-ER". The phrase "to be exposed" was changed to "to be installed exposed" to provide clarity.
The text in the proposal was changed by restructuring the format such that it contains an introductory statement dealing with the limitation to only applying to industrial establishments and then subdividing the types of PLTC into two subsections for clarity. The phrase "and where not subject to physical damage" was removed, since each cable must be protected against physical damage based on the text in the second to last sentence in each subsection. The word "dedicated" was not removed, since the intent is to require dedicated support for the cable installation.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-180 Log #2371 NEC-P03 **Final Action: Reject**
(725.61(E), FPN (New))

Submitter: Allen C. Weidman, The Society of the Plastics Industry, Inc.

Recommendation: Add the following Fine Print Note to 725.61(E).

FPN: See 8.14.1 of NFPA 13-2002, *Installation of Sprinkler Systems* , for requirements for sprinklers in concealed spaces containing exposed combustibles.

Substantiation:

The Fine Print Note provides guidance to system designers, installers, and code officials. Over the past few decades, there has been a significant increase in the quantity of combustible cables installed in concealed spaces (hollow spaces and HVAC system spaces).

NFPA 13, Installation of Sprinkler Systems, requires installation of a sprinkler system where combustible loading is present. Because other NFPA documents reference NFPA 13, it is important for correlation for the NEC to include a pointer to NFPA 13. The following requirements are from NFPA 13-2002:

"8.14.1.5 Localized Protection of Exposed Combustible Construction or Exposed Combustibles. In concealed spaces having exposed combustible construction, or containing exposed combustibles, in localized areas, the combustibles shall be protected as follows:

(1) If the exposed combustibles are in the vertical partitions or walls around all or a portion of the enclosure, a single row of sprinklers spaced not over 12 ft (3.7 m) apart nor more than 6 ft (1.8 m) from the inside of the partition shall be permitted to protect the surface. The first and last sprinklers in such a row shall not be over 5 ft (1.5 m) from the ends of the partitions.

(2) If the exposed combustibles are in the horizontal plane, the area of the combustibles shall be permitted to be protected with sprinklers on a light hazard spacing. Additional sprinklers shall be installed no more than 6 ft (1.8 m) outside the outline of the area and not more than 12 ft (1.8 m) on center along the outline. When the outline returns to a wall or other obstruction, the last sprinkler shall not be more than 6 ft (1.8 m) from the wall or obstruction."

"8.14.1.2.1 Noncombustible and limited combustible concealed spaces with no combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum."

The definition of combustible, from NFPA 5000 is:

"3.3.340.2 Combustible (Material). A material that, in the form in which it is used and under the conditions anticipated, will ignite and burn; a material that does not meet the definition of noncombustible or limited-combustible."

During the 2005 NEC code cycle, the proposed Fine Print Note was added to 800.154(A). Because Type CMP cable is permitted to substitute for Type CL2P and Type CL3P cables, it is important to have parallel requirements in both NEC Sections.

In July of 2004, an appeal to the NFPA Standards Council requested deletion of the Fine Print Note to 800.154(A), prior to publication of the 2005 NEC. The appeal was denied in Standards Council Decision 04-7-1-z-cc, copy provided.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The definition for "concealed" in Article 100 in the 2005 NEC does not apply to the proposed fine print note. The reference to NFPA 13 does not seem appropriate in 725.61(E) at this time, since putting a sprinkler head in an inaccessible location inside the wall or above a drywall ceiling would not permit access for servicing. The area above a suspended ceiling is not considered by the NEC to be a concealed space.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

Explanation of Negative:

EGESDAL, S.: The panel statement is correct that the term "concealed" in the proposed Fine Print Note does not apply using NEC terminology. The term "concealed" as used in NFPA 13 applies to the proposed FPN. See additional information in my Explanation of Negative for Proposal 3-89, which shows that NFPA 13 does requrie sprinklers in certain concealed spaces rendered inaccessible by the building finish (e.g. drywall).

3-181 Log #3292 NEC-P03 **Final Action: Accept in Principle**
(725.61(E)(1) through 725.61(E)(7))

Submitter: Sanford Egesdal, Egesdal Associates PLC

Recommendation: Add titles, as shown:

(E) Other Wiring Within Buildings. Cables installed in building locations other than those covered in 725.61(A) through 725.61(D) shall be as described in any of (1) through (7).

(1) **General.** Type CL2 or CL3 shall be permitted.
(2) **In Raceways.** Type CL2X or CL3X shall be permitted to be installed in a raceway or in accordance with other wiring methods covered in Chapter 3.
(3) **Nonconcealed Spaces.** Cables shall be permitted to be installed in nonconcealed spaces where the exposed length of cable does not exceed 3 m (10 ft).
(4) **One- and Two-Family Dwellings.** Listed Type CL2X cables less than 6 mm (0.25 in.) in diameter and listed Type CL3X cables less than 6 mm (0.25 in.) in diameter shall be permitted to be installed in one- and two-family dwellings.
(5) **Multi-Family Dwellings.** Listed Type CL2X cables less than 6 mm (0.25 in.) in diameter and listed Type CL3X cables less than 6 mm (0.25 in.) in diameter shall be permitted to be installed in nonconcealed spaces in multifamily dwellings.
(6) **Under Carpets.** Type CMUC undercarpet communications wires and cables shall be permitted to be installed under carpet.
(7) **Industrial Establishments.** In industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons service the installation, and where the cable is not subject to physical damage, Type PLTC cable that complies with the crush and impact requirements of Type MC cable and is identified for such use shall be permitted to be exposed between the cable tray and the utilization equipment or device. The cable shall be continuously supported and protected against physical damage using mechanical protection such as dedicated struts, angles, or channels. The cable shall be supported and secured at intervals not exceeding 1.8 m (6 ft).
Substantiation: This proposal is editorial. This proposal adds titles to subsections in accordance with the NEC Style Manual. Additionally, the titles are parallel to titles in 800.154(E).
Panel Meeting Action: Accept in Principle
In the recommended text, (2) title should be "(2) In Raceways or Other Wiring Methods." The entire title, including the number in parenthesis should be bolded.
Panel Statement: These numbered items are simply a list and, by the NEC Style Manual, do not require titles but, if the titles are to be used, they should be complete.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-182 Log #3291 NEC-P03 **Final Action: Accept in Principle**
(725.61(E)(3), 725.61(E)(4) & 725.61(E)(5))

Submitter: Sanford Egesdal, Egesdal Associates PLC
Recommendation: Revise 725.61(E) as follows:
(3) Type CL2X and Type CL3X c ~~C~~ ables shall be permitted to be installed in nonconcealed spaces where the exposed length of cable does not exceed 3 m (10 ft).
(4) ~~Listed~~ Type CL2X cables less than 6 mm (0.25 in.) in diameter and listed Type CL3X cables less than 6 mm (0.25 in.) in diameter shall be permitted to be installed in one- and two-family dwellings.
(5) ~~Listed~~ Type CL2X cables less than 6 mm (0.25 in.) in diameter and listed Type CL3X cables less than 6 mm (0.25 in.) in diameter shall be permitted to be installed in nonconcealed spaces in multifamily dwellings.
Substantiation: 725.61(E) (3) applies to "X" cables, and does not apply to Type CL2 and Type CL3 cables.
Deletion of "Listed" in 725.61(E)(4) & (5) is editorial, as all cables are required to be listed.
Panel Meeting Action: Accept in Principle
Accept the submitter's recommendation but additionally remove the word "listing" before "CL3X in both (4) and (5).
Panel Statement: Since "listing" is being removed for CL2X in both locations, then it should also be removed in CL3X.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

(725.61(G))

Submitter: Frank Peri, Communications Design Corporation
Recommendation: Revise 725.61(G), as shown.
(G) Class 2 and Class 3 Cable Substitutions. The substitutions for Class 2 and Class 3 cables listed in Table 725.61 shall be permitted. Type CL3D shall be permitted to substitute for all Class 2 and Class 3 cables listed in Table 725.61 and Figure 725.61. Type CL2D shall be permitted to substitute for all Class 2 cables listed in Table 725.61 and Figure 725.61. Where substitute cables are installed, the wiring requirements of Article 725, Parts I and III, shall apply.
FPN: For information on Types CMD, CMP, CMR, CM, and CMX cables, see 800.179.
Substantiation: This proposal correlates the substitution table and figure with the listing and application requirements for air duct cable.
Panel Meeting Action: Reject
Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:
"[S]o as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."
This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-185 Log #2522 NEC-P03 **Final Action: Reject**
(725.61(G) and FPN to 725.61(G))

Submitter: Sanford Egesdal, Egesdal Associates PLC
Recommendation: Revise 725.61(G), as shown.
(G) Class 2 and Class 3 Cable Substitutions. The substitutions for Class 2 and Class 3 cables listed in Table 760.61 shall be permitted. Types CL250 and CL350 very-low-smoke cables shall be permitted to substitute for all Class 2 and Class 3 cables in Table 725.61 to meet requirements for very-low-smoke producing characteristics, low potential heat release, and low flame spread characteristics. Where substitute cables are installed, the wiring requirements of Article 725, Parts I and III shall apply.
FPN No. 1 : For information on Types CMP, CMR, CM, and CMX, see 800.179.
FPN No. 2: See 8.14.1 of NFPA 13-2002, *Installation of Sprinkler Systems* , for requirements for sprinklers in concealed spaces containing exposed combustibles.
Substantiation: This proposal correlates with the proposal to add Types CL250 and CL350 cables to 725.61.
There is a companion proposal for the listing and marking of Types CL250 and CL350.
Panel Meeting Action: Reject
Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:
"[S]o as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-186 Log #3290 NEC-P03 **Final Action: Reject**
(725.81)

Submitter: Sanford Egesdal, Egesdal Associates PLC
Recommendation: Add new 725.81, as shown

725.81 Listing and Marking of Class 1 Cables.

Class 1 cables installed as wiring within buildings shall be listed in accordance with 725.81(A) and 725.81(B) and as being resistant to the spread of fire in accordance with 725.81(C) through 725.81(F), and shall be marked in accordance with 725.81(G).

(A) Class 1 Conductor Materials. Conductors shall be 18 AWG or larger, solid or stranded copper.

(B) Insulated Conductors. Insulated conductors shall be suitable for 600 volts. Insulated conductors 14 AWG and larger shall be one of the types listed in Table 310.13 or one that is identified for this use. Insulated conductors 18 AWG and 16 AWG shall be in accordance with 725.27.

(C) Type CL1P. Type CL1P plenum cable shall be listed as being suitable for use in other space used for environmental air as described in 300.22(C) and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.

FPN: One method of defining low smoke-producing cable is by establishing an acceptable value of the smoke produced when tested in accordance with NFPA 262-2002, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces, to a maximum peak optical density of 0.5 and a maximum average optical density of 0.15. Similarly, one method of defining fire-resistant cables is be establishing a maximum allowable flame travel distance of 1.52 m (5 ft) when tested in accordance with the same test.

(D) Type CL1R. Type CL1R riser cable shall be listed as being suitable for use in a vertical run in a shaft or from floor to floor and shall also be listed as having fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.

FPN: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the cables pass ANSI/UL 1666-2002, Test for Flame Propagation Height of Electrical and Optical-Fiber Cables Installed Vertically in Shafts.

(E) Type CL1. Type CL1 able shall be listed as being suitable for general-purpose use, with the exception of risers, ducts, plenums, and other space used for environmental air, and shall also be listed as being resistant to the spread of fire.

FPN No. 1: One method of defining resistant to the spread of fire is that the cables do not spread fire to the top of the tray in the vertical-tray flame test in ANSI/UL 1581-1991, Reference Standard for Electrical Wires, Cables and Flexible Cords.

FPN No. 2: Another method of defining resistant to the spread of fire is for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing the CSA vertical flame test for cables in cable trays, as described in CSA C22.2 No. 0.3-M-1985, Test Methods for Electrical Wires and Cables.

(F) Circuit Integrity (CI) Cable or Electrical Circuit Protective System. Cables used for survivability of critical circuits shall be listed as circuit integrity (CI) cable. Cables specified in 725.81(C), (D), and (E), and used for circuit integrity shall have the additional classification using the suffix "-CI." Cables that are part of a listed electrical circuit protective system shall be considered to meet the requirements of survivability.

FPN No. 1: Fire alarm circuit integrity (CI) cable and electrical circuit protective systems may be used for fire alarm circuits to comply with the survivability requirements of NFPA 72®-2002, National Fire Alarm Code®, 6.9.4.3 and 6.9.4.6, that the circuit maintain its electrical function during fire conditions for a defined period of time.

FPN No. 2: One method of defining circuit integrity (CI) cable is by establishing a minimum 2-hour fire resistance rating for the cable when tested in accordance with UL 2196-1995, Standard for Tests of Fire Resistive Cables.

(G) Class 1 Cable Markings. Multiconductor non–power-limited cables shall be marked in accordance with Table 725.81(G). Class 1 circuit cables shall be permitted to be marked with a maximum usage voltage rating of 150 volts. Cables that are listed for circuit integrity shall be identified with the suffix "CI" as defined in 725.81(F).

Table 725.81(G) Class 1 Cable Markings

Cable Marking	Type
CL1P	Class 1 circuit cable for use in "other space used for environmental air"725.31(D) and (H)
CL1R	Class 1 circuit riser cable 725.31(E) and (H)
CL1	Class 1 circuit cable 725.31(F) and (H)

Note: Cables identified in 725.81(C), (D), and (E) and meeting the requirements for circuit integrity shall have the additional classification using the suffix "CI" (for example, CL1P-CI, CL1R-CI, and CL1-CI).

FPN: Cable types are listed in descending order of fire resistance rating.

Substantiation: The listing requirements for the proposed cables are identical to the requirements for non-power-limited fire alarm cable. See proposal for new 725.30 for applications.

Section 760.26(A) permits "Class 1 and non–power-limited fire alarm circuits shall be permitted to occupy the same cable, enclosure, or raceway…", so identical listing requirements make sense.

Panel Meeting Action: Reject
Panel Statement: The submitter has not provided any technical substantiation that a Listed Class 1 multiconductor cable exists. No information has been provided with the proposal that non-power-limited fire alarm cable is the same cable as this proposed Class 1 cable, especially since NPLFR is a specifically listed fire alarm cable.
In addition, a fact-finding report should be submitted as part of the substantiation for acceptance of the cable to help determine the acceptability and the installation criteria for the cable.
The panel refers to (C) of the submitter's recommendation. The panel is acting on this and other proposals related to wire and cable in plenum and other air-handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:
"[S]o as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."
This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-187 Log #3232 NEC-P03 **Final Action: Reject**
(725.82)

Submitter: Frank Peri, Communications Design Corporation
Recommendation: Add CL2D and CL3D to the top of the cable list in Table 725.82, preceding CL3P, as shown.

Type CL3D	Class 3 air duct cable
Type CL2D	Class 2 air duct cable

Substantiation: This addition to the table correlates with the listing and marking of air duct cable.
Panel Meeting Action: Reject
Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air-handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:
"[S]o as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."
This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-188 Log #2002 NEC-P03 **Final Action: Reject**
(725.82(G))

Submitter: Richard Carswell, The Okonite Company
Recommendation: Revise as follows:

725.82(G) Class 2 and Class 3 cables shall have a voltage rating of not less than 300 volts.

Substantiation: Voltage ratings of 150 volts for Class 2 cables and voltage ratings of 300 volts for Class 3 cables create additional confusion. Consistent ratings of 300 volts for both Class 2 and Class 3 cables allows for continuity of both cable type.
Panel Meeting Action: Reject
Panel Statement: There was no technical substantiation submitted with the proposal to warrant raising the insulation rating on Class 2 cables to 300 volts.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-189 Log #3033 NEC-P03 **Final Action: Reject**
(725.82(A), FPN)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Recommendation: Revise text to read as follows:
725.82 Listing and Marking of Class 2, Class 3, and Type PLTC Cables.
Class 2, Class 3, and Type PLTC cables installed as wiring within buildings shall be listed as being resistant to the spread of fire and other criteria in accordance with 725.82(A) through 725.82 (K) and shall be marked in accordance with 725.82(L).
(A) Types CL2P and CL3P. Types CL2P and CL3P plenum cables shall be listed as being suitable for use in ducts, plenums, and other space used for environmental air and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.
FPN: One method of defining a cable that is low smoke-producing cable and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces. ~~is by establishing an acceptable value of the smoke produced when tested in accordance with NFPA 262-1999, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces, to a maximum peak optical density of 0.5 and a maximum average optical density of 0.15. Similarly, one method of defining fire-resistant cables is by establishing a maximum allowable flame travel distance of 1.52 m (5 ft) when tested in accordance with the same test.~~
No change for 725.82 (B) through 725.82 (K)
Substantiation: This comment recommends a slight change in wording for the existing Fine Print Note, by recognizing that listing of plenum cable by NFPA 262 represents listing to both low smoke and low flame spread, and that cables cannot be listed separately to either property. This is basically an editorial change, as a clarification, to the existing Fine Print Note.
The same change is being proposed to the corresponding Fine Print Notes in article 760. The new language is consistent with the language in the corresponding fine print notes in articles 770, 800, 820 and 830, all of which deal with the same type of cables.
Panel Meeting Action: Reject
Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:
"[S]o as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."
This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
GUIDA, T.: This proposal should have been accepted. With reference to the Panel Statement, this proposal does not change the "status quo" with regard to plenum cables. The proposal is essentially editorial. The proposed revised FPN actually aligns the wording of the FPN with the existing wording in NFPA 90A for cables in ceiling cavity and raised floor plenums.

3-190 Log #1419 NEC-P03 **Final Action: Accept**
(725.82(C), 725.8 (E) and 725.82(H) FPNs)

Submitter: Thomas J. Guida, Underwriters Laboratories Inc.
Recommendation: Revise text to read as follows:
FPN: One method of defining "resistant to the spread of fire" is that the cables do not spread fire to the top of the tray in the " UL Flame Exposure , Vertical Tray Flame Test" in ~~ANSI/UL 1581-2001, Standard for Electrical Wires, Cables, and Flexible Cords~~ . UL 1685-2000 Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables. The smoke measurements in the test method are not applicable.
Another method of defining resistant to the spread of fire is for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing the CSA "Vertical Flame Test - Cables in Cable Trays," as described in CSA C22.2 No. 0.3-M- ~~1985~~ 2001 , Test Methods for Electrical Wires and Cables.
Substantiation: The revised wording is an update of the standard references and not a change in the test method. UL 1581 references UL 1685 for the text of the test method.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-191 Log #2005 NEC-P03 **Final Action: Accept**
(725.82(E))

Submitter: Richard Carswell, The Okonite Company
Recommendation: Revise as follows:
(E) Insulation on conductors shall be rated for 300 volts.
Substantiation: As written: "Suitable" for 300 volts is not the same as rated for 300 volts. This change will be consistent with 725.82(G).
Panel Meeting Action: Accept
Panel Statement: The panel clarifies that the recommendation only affects the 4th sentence of 725.82(E).
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-192 Log #2984 NEC-P03 **Final Action: Accept in Principle**
(725.82(E)(1) (New))

Submitter: Robert Konnik, Rockbestos-Suprenant
Recommendation: Add text to read as follows:
(1) Wet Locations: Type PLTC cable used in a wet location shall be listed for use in wet locations, or have a moisture impervious metal sheath.
Substantiation: PLTC cable is allowed to be used outdoors per 725.61(C), and direct buried per 725.61(D)(1). The new wording paraphrased from 310.8 clarifies that PLTC cable used in wet locations shall be listed for this use, or protected from the wet location by a moisture impervious metal sheath. UL has an optional listing for wet rated PLTC cable.
Panel Meeting Action: Accept in Principle
Add as a new last sentence to the existing first paragraph of 725.82(E) to read as follows:
Type PLTC cable used in a wet location shall be listed for use in wet locations, or have a moisture impervious metal sheath.
Panel Statement: The panel has accepted the recommendation but provided more appropriate direction for the location of this text.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-193 Log #2523 NEC-P03 **Final Action: Reject**
(725.82(G))

Submitter: Sanford Egesdal, Egesdal Associates PLC
Recommendation: Revise Section 725.82 and Table 725.82, as shown below.
Sections 725.82(A), through (F) do not change.
Insert new 760.82(G), renumber existing subsections as follows: "G" to "H", "H" to "I"; and "I" to "J", "J" to "K", "K" to "L", and "L" to "M".
(G) Type CL250 and Type CL350. Types CL250 and Type CL350 cables shall be listed as suitable for installation in concealed spaces having restrictive requirements for smoke generation, combustible loading, and flame spread and shall be listed as having very-low-smoke producing characteristics, a low potential heat release value, and low flame spread characteristics.
FPN No. 1: One method of defining a low flame spread and very low smoke-producing cable is that the cable exhibits a maximum flame spread index of 25 and maximum smoke developed index of 50 when tested in accordance with NFPA 255, *Standard Method of Test of Surface Burning Characteristics of Building Materials* with the cable unslit (intact) and cut through to expose the cable core. One method of defining a low potential heat cable is that the cable exhibits a maximum potential heat value of exceeding 8141 kJ/kg (3500 BTU/lb) when tested in accordance with NFPA 259, *Standard Test Method for Potential Heat of Building Materials.*
FPN No. 2: See 8.14.1 of NFPA 13-2002, *Installation of Sprinkler Systems* , for requirements for sprinklers in concealed spaces containing exposed combustibles.
FPN No. 3: Building codes adopted by code jurisdictions may contain restrictions on permissible flame spread index and smoke developed index.
Add the following to Table 725.82, on the line above "CL3P Class 3 plenum cable".

CL350	Class 3 very low-smoke cable
CL250	Class 2 very low-smoke cable

Substantiation: This proposal establishes a listing and marking for cable permitted as an electrical wiring option in concealed spaces where a smoke developed index no greater than 50 is required or large quantities of cable may cause combustible loading. The proposed cable has very-low-smoke-producing characteristics, a low potential heat release value, and low flame spread characteristics. Presently, a number of manufacturers have cables listed to the proposed requirements.
The testing criteria are based on the requirements found in NFPA 13-2003 and the 2003 International Mechanical Code, as revised.
NFPA 13, Section 8.14.1.2.1 follows: "Noncombustible and limited combustible concealed spaces with no combustible loading having no access

shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum." The proposed cable has a very low heat of combustion. While the term "combustible loading" is not defined, the fuel load can be calculated to determine the potential hazard from large quantities of cable.

The 2003 International Mechanical Code, 602.2.1, requires materials in plenums to be noncombustible or have a flame spread index no greater 25 and a smoke index no greater than 50. At the recent ICC meeting in Detroit, exception #5 to 602.2.1 was revised to include "combustible material (electrical wiring) installed in noncombustible raceways or enclosures." The requirements in IMC 602.2.1.1 permits cables meeting NFPA 262 test requirements. Cables meeting NFPA 262 requirements, according to Fire Protection Research Foundation testing using NFPA 255, have a smoke developed index that varies between 450 and 850. The proposed cable meets the requirements of the base paragraph, 602.2.1.

The following (change is underlined) shows the result of action on IMC public comment on M 77 (floor actions in Detroit, September 2005).

602.2.1 Materials exposed within plenums. Except as required by Sections 602.2.1.1 through 602.2.1.5, materials within plenums shall be noncombustible or shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84.

Exceptions:

1. Rigid and flexible ducts and connectors shall conform to Section 603.
2. Duct coverings, linings, tape and connectors shall conform to Sections 603 and 604.
3. This section shall not apply to materials exposed within plenums in one- and two-family dwellings.
4. This section shall not apply to smoke detectors.
5. Combustible materials enclosed in noncombustible raceways or enclosures, approved gypsum board assemblies or enclosed in materials listed and labeled for such application.

602.2.1.1 Wiring. Combustible electrical or electronic wiring methods and materials, optical fiber cable, and optical fiber raceway exposed within a plenum shall have a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread not greater than 5 feet (1524 mm) when tested in accordance with NFPA 262. Only type OFNP (plenum rated nonconductive optical fiber cable) shall be installed in plenum-rated optical fiber raceways. Wiring, cable, and raceways addressed in this section shall be listed and labeled as plenum rated and shall be installed in accordance with ICC *Electrical Code* .

The Fire Protection Research Foundation report demonstrated that NFPA 255, *Standard Method of Test of Surface Burning Characteristics of Building Materials* , provides a suitable test method for establishing the cable characteristics (flame spread index & smoke developed index) specified in the FPN.

Establishing a listing and marking for a Types CL250 and CL350 cables provides a wiring option for complying with requirements of other standards and building codes. The NEC has previously established listings and markings for cable to correlate with other codes and standards. Additionally, the listing and marking may or may not have a specific application. Specific examples follow:

1. Type CMG cable was included in the 1993 NEC to correlate with the Canadian Electrical Code. The change was proposed by the Chair of NEC TCC, Harold Ware and Roy Hicks from Canada. Type CMG has a listing and marking in the NEC. Article 800 permits "Type CM or Type CMG" to be installed as a general purpose cable. Note: Type CMG does not have a unique application, and neither cable is considered a minimum requirement.
2. Types MP, MPR, and MPP cable was included in the 1990 NEC. The cables had a listing and marking. The multiple-purpose cables were permitted to substitute for similar cables in Articles 725, 760, & 800. Note: Types MP, MPR, and MPP cables do not have a unique application, just a listing and marking.
3. A change to the 1999 NEC permitted Types NPLF, NPLFR, NPLFP, FPL, FPLR, and FPLP to have a "-CI" suffix. The change included only listing and marking requirements. This change to the NEC correlated with NFPA 72, National Fire Alarm Code, requirements for a circuit integrity cable. Note: Cables with a "-CI" suffix did not have an application, until changes were made to the 2005 NEC.
4. A change to the 2005 NEC permitted Types CM, CMR and CMP to have a "-CI" suffix. As of today, no company has a listed circuit integrity using the permitted markings. Note: Types CM-CI, CMR-CI, and CMP-CI do not have an application, just a listing and marking.

Panel Meeting Action: Reject

Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"[S]o as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

Explanation of Negative:

EGESDAL, S.: Referencing the NFPA 90A directive on NFPA 90A as a reason to reject this proposal is in error. The proposed cable marking clearly indicates the cable could not be installed in a plenum, and could only be installed in spaces permitted by 725.61(E), Other Wiring Within Buildings.

Section 725.82 provides for listing and marking requirements for cables referenced in Section 725.61. The marking requirements in the various 725.82 sections correlate with the various applications in the various 725.61 sections. For example 725.82(A) provides the listing and marking requirements for Type CL2P and CL3P plenum cable that correlates with the application requirements in 725.61(A).

The Panel is in error by stating that the proposed application CL250 or CL350 could be used in a plenum. Again, Section 725.61(A) requires a Type CL2P or CL3P cable. The proposed cable does not have a "P" in the marking. Likewise, the proposed cable does not have an "R" in the marking, so could not be installed in a riser.

3-194 Log #3289 NEC-P03 **Final Action: Reject**

(725.82(G))

Submitter: Sanford Egesdal, Egesdal Associates PLC

Recommendation: Revise 782.82(G) and reformat as shown.

(G) Class 2 and Class 3 Cable ~~Voltage~~ Ratings.

Voltage . Class 2 cables shall have a voltage rating of not less than 150 volts. Class 3 cables shall have a voltage rating of not less than 300 volts..

Temperature. Conductor insulation shall have a rating of not less than 60ºC. Class 2 and Class 3 cables shall be marked with the temperature rating of the insulation immediately following the Type designation.

FPN No. 1: For more information, see 310.10 Temperature Limitation of Conductors.

FPN No. 2: Building codes may have a cable insulation temperature requirement as high as 200ºC.

FPN No. 3: An example of the marking is CL2P 200ºC, or CL3P 200ºC, indicating a plenum cable rated at 200ºC.

Substantiation: Presently, this article does not have a temperature rating requirement on conductor insulation.

Class 3 and Class 2 cables on the market today are typically listed with a 60ºC temperature rating on the conductors. Some applications may a temperature rating much higher than , perhaps as high as high as 200ºC.

By referencing to 310.10, users will be aware that a cable with a temperature rating higher than 60ºC is required to meet a high temperature application. For information 310.10 follows:

310.10 Temperature Limitation of Conductors.

No conductor shall be used in such a manner that its operating temperature exceeds that designated for the type of insulated conductor involved. In no case shall conductors be associated together in such a way, with respect to type of circuit, the wiring method employed, or the number of conductors, that the limiting temperature of any conductor is exceeded.

FPN No. 1: The temperature rating of a conductor (see Table 310.13 and Table 310.61) is the maximum temperature, at any location along its length, that the conductor can withstand over a prolonged time period without serious degradation. The allowable ampacity tables, the ampacity tables of Article 310 and the ampacity tables of Annex B, the correction factors at the bottom of these tables, and the notes to the tables provide guidance for coordinating conductor sizes, types, allowable ampacities, ampacities, ambient temperatures, and number of associated conductors.

The principal determinants of operating temperature are as follows:

(1) Ambient temperature — ambient temperature may vary along the conductor length as well as from time to time.

(2) Heat generated internally in the conductor as the result of load current flow, including fundamental and harmonic currents.

(3) The rate at which generated heat dissipates into the ambient medium. Thermal insulation that covers or surrounds conductors affects the rate of heat dissipation.

(4) Adjacent load-carrying conductors — adjacent conductors have the dual effect of raising the ambient temperature and impeding heat dissipation.

FPN No. 2: Conductors installed in conduit exposed to direct sunlight in close proximity to rooftops have been shown, under certain conditions, to experience a temperature rise of 17°C (30°F) above ambient temperature on which the ampacity is based.

Panel Meeting Action: Reject

Panel Statement: This proposal does not add any new requirement except for marking, which is already covered by the product standard and general directory.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

Explanation of Negative:

EGESDAL, S.: It seems appropriate that the NEC define the minimum temperature rating for conductors and cables installed in compliance with Article 725. Chapter 3 wiring methods are permitted for Class 2 or Class 3 circuits by 725.52, so the temperature rating requirements in Sections 300.2(B) and 310.10 would apply. However, if a Class 2 or Class 3 cable is installed, there are no requirements for a temperature rating on the cable. Right now, the user is dependent on whatever testing laboratories mark or do not mark on cable. As cable can be installed in a variety of areas having significantly different ambient temperatures, it makes sense to require a minimum temperature rating with that minimum temperature not required to be marked on the cable.

3-195 Log #3631 NEC-P03 **Final Action: Reject**
(725.82(G) (New))

Submitter: Allen C. Weidman, The Society of the Plastics Industry, Inc.
Recommendation: Insert new section (G) and renumber existing sections (G) through (L) to (H) through (M).

(G) Concealed Space Cables. Class 2 and class 3 cables that meet the requirements for Types CL2 and CL3 that are also listed as having a low potential heat value, low flame spread characteristics, and low-smoke producing characteristics shall be permitted to be listed and marked as concealed space cables Type CL2-CS and CL3-CS.

FPN: One method of defining a low flame spread and low smoke-producing cable is that the cable exhibits a maximum flame spread distance of 1.52 m (5 ft), a maximum peak optical density of 0.5 and a maximum average optical density of 0.15 when tested in accordance with NFPA 262-2002, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces with the cable unslit (intact) and cut through to expose the cable core. One method of defining a low potential heat cable is that the cable exhibits a maximum potential heat value of exceeding 8141 kJ/kg (3500 BTU/lb) when tested in accordance with NFPA 259, *Standard Test Method for Potential Heat of Building Materials.*

Substantiation: The purpose of this proposal is to provide listing and marking for a cable that will be suitable for use in concealed spaces where there are large quantities of cables. Users would have the option of using these cables to avoid establishing a fuel load above the threshold where the quantity of cables would be considered a combustible loading. Also, these cables provide a flame spread index and a smoke developed index that correlate with the requirements for exposed materials within concealed spaces in buildings.

Cables tested using NFPA 255 and 259 establish parameters commonly used in NFPA standards and building codes: smoke developed index, smoke developed index, and heat of combustion. This proposal uses the NFPA 262 test in place of NFPA 255. The Fire Protection Research Foundation's *International Limited Combustible Plenum Cable Fire Test Project* (copy attached) has shown that both of these tests are suitable and provided data (page 18 of the report) for setting equivalent criteria in the two tests. A maximum average optical density of 0.17 in NFPA 262 is equivalent to a smoke developed index of 450 in NFPA 255. This proposal sets the maximum optical density requirement at 0.15 to allow for a margin of error and to correlate with the existing requirements for plenum cable.

NFPA 13 has requirements for sprinklers in a concealed space that contains a combustible loading. Combustible loading is a function of the density (number) of cables and their potential heat release determined by NFPA 259.

The following is excerpted from the Automatic Systems Sprinkler Handbook 2002 edition: In the handbook the commentary is printed in blue. Since the proposals are printed in black and white I have changed the handbook commentary to ***bold italics*** . I also underlined the text that refers to computer room raised floors.

As indicated in 8.1.1(1), sprinklers are required throughout the premises. Under certain conditions, however, the omission of sprinklers in certain areas and spaces within a building is permitted. Section 8.14 identifies these spaces and conditions.

8.14.1 Concealed Spaces.

8.14.1.1 Concealed Spaces Requiring Sprinkler Protection. All concealed spaces enclosed wholly or partly by exposed combustible construction shall be protected by sprinklers except in concealed spaces where sprinklers are not required to be installed by 8.14.1.2.1 through 8.14.1.2.15.

Concealed spaces requiring sprinkler protection are covered in 8.14.1.1. Concealed spaces, unless protected, can provide an unabated passage for firespread throughout a building. Paragraph 8.14.1 applies to those portions of a building that have construction or finish materials of a combustible nature, are used for the storage of combustible materials, and can contain combustibles associated with building system features such as computer wiring or large quantities of nonmetallic piping.

Any of these scenarios could be found in a concealed space. It is important to recognize that concealed spaces are not exclusively limited to areas above ceilings but can also be found in walls and in spaces beneath the floor. For example, a raised floor in a computer room is a . concealed space. If none of the three prescribed conditions exists, the space is defined as a concealed, noncombustible space with respect to combustible objects and requires no additional sprinkler protection.

Some minor quantities of combustible materials, such as communication wiring, can be present in some concealed spaces but should not typically be viewed as requiring sprinklers (see 8.14.1.1). The threshold value at which sprinklers become necessary in the concealed space is not defined. For example, the usual amounts of data or telephone wiring found above a ceiling would not typically constitute a threat. If bundles of unsheathed computer wiring are installed above the ceiling or beneath the floor in a manner where fire propagation in all directions is likely, then the concealed space should be treated the same as a combustible space, thereby requiring appropriate sprinkler protection. If some other protection measure is provided, such as a CO, system, then the concealed space is considered to be protected, and sprinklers are not required.

Users of this article need to be aware of the requirements of NFPA 13 so they can provide the appropriate fire protection where these is a build-up of combustible cables that constitute a combustible loading, or preferably avoid the buildup of combustible cables that would result in a combustible loading. Use of concealed space cables would be an option in a strategy to avoid establishing a combustible loading.

A flame spread index of 25 is a typical requirement for materials permitted in concealed spaces or exposed in buildings.

A smoke developed index of 450 is a typical requirement for materials permitted in concealed spaces or exposed in buildings.

The following requirements are from NFPA 5000-2003 identify heat of combustion, flame spread, and smoke as major concerns:

Chapter 4 General

4.4.7 Limiting Fire Spread.

4.4.7.1 Interior Finishes. The interior surfaces of the building shall not contribute to an unacceptable rate and magnitude of fire spread and generation of heat and smoke.

4.4.7.2 Concealed Spaces. The construction of concealed spaces shall not contribute to an unacceptable rate of the spread of fire, hot gases, and smoke to areas of the building remote from the fire source and shall limit their spread beyond the immediate area of the origin of the fire.

4.4.7.3 Compartmentation. The building shall be compartmented, as appropriate, by walls and floors, including their associated openings with proper closures, to limit the spread of fire, hot gases, and smoke to an acceptable area beyond the immediate area of fire origin.

Chapter 8 Fire-Resistive Materials and Construction

8.1 General.

8.1.1 The chapter addresses fire protection features intended to restrict or resist the spread of fire and smoke beyond the compartment of fire origin.

8.1.2 Where required by other chapters of this Code, every building shall be divided into compartments to limit the spread of fire and restrict or resist the movement of smoke.

8.1.2.1* Fire compartments shall be formed with fire barrier walls that comply with Section 8.4 or horizontal assemblies that comply with Section 8.6, or a combination of both.

8.1.2.2 Smoke compartments shall be formed with smoke barriers that comply with Section 8.11.

8.16 Insulating Materials.

8.16.7 Insulation and Covering on Pipe and Tubing. Insulation and covering on pipe and tubing shall have a flame spread index of not more than 25 and a smoke developed index of not more than 450.

Chapter 10 Interior Finishes

10.3.2* Products required to be tested in accordance with NFPA 255 or ASTM E 84 shall be grouped in the classes described in 10.3.2(A) through 10.3.2(C) in accordance with their flame spread and smoke development, except as indicated in 10.3.3.

(A) Class A Interior Wall and Ceiling Finish. Class A interior wall and ceiling finishes shall be those finishes with a flame spread of 0–25 and smoke development of 0–450 and shall include any material classified at 25 or less on the flame spread test scale and 450 or less on the smoke test scale. Any element thereof, when so tested, shall not continue to propagate fire.

Panel Meeting Action: Reject

Panel Statement: The definition for "concealed" in Article 100 in the 2005 NEC does not apply to the proposed text. The reference to NFPA 13 in the substantiation does not seem appropriate at this time, since putting a sprinkler head in an inaccessible location inside the wall or above a drywall ceiling would not permit access for servicing. The area above a suspended ceiling is not considered by the NEC to be a concealed space.

The panel is acting on this and other proposals related to wire and cable in plenum and other air-handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"[S]o as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

Explanation of Negative:

EGESDAL, S.: See my Explanation of Negative for Proposal 3-193.

3-196 Log #3288 NEC-P03 **Final Action: Accept in Principle**
(725.82(G) Exception and FPN (New))

Submitter: Sanford Egesdal, Egesdal Associates PLC
Recommendation: Revise 760.82(G), as shown.

(G) Class 2 and Class 3 Cable Voltage Ratings. Class 2 cables shall have a voltage rating of not less than 150 volts. Class 3 cables shall have a voltage rating of not less than 300 volts.

Exception: Bare Class 2 conductors shall be permitted.

FPN: Security systems may use bare copper wire (e.g. 26 AWG), to protect openings, which is referred to as "lacing.

Substantiation: The purpose of this proposal is to permit a commonly used security system practice, which is referred to as "lacing." Lacing may require the use of bare conductors, perhaps 26 AWG. During the 1999 code cycle, CMP 16 added a new requirement to this section: Class 2 conductors were required to have insulation rated at 150 volts.

This proposal is a result of a recent question from a nation-wide security company. The person asking the question wondered if it was permissible to install bare 26 AWG conductors on a Class 2 security system circuit. Because the NEC now requires all Class 2 conductors to be insulated to 150 volts, the answer to the question is, "No." Prior to the 1999 edition of the NEC, bare copper conductors were permissible. Prior to the 1999 NEC, there was no voltage requirement for insulation on a Class 2 conductor, because there was no requirement to have insulation on a Class 2 conductor. A change to the 1987 NEC required that if a Class 2 conductor was insulated, the insulation was required to be resistant to the spread of fire. Prior to the 1987 NEC there was no resistant to the spread of fire requirement related to the insulation on Class 2 conductors.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle

Add the following to 725.52(B) to read as follows:

Exception No. 3: Bare Class 2 conductors shall be permitted as part of a listed intrusion protection system where installed in accordance with the listing instructions for the system.

Panel Statement: The panel has accepted the exception but modified it to be more specific to the intended application. The FPN has been deleted, since the change to the exception addresses the information contained in the proposed FPN. The exception has been relocated to a more appropriate location in Article 725.

Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:

CASPARRO, P.: During the panel discussion the queston was raised "Why can't the same purpose be achieved by using an inslated wire?" There was no valid reason why not, and with this in mind I see no reason to expose persons to energized conductors.

3-197 Log #2387 NEC-P03 **Final Action: Reject**
(725.82(L))

Submitter: Allen C. Weidman, The Society of the Plastics Industry, Inc.
Recommendation: Revise 725.82(L) as follows:

(L) Marking. Cables shall be marked in accordance with 310.11(A)(2), (A)(3), (A)(4), and (A)(5) and Table 725.82. Voltage ratings shall not be marked on the cables. The temperature rating shall be marked on the cable .

FPN: Voltage markings on cables may be misinterpreted to suggest that the cables may be suitable for Class 1 electric light and power applications.

Exception: Voltage markings shall be permitted where the cable has multiple listings and a voltage marking is required for one or more of the listings.

Substantiation: The cables and conductors in this article do not have a temperature rating requirement. It is important for the system designer, installer, local authority, and building owners to know the temperature rating of cables and conductors for proper application.

Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 3-194.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:

EGESDAL, S.: See my Explanation of Negative for Proposal 3-194.

3-198 Log #3233 NEC-P03 **Final Action: Reject**
(725.82(M))

Submitter: Frank Peri, Communications Design Corporation
Recommendation: Add new 725.82(M), as shown.

(M) Types CL2D and CL3D. Types CL2D and CL3D air duct cable shall be listed as being suitable for use in ducts, plenums, and other spaces used for environmental air and shall also be listed as having adequate fire-resistant, very low smoke-producing characteristics, and very low potential heat release.

FPN No: One method of defining a low flame spread and very low smoke-producing cable is that the cable exhibits a maximum flame spread index of 25 and maximum smoke developed index of 50 when tested in accordance with NFPA 255, *Standard Method of Test of Surface Burning Characteristics of Building Materials* with the cable unslit (intact) and cut through to expose the cable core. One method of defining a low potential heat cable is that the cable exhibits a maximum potential heat value of exceeding 8141 kJ/kg (3500 BTU/lb) when tested in accordance with NFPA 259, *Standard Test Method for Potential Heat of Building Materials.*

Substantiation: The purpose of this proposal is to correlate with NFPA 5000-2006. NFPA 5000-2006, recently issued by the NFPA Standards Council, incorporates extracted plenum requirements from NFPA 90A-2002. Consequently, the plenum requirements in NFPA 5000-2006 are identical to the ceiling cavity plenum requirements in NFPA 90A-2002. This proposal provides listing requirements for a cable with characteristics that complies with the NFPA 90A-2002, 4.3.10.2.6: requirements for limited combustible materials exposed to the airflow. This proposal provides a listing and marking for a cable that complies with the NFPA 90A-2002, 4.3.10.2.6.1:a requirement for a listed limited combustible cable with a maximum smoke developed index of 50. The proposed cable meets the NFPA Standards Council's directive to not identify cable as "limited combustible," because it is not a building construction material. The cable name and listing requirements meets guidance from the NFPA Standards Council to identify cable characteristics in terms of flame spread index, smoke developed index, and potential heat release.

As compared to a combustible plenum cable that is listed using NFPA 262, air duct cable is a much "safer" cable. Air duct cable provides users with an opportunity to significantly reduce the potential hazard from smoke during a fire emergency. Additionally, the much lower potential heat release of air duct cable provides much lower combustible loading than found in combustible plenum cable listed using NFPA 262.

Air duct cables are available on the market today. Presently, there is air duct cable available to meet the plenum installation requirements of Articles 725, 760, 770, and 800. Unfortunately, the only marking available in the NEC is for a combustible plenum cable. The NEC decides what marking is permitted, and listing organizations correlate. That is, it would be inappropriate for a listing organization to mark cable with a "Type XXX" that is not published in the NEC.

The following is an example of air duct cable information from the UL Web Site:

OWKZ. GuideInfoLimited Combustible Cable
Guide Information for Electrical Equipment for Use in Ordinary Locations
GENERAL

This category covers electrical and optical fiber cable that meets the limited combustible and smoke developed requirements for cable in ceiling cavity and raised floor plenums in accordance with NFPA 90A, "Standard for the Installation of Air Conditioning and Ventilating Systems." This cable also meets the requirements for cable used in ducts, plenums and other spaces used for environmental air in accordance with Articles 725, 760, 770, 800, 820 and 830 of ANSI/NFPA 70, "National Electrical Code".

This cable has a maximum Potential Heat value of 3500 Btu/lb when tested in accordance with NFPA 259, "Standard Test Method for Potential Heat of Building Materials." This cable has a maximum smoke developed index of 50 and a maximum flame spread index of 25 when tested in accordance with UL 723 (NFPA 255), "Test for Surface Burning Characteristics of Building Materials" before and after exposure to elevated temperature and humidity. The cable also meets the requirements for plenum cable in one or more of the following product categories:

- Power-limited Circuit Cable (**QPTZ**) - Types CL2P or CL3P
- Communications Cable (**DUZX**) - Type CMP
- Power-limited Fire Alarm Cable (**HNIR**) - Type FPLP
- Nonpower-limited Fire Alarm Cable (**HNHT**) - Type NPLFP
- Optical Fiber Cable (**QAYK**) - Types OFNP or OFCP
- Community Antenna Television Cable (**DVCS**) - Type CATVP
- Network-powered Broadband Communications Cable (**PWIP**) - Type BLP

PRODUCT MARKINGS

This cable is identified by the marking "Limited Combustible FHC 25/50" on the surface of the jacket or on a marker tape under the jacket. This marking is immediately followed by one of the Type designations shown above. The cable also has the required markings including optional markings as indicated in the product categories referenced above. This cable may also be Verified for transmission performance if authorized in the product categories referenced above, and will bear the appropriate performance verification marking.

ADDITIONAL INFORMATION

For additional information, see Electrical Equipment for Use in Ordinary Locations (**AALZ**).

REQUIREMENTS

The basic requirements used to investigate products in this category are contained in Subject 2424, "Outline of Investigation for Cable Marked 'Limited Combustible.'"

UL MARK

The UL symbol on the product and the Listing Mark of Underwriters Laboratories Inc. on the attached tag, the reel, or the smallest unit container in which the product is packaged is the only method provided by UL to identify products manufactured under its Listing and Follow-Up Service. The Listing Mark for these products includes the UL symbol (as illustrated in the Introduction of this Directory) together with the word "LISTED," a control number, and the product name "Limited Combustible Cable."

Cable which is also Verified to the UL Data Transmission Performance Category Marking Program has the marking "Verified to UL Performance

Category Program," or the UL Verification Mark along with the words "Performance Category Program" together with the Listing Mark information on the tag, the reel, or the smallest unit container. Cable which is also Verified to another transmission performance specification has the marking "Verified in Accordance with [Specification name and/or number]" or the UL Verification Mark along with the applicable Specification name and/or number together with the Listing Mark information on the tag, the reel, or the smallest unit container.

ARTICLE 727 — INSTRUMENTATION TRAY CABLE: TYPE ITC

3-199 Log #989 NEC-P03 **Final Action: Accept**
(727.3)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Delete "such as Articles 240, 250, 300, and 392".
Substantiation: To conform to Style Manual. Already covered in 90.3.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-200 Log #2004 NEC-P03 **Final Action: Reject**
(727.4)

Submitter: Richard Carswell, The Okonite Company
Recommendation: Revise as follows:
727.4 Uses Permitted. "Type ITC cable shall be permitted to be used on NON-POWER LIMITED CIRCUITS as follows in industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons service the installation.
Substantiation: This was the original intent of ITC type cable when introduced by the NEC. Additionally, this also makes it clear that Type ITC cable can be used with a non-power limited system as long as the constraints of 150 volts or less and 5 amps or less are met.
Panel Meeting Action: Reject
Panel Statement: Section 727.5, last paragraph does not permit Type ITC cable to be installed with non-power-limited circuits, so it remains a power-limited cable of not more than 150 volts and 5 amps. This is a very special application cable for instrumentation and control circuits as stated in 727.1, and the scope of Article 727 restricts ITC to only this use. It cannot be used as a general-use cable.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-201 Log #2007 NEC-P03 **Final Action: Reject**
(727.4)

Submitter: H. R. Stewart, HRS Consulting
Recommendation: Revise as follows:
727.4 Uses Permitted. Type ITC cable shall be permitted to be used on both Power Limited and Non-Power Limited circuits and as follows in industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons service the installations.
Substantiation: ITC cable by definition can be used on circuits of 150 volts or less and 5 amps or less. This makes it clear that ITC cable and restrictions of its use are clear. Therefore, this type cable should be used on these applications.
Panel Meeting Action: Reject
Panel Statement: See the panel statement in Proposal 3-200.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-202 Log #3444 NEC-P03 **Final Action: Reject**
(727.4(11))

Submitter: David Wechsler, The Dow Chemical Company
Recommendation: Add the following new text:
Type ITC cable shall be permitted to be used as follows in industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons service the installation:
(11) With Closed-Loop and Programmed Power Distribution in accordance with 780.6.
Substantiation: Action taken in the last code cycle provided that Class II and Class III cables could be used in accordance with 780.6(B). Type ITC cable is a robust cable having greater overall electrical insulation properties than a Class II cable and thus as a cable it can be used for the same conditions.
Panel Meeting Action: Reject
Panel Statement: Article 780 was the "Smart House" article, placed in the NEC to apply to a wiring system designed to control power to various outlets, such as appliances and similar applications. This system was never intended as an industrial application. Section 780.2(B) required all equipment and conductors to be listed and 780.3 requires the control equipment and all power switching devices operated by the control equipment to be listed and identified. The system is required to comply with four different subsections to ensure the outlets will not be energized unless the utilization equipment exhibits a characteristic electrical identification. Also, Type ITC cable is not a listed hybrid cable.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-203 Log #371 NEC-P03 **Final Action: Reject**
(727.4(5))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise text as follows:
Without a metallic sheath or armor between cable tray and equipment in lengths not to exceed 15 m (50 ft), where the cable is supported and protected against ~~physical~~ damage using mechanical protection, such as dedicated struts, angles, or channels. The cable shall be supported and secured at intervals not exceeding 1.8 m (6 ft).
Substantiation: Use of the word "physical" is superfluous–the intent is obvious given the context. (I leave it to the CMP whether you want to get more specific naming some source of damage such as "blows or abrasion.")
Submitting proposals removing the adjective "physical" may strike people as about as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every unnecessary instance, as I am attempting to do, we actually cut the NEC down by up to oh, maybe a quarter-page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the unneeded use of "physical" not only is poor writing–look at William Zinsser's classic, On Writing Well–but is silly, and reflects a bit poorly on the Code process. When references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 3-177.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-204 Log #2003 NEC-P03 **Final Action: Accept in Principle**
(727.4(5))

Submitter: Richard Carswell, The Okonite Company
Recommendation: Delete subparagraph (5) in total.
Substantiation: Subparagraph (5), as currently written, allows unarmored Type ITC cable to be installed in an unsafe manner. This is consistent with the requirements for both Type PLTC and Type TC cables.
Panel Meeting Action: Accept in Principle
Panel Statement: Refer to the panel action and statement on Proposal 3-205. The panel does not agree with the submitter's substantiation that the current text permits an unsafe installation. The panel action in Proposal 3-205 recognizes a nonmetallic-sheathed cable with impact and crush tests with a designation of ITC-ER.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-205 Log #2721 NEC-P03 **Final Action: Accept in Principle**
(727.4(5) & (6))

Submitter: Dorothy Kellogg, American Chemistry Council
Recommendation: Revise text of sections as follows:

(5) Without a metallic sheath or armor the cable shall be permitted to be installed exposed ~~between cable tray and equipment in lengths not to exceed 15 m (50 ft),~~ where the cable is supported and protected against physical damage using mechanical protection, such as struts, angles, or channels. The cable shall be supported and secured at intervals not exceeding 1.8 m (6 ft).

(6) The cable shall be permitted to be installed exposed. ~~Between cable tray and equipment in lengths not to exceed 15 m (50 ft),~~ where the cable complies with the crush and impact requirements of Type MC cable and is identified for such use. The cable shall be supported and secured at intervals not exceeding 1.8 m (6 ft).

Substantiation: (5) By installing the cable in a way where it is protected from damage the limitations between cable tray and equipment and the limitations of 50 ft are not needed.

(6) There are three different installation methods for Type TC, Type PLTC and Type ITC. All of these cables are permitted to be installed as Exposed Routing (ER) when the cable is listed as ER. The installation requirements should be similar to reduce confusion in field. A similar proposal is being submitted for Articles 336 and 727 in an effort to align the installation methods.

Where cable listed as ER is used, there is no technical reason to limit this installation method to only between a cable tray and utilization equipment or device nor to limit the installation to 50 ft. Cables listed for ER installations are a stronger cable capable of withstanding more abuse than cables not listed for use in ER installations.

Panel Meeting Action: Accept in Principle

Delete current 727.4(5) and replace 727.4(6) in the existing code with this new 727.4(5) to read as follows:

(5) Cable, without a metallic sheath or armor, that complies with the crush and impact requirements of Type MC cable and is identified for such use with the marking ITC-ER, shall be permitted to be installed exposed. The cable shall be continuously supported and protected against physical damage using mechanical protection such as dedicated struts, angles, or channels. The cable shall be secured at intervals not exceeding 1.8 m (6ft).

[Renumber the remaining paragraphs accordingly.]

Panel Statement: The panel concurs that Types TC, PLTC, and ITC should have similar if not identical installation methods. The panel also recognizes that TC cable is primarily limited to installations in cable trays and raceways and that this limitation does not apply to PLTC and ITC cables. Also, Type TC cable is limited to constructions with a nonmetallic jacket and does not have metallic sheathed or armored designs. The revised wording accepts the submitter's position that this cable does not need to be limited to use from cable tray to equipment. The UL Standard for Instrumentation Tray Cable is being revised to replace the "open wiring" wording to "-ER".

Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-206 Log #1291 NEC-P03 **Final Action: Accept in Principle in Part**
(727.4(5) and 727.4 (6))

TCC Action: The Technical Correlating Committee understands that the Panel Action should be "Accept in Principle in Part".
Submitter: Gerald Lee Dorna, Belden CDT. Inc.
Recommendation: Combine 727.4 (5) and 727.4 (6) into one statement 727.4 (5). Re-number the balance of the article. The new wording would be as follows.

(5) In industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons service the installation, and where the cable is not subject to physical damage, Type ITC cable shall be permitted to be ~~exposed~~ run between the cable tray and utilization equipment or device. The cable shall be continuously supported and protected against physical damage using mechanical protection such as dedicated struts, angles, or channels. The cable shall be secured at intervals not exceeding 1.8 m (6 ft).

Substantiation: First, I removed the 50 ft limitation. There is no reason to limit the run to 50 ft especially since ITC has to be, in this application, "be continuously supported and protected against physical damage using mechanical protection such as dedicated struts, angles, or channels". If the ITC is protected in this manor, why would there be a 50 ft limit? In addition PLTC in the same application (see Article 725.61(D)(4) does not have this 50 ft limit.

Secondly, I also removed the text about the ITC having to meet the requirements of crush and impact of Type MC. Again if the ITC is to "be continuously supported and protected against physical damage using mechanical protection such as dedicated struts, angles, or channels", there is no need for the cable to additionally have to meet the crush and impact requirements of Type MC cable.

Thirdly, I also changed the word "exposed" to "run" because again if the cable is protected as stated above it really is not exposed.

I have also put in a proposal to Article 725.61(D)(4) to have the same wording. Therefore, ITC and PLTC will have the same wording.

Panel Meeting Action: Accept in Principle

The panel accepts in principle the revision to paragraph (6) but has deleted (5). The Panel accepts the elimination of the 50 ft limitation and has provided text to deal with the exposed portion of the ITC cable installation requirements.

Panel Statement: See the panel action and statement for Proposal 3-205. The panel considers this to be an exposed installation in accordance with the definition of Exposed in Article 100. There is no substantiation for eliminating the crush and impact tests for the non-armored cables

Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-207 Log #3443 NEC-P03 **Final Action: Accept in Principle**
(727.4(6))

Submitter: David Wechsler, The Dow Chemical Company
Recommendation: Revise the text as follows:

Between cable tray and equipment ~~in lengths not to exceed 15 m (50 ft),~~ where the cable complies with the crush and impact requirements of Type MC cable and is identified for such use. The cable shall be supported and secured at intervals not exceeding 1.8 m (6 ft).

Substantiation: Type ITC cable was the former PLTC cable applied in Article 725 as a Class II - Class III wiring method that was moved into its own chapter due to limitations imposed by the "listed Class II/Class III" power source requirement that was clarified by earlier actions in the Code. Not such cable length restrictions were imposed upon the Type PLTC. As can be seen Type ITC, like PLTC is also permitted to be run on messenger without limitations to its length. The added conditions of crush and impact of Type MC that have been added to Type ITC, therefore make Type ITC even more enhanced for not needing a limitation as to its length as it will continue to be better protected than the same identical cable when it was a Type PLTC. To those that might suggest that the PLTC is perhaps a safer cable because of the voltage and current limitations afforded PLTC, the voltage and current limitations defined for Type ITC are exactly those same limitations for Type PLTC defined in Tables 11(A) and 11(B). The end points of those Table values are precisely those 150 volts and 5 amp maximums contained within the Article 727 requirements.

Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 3-205.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-208 Log #2723 NEC-P03 **Final Action: Reject**
(727.5)

Submitter: Dorothy Kellogg, American Chemistry Council
Recommendation: 727.5 Uses Not Permitted. Type ITC cable shall not be installed on circuits operating at more than 150 volts or more than 5 amperes. Installation of Type ITC cable with other cables shall be subject to the stated provisions of the specific articles for the other cables. Where the governing articles do not contain stated provisions for installation with Type ITC cable, the installation of Type ITC cable with the other cables shall not be permitted.

Type ITC cable shall not be installed with power, lighting, Non-Power-Limited Class 1, or non–power-limited circuits.

Substantiation: The wording in the last sentence indicates that ITC circuits can be installed with Power Limited circuits. There are two types of Class 1 Circuits. Power-Limited and Non-Power-Limited. ITC circuits should not be installed with Non-Power-Limited Class 1 circuits. However, Power-Limited Class 1 Circuits should be allowed to be installed with ITC circuits. The revised wording would clarify the intent and allow installations to meet the intent.

Panel Meeting Action: Reject
Panel Statement: Article 725 does not differentiate between power-limited Class 1 and non-power-limited Class 1 with regard to separation of circuits. Both types of Class 1 circuits are a potential shock and fire hazard.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:

PACE, D.: The panel should have accepted this proposal.

The panel statement says "Article 725 does not differentiate between power-limited and non-power-limited Class I with regard to separation of circuits". I believe this is exactly the submitter's point. The submitter offered wording that was felt would provide this differentiation that is needed. Without it, the existing text can be interpreted as allowing ITC cables to be installed with non-power-limited circuits, in this case those being non-power-limited Class I. At the very least, the existing text can be interpreted as not prohibiting this.

3-209 Log #2006 NEC-P03 **Final Action: Reject**
(727.6)

Submitter: Richard Carswell, The Okonite Company
Recommendation: Revise as follows:
In industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons service the installation, and where the cable is not subject to physical damage. Type PLTC cable that complies with the crush and impact requirements of Type MC cable and is identified for such use should be permitted to be exposed between the cable tray and utilization equipment or device. The cable shall be continuously supported and protected against physical damage using mechanical protection such as dedicated struts, angles or channels. The cable shall be secured at intervals not exceeding 1.8 m (6 ft).
Substantiation: The present 50 foot limit and unsupported status is an unsafe condition.
Panel Meeting Action: Reject
Panel Statement: The proposal is for PLTC and not appropriate for 727.6. See the panel actions and statements for Proposals 3-204 and 3-205.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-210 Log #1420 NEC-P03 **Final Action: Accept**
(727.6, FPN 2)

Submitter: Thomas J. Guida, Underwriters Laboratories Inc.
Recommendation: Revise text to read as follows:
<u>FPN No 2: One method of defining "resistant to the spread of fire" is that the cables do not spread fire to the top of the tray in the " UL Flame Exposure, Vertical Tray Flame Test" in UL 1685-2000 Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables. The smoke measurements in the test method are not applicable. Another method of defining "resistant to the spread of fire" is for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing the CSA "Vertical Flame Test - Cables in Cable Trays," as described in CSA C22.2 No. 0.3-M- 2001, Test Methods for Electrical Wires and Cables.</u>
Substantiation: The FPN is proposed to make Article 727 consistent with Articles 725, 760, 770, 800, 820 and 830 all of which have FPNs for methods of defining "resistant to the spread of fire".
Panel Meeting Action: Accept
Designate the addition as FPN, not FPN No.2.
Panel Statement: The panel has made an editorial correction, since there is no current FPN.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

ARTICLE 760 — FIRE ALARM SYSTEMS

3-211 Log #842 NEC-P03 **Final Action: Accept**
(760)

Submitter: Richard P. Owen, St. Paul, MN
Recommendation: Renumber Article 760 to read as follows:
ARTICLE 760 Fire Alarm Systems
I. General
760.1 Scope.
760.2 Definitions.
760.3 Other Articles.
~~760.7~~ <u>760.21</u> Access to Electrical Equipment Behind Panels Designed to Allow Access.
~~760.8~~ <u>760.24</u> Mechanical Execution of Work.
~~760.9~~ <u>760.26</u> Fire Alarm Circuit and Equipment Grounding.
~~760.10~~ <u>760.30</u> Fire Alarm Circuit Identification.
~~760.11~~ <u>760.32</u> Fire Alarm Circuits Extending Beyond One Building.
~~760.15~~ <u>760.35</u> Fire Alarm Circuit Requirements.
II. Non–Power-Limited Fire Alarm (NPLFA) Circuits
~~760.21~~ <u>760.41</u> NPLFA Circuit Power Source Requirements.
~~760.23~~ <u>760.43</u> NPLFA Circuit Overcurrent Protection.
~~760.24~~ <u>760.45</u> NPLFA Circuit Overcurrent Device Location.
~~760.25~~ <u>760.46</u> NPLFA Circuit Wiring Methods.
~~760. 26~~ <u>760.48</u> Conductors of Different Circuits in Same Cable, Enclosure, or Raceway.
~~760.~~ 27 <u>760.49</u> NPLFA Circuit Conductors.
~~760.~~ 28 <u>760.51</u> Number of Conductors in Cable Trays and Raceways, and Derating.
~~760.30~~ <u>760.53</u> Multiconductor NPLFA Cables.
III. Power-Limited Fire Alarm (PLFA) Circuits

~~760.61~~ <u>760.154</u> Applications of Listed PLFA Cables.
Figure ~~760.61~~ <u>760.154</u> Cable Substitution Hierarchy.
Table ~~760.~~ 61 <u>760.154</u> Cable Substitutions
IV. Listing Requirements
~~760.~~ 81 <u>760.176</u> Listing and Marking of NPLFA Cables.
Table ~~760.81(G)~~ <u>760.176(G)</u> NPLFA Cable Markings
~~760.~~ 82 <u>760.179</u> Listing and Marking of PLFA Cables and Insulated Continuous Line-Type Fire Detectors.
Table ~~760.82(I)~~ <u>760.179(I)</u> Cable Markings
Substantiation: This proposal was developed by a Task Group consisting of CMP-3 members Ray Keden, Robert Walsh, Ron Maassen, Mark Ode, Tom Guida and Chair Richard Owen.
The Task Group was formed to look at held Comment 3-108, which suggested a new parallel numbering system for Articles 725 and 760. As a result of several conference calls and by work outside the calls, the Task Group unanimously approved the proposal as shown. The Task Group attempted as much as was possible to correlate the numbering of the two articles, as well as a similar numbering sequence for those related sections in Chapter 8 for overall correlation, while leaving adequate room between sections for future additions. It was impossible to renumber the two articles exactly, since some sections could not be moved without changing their intent. One example of this is newly renumbered Sections 725.52 covering Class 1 circuits extending beyond one building and 760.32 covering both power limited fire alarm and non-power-limited fire alarm circuits extending beyond one building, which both address the same thing, but the numbering could not be the same without changing the intent of these sections due to their location in their respective articles.
There is a companion proposal to this one for Article 725.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-212 Log #2362 NEC-P03 **Final Action: Reject**
(760.2.Abandoned Fire Alarm Cable)

Submitter: John H. Schmidt, ABC Television Network
Recommendation: In the definition for Abandoned Fire Alarm Cable, after the words "and not identified for future use with a tag" add the words "or in a database."
Substantiation: In modern large systems, cables are often identified with a number at each end, and the function of the cable is listed in a database referencing that number. This database should be adequate to identify cables for future use.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 3-139.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-213 Log #3029 NEC-P03 **Final Action: Reject**
(760.2. Abandoned Fire Alarm Cable)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Recommendation: Revise text to read as follows:
760.2 Definitions.
Abandoned Fire Alarm Cable. Installed fire alarm cable that is not terminated at equipment ~~other than a connector~~ and not identified for future use with a tag.
Substantiation: The definitions of abandoned cable in every article should be identical. The relevant articles are: 640, 645, 725, 760, 770, 800, 820 and 830. The definitions at articles 640 and 725 are already correct as follows:
640.2: Abandoned Audio Distribution Cable. Installed audio distribution cable that is not terminated at equipment and not identified for future use with a tag.
725.2: Abandoned Class 2, Class 3, and PLTC Cable. Installed Class 2, Class 3, and PLTC cable that is not terminated at equipment and not identified for future use with a tag.
The additional wording in this definition causes confusion. Proposals are

being made to make changes to the definitions in articles 770, 800, 820 and 830, and to add a general definition into article 645 and into article 100.
Panel Meeting Action: Reject
Panel Statement: Each article has different requirements for what constitutes an abandoned cable. Some applications require that a connector be installed along with an identification tag on the cable, whereas others, such as the one for Article 725, require only that the cable not be terminated at equipment and an identification tag be installed for it to not be considered to be abandoned. In this application for fire alarm systems, coaxial cables are often installed for cabling to "smart" systems or for interface units and would be tagged with a connector installed on the cable for quick connect at a future time.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-214 Log #2982 NEC-P03 **Final Action: Reject**
(760.2, FPN (New))

Submitter: Robert Konnik, Rockbestos-Suprenant
Recommendation: Add a FPN to 760.2 for fire alarm circuit integrity cable to indicate that the cable should be tested for the environment it is installed in as follows:
<u>FPN: Since CI Cables may be installed in a raceway or free air they must be tested for both these conditions.</u>
Substantiation: Some CI cables are not tested in conduit, with boxes, vertically, etc, but are installed this way.
Panel Meeting Action: Reject
Panel Statement: This proposed fine print note contains mandatory text by stating that circuit Integrity cables must be tested for free air and raceway installations and, as such, this fine print note does not comply with Section 3.1.3 of the NEC Style Manual. Section 760.2 contains the definition of the circuit integrity cable, and a definition cannot contain mandatory text, so the proposed text cannot be moved into the definition.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
EGESDAL, S.: Circuit integrity cables are required for certain notification appliance circuits to insure survivability of the circuit. Because it is standard practice for installing a typical fire alarm cable exposed or in raceway, installers may not be aware that a "-CI" must be installed in accordance with its listing requirements, which may or may not require or not permit installation in raceway. The information is on the data sheet provided, but so often not read in detail. The goal of the proposed Fine Print Note is an alert to system designers, installers, and enforcers to the critical nature of circuit integrity cable installation requirements. Improper installation has the potential to put lives at risk.
Additionally, the Panel Statement is unfair to the submitter of the proposal. To only indicate the proposal violates the style manual without giving a technical substantiation for rejecting. Or, the Panel could have taken the time to change the text in the proposal and "Accept in Principle."

3-215 Log #3107 NEC-P03 **Final Action: Reject**
(760.3)

Submitter: Donald Hall, Corning Cable Systems
Recommendation: Revise text to read as follows:
760.3 Other Articles.
Circuits and equipment shall comply with 760.3(A) through 760.3(F). Only those sections of Article 300 referenced in this article shall apply to fire alarm systems.
(A) Spread of Fire or Products of Combustion. 300.21 shall apply. ~~The accessible portion of a~~ Abandoned fire alarm cables shall be removed.
Also, add the following FPN to 760.3(A):
<u>FPN: ANSI/NECA/BICSI 568-2001, Standard for Installing Commercial Building Telecommunications Cabling, and other industry standards provide recommended cable installation practices which facilitate the eventual removal of cables as they become abandoned.</u>
Substantiation: Abandoned cable should be removed to reduce unnecessary accumulation of fuel load and promote electrical safety. It is not reasonable or necessary to install cables in a manner that prevents their eventual removal.
The proposed FPN will provide useful information to architects, system designers, and installers to help minimize the cost and inconvenience of removing abandoned cable.
Panel Meeting Action: Reject
Panel Statement: Requiring inaccessible portions of a cable to be removed could mean damaging building finish and demolition or destruction of the building to remove abandoned cable, which is unrealistic to require. There is no added benefit to the user of the NEC in adding this fine print note since the removal of cable in accordance with 760.3(A) is already a requirement. The relevant portions of the suggested document in the FPN have not been provided for informational purposes. With regard to the addition of the FPN, the panel refers to 90.1(C): The Code is not for untrained personnel and is not an instruction manual.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-216 Log #1375 NEC-P03 **Final Action: Reject**
(760.3(A))

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Delete text concerning abandoned cables
760.3 Other Articles.
Circuits and equipment shall comply with 760.3(A) through 760.3(F). Only those sections of Article 300 referenced in this article shall apply to fire alarm systems.
(A) Spread of Fire or Products of Combustion. Section 300.21. ~~The accessible portion of abandoned fire alarm cables shall be removed.~~
(B) Ducts, Plenums, and Other Air-Handling Spaces. Section 300.22, where installed in ducts or plenums or other spaces used for environmental air.
Exception: As permitted in 760.30(B)(1) and (B)(2) and 760.61(A).
(C) Hazardous (Classified) Locations. Articles 500 through 516 and Article 517, Part IV, where installed in hazardous (classified) locations.
(D) Corrosive, Damp, or Wet Locations. Sections 110.11, 300.6, and 310.9 where installed in corrosive, damp, or wet locations.
(E) Building Control Circuits. Article 725 where building control circuits (e.g., elevator capture, fan shutdown) are associated with the fire alarm system.
(F) Optical Fiber Cables. Where optical fiber cables are utilized for fire alarm circuits, the cables shall be installed in accordance with Article 770.
Substantiation: The NEC is an installation standard, not a maintenance standard. Because of this, this rule should not be a part of the NEC. Furthermore, this provision does not accomplish its intent, as the code is not a retroactive document. To require abandoned cables to be removed is similar to requiring facilities to update their receptacles to the new GFCI provision every three years. With that said, the only time this rule applies is when an installer creates an abandoned cable. Also, this provision does not fall within the purpose of the NEC 90.1(A). The NEC is concerned with the hazards created from the use of electricity…this rule seems to imply that a cable with a voltage applied to it is safe, but a cable with no voltage applied to it is dangerous.
This proposal is also being made to sections 725.3(B), 770.3(A), 800.3(C), 820.3(A) and 830.3(A).
Panel Meeting Action: Reject
Panel Statement: This is not a retroactive requirement, since the abandoned cable either must be marked at the time it is disconnected or must be removed. Removal of discontinued conductors is not new to the Code.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-217 Log #2806 NEC-P03 **Final Action: Reject**
(760.3(A))

Submitter: Harold C. Ohde, IBEW #134
Recommendation: 760.3 Other Articles. No change
(A) Spread of Fire or Products of Combustion. ~~Section~~ 300.21 <u>shall apply</u> . ~~The accessible portion of abandoned fire alarm cables shall be removed.~~
Substantiation: The requirements for removal of abandoned fire alarm cables would be better suited in appropriate code section within Article 760. I have submitted another proposal that would move the abandoned fire alarm cables requirements to 760.8 - Mechanical Execution of Work. The abandoned fire alarm cables requirements are out of place in 760.3 - Other Articles. The requirements are not part of another Article as they are part of Article 760 and are located within Article 760.
The addition of the words "shall apply" would incorporate language that is consistent with 800.3, 820.3 and 830.3.
Similar proposals have been submitted for 640.3, 725.3, 770.3, 800.3, 820.3, and 830.3 to revise these sections as well.
Panel Meeting Action: Reject
Panel Statement: The concern of 300.21 is the spread of fire and products of combustion in hollow spaces, vertical shafts, and ventilation and air-handling ducts caused by electrical installations. Removing the accessible portion of the cable seems to fit very well within 300.21 and should remain in Section 760.3(A) as a means of reducing unnecessary electrical products in these areas.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
CASPARRO, P.: This proposal should have been accepted. This proposal was submitted not to interfere with the intent of 300.21, but rather locate all abandoned cable requirements in one Code section located in Part 1 - General. Having the requirements in a central section in Part I - General, would eliminate confusion or concerns in regard to the removal of abandoned requirements.

3-218 Log #3004 NEC-P03 **Final Action: Reject**
(760.3(A))

Submitter: Marcelo M. Hirschler, GBH International
Recommendation: Revise text to read as follows:
760.2 Definitions.
Abandoned Fire Alarm Cable. Installed fire alarm cable that is not terminated at equipment other than a connector and not identified for future use with a tag.
760.3 Other Articles.
Circuits and equipment shall comply with 760.3(A) through 760.3(F). Only those sections of Article 300 referenced in this article shall apply to fire alarm systems.
(A) Spread of Fire or Products of Combustion. Section 300.21. ~~The accessible portion of abandoned~~ Abandoned fire alarm cables shall be removed. Removal of abandoned cables shall not damage the building structure or finish and shall not compromise the performance of adjacent wiring systems or components.
Substantiation: This comment recommends a change in wording to ensure that abandoned cables are removed and to prevent confusion in future. There have been multiple proposals that would permit some cables to remain in “inaccessible spaces”. This is not conducive to safe electrical practice; this the key change is the elimination of the words “the accessible portion of”.
If the intent of the code-making panel was to clarify that removal of cable should not be done if such removal would damage the building, which is obviously not the intent, a second sentence can be added stating that removal of abandoned cables shall not be performed if it would damage the building structure or finish or in any way compromise the functional performance of any other wiring systems or components. This would be accomplished by the optional added sentence.
Consistent wording on removal of abandoned cables is being proposed for sections: 640.3, 725.3, 770.3, 770.154, 800.3, 800.154, 820.3, 820.154 and 830.3.
For information, see the relevant definitions in the NEC.
Accessible (as applied to equipment). Admitting close approach; not guarded by locked doors, elevation, or other effective means.
Accessible (as applied to wiring methods). Capable of being removed or exposed without damaging the building structure or finish or not permanently closed in by the structure or finish of the building.
Accessible, Readily (Readily Accessible). Capable of being reached quickly for operation, renewal, or inspections without requiring those to whom ready access is requisite to climb over or remove obstacles or to resort to portable ladders, and so forth.
Concealed. Rendered inaccessible by the structure or finish of the building. Wires in concealed raceways are considered concealed, even though they may become accessible by withdrawing them.
Isolated (as applied to location). Not readily accessible to persons unless special means for access are used.
Panel Meeting Action: Reject
Panel Statement: This proposed change would make it a requirement that removal of abandoned cable never damage the building finish or compromise adjacent wiring systems or components. This expectation is unrealistic. If the building owner wants to take a ceiling down to access and remove abandoned cables, the NEC should not and cannot restrict this action. In regard to the removal of accessible cable, the panel refers to the definition of accessible as it applies to wiring methods.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-219 Log #2389 NEC-P03 **Final Action: Reject**
(760.3(A) and 760.17 (new))

Submitter: Allen C. Weidman, The Society of the Plastics Industry, Inc.
Recommendation: Move the abandoned cable requirement from 760.3(A) to new 760.17.
(A) Spread of Fire or Products of Combustion. Section 300.21. ~~The accessible portion of abandoned fire alarm cables shall be removed.~~
760.17. Abandoned Cables. The accessible portion of abandoned fire alarm cables shall be removed.
Substantiation: This change is editorial. The requirement to remove abandoned cables applies to Article 760, not other articles.
Panel Meeting Action: Reject
Panel Statement: Moving this text to a new section without this restriction would make this a requirement for every location within a building. There has been no substantiation provided to expand this requirement beyond hollow spaces, vertical shafts, and air-handling areas. The concern of 300.21 is the spread of fire and products of combustion in hollow spaces, vertical shafts, and ventilation and air-handling ducts caused by electrical installations. Removing the accessible portion of the cable seems to fit very well within 300.21 and should remain in Section 760.3(A) as a means of reducing unnecessary electrical products in these areas.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
EGESDAL, S.: This proposal should be accepted. The removal of abandoned cable should be in its own section to make it clear that the requirement applies to Parts I, II, and III of Article 760. Presently, the removal of abandoned cable in 760.3(C) applies when 300.21 is required to be referenced.
The 2002 NEC had the removal of abandoned cable requirement in Sections 760.3(B), 760.61(A), Plenums; 760.61(B), Risers; and 760.61(E), Other Wiring in Buildings. As 760.3(C) would supposedly cover all the Parts of Article 760; the requirements were removed from 760.61(A) and (B) in an effort to simplify the NEC. As a former member of Panel 16, I know the intent of the requirements in Article 760 (2002 edition) was to require removal of abandoned cable, regardless of where the cable was installed in a building. The Panel should reconsider the proposals that recommend moving the requirements for removal of abandoned cable to its own section in Part I of Article 760.

3-220 Log #894 NEC-P03 **Final Action: Reject**
(760.3(B) Exception)

Submitter: Noel Williams, Noel Williams Consulting
Recommendation: Delete the Exception to 760.3(B) entirely.
Substantiation: These exceptions only confuse the issue. No special rule that violates 300.22 is found in 760.30(B)(1) or (B)(2). Ducts and plenums should not be used as raceways for FA cables, so the cables should not be installed there unless they connect to equipment that acts on the air. 300.22(B) with 760.61 is sufficient.
Panel Meeting Action: Reject
Panel Statement: The purpose of this exception is to point out that power-limited plenum cables are for ducts, plenums and other spaces used for environmental air. Non-power-limited plenum cables are for other spaces only. The exception needs to be retained for usability.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
AYER, L.: The NEC does not allow Class 2 or Class 3 plenum cables to be installed exposed inside ducts or plenums. This can be found in 725.3(C). Low-voltage and low-energy fire alarm cables which are found in Article 760 should be treated in the same fashion. While I agree with the submitter’s substantiation to delete the Exception to 760.3(B), 760.61(A) would also have to be reworded to add more clarity to the user of the code.
The panel should delete the Exception as recommended by the submitter. The panel should also delete the first sentence of 760.61(A) and rewrite the second sentence into mandatory code text.

3-221 Log #2184 NEC-P03 **Final Action: Accept**
(760.3(G))

Submitter: Dann Strube, Strube Consulting
Recommendation: Add text to read as follows:
(G) Installation of conductors with other systems. Installations shall comply with 300.8.
Substantiation: Fire alarm systems should not be mixed with water, air, etc. Without this change, 760.3 removes the 300.8 requirement.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-222 Log #2388 NEC-P03 **Final Action: Reject**
(760.3(G) (New))

Submitter: Allen C. Weidman, The Society of the Plastics Industry, Inc.
Recommendation: Add new 760.3(G), as follows:
760.3(G). Temperature Limitation of Conductors. See 310.10.
Substantiation: The cables and conductors in this article do not have a temperature rating requirement. It is important for the system designer, installer, local authority, and building owners to know the temperature rating of cables and conductors for proper application.
Section 310.10 from the 2002 NEC follows:
310.10 Temperature Limitation of Conductors.
No conductor shall be used in such a manner that its operating temperature exceeds that designated for the type of insulated conductor involved. In no case shall conductors be associated together in such a way, with respect to type of circuit, the wiring method employed, or the number of conductors, that the limiting temperature of any conductor is exceeded.
FPN No. 1: The temperature rating of a conductor (see Table 310.13 and Table 310.61) is the maximum temperature, at any location along its length, that the conductor can withstand over a prolonged time period without serious degradation. The allowable ampacity tables, the ampacity tables of Article 310 and the ampacity tables of Annex B, the correction factors at the bottom of these tables, and the notes to the tables provide guidance for coordinating conductor sizes, types, allowable ampacities, ampacities, ambient temperatures, and number of associated conductors.

The principal determinants of operating temperature are as follows:

(1) Ambient temperature — ambient temperature may vary along the conductor length as well as from time to time.

(2) Heat generated internally in the conductor as the result of load current flow, including fundamental and harmonic currents.

(3) The rate at which generated heat dissipates into the ambient medium. Thermal insulation that covers or surrounds conductors affects the rate of heat dissipation.

(4) Adjacent load-carrying conductors — adjacent conductors have the dual effect of raising the ambient temperature and impeding heat dissipation.

FPN No. 2: Conductors installed in conduit exposed to direct sunlight in close proximity to rooftops have been shown, under certain conditions, to experience a temperature rise of 17°C (30°F) above ambient temperature on which the ampacity is based.

Panel Meeting Action: Reject

Panel Statement: Adding this section to 760.3 is unnecessary since Article 310 already applies within Article 760 for fire alarm systems, wherever appropriate. For example, 760.27(A) references 310.15 for those conductors larger than 16 AWG.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

Explanation of Negative:

EGESDAL, S.: It seems appropriate that the NEC define the minimum temperature rating for conductors and cables installed in compliance with Article 760. Chapter 3 wiring methods are permitted for power-limited fire alarm circuits by 760.52, so the temperature rating requirements in Sections 300.2(B) and 310.10 would apply. However, if a power-limited cable is installed, there are no requirements for a temperature rating on the cable. Right now, the user is dependent on whatever testing laboratories mark or do not mark on cable. As cable can be installed in a variety of areas having significantly different ambient temperatures, it makes sense to require a minimum temperature rating for cables with that minimum temperature not required to be marked on the cable.

3-223 Log #895 NEC-P03 **Final Action: Reject**
(760.8)

Submitter: Noel Williams, Noel Williams Consulting

Recommendation: Revise 760.8 as follows:

"...Cables and conductors installed exposed ~~on the surface of ceilings and sidewalls~~ shall be supported in such a manner...The installation shall also conform to 300. 4 ~~(D)~~ and 300.11 ." (Other portions to remain unchanged.)

Substantiation: Current cable support rules apply only to cables exposed to view (on surfaces). Cables above ceilings are "exposed" as defined, but such cables are only required to be "neat and workmanlike." All of 300.4 should apply. 300.4(D) is only for cables run parallel to framing. 300.11 should apply as it does in 640.6.

Panel Meeting Action: Reject

Panel Statement: The use of the word "exposed" was to recognize that exposed cables that are installed horizontally on framing members are more apt to be damaged than those cables installed through framing members or otherwise protected inside a drop ceiling or similar application.

There is no substantiation provided that justifies requiring fire alarm cables of smaller sizes to be supported separate from the ceiling wires. This is a different issue from raceways containing power conductors being connected to ceiling wires.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

Comment on Affirmative:

AYER, L.: The wording of 760.8 is a result of the 2002 code cycle. The text was changed to notify the user of the code that fire alarm cables are required to be supported and secured differently below ceilings and sidewalls as compared to cables installed in the void spaces above an accessible ceiling. To require low-energy low-hazard fire alarm cables to be supported above an accessible ceiling to the same requirements of exposed cables below the ceiling that could be damaged would not be appropriate.

The addition of 300.11 would also be considered excessive. Some installations may have 10 feet of space between the dropped ceiling and the structure above. To require an independent support wire when adding a few fire alarm cables would be costly and burdensome for this application. There has been no technical substantiation provided that low voltage cabling is causing a problem with existing or new ceiling grids. Power wiring was moved to independent support wires due to actual problems that were occurring.

3-224 Log #1376 NEC-P03 **Final Action: Reject**
(760.8)

Submitter: Mike Holt, Mike Holt Enterprises

Recommendation: Delete requirement to comply with 300.4(D)

760.8 Mechanical Execution of Work.

Fire alarm circuits shall be installed in a neat workmanlike manner. Cables and conductors installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be supported by straps, staples, hangers, or similar fittings designed and installed so as not to damage the cable. ~~The installation shall also conform with 300.4(D).~~

Substantiation: There is no reason to protect limited energy circuits from accidental contact with nails or screws. Limited energy circuits are considered to be inherently safe from a fire and electric shock perspective, hence the allowances of lesser wiring methods and allowances for open splicing with out boxes. The protection of these circuits is a design and/or performance issue, not a safety issue. The requirement found in the existing *Code* text does not fit into the purpose of the NEC, as addressed in 90.1(A).

Panel Meeting Action: Reject

Panel Statement: Even though fire alarm circuits can be limited energy circuits, these circuits are an integral part of the life safety protection for a building. Disruption of the system through a fault or an open in a circuit can have serious consequences for early warning fire-related systems. Communications circuits are often tied into the fire alarm panel to provide communications for emergency evacuation and relocation during a fire. This section and 725.8 provide a link for the connection of various critical circuits, such as door release, elevator capture, smoke door and damper controls, fresh air intake and exhaust fan shutdown, as well as other building safety control systems. Many of these control circuits are connected through normally open or closed contacts in the fire alarm cabinet, and damage of the conductors can have some devastating results for the occupants of the building.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-225 Log #1377 NEC-P03 **Final Action: Reject**
(760.8)

Submitter: Mike Holt, Mike Holt Enterprises

Recommendation: Add "Cable Ties" to the list of supporting methods.

760.8 Mechanical Execution of Work.

Fire alarm circuits shall be installed in a neat workmanlike manner. Cables and conductors installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be supported by straps, staples, cable ties , hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also conform with 300.4(D).

Substantiation: This is being proposed in an effort to create uniform language with the chapter three cable wiring method support sections, specifically, 230.30(A), 330.30(A) and 334.30. Similar proposals are also being made to 725.8, 640.6, 770.24, 800.24, 820.24 and 830.24

Panel Meeting Action: Reject

Panel Statement: It is not acceptable to use a cable tie to serve as a sole support for a fire alarm cable when there is no spacing requirement provided for the distance between supports.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 10 Negative: 3

Explanation of Negative:

AYER, L.: Cable ties should be added to 725.8 as proposed by the submitter. These support device have been used for years without hazard even though they are not mentioned in this section. Adding this wording is just to notify users of the code that Class 1, Class 2 and Class 3 cables can be supported by this device. The panel's substantiation that cable ties cannot be used since there is no spacing requirement provided between supports does not make sense. There has never been spacing requirements when supporting control cables on straps, staples and hangers. To allow a thermostat cable to be supported by a strap, but not a cable tie, is not logical. The rejection of this proposal will cause confusion since cable ties will be allowed to support low-energy cables above a dropped ceiling but not below.

EASTER, L.: Unspecified straps, staples, hangers and similar fittings are permitted in this section to provide required support without prescribe maximum spacing intervals. The codemaking panel has not seen it necessary to prescribe maximum spacing intervals for cables covered by Article 760. UL1565 provides requirements for listed cable ties intended for primary support of flexible conduits and cables in accordance with the NEC. Such cable ties must have a minimum loop tensile strength rating of 23 kg (50 lbs.) or greater. NEMA believes that the panel action should be changed to Accept in Principle. Accept the proposed addition in the third sentence but add the following new fourth sentence. "Cable ties that provide primary support for such cables shall have a minimum loop tensile strength of 23 kg (50 lbs.)."

PACE, D.: The panel should have accepted the proposal.

The existing text says "or similar fittings" leaving the list of support means open to other methods other than those listed. The use of cable ties or other methods is not prohibited by the existing text. Other parts of the NEC contain adequate requirements relating to issues such as the items being suitable for the service, adequate support distances, and being such that the cable is not subject to damage. The panel statement is not sufficient justification to reject including cable ties to the list in the existing text. If properly selected and installed, cable ties are a suitable means of support.

Comment on Affirmative:

CASPARRO, P.: While the submitter is correct in stating that cable ties are allowed in the other articles that he cites; all of the other articles that allow the use of cable ties as a means of support also contain a requirement for spacing between supports. It was pointed out in the panel discussion that a 100 foot run of cable with a tie wrap at each end would be allowed by the proposed text, this is certainly not acceptable especially since this cable contains a life safety circuit.

EGESDAL, S.: See my Explanation of Affirmative for Proposal 3-155.

3-226 Log #3051 NEC-P03 **Final Action: Reject**
(760.8)

Submitter: Harold C. Ohde, IBEW #134
Recommendation: Revise 760.8 as follows:

760.8 Mechanical Execution of Work

(A) **Neat and Workmanlike Manner.** Fire alarm equipment, cables and circuits shall be installed in a neat and workmanlike manner.

(B) Installation of Fire Alarm Cables . Fire alarm cables installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the fire alarm cables will not be damaged by normal building use. Such cables shall be secured by listed straps, staples, hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also comply with 300.4(D) and 300.11 .

FPN: Accepted industry practices are described in ANSI/NECA/BICSI 568-2001, *Standard for Installing Commercial Building Telecommunication Cabling,* and other ANSI-approved installation standards.

(C) **Abandoned Fire Alarm Cables.** Abandoned fire alarm cables shall be removed.

FPN: Accepted industry practices are described in ANSI/NECA/BICSI 568-2001, Standard for Installing Commercial Building Telecommunications Cabling, and other ANSI-approved standards which provide cable installation that facilitates the removal of abandoned optical fiber cables.

Substantiation: This proposal revises this section into a practical working tool which will assist in making 760.8 a clear, usable and enforceable code. Each first level subdivision contains a code rule that requires action and the required action has been presented in clear, usable and enforceable manner.

In the electrical industry, the electrician, contractor and AHJ have been taught the importance and significance of the concept of mechanical execution of work. I am an electrical instructor who teaches this important concept to the people involved. This is one of the basis for 90.1(A) which serves as the purpose of this Code. The Code's purpose is to provide a safe installation from hazards arising from the use of electricity.

The revised text in 760.8(A) will require all fire alarm equipment, cables and circuits to be installed in a neat and workmanlike manner.

760.8(B) is an editorial change with additional language to require the means of securing and supporting to be listed for the purpose. The inclusion of "and 300.11" will provide the same installation requirements that can be found be in 640.3, 770.24, 800.24, 820.24 and 830.24. The wording "and 300.11" was accepted by both CMP 12 and CMP 16 for the 2005 NEC edition.

The addition of 760.8(C) would replace the requirement that was in 760.3(A). It makes sense to have the requirements of both the installation of cable and the removal of cable in the same Code section. This would provide the proper guidance to everyone involved. The installer, contractor and the AHJ would gain from this revised section as the rules are centrally located in one Code section. If fire alarm cable is installed properly then the removal of fire alarm cable should be no problem if it is not needed anymore or abandoned. The proposed FPN will provide useful guidance and information to everyone involved regarding correct installation practices which would facilitate the removal of the cable as well.

Similar proposals have been submitted for 640.6, 725.8, 770.24, 800.24, 820.24, and 830.24.

Panel Meeting Action: Reject

Panel Statement: Fire alarm equipment is already required specifically to be installed in a neat and workmanlike manner by 110.12, so inserting it here is unnecessary.

Requiring listed straps, staples, and other supporting means for power-limited fire alarm cable is not necessary as long as the support mechanism can be accomplished without harming the cable. Section 760.25 already provides the link to the appropriate wiring methods used for the non-power-limited fire alarm circuits.

The requirement in Section 760.8 to apply Section 300.11 to fire alarm circuits is not necessary since Section 760.25 requires non-power-limited fire alarm circuits to have wiring methods comply with 300.11 and the small cables for power-limited fire alarm cables will not cause a problem for ceiling grid installations.

In Section 760.3(A), the concern of 300.21 is the spread of fire and products of combustion in hollow spaces, vertical shafts, and ventilation and air handling ducts caused by electrical installations. Removing the accessible portion of the cable seems to fit very well within 300.21 and should remain in Section 760.3(A) as a means of reducing unnecessary electrical products in these areas. There is no added benefit to the user of the NEC in adding this Fine Print Note since the removal of cable in accordance with 760.3(A) is already a requirement.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

Explanation of Negative:

CASPARRO, P.: This proposal should have been accepted in part. In the submitter's substantiation, he revised and restructured 760.8 into a practical working tool for all involved. This would have significant impact and provide guidance for the contractor, the installer and the AHJ. This would provide good and sound code that is easy to enforce. The FPNs that follow 760.8(B) and 760.8(C) provide no guidance nor any added benefit to the user of the code therefore, should be deleted.

3-227 Log #3625 NEC-P03 **Final Action: Reject**
(760.8)

Submitter: Christopher R. Pharo, Marlton, NJ
Recommendation: 760.8 after the second sentence to read:

Cables shall be supported from the building structure every 1.8m (6ft.)and 300mm (12in.) from a box or cabinet. Cables and conductors...".

Substantiation: There are currently no guidelines for distances between supports for the type of cabling used in this article. 5ft, 30ft, or even 100ft between supports is acceptable now in the 2005 NEC because it is not addressed. MC cable, a stiffer, more robust wiring method addressed in Chapter3, Article 330, dictates securing the cable at intervals not exceeding 1.8m (6ft.)

The previous code panel stated as the reason for rejecting this change was "The support of this cable should be based upon the size of the cable. Other wiring methods from Chapter 3 must follow the support requirements in that particular wiring method article." I agree with the panel that wiring methods listed in Chapter 3 have specific requirements with regards to distances beteen supports. This cable is not addressed in Chapter 3 therefore no requirements exist. It must be addressed in this article.

I am merely asking that this cable, the backbone of a fire alarm system, be supported at intervals that are consistent with wiring methods in Chapter 3.

Panel Meeting Action: Reject

Panel Statement: The recommendation to require a small four-conductor fire alarm cable to be supported every 6 feet and within 12 inches of a box or cabinet is more restrictive than the support requirements for rigid metal conduit or IMC. The support of this cable should be based on the size of the cable and the ability to adequately provide support so the cable is not damaged. Building construction methods will differ enough to affect the support requirements for fire alarm cables, so providing specific support requirements would be unrealistic. The submitter has not provided any industry-wide job problems to support this additional requirement.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

Explanation of Negative:

CASPARRO, P.: I agree that the panel statement that these requirements are more restrictive for a four pair cable than for rigid metal conduit, or IMC, but the tensile strength of these conduits is substantially greater to allow for this increased allowable spacing between supports. There may need to be different spacing requirements for four pair cable as compared to 600 pair cable, but this proposal is a step in the right direction. Currently, there is no requirement for the spacing of supports for these cables; this is clearly not in accordance with 90.1; especially since this cable contains a life safety circuit.

3-228 Log #2883 NEC-P03 **Final Action: Reject**
(760.8, FPN)

Submitter: Ron Alley, ELECTRICO
Recommendation: Delete the following FPN:

~~FPN: One source for information describing industry practices is ANSI/NECA 305-2001, Standard for Fire Alarm System Job Practices.~~

Substantiation: Numerous consensus standards from organizations such as National Fire Protection Association, Inc. (NFPA), Underwriters Laboratories Inc. (UL), NEMA and IEEE could be added as a Fine Print Note throughout the Code to assist the reader of the NEC as the existing FPN note does. There are just as many publications such as NFPA Pocket Guide to Fire Alarm System Installation and Fire Alarm Systems, and many others that could be listed in a FPN that would benefit the reader. Also, there are safety regulations, pertaining to fire alarm systems such as OSHA 1910 and OSHA 1926 that could be added as a Fine Print Note to assist readers to make their companies and workers safer. Adding a Fine Print Note for the purpose of informing the reader of all related standard and publications would be cumbersome. The NEC should list all prominent standards and Publications in a FPN or it should list none.

The particular standard mentioned in the FPN, (ANSI/NECA/305-2001 (Standard for Fire Alarm Systems Job Practices) is generic. In fact the document requires the manufacturer's instructions and a copy of NFPA 72. The standard does not contain enough information to be used as a stand alone document without the use of other material that is not mentioned in the FPN. In my opinion the ANSI standard listed in the FPN adds very little to the manufacturers instructions and should never be used instead of manufacturer's instructions.

Manufacturer's instructions are sometimes required to be included as a condition of listing or labeling of telecommunications equipment and are sent with the listed or labeled products or can be requested from the manufacturer

prior to installation. Manufacturers instructions are updated as needed to keep up with product improvements. The FPN in the 2005 Code most likely will not be as up to date as the manufacturer's instructions.
Panel Meeting Action: Reject
Panel Statement: The Code contains many fine print note references to ANSI-approved industry standards that provide explanatory information to Code users. Far from being generic, ANSI/NECA 305-2001 applies specifically to NEC 760.8; it provides additional information to explain what is meant by installing fire alarm circuits in a "neat and workmanlike manner".
Other documents mentioned in the submitter's substantiation such as OSHA 1910 and 1926 truly are generic. Others, such as the NFPA Pocket Guide to Fire Alarm Installation, are not appropriate to include in FPNs because they are not industry consensus standards developed with broad participation by Code users. The scope of ANSI/NECA 305-2001 states that "Installers should always follow the National Fire Alarm Code... and manufacturers, instruction when installing fire alarm equipment and systems".
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
AYER, L.: The ANSI/NECA-305 Fire Alarm Standard is simply extracted material from NFPA 72. Listing this document in a fine print note is inappropriate since users of the code may be led to believe this is a valuable standard when in fact 95% of the material is found within the NFPA 72 document. This may lead individuals to purchase both the ANSI and NFPA 72 material when this is not necessary. The fine print note should be deleted.

3-229 Log #3368 NEC-P03 **Final Action: Reject**
(760.8, FPN)

Submitter: Mark Miller, Plumechtrics Consulting Engineering
Recommendation: Revise text to read:
~~FPN: One source for information describing industry practices is ANSI/NECA 305-2001, Standard for Fire Alarm System Job Practice.~~ Installation practices and instructions for specific fire alarm equipment should be obtained from the manufacturer.
Substantiation: The fine print note should be revised. The ANSI/NECA standard is general in nature and is intended for any and all fire alarm systems. As a result, it is not specific enough to be helpful for the installer on any given system. We are fortunate to have numerous manufacturers in the marketplace which publish high quality installation instructions, technical notes and diagrams specific to their particular product. In the interest of safety and quality, the user of the code should be directed to the most accurate and most up-to-date information. This information should be orientated to the brand system that is being installed. The user should not be misdirected to general information.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 3-228. Section 110.3(B) already covers installation instructions of listed equipment. Installation practices are already provided in the NEC.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 11 Negative: 2
Explanation of Negative:
AYER, L.: See my explanation of negative vote on Proposal 3-228.
CASPARRO, P.: See my explanation of negative vote on Proposal 3-228.

3-230 Log #2981 NEC-P03 **Final Action: Reject**
(760.8, FPN 2 (New))

Submitter: Robert Konnik, Rockbestos-Suprenant
Recommendation: Add text to read as follows:
<u>FPN No 2: Fire alarm circuit integrity cables require special precautions of installation to maintain circuit integrity ratings. UL Guide information for category FHIT contains information on proper installation requirements to maintain the fire rating, including raceway support, vertical support testing of boxes, compatibility of pulling lubricants and ground wires, and whether splices are allowable.</u>
Substantiation: There has been some confusion on installation of circuit integrity cables to maintain fire ratings. UL Guide information has been updated to provide useful information to clarify installation requirements.
Panel Meeting Action: Reject
Panel Statement: There are many more requirements located in category FHIT covering electrical circuit protective systems than have been proposed, but there are multiple UL standards for listing of this cable. UL 2196 provides testing requirements for fire-resistive cables and Subject 1724 provides the outline of investigation for fire-protective systems. This information is more appropriate for Annex A, since the user will be provided with both the outline of investigation reference number as well as the UL standard for testing these cables. The information provided by this proposal may be good information for the NEC Handbook.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
EGESDAL, S.: See my Explanation of Negative for Proposal 3-214.

3-231 Log #896 NEC-P03 **Final Action: Accept**
(760.9)

Submitter: Noel Williams, Noel Williams Consulting
Recommendation: Delete 760.9 entirely.
Substantiation: Most similar statements were deleted in the last code cycle. This section was left even though it adds no additional information or requirements - making it completely redundant. Most fire alarm equipment and circuits are not required to be grounded [per 250.112(I)], but that fact is obscured by this section.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
EGESDAL, S.: While the present text is a violation of the NEC Style Manual, it seems reasonable to provide NEC users a clue that grounding rules may or may not apply to Article 760 circuits. Deletion of the 760.9 creates a conflict with Table 250.3, which points to 760.9.

3-232 Log #3023 NEC-P03 **Final Action: Reject**
(760.10)

Submitter: Barry F. O'Connell, Tyco Thermal Controls
Recommendation: Add to 760.10:
760.10 Fire Alarm Circuit Identification.
Fire alarm circuits shall be identified at terminal and junction locations, in a manner that will prevent unintentional interference with the signaling circuit during testing and servicing. <u>Raceways containing survivable circuits shall also be identified to facilitate inspection.</u>
Substantiation: Survivable circuits in fire alarm systems are not consistently inspected for compliance with the requirements in NFPA 72. The reason for this is that in many cases the onus for inspection rests with the fire department, who may inspect functionality, but not wiring; while the Electrical Inspector often will not inspect the fire alarm wiring given that the system is inspected by the fire department.
Panel Meeting Action: Reject
Panel Statement: The issue in this section is to ensure that the fire alarm circuits are identified at terminals and at junction locations so maintenance personnel are not required to disconnect fire alarm circuits to determine the function of the circuits and, in doing so, inadvertently cause problems with the fire alarm. There are several different methods for ensuring survivability for fire alarm circuits. One of the methods is to install these conductors in a metal raceway and by routing the raceway through a particular area of a building. Requiring identification of these raceways based on the survivability required in NFPA 72, the National Fire Alarm Code, would be difficult at best, if not impossible. Knowledgeable fire alarm inspectors, using NFPA 72, should be able to make the determination how these circuits must be installed to meet the survivability requirements in NFPA 72.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 11 Negative: 2
Explanation of Negative:
CASPARRO, P.: The panel statement correctly points out that the proposal is trying to eliminate inadvertent problems with the Fire Alarm circuit. But, the statement that the enforcement would be next to impossible is a little far fetched. The marking of the conduits would actually make it very easy for the inspector to identify the raceway without the need for close proximity. Also, fire alarm inspectors do not usually check for wiring issues, this is usually left to the electrical inspector so should be included in the NEC.
EGESDAL, S.: See my Explanation of Negative for Proposal 3-234.

3-233 Log #3251 NEC-P03 **Final Action: Reject**
(760.10)

Submitter: David Filipiak, Sky Electric, Inc.
Recommendation: Add text to read as follows:
...shall be identified at terminal, <u>junction and pull</u> locations in a manner... testing and servicing.
Identification shall be by permanent marking with the color red at terminal, junction and, pull locations.
Substantiation: Pull locations are points of conduit intersections and are referenced in Article 314.
How identification is to be accomplished is not defined and a hand written note on a napkin would satisfy the code as it is currently written. The color red is universal with fire alarms and associated equipment.
Panel Meeting Action: Reject
Panel Statement: The issue in this section is to ensure that the fire alarm circuits are identified at terminals and at junction locations. The intent of the section is not to paint the connections red, but to provide actual identification at the terminals for ease of troubleshooting. Identifying conductors in a pull box where there are no terminations is not necessary since the purpose of the identification is to ensure ease of troubleshooting at terminal points.

Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-234 Log #3287 NEC-P03 **Final Action: Reject**
(760.10)

Submitter: Sanford Egesdal, Egesdal Associates PLC
Recommendation: Revise 760.10, as shown.

760.10 Fire Alarm Circuit Identification and Marking .

(A) Circuit Identification. Fire alarm circuits shall be identified at terminal and junction locations ~~in a manner that wil~~ l to prevent unintentional ~~interference with the signaling circuit~~ faults on initiating device(IDC), notification appliance (NAC), and signaling line (SLC) circuits during testing and servicing.

(B) Circuit Marking. Initiating device (IDC), notification appliance (NAC), and signaling line (SLC) circuits shall be marked with tags or other appropriate means as follows: IDC, NAC, or SLC

FPN: Additional marking; if used; shall indicate the style of circuit (Class A or Class B) with the suffix letter "-A" or "-B".

Substantiation: The proposed marking provides specific instructions to the installer on how to provide critical fire alarm circuit identification and marking. In the fire alarm industry, the terms IDC, NAC, and SLC are commonly used, and coincide with text in the National Fire Alarm Code, NFPA 72-2002.

Panel Meeting Action: Reject

Panel Statement: The issue in this section is to ensure that the fire alarm circuits are identified at terminals and at junction locations so maintenance personnel are not required to disconnect fire alarm circuits to determine the function of the circuits and, in doing so, inadvertently cause problems with the fire alarm. Circuit identification can be accomplished by a variety of different methods, obviously tagging being one method but color-coding of the circuit conductors can be another method. Specific methods of identification should be limited to the requirements in NFPA 72 or the local facility. Many facilities have their own method for identification of initiating device circuits and notification appliance circuits. For example, a facility may require all pull stations be installed on a particular zone for all their buildings with a particular wire color for the pull station wiring and different colored wire for the smoke detectors. The fine print note contains mandatory text and is unnecessary, since this information is already contained in NFPA 72, which must be used in conjunction with the NEC for any fire alarm installation.

Number Eligible to Vote: 13
Ballot Results: Affirmative: 11 Negative: 2
Explanation of Negative:

CASPARRO, P.: The panel statement says that circuit identification can be accomplished in a variety of methods, but this does not address the problem that is being pointed out by the proposal. If the scenario that is spelled out in the panel statement were used, the installer still would not have any way to identify exactly what type of circuit that exists in a junction box without prior knowledge of the specific facilities protocol as to identification of fire alarm circuits.

EGESDAL, S.: It is important to provide detailed and accurate identification of fire alarm circuits. Fire alarm circuits are permitted to be installed with circuits of other systems. If the fire alarm circuits are identified as requried in the proposal, inadvertent interruption of fire alarm service is minimized. Also, for systems additions or changes, as well as testing and servicing, detailed identification of circuits helps assure protection of life and property.
Many buildings do not have responsible staff in proximity of the fire alarm panel on a 24/7 basis. Even though a fire alarm panel will detect an inadvertent open circuit or ground fault, the trougle signal may go unnoticed for an unknown period of time.

3-235 Log #1202 NEC-P03 **Final Action: Reject**
(760.11)

Submitter: Merton W. Bunker, Jr., Ivan Rockwell, US Department of State
Recommendation: Add the following as a new last sentence to 760.11:

"Copper conductors run aerially or underground between buildings shall be protected with primary protection in accordance with Article 800."

Substantiation: The reference to 800.50 is not clear nor is it well enforced in the field and Article 225 does not require primary protection. A lightning strike raises ground plane potential sufficiently to cause severe damage unless primary protection is installed. This change makes it clear that protection is needed in all cases.

Panel Meeting Action: Reject

Panel Statement: Adding this sentence to 760.11 for power-limited fire alarm circuits is unnecessary since the section's reference to Part III of Article 800 would already require primary protectors in accordance with 800.90. Non-power-limited fire alarm circuits would be treated the same as branch circuits in accordance with Part I of Article 225 with the output voltage not greater than 600 volts. Primary and secondary protectors are rated to protect communications circuits (low voltages) against exposure to line voltages, so protectors are not rated for connection to non-power-limited circuits. The submitter has referenced an entire article, which is not permitted by Section 4.1.1 of the NEC Style Manual.

Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-236 Log #3596 NEC-P03 **Final Action: Reject**
(760.12 (New))

Submitter: Robert Hagarty, RANDL Industries, Inc.
Recommendation: Add new text to read:

760.12 Device or Equipment Fill. Where fire alarm devices or equipment are installed in outlet or device boxes their volume shall be deducted from the box volume and shall not be greater than 35 percent of the box volume. the remaining volume will be used to calculate the number of conductors in accordance with Table 314.16(B).

Substantiation: Observation

The proposed code changes are necessary to meet the intent of NEC 314.16 where it states:

Boxes shall be of sufficient size to provide free space for all enclosed conductors.

It has been observed repeatedly during 12 years tracking projects that for many modern devices the required free space is not available for conductors in the device box.

Goal

Demonstrate mathematically that a code change is necessary and essential to meet the intent of the code for box fill when using modern devices and equipment.

Problem and Solution

The volume allowance for device(s) and equipment in electrical boxes that is based upon the largest size of conductor terminated to the device(s) or equipment does not achieve the conductor free space required in Table 314.16(B) when modern devices and equipment that are larger than traditional receptacles and switches are installed.

The proposed method is based upon the actual device and equipment volume. Research indicates 35 percent of box fill for devices and equipment provides adequate free space for conductors.

To calculate box fill using this proposed method:

1. Check the volume of the device or equipment and deduct that volume from the box volume and verify it is no more than 35 percent of the box volume.

2. The remaining volume is then used to determine the maximum number of conductors allowable per Table 314.16(B).

Mathematical Demonstration

The representative few examples below are actual and commonly used in industry today.

Example A – Fire Alarm Device

1. Current Code: When a 13 in. 3 device is installed in a 21 in 3 box as specified by the manufacturer the device fills 62 percent of the box volume and leaves only 8 in. 3 of space for conductors. Per existing code 10 #14 AWG conductors may be installed in this box less 2 conductors for a double volume allowance terminated on the device per 314.16(B)(4). Thus 8 conductors in 8 in. 3 of free space yields a ratio of 1.0 in. 3 of free space per conductor. This is only 50 percent of the free space required by Table 314.16(B).

2. Proposed Code. A 13 in. 3 device wold require a minimum of 37 in. 3 at 35 percent fill. 37 less 13 equals 24 in. 3 free space available for up to 12 #14 AWG conductors with 2.0 in. 3 of free space for each conductor, thus meeting the 2.0 in. 3 requirement of Table 314.16(B).

Example B – Fire Alarm Device

1. Current Code: When a 14 in. 3 device is installed in a 30 in. 3 box as specified by the manufacturer the device fills 47 percent of the box volume and leaves only 16 in. 3 of free space for conductors. Per existing code 15 #14 AWG conductors may be installed in this box less 2 conductors for a double volume allowance terminated on the device per 314.16(B)(4). Thus, 13 conductors in 16 in. 3 of free space yields a ratio of 1.23 in. 3 of free space per conductor. This is only 62 percent of the free space required by Table 314.16(B).

2. Proposed Code: A 14 in. 3 device would require a minimum of 40 in. 3 at 35 percent fill. 40 less 14 equals 26 in. 3 free space available for up to 13 #14 AWG conductors with 2.0 in. 3 free space for each conductor, thus meeting the 2.0 in. 3 requirements of Table 314.16(B).

Example C – Fire Alarm Device

1. Current Code: When a 27 in. 3 device is installed in a 51 in.3 box it consumes 53 percent of the box volume and leaves 24 in. 3 of space for conductors. Per existing Code 25 #14 AWG conductors may be installed in this box less 2 conductors for a double volume allowance terminated on the device per 314.16(B)(4). thus 23 conductors in 24 in. 3 of free space yields a ratio of 1.04 in. 3 of free space per conductor. This is only 52 percent of the free space required by Table 314.16(B).

2. Some suggest a quadruple conductor allowance to resolve this problem. If we install a 27 in. 3 device in a 51 in. 3 box existing code allows 25 #14 AWG conductors less 4 conductors still leaving 21 conductors. The device only requires 8 conductors; therefore a quadruple deduction has no real impact. The only thing that does alleviate these problems is limiting the volume that a device or equipment may consume in a box.

Response to Alternatives

1. If a box has conductors only and the maximum fill by actual volume of those conductors does not exceed 5 percent, why would we then allow a device to fill 65 percent the box volume and yet only reduce the number of conductors

by two? Why not fill a conductor only box up to 65 percent? The hazards become very obvious and so should the hazards of allowing devices and equipment with this same level of fill.

2. Some suggest a quadruple conductor allowance to resolve this problem. If we install a 27 in. 3 device in a 51 in. 3 box existing code allows 25 #14 AWG conductors less 4 conductors, still leaving 21 conductors. The device only requires 8 conductors; therefore a quadruple deduction has no real impact. The only thing that does alleviate these problems is limiting the volume that a device or equipment may consume in a box.

Impact of Proposed Code Change

The previous cycle of the code making panel expressed concern that manufacturers may be forced to stop making some products and be forced out of business. Our research indicates that this is unlikely because a larger box size is all that will be required for a product to meet the revised code. More importantly, these products will be installed more safely and with fewer wiring problems. As a result, even with the marginal cost increase for larger boxes, the overall costs will be less due to reduced installation and troubleshooting time.

It is our contention that if implemented the industry will see a marked decrease in the number of box related fires and fire related injuries and equipment damage.

Conclusion

The mathematical calculations using actual modern device volumes and the existing code fill allowances demonstrate unequivocally that the proposed code change is necessary to meet the spirit and safety intent of the code.

Panel Meeting Action: Reject

Panel Statement: The submitter provided very impressive mathematical calculations in his substantiation but did not provide actual fire alarm device dimensions to provide real box fill examples. Smoke detectors, for instance, have very small, if any, box intrusion, whereas pull stations have slightly more box intrusion. The dimensions provided in the mathematical demonstration portion of the substantiation only related to fictitious “fire alarm devices.” One volume deduction may not be reflective for all fire alarm devices, since some have more box intrusion than others.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-237 Log #3286 NEC-P03 **Final Action: Reject**
(760.15)

Submitter: Sanford Egesdal, Egesdal Associates PLC

Recommendation: Revise 760.15, as shown:

760.15 Fire Alarm Circuit Requirements.

Fire alarm circuits shall comply with 760.15(A) and 760.15(B).

(A) Non–Power-Limited Fire Alarm (NPLFA) Circuits. See Parts I and II.

(B) Power-Limited Fire Alarm (PLFA) Circuits. See Parts I and III.

FPN to (A) and (B): Fire alarm wiring methodology for installing Class A and Class B fire alarm circuits can be found in NFPA 72, National Fire Alarm Code.

Substantiation: Class A and Class B wiring methodology is not addressed in the NEC and it will be helpful to provide guidance for installers on where to go to find that information. This will go a long way towards improving quality of fire alarm installations. Job issues exist today because installers are not using NFPA 72 for application specific wiring requirements. This will be similar to directing individuals to Article 250 for grounding requirements.

Panel Meeting Action: Reject

Panel Statement: Section 760.1 already has a fine print note that states for further information on the installation and monitoring for integrity requirements in fire alarm systems, refer the reader to NFPA 72. As involved as fire alarm system wiring is for modern fire protection, understanding the fire alarm system performance and integrity requirements for Class and style is very important but is more complex than can be provided in a fine print note in the NEC.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

Explanation of Negative:

EGESDAL, S.: See my Explanation of Negative for Proposal 3-234. Additionally, Class A circuits have physical separation installation requirements. Unless the system designer and installer is alerted, the outbound and inbound fire alarm circuit conductors may be installed in the same cable or raceway, thereby defeating the purpose of requiring a Class A circuit. NFPA 72, National Fire Alarm Code is not directly adopted in many jurisdictions. It is imperative that the NEC “assist” the fire alarm industry by providing guidance on key fire alarm system functionality.

3-238 Log #2651 NEC-P03 **Final Action: Reject**
(760.16)

Submitter: Robert W. Jensen, dbi / Rep. BICSI, A Telecommunications Association

Recommendation: Move to a new section:

760.16 Abandoned Cables. The accessible portion of abandoned fire alarm cables shall be removed.

Remove wording in 760.3(A) “The accessible portion of abandoned fire alarm cables shall be removed.”

Substantiation: The title of Section 760.3 is “Other Articles”. The requirement for the removal of abandoned cables is not in another article; it is in Article 760. It is out of place in section 760.3. This proposal will move it to a new section of Article 760.

Panel Meeting Action: Reject

Panel Statement: The concern of 300.21 is the spread of fire and products of combustion in hollow spaces, vertical shafts, and ventilation and air-handling ducts caused by electrical installations. Removing the accessible portion of the cable seems to fit very well within 300.21 and should remain in Section 760.3(A) as a means of reducing unnecessary electrical products in these areas. Location of the requirement would mean that the requirement would apply more extensively than is currently required.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 11 Negative: 2

Explanation of Negative:

CASPARRO, P.: The last sentence of the panel statement states that if accepted “...the requirement would apply more extensively than is currently required.” I think this is exactly what needs to happen because cables that are not in an area designated by 300.21 are being left abandoned in the rest of the building. While one abandoned cable left in a building poses no real threat; several hundred or even more certainly does add some unintended fire load to the building.

EGESDAL, S.: See my Explanation of Negative for Proposal 3-219.

3-239 Log #1909 NEC-P03 **Final Action: Accept**
(760.21)

Submitter: James W. Carpenter, International Association of Electrical Inspectors

Recommendation: Revise 760.21 to read as follows:

760.21 NPLFA Circuit Power Source Requirements.

(A) Power Source. The power source of non-power-limited fire alarm circuits shall comply with Chapters 1 through 4, and the output voltage shall not be more than 600 volts, nominal.

(B) Branch Circuit. An individual branch circuit shall be required for the supply of the power source. This branch circuit ~~These circuits~~ shall not be supplied through ground-fault circuit interrupters or arc-fault circuit interrupters.

FPN: See 210.8(A)(5), Exception No. 3, for receptacles in dwelling-unit unfinished basements that supply power for fire alarm systems.

Substantiation: This revision editorially splits up the paragraph and adds titles. The technical revision is to bring the requirements into alignment with NFPA 72, 4.4.1.4.1 which requires a dedicated branch circuit to supply the fire alarm power supply. The addition to the NEC will make it known what the proper circuit configuration is for the fire alarm supply. In addition, the term “individual branch circuit” is proposed to make the language consistent with the NEC definitions.

Panel Meeting Action: Accept

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-240 Log #1201 NEC-P03 **Final Action: Accept**
(760.25)

Submitter: Merton W. Bunker, Jr., Ivan Rockwell, US Department of State

Recommendation: Add the following reference to 300.7 as follows:

“...110.3(B), 300.7 , 300.11...”.

Substantiation: Conduit installed in humid climates is often routed through air-conditioned spaces, which causes condensation in the conduit and equipment. This condensation has caused damage and failure of fire alarm systems on a frequent basis. A specific reference to 300.7 would remedy this problem

Panel Meeting Action: Accept

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-241 Log #904 NEC-P03 **Final Action: Reject**
(760.25 Exception No. 2)

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Revise text to read as follows:

Where other articles of this Code require or permit other methods.

Substantiation: Edit. Overhead open wiring is permitted between buildings and structures as permitted in Article 225 and 553.13(B) and wiring methods of 553.13(A)(2) are permitted, but not required.

Panel Meeting Action: Reject

Panel Statement: The provisions of Article 225 are requirements for outside branch circuits and feeders and are not primarily permissive type rules but rather are mandatory rules when these circuits are installed outside a building. The other two references provided in the substantiation do not exist.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-242 Log #369 NEC-P03 **Final Action: Reject**
(760.30(A)(1))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise text as follows:
Where installed exposed, cables shall be adequately supported and installed in such a way that maximum protection against ~~physical~~ damage is afforded by building construction such as baseboards, door frames, ledges, and so forth.
Substantiation: Use of the word "physical" is superfluous–the intent is obvious given the context. (I leave it to the CMP whether you want to get more specific naming some source of damage such as "blows or abrasion.")
Submitting proposals removing the adjective "physical" may strike people as about as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every unnecessary instance, as I am attempting to do, we actually cut the NEC down by up to oh, maybe a quarter-page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the unneeded use of "physical" not only is poor writing–look at William Zinsser's classic, On Writing Well–but is silly, and reflects a bit poorly on the Code process. When references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."
Panel Meeting Action: Reject

Ballot Results: Affirmative: 13

3-243 Log #2372 NEC-P03 **Final Action: Reject**
(760.30(B)(2), FPN)

Submitter: Allen C. Weidman, The Society of the Plastics Industry, Inc.
Recommendation: Add the following Fine Print Note to 760.30(B)(2).
<u>FPN: See 8.14.1 of NFPA 13-2002, *Installation of Sprinkler Systems* , for requirements for sprinklers in concealed spaces containing exposed combustibles.</u>
Substantiation: The Fine Print Note provides guidance to system designers, installers, and code officials. Over the past few decades, there has been a significant increase in the quantity of combustible cables installed in concealed spaces (hollow spaces and HVAC system spaces).
NFPA 13, Installation of Sprinkler Systems, requires installation of a sprinkler system where combustible loading is present. Because other NFPA documents reference NFPA 13, it is important for correlation for the NEC to include a pointer to NFPA 13. The following requirements are from NFPA 13-2002:
"8.14.1.5 Localized Protection of Exposed Combustible Construction or Exposed Combustibles. In concealed spaces having exposed combustible construction, or containing exposed combustibles, in localized areas, the combustibles shall be protected as follows:
(1) If the exposed combustibles are in the vertical partitions or walls around all or a portion of the enclosure, a single row of sprinklers spaced not over 12 ft (3.7 m) apart nor more than 6 ft (1.8 m) from the inside of the partition shall be permitted to protect the surface. The first and last sprinklers in such a row shall not be over 5 ft (1.5 m) from the ends of the partitions.
(2) If the exposed combustibles are in the horizontal plane, the area of the combustibles shall be permitted to be protected with sprinklers on a light hazard spacing. Additional sprinklers shall be installed no more than 6 ft (1.8 m) outside the outline of the area and not more than 12 ft (1.8 m) on center along the outline. When the outline returns to a wall or other obstruction, the last sprinkler shall not be more than 6 ft (1.8 m) from the wall or obstruction."
"8.14.1.2.1 Noncombustible and limited combustible concealed spaces with no combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum."
The definition of combustible, from NFPA 5000 is:
"3.3.340.2 Combustible (Material). A material that, in the form in which it is used and under the conditions anticipated, will ignite and burn; a material that does not meet the definition of noncombustible or limited-combustible."
During the 2005 NEC code cycle, the proposed Fine Print Note was added to 800.154(A). Because Type CMP cable is permitted to substitute for Type CL2P and Type CL3P cables, it is important to have parallel requirements in both NEC Sections.
In July of 2004, an appeal to the NFPA Standards Council requested deletion of the Fine Print Note to 800.154(A), prior to publication of the 2005 NEC. The appeal was denied in Standards Council Decision 04-7-1-z-cc, copy provided.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The definition for "concealed" in Article 100 in the 2005 NEC does not apply to the proposed fine print note. The area above a suspended ceiling is not considered by the NEC to be a concealed space. The definition of concealed does not exist in NFPA 13, but they allude to the area above a drop ceiling as being concealed which does not match the definition used in Article 100. The reference to NFPA 13 does not seem appropriate in 760.30(B)(2) at this time, since putting a sprinkler head in an inaccessible location inside the wall or above a drywall ceiling would not permit access for servicing.

Submitter: Gerald Lee Dorna, Belden CDT. Inc.

Recommendation: Revise text to read:

760.56 Installation of Conductors of Different PLFA Circuits, Class 2, Class 3, and Communications Circuits in the Same Cable, Enclosure, <u>Cable Tray</u> or Raceway.

(A) Two or More PLFA Circuits. Cable and conductors of two or more power-limited fire alarm circuits, communications circuits, or Class 3 circuits shall be permitted within the same cable, enclosure, <u>cable tray</u> or raceway.

(B) Class 2 Circuits with PLFA Circuits. Conductors of one or more Class 2 circuits shall be permitted within the same cable, enclosure, <u>cable tray</u> or raceway with conductors of power-limited fire alarm circuits, provided that the insulation of the Class 2 circuit conductors in the cable, enclosure, or raceway is at least that required by the power-limited fire alarm circuits.

(C) Low-Power Network-Powered Broadband Communications Cables and PLFA Cables. Low-power network-powered broadband communications circuits shall be permitted in the same enclosure <u>, cable tray</u> or raceway with PLFA cables.

(D) Audio System Circuits and PLFA Circuits. Audio system circuits described in 640.9(C) and installed using Class 2 or Class 3 wiring methods in compliance with 725.54 and 725.61 shall not be permitted to be installed in the same cable <u>, cable tray,</u> or raceway with power-limited conductors or cables.

Substantiation: Obviously, cables that can be safely installed in the same raceway or enclosure can also be safely installed in the same cable tray. Stating that these cables are allowed "in the same cable tray" will avoid having the user assume that they are not permitted to be installed together in the same cable tray. It clarifies the use in the Code. Article 770, in section 770.133(B), has text similar to that proposed here. This is one of five similar proposals that are being submitted for Articles 725, 760, 800, 820 and 830.

Conversely thinking, I therefore also added "cable tray" to 760.56(D).

Panel Meeting Action: Accept

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

Comment on Affirmative:

SANDERS, M.: IEEE agrees that all cables listed for the application should be allowed to be installed in cable trays under 650.56(A), (B), and (C). IEEE further agrees that adding "cable trays" to 760.56(D) is necessary and will then prevent installation of Audio System Circuits and PLFA Circuits within the same cable trays.

However, IEEE disagrees with the submitter's assertion, "Obviously, cables that can be safely installed in the same raceway or enclosure can also be safely installed in the same cable tray."

Only cable listed for installation in cable trays can be installed in cable trays.

3-249 Log #1837 NEC-P03 **Final Action: Reject**

(760.56(D))

Submitter: Mark T. Rochon, Mark J. Rochon Master Electrician

Recommendation: Revise as follows:

(D) Audio system circuits described in 640.9(C) and installed using Class 2 or Class 3 wiring methods in compliance with 725.4 and 725.61 shall not be permitted to be installed on the same cable or raceway with power-limited connections or cables. <u>Separation in enclosures shall be required by dividers or equivalent.</u>

Substantiation: The same requirement is needed for protection of terminal boxes, enclosures, and the like. Same dangers are present in cables or raceways.

Panel Meeting Action: Reject

Panel Statement: The reason for restricting power-limited fire alarm circuits from being in the same cable or raceway with audio circuits is the possibility of power noise inductively coupling into the audio circuit and affecting fire alarm audio communication circuits used for emergency evacuation. The small amount of exposure within a box or an enclosure is negligible.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-250 Log #2524 NEC-P03 **Final Action: Reject**

(760.61)

Submitter: Sanford Egesdal, Egesdal Associates PLC

Recommendation: Add the following sentence to 760.61, to read as follows:

PLFA cables shall comply with the requirements described in either 760.61(A), (B), or (C) or where cable substitutions are made as shown in 760.61(D). <u>Type FPL50 fire alarm very-low-smoke cable shall be permitted to be installed meet requirements for very-low-smoke producing characteristics, low potential heat release, and low flame spread characteristics.</u>

Substantiation: NFPA 13-2002 has requirements for installation of sprinklers where a concealed space has combustible loading. The proposed very-low-smoke producing cable has a heat release that is significantly lower than combustible plenum cable listed using NFPA 262-2002, *Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces* .

The 2003 International Mechanical Code (IMC), 602.2.1 requires a smoke developed index less than 25 and a smoke developed index less than 50 for materials in plenums.

The Fine Print Note provides guidance to system designers, installers, and code officials. Over the past few decades, there has been a significant increase in the quantity of combustible cables installed in concealed spaces (hollow spaces and HVAC system spaces).

NFPA 13-2002, Installation of Sprinkler Systems, requires installation of a sprinkler system in concealed spaces where combustible loading is present. Because other NFPA documents reference NFPA 13, it is important for correlation for the NEC to include a pointer to NFPA 13. The following requirements are from NFPA 13-2002:

"8.14.1.5 Localized Protection of Exposed Combustible Construction or Exposed Combustibles. In concealed spaces having exposed combustible construction, or containing exposed combustibles, in localized areas, the combustibles shall be protected as follows:

(1) If the exposed combustibles are in the vertical partitions or walls around all or a portion of the enclosure, a single row of sprinklers spaced not over 12 ft (3.7 m) apart nor more than 6 ft (1.8 m) from the inside of the partition shall be permitted to protect the surface. The first and last sprinklers in such a row shall not be over 5 ft (1.5 m) from the ends of the partitions.

(2) If the exposed combustibles are in the horizontal plane, the area of the combustibles shall be permitted to be protected with sprinklers on a light hazard spacing. Additional sprinklers shall be installed no more than 6 ft (1.8 m) outside the outline of the area and not more than 12 ft (1.8 m) on center along the outline. When the outline returns to a wall or other obstruction, the last sprinkler shall not be more than 6 ft (1.8 m) from the wall or obstruction."

"8.14.1.2.1 Noncombustible and limited combustible concealed spaces with no combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum."

The definition of combustible, from NFPA 5000 is:

"3.3.340.2 Combustible (Material). A material that, in the form in which it is used and under the conditions anticipated, will ignite and burn; a material that does not meet the definition of noncombustible or limited-combustible."

During the 2005 NEC code cycle, the proposed Fine Print Note was added to 800.154(A). Because communications cables are permitted to substitute for Class 2 and Class 3 circuit cables, it is important to have parallel requirements in both NEC Sections. Additionally, the Fine Print Note applies to all concealed spaces.

In July of 2004, an appeal to the NFPA Standards Council requested deletion of the Fine Print Note to 800.154(A), prior to publication of the 2005 NEC. The appeal was denied.

There is a companion proposal for the listing and marking of Type FPL50.

Panel Meeting Action: Reject

Panel Statement: See panel statement on Proposal 3-171.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

Comment on Affirmative:

EGESDAL, S.: As submitter of this proposal, I agree with the part of the Panel Statement indicating the proposed text would have been more appropriate in another section, such as 760.61(C), Other Wiring Within Buildings.

However, the Panel is in error by stating that the proposed Type FPL50 could be used in a plenum. Section 760.61(A) requires a Type FPLP cable. The proposed cable does not have a "P" in the marking. So, clearly, referencing the NFPA 90A directive on NFPA 90A is in error.

3-251 Log #2199 NEC-P03 **Final Action: Reject**
(760.61,760.82)

Submitter: Frank Peri, Communications Design Corporation

Recommendation: In 760.61 revise and re-letter the existing section (A) to (B) and introduce a new (A) as shown below. Also revise (I) as shown below. Re-letter the remaining sections, (B) to (C), (C) to (D) etc.

(A)Air Ducts. Cables installed in air ducts shall be Type FPLD and shall be associated with the air distribution system and shall be as short as practicable. Types FPLD, FPLP and FPL cables installed in raceway that is installed in compliance with 300.22(B) shall also be permitted.

(B~~A~~) Plenum. Cables installed in ~~ducts,~~ plenums~~,~~ and other space~~s~~ used for environmental air shall be Type FPLD or FPLP. Types FPLD, FPLP, FPLR, and FPL cables installed in compliance with 300.22 shall be permitted. Types FPLD-CI and FPLP-CI cables shall be permitted to be installed to provide a 2-hour circuit integrity rated cable.

(E~~D~~) Fire Alarm Cable Substitutions. The substitutions for fire alarm cables listed in Table 760.61 shall be permitted. Where substitute cables are installed, the wiring requirements of Article 760, Parts I and III shall apply.

FPN: For information on communications cables (CMD, CMP, CMR, CMG, CM), see 800.179.

Table 760.61 Cable Substitutions

Cable Type	References	Permitted Substitutions
FPLP	760.61(A)	CMD, CMP
FPLR	760.61(B)	CMD, CMP, FPLP, CMR
FPL	760.61(C)	CMD, CMP, FPLP, CMR, FPLR, CMG, CM

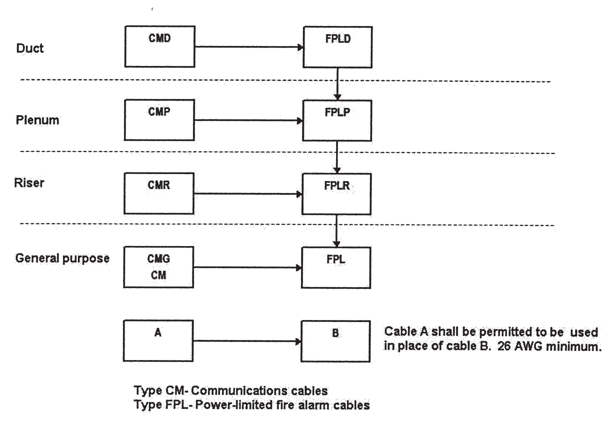

Figure 760-61 Cable substitution hierarchy.

In 760.82 revise and re-letter the existing section (D) to (E) and introduce a new (D) as shown below. Revise section (I) as show. Re-letter the remaining sections, (E) to (F), (F) to (G) etc.

(D)Types CL2D and CL3D. Type FPLD power-limited fire alarm air duct cable shall be listed as suitable for use in air ducts and shall be rated for continuous use at 121ºC. Type FPLD power-limited fire alarm air duct cable shall also be listed as having a low potential heat value, low flame spread characteristics, and very low smoke-producing characteristics.

FPN: One method of defining a low potential heat cable is establishing an acceptable value of potential heat when tested in accordance with NFPA 259, *Standard Test Method for Potential Heat of Building Materials*, to a maximum potential heat value not exceeding 8141 kJ/kg (3500 BTU/lb). One method of defining low flame spread cable is establishing an acceptable value of flame spread when tested in accordance with NFPA 255, *Standard Method of Test of Surface Burning Characteristics of Building Materials*, to a maximum flame spread index of 25, with the cable unslit (intact) and slit. Similarly, one method of defining very low smoke-producing cable is establishing an acceptable value when tested in accordance with NFPA 255, *Standard Method of Test of Surface Burning Characteristics of Building Materials*, to maximum smoke developed index of 50, with the cable unslit (intact) and slit. These test methods and resultant values correlate with the requirements of NFPA 90A-2002, *Standard for the Installation of Air-Conditioning and Ventilating Systems* for materials installed in ducts and plenums. *For additional testing information see Underwriters Laboratories Subject 2424, Outline of Investigation For Cable Marked Limited Combustible.*

(E~~D~~) Type FPLP. Type FPLP power-limited fire alarm plenum cable shall be listed as being suitable for use in ~~ducts,~~ plenums~~,~~ and other space used for environmental air and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.

FPN: One method of defining low smoke-producing cable is by establishing an acceptable value of the smoke produced when tested in accordance with NFPA 262-2002, *Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces*, to a maximum peak optical density of 0.5 and a maximum average optical density of 0.15. Similarly, one method of defining fire-resistant cables is by establishing a maximum allowable flame travel distance of 1.52 m (5 ft) when tested in accordance with the same test.

(J~~I~~) Cable Marking. The cable shall be marked in accordance with Table 760.82(I). The voltage rating shall not be marked on the cable. Cables that are listed for circuit integrity shall be identified with the suffix CI as defined in 760.82(G).

FPN: Voltage ratings on cables may be misinterpreted to suggest that the cables may be suitable for Class 1, electric light, and power applications.

Exception: Voltage markings shall be permitted where the cable has multiple listings and voltage marking is required for one or more of the listings.

Table 760.82(I) Cable Markings	
Cable Marking	**Type**
FPLD	Power-limited fire air duct cable
FPLP	Power-limited fire alarm plenum cable
FPLR	Power-limited fire alarm riser cable
FPL	Power-limited fire alarm cable
Note: Cables identified in 760.82(D), (E), and (F) as meeting the requirements for circuit integrity shall have the additional classification using the suffix "CI" (for example, FPLD-CI, FPLP-CI, FPLR-CI, and FPL-CI).	

FPN: Cable types are listed in descending order of fire-resistance rating.

Substantiation: Summary

This proposal is submitted to accomplish four things:

1.) Change the code to not allow the dangerous practice of using air ducts as a cable pathway.

2.)Code recognition that there may be instances where a small amount of in-duct cable is necessary for air handling equipment, dampers, security, temperature control, fire protection, etc.

3.)Establish minimum requirements for flame spread, smoke, and potential heat for in-duct (CL2D, CL3D, FPLP, OFND, OFCD, CMD and CATVD) cables used in this special hazard space.

4.)Include air duct "D" cables as permissible substitute for plenum "P" cables for installation in ceiling cavity and raised floor plenums (other space used for environmental air).

This proposal correlates with a TIA that I submitted for NFPA 90A-2002, *Standard for the Installation of Air-Conditioning and Ventilating Systems.* Similar proposals have been submitted for Articles 725, 760, 770, 800 and 820.

The substantiation for the TIA is shown below:

"This TIA is being submitted in accordance with Section 5 of the *2005 NFPA REGULATIONS GOVERNING COMMITTEE PROJECTS.* In particular, it addresses a hazard meeting the criteria of section 5-2(d), which states:

(d) The proposed TIA intends to offer to the public a benefit that would lessen a recognized (known) hazard or ameliorate a continuing dangerous condition or situation.

The purpose of this TIA is to address the dangerous practice of installing combustible communications/data cables in air ducts.

NFPA 90A-2002 does not have explicit requirements for electrical wiring in air ducts. While there is a need for some limited amount of wiring in air ducts where the function of the wiring is associated with the function of the air handling system, use of air duct instead of an electrical raceway for routing wiring unassociated with the air handling system is a dangerous practice. It introduces unlimited quantities of combustible cable into an air handling system and thus unacceptability increases the potential for the spread of fire and smoke through the air distribution system.

This TIA would greatly reduce the amount of wiring in air ducts by only permitting wiring and raceways associated with the air distribution system and also requiring that they be as short as practicable. It would require that the wiring and nonmetallic raceway in the ducts have the appropriate temperature rating for hot air ducts; NFPA 90A permits the supplied air to be at 121° C (250 ° F). The permitted wiring and nonmetallic raceway would be required to have initial flame spread and smoke requirements identical to those for supplementary materials in an air duct (flame spread index =25, smoke developed index =50). In addition to these initial requirements, there are slitting and ageing requirements to assure that the cables installed in air ducts meet the flame spread, smoke and potential heat requirements equivalent to those for limited combustible materials. Essentially they would be required to be listed to the UL 2424.

Combustible plenum cable is unsuitable and dangerous for this application. Typically, combustible plenum cable has a temperature rating of 60° C, which is significantly less that the 121° C air permitted in the air duct. Furthermore, according to Fire Protection Research Foundation tests, these cables can have smoke developed index (SDI) of up to 850. This SDI is an order of magnitude greater than permitted for supplementary materials installed in an air duct.

It is essential that these requirements be adopted now in NFPA 90A."

Section 760.61(A) in the 2005 NEC permits unlimited amounts of Type FPLP cable in air ducts. While there is a need for some limited amount of wiring in air ducts where the function of the wiring is associated with the function of the air handling system, use of an air duct instead of an electrical raceway for routing wiring unassociated with the air handling system is a dangerous practice. It introduces unlimited quantities of combustible cables into an air handling system and thus unacceptability increases the potential for the spread of fire and smoke through the air distribution system.

This proposal would greatly reduce the amount of wiring in air ducts by only permitting wiring associated with the air duct and as short as practicable. It would require that the wiring in the ducts have the appropriate temperature rating for hot air ducts; NFPA 90A-2002, *Standard for the Installation of Air-Conditioning and Ventilating Systems*, permits the supplied air to be at 121° C (250° F). The permitted wiring would be required to have flame spread and smoke requirements identical to those in NFPA 90A-2002 section 4.3.3.1 for supplementary materials in an air duct (flame spread index =25, smoke developed index =50). Essentially they would be required to be listed to the UL 2424, *Outline of Investigation For Cable Marked Limited Combustible* (copy attached) .

"P" type plenum cables are unsuitable and dangerous for this application. Typically, they have a temperature rating of 60° C, which is significantly less that the 121° C air permitted in the air duct. Furthermore, according to Fire Protection Research Foundation tests (copy attached), these cables can have smoke developed index (SDI) of up to 850. This SDI is an order of magnitude greater than permitted for supplementary materials installed in an air duct.

"D" type air duct cables will meet the NFPA 90A listing requirements for use in ceiling cavity and raised floor plenums (other space used for environmental air) and therefore will be able to safely substitute for "P" type plenum cables. "D" type air duct cables have approximately 1/20 the smoke production of "P" type plenum cables.

In order to be consistent with the applications of plenum cable, this proposal will also prohibit the installation of plenum communications raceways in air ducts.

The cable substitution table and figure have been revised to permit air duct cables to substitute for plenum cables since air duct cables are superior cables. "D" type air duct cables also meet the requirements in NFPA 90A for use in ceiling cavity plenums and raised floor plenums (other space used for environmental air).

Some of the applications that require the installation of cables in air ducts are fire alarm (Article 760), temperature sensing and control (Article 725), security (Articles 725 and 820) and communications (Article 800). Optical fiber cables (Article 770) could be used in place of copper conductor cables. Communications cables are permitted to substitute for Class 2 & 3, fire alarm and CATV cables. I am submitting similar proposals for each of these articles.

Note: Supporting Material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: See panel statement on Proposal 3-252.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-252 Log #3234 NEC-P03 **Final Action: Reject**

(760.61(A))

Submitter: Frank Peri, Communications Design Corporation

Recommendation: Revise 760.61(A), as shown.

(A) Plenum. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type FPLD, or FPLP. Types FPLD, FPLP, FPLR, and FPL cables installed in compliance with 300.22 shall be permitted. Type FPLP-CI cable shall be permitted to be installed to provide a 2-hour circuit integrity rated cable.

Substantiation: The purpose of this proposal is to correlate with NFPA 5000-2006. NFPA 5000-2006, recently issued by the NFPA Standards Council, incorporates extracted plenum requirements from NFPA 90A-2002. Consequently, the plenum requirements in NFPA 5000-2006 are identical to the ceiling cavity plenum requirements in NFPA 90A-2002. This proposal provides listing requirements for a cable with characteristics that complies with the NFPA 90A-2002, 4.3.10.2.6: requirements for limited combustible materials exposed to the airflow. This proposal provides a listing and marking for a cable that complies with the NFPA 90A-2002, 4.3.10.2.6.1: a requirement for a listed limited combustible cable with a maximum smoke developed index of 50. The proposed cable meets the NFPA Standards Council's directive to not identify cable as "limited combustible," because it is not a building construction material. The cable name and listing requirements meets guidance from the NFPA Standards Council to identify cable characteristics in terms of flame spread index, smoke developed index, and potential heat release.

As compared to a combustible plenum cable that is listed using NFPA 262, air duct cable is a much "safer" cable. Air duct cable provides users with an opportunity to significantly reduce the potential hazard from smoke during a fire emergency. Additionally, the much lower potential heat release of air duct cable provides much lower combustible loading than found in combustible plenum cable listed using NFPA 262.

Air duct cables are available on the market today. Presently, there is air duct cable available to meet the plenum installation requirements in Articles 725, 760, 770, and 800. Unfortunately, the only marking available in the NEC is for a combustible plenum cable. The NEC decides what marking is permitted, and listing organizations correlate. That is, it would be inappropriate for a listing organization to mark cable with a "Type XXX" that is not published in the NEC.

Panel Meeting Action: Reject

Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"[S]o as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to

plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."
This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-253 Log #2375 NEC-P03 **Final Action: Reject**
(760.61(A), FPN)

Submitter: Allen C. Weidman, The Society of the Plastics Industry, Inc.
Recommendation: Add the following Fine Print Note to 760.61(A).
FPN: See 8.14.1 of NFPA 13-2002, *Installation of Sprinkler Systems* , for requirements for sprinklers in concealed spaces containing exposed combustibles.
Substantiation: The Fine Print Note provides guidance to system designers, installers, and code officials. Over the past few decades, there has been a significant increase in the quantity of combustible cables installed in concealed spaces (hollow spaces and HVAC system spaces).
NFPA 13, Installation of Sprinkler Systems, requires installation of a sprinkler system where combustible loading is present. Because other NFPA documents reference NFPA 13, it is important for correlation for the NEC to include a pointer to NFPA 13. The following requirements are from NFPA 13-2002:
"8.14.1.5 Localized Protection of Exposed Combustible Construction or Exposed Combustibles. In concealed spaces having exposed combustible construction, or containing exposed combustibles, in localized areas, the combustibles shall be protected as follows:
(1) If the exposed combustibles are in the vertical partitions or walls around all or a portion of the enclosure, a single row of sprinklers spaced not over 12 ft (3.7 m) apart nor more than 6 ft (1.8 m) from the inside of the partition shall be permitted to protect the surface. The first and last sprinklers in such a row shall not be over 5 ft (1.5 m) from the ends of the partitions.
(2) If the exposed combustibles are in the horizontal plane, the area of the combustibles shall be permitted to be protected with sprinklers on a light hazard spacing. Additional sprinklers shall be installed no more than 6 ft (1.8 m) outside the outline of the area and not more than 12 ft (1.8 m) on center along the outline. When the outline returns to a wall or other obstruction, the last sprinkler shall not be more than 6 ft (1.8 m) from the wall or obstruction."
"8.14.1.2.1 Noncombustible and limited combustible concealed spaces with no combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum."
The definition of combustible, from NFPA 5000 is:
"3.3.340.2 Combustible (Material). A material that, in the form in which it is used and under the conditions anticipated, will ignite and burn; a material that does not meet the definition of noncombustible or limited-combustible."
During the 2005 NEC code cycle, the proposed Fine Print Note was added to 800.154(A). Because Type CMP cable is permitted to substitute for Type CL2P and Type CL3P cables, it is important to have parallel requirements in both NEC Sections.
In July of 2004, an appeal to the NFPA Standards Council requested deletion of the Fine Print Note to 800.154(A), prior to publication of the 2005 NEC. The appeal was denied in Standards Council Decision 04-7-1-z-cc, copy provided.
Note: Supporting material is available for review at NFPA Headquarters.

(760.81(B)(1) (New))

Submitter: Robert Konnik, Rockbestos-Suprenant
Recommendation: Add text to read as follows:
(1) Wet Locations: Cable used in a wet locations shall be listed for use in wet locations or have a moisture impervious metal sheath.
Substantiation: Fire alarm cables, type NPLF is used outdoors (such between buildings per 760.11) or in wet locations. The new wording paraphrased from 310.8 clarifies that NPLF cable used in wet locations shall be listed for this use, or protected from the wet location by a moisture impervious metal sheath. UL has an optional listing for wet ratings of NPLF cable.
Panel Meeting Action: Accept in Principle
Add the following sentence at the end of the 760.81 main rule to read as follows:
Cable used in a wet location shall be listed for use in wet locations or have a moisture impervious metal sheath.

Panel Statement: The panel has accepted the recommendation but provided more appropriate direction for the location of this text.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-259 Log #3034 NEC-P03 **Final Action: Reject**
(760.81(C), FPN)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Recommendation: Revise text to read as follows:
760.81 Listing and Marking of NPLFA Cables.
Non–power-limited fire alarm cables installed as wiring within buildings shall be listed in accordance with 760.81(A) and 760.81(B) and as being resistant to the spread of fire in accordance with 760.81(C) through 760.81(F), and shall be marked in accordance with 760.81(G).
(A) NPLFA Conductor Materials. Conductors shall be 18 AWG or larger solid or stranded copper.
(B) Insulated Conductors. Insulated conductors shall be suitable for 600 volts. Insulated conductors 14 AWG and larger shall be one of the types listed in Table 310.13 or one that is identified for this use. Insulated conductors 18 AWG and 16 AWG shall be in accordance with 760.27.
(C) Type NPLFP. Type NPLFP non–power-limited fire alarm cable for use in other space used for environmental air shall be listed as being suitable for use in other space used for environmental air as described in 300.22(C) and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.
FPN: One method of defining a cable that is low smoke-producing cable and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces. ~~is by establishing an acceptable value of the smoke produced when tested in accordance with NFPA 262-1999, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces, to a maximum peak optical density of 0.5 and a maximum average optical density of 0.15. Similarly, one method of defining fire-resistant cables is by establishing a maximum allowable flame travel distance of 1.52 m (5 ft) when tested in accordance with the same test.~~
No change for 760.81 (D) through 760.81 (G)
Substantiation: This comment recommends a slight change in wording for the existing Fine Print Note, by recognizing that listing of plenum cable by NFPA 262 represents listing to both low smoke and low flame spread, and that cables cannot be listed separately to either property. This is basically an editorial change, as a clarification, to the existing Fine Print Note.
The same change is being proposed to the other corresponding Fine Print Note in article 760 and to that in article 725. The new language is consistent with the language in the corresponding fine print notes in articles 770, 800, 820 and 830, all of which deal with the same type of cables.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 3-252.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
GUIDA, T.: This proposal should have been accepted. With reference to the Panel Statement, this proposal does not change the “status quo” with regard to plenum cables. The proposal is essentially editorial. The proposed revised FPN actually aligns the wording of the FPN with the existing wording in NFPA 90A for cables in ceiling cavity and raised floor plenums.

3-260 Log #1421 NEC-P03 **Final Action: Accept**
(760.81(E) and 760.82(F) FPNs)

Submitter: Thomas J. Guida, Underwriters Laboratories Inc.
Recommendation: Revise text to read as follows:
FPN: One method of defining “resistant to the spread of fire” is that the cables do not spread fire to the top of the tray in the “ UL Flame Exposure , Vertical Tray Flame Test” in ~~ANSI/UL 1581-2001, Standard for Electrical Wires, Cables, and Flexible Cords~~ . UL 1685-2000 Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables. The smoke measurements in the test method are not applicable.
Another method of defining resistant to the spread of fire is for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing the CSA “Vertical Flame Test - Cables in Cable Trays,” as described in CSA C22.2 No. 0.3-M- ~~1985~~ 2001 , Test Methods for Electrical Wires and Cables.
Substantiation: The revised wording is an update of the standard references and not a change in the test methods. UL 1581 now references UL 1685 for the text of the test method.

(760.82(C))

Submitter: Allen C. Weidman, The Society of the Plastics Industry, Inc.
Recommendation: Revise 760.82(C) as follows:
(C) Ratings. The cable shall have a voltage rating of not less than 300 volts and a temperature rating of not less that 60ºC .

Substantiation: The cables and conductors in this article do not have a temperature rating requirement. It is important for the system designer, installer, local authority, and building owners to know the temperature rating of cables and conductors for proper application.
The following is from Underwriters Laboratories HNIR. GuideInfo for Power-limited Fire Alarm Cable.
“Unless a higher temperature rating is marked on the cable, power-limited fire alarm cable is intended for use where operating temperature does not exceed 60°C. The voltage rating is 300 V but is not marked.”
There are applications where ambient temperature or job specifications require cable with a temperature rating higher than 60ºC. For example, a cable could contact the outside of an air duct. The 2003 International Mechanical Code, 604.3 requires material that covers the outside of an air duct to be tested at a temperature no less than 121C (250F), and in addition requires the test temperature to match the planned application.
Where there is electrical wiring to a smoke control system, a cable with higher than a 60C rating may be required. IMC; “ **607.3.2 Smoke damper ratings.** Smoke damper leakage ratings shall not be less than Class II. Elevated temperature ratings shall be not less than 250ºF (121ºC).
Panel Meeting Action: Reject
Panel Statement: This proposal does not add any new requirement except for marking, which is already covered by the product standard and general directory.

3-263 Log #3284 NEC-P03 **Final Action: Reject**
(760.82(C))

Submitter: Sanford Egesdal, Egesdal Associates PLC
Recommendation: Revise 760.82(C) and reformat as shown.
(C) Ratings.
Voltage. The cable shall have a voltage rating of not less than 300 volts.
Temperature. Conductor insulation shall have a rating of not less than 60ºC. Fire alarm cables shall be marked with the temperature rating of the insulation immediately following the Type designation.
FPN No. 1: For more information, see 310.10 Temperature Limitation of Conductors.
FPN No. 2: Building codes may have a cable insulation temperature requirement as high as 200ºC.
FPN No. 3: An example of the marking is FPLP 200ºC indicating a plenum cable rated at 200ºC.
Substantiation: Presently, this article does not have a temperature rating requirement on conductor insulation.
Power-limited fire alarm cable on the market today are typically listed with a 60ºC temperature rating on the conductors. Some building codes require a temperature rating as high as 200ºC. The following is from a cable supplier specification sheet: **Plenum Fire Alarm Cable, New York City Certified, (UL) FPLP, Low Capacitance 200°C.**
By referencing to 310.10, users will be aware that a cable with a temperature rating higher than 60ºC is required to meet a high temperature application. For information 310.10 follows:
310.10 Temperature Limitation of Conductors.
No conductor shall be used in such a manner that its operating temperature exceeds that designated for the type of insulated conductor involved. In no case shall conductors be associated together in such a way, with respect to type of circuit, the wiring method employed, or the number of conductors, that the limiting temperature of any conductor is exceeded.
FPN No. 1: The temperature rating of a conductor (see Table 310.13 and Table 310.61) is the maximum temperature, at any location along its length, that the conductor can withstand over a prolonged time period without serious degradation. The allowable ampacity tables, the ampacity tables of Article 310

and the ampacity tables of Annex B, the correction factors at the bottom of these tables, and the notes to the tables provide guidance for coordinating conductor sizes, types, allowable ampacities, ampacities, ambient temperatures, and number of associated conductors.

The principal determinants of operating temperature are as follows:

(1) Ambient temperature — ambient temperature may vary along the conductor length as well as from time to time.

(2) Heat generated internally in the conductor as the result of load current flow, including fundamental and harmonic currents.

(3) The rate at which generated heat dissipates into the ambient medium. Thermal insulation that covers or surrounds conductors affects the rate of heat dissipation.

(4) Adjacent load-carrying conductors — adjacent conductors have the dual effect of raising the ambient temperature and impeding heat dissipation.

FPN No. 2: Conductors installed in conduit exposed to direct sunlight in close proximity to rooftops have been shown, under certain conditions, to experience a temperature rise of 17°C (30°F) above ambient temperature on which the ampacity is based.

(760.82(H) (New))

Submitter: Richard J. Rockosi, ARKEMA Chemicals

Recommendation: Insert new section (H) and renumber existing sections (H) through (J) to (I) through (K). Also, renumber Table 760.82(I) to Table 760.82(J).

<u>**(H) Concealed Space Cables.** Power-limited fire alarm cables that meet the requirements for Type FPL that are also listed as having a low potential heat value, low flame spread characteristics, and low-smoke producing characteristics shall be permitted to be listed and marked as concealed space cables Type FPL-CS.</u>

<u>FPN: One method of defining a low flame spread and low smoke-producing cable is that the cable exhibits a maximum flame spread distance of 1.52 m (5 ft), a maximum peak optical density of 0.03 and a maximum average optical density of 0.01 when tested in accordance with NFPA 262-2002, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces with the cable unslit (intact) and cut through to expose the cable core. One method of defining a low potential heat cable is that the cable exhibits a maximum potential heat value of exceeding 8141 kJ/kg (3500 BTU/lb) when tested in accordance with NFPA 259, *Standard Test Method for Potential Heat of Building Materials.*</u>

Substantiation: The purpose of this proposal is to provide listing and marking for a cable that will be suitable for use in concealed spaces where there are large quantities of cables. Users would have the option of using these cables to avoid establishing a fuel load above the threshold where the quantity of cables would be considered a combustible loading. Also, these cables provide a flame spread index and a smoke developed index that correlate with the requirements for exposed materials within concealed spaces in buildings.

Cables tested using NFPA 255 and 259 establish parameters commonly used in NFPA standards and building codes: Flame spread, smoke developed index, and heat of combustion. This proposal uses the NFPA 262 test in place of NFPA 255. The Fire Protection Research Foundation's *International Limited Combustible Plenum Cable Fire Test Project* (copy attached) has shown that both of these tests are suitable and provided data (page 18 of the report) for setting equivalent criteria in the two tests. A maximum average optical density of 0.01 in NFPA 262 is equivalent to a smoke developed index of 50 in NFPA 255. Additional data is incorporated in the 3 other documents provided which demonstrate the applicability of the limits proposed for the peak and average smoke generation when using the 262 test.

NFPA 13 has requirements for sprinklers in a concealed space that contains a combustible loading. Combustible loading is a function of the density (number) of cables and their potential heat release determined by NFPA 259.

The following is excerpted from the Automatic Systems Sprinkler Handbook 2002 edition: In the handbook the commentary is printed in blue. Since the proposals are printed in black and white I have changed the handbook commentary to ***bold italics*** . I also underlined the text that refers to computer room raised floors.

As indicated in 8.1.1(1), sprinklers are required throughout the premises. Under certain conditions, however, the omission of sprinklers in certain areas and spaces within a building is permitted. Section 8.14 identifies these spaces and conditions.

8.14.1 Concealed Spaces.

8.14.1.1 Concealed Spaces Requiring Sprinkler Protection. All concealed spaces enclosed wholly or partly by exposed combustible construction shall be protected by sprinklers except in concealed spaces where sprinklers are not required to be installed by 8.14.1.2.1 through 8.14.1.2.15.

Concealed spaces requiring sprinkler protection are covered in 8.14.1.1. Concealed spaces, unless protected, can provide an unabated passage for firespread throughout a building. Paragraph 8.14.1 applies to those portions of a building that have construction or finish materials of a combustible nature, are used for the storage of combustible materials, and can contain combustibles associated with building system features such as computer wiring or large quantities of nonmetallic piping.

Any of these scenarios could be found in a concealed space. It is important to recognize that concealed spaces are not exclusively limited to areas above ceilings but can also be found in walls and in spaces beneath the floor. For example, a raised floor in a computer room is a . concealed space. If none of the three prescribed conditions exists, the space is defined as a concealed, noncombustible space with respect to combustible objects and requires no additional sprinkler protection.

Some minor quantities of combustible materials, such as communication wiring, can be present in some concealed spaces but should not typically be viewed as requiring sprinklers (see 8.14.1.1). The threshold value at which sprinklers become necessary in the concealed space is not defined. For example, the usual amounts of data or telephone wiring found above a ceiling would not typically constitute a threat. If bundles of unsheathed computer wiring are installed above the ceiling or beneath the floor in a manner where fire propagation in all directions is likely, then the concealed space should be treated the same as a combustible space, thereby requiring appropriate sprinkler protection. If some other protection measure is provided, such as a CO, system, then the concealed space is considered to be protected, and sprinklers are not required.

Users of this article need to be aware of the requirements of NFPA 13 so they can provide the appropriate fire protection where these is a build-up of combustible cables that constitute a combustible loading, or preferably avoid the buildup of combustible cables that would result in a combustible loading. Use of concealed space cables would be an option in a strategy to avoid establishing a combustible loading.

A flame-spread index of 25 is a typical requirement for materials permitted in concealed spaces or exposed in buildings. A smoke developed index of 50 is typical of material not requiring additional protection. These values exist in several NFPA documents and Building codes and define the requirements for materials not requiring additional fire protection.

The following requirements are from NFPA 5000-2003 identify heat of combustion, flame spread, and smoke as major concerns:

Chapter 4 General

4.4.7 Limiting Fire Spread.

4.4.7.1 Interior Finishes. The interior surfaces of the building shall not contribute to an unacceptable rate and magnitude of fire spread and generation of heat and smoke.

4.4.7.2 Concealed Spaces. The construction of concealed spaces shall not contribute to an unacceptable rate of the spread of fire, hot gases, and smoke to areas of the building remote from the fire source and shall limit their spread beyond the immediate area of the origin of the fire.

4.4.7.3 Compartmentation. The building shall be compartmented, as appropriate, by walls and floors, including their associated openings with proper closures, to limit the spread of fire, hot gases, and smoke to an acceptable area beyond the immediate area of fire origin.

Chapter 7 Construction Types and Area Requirements

Chapter 8 Fire-Resistive Materials and Construction

8.1 General.

8.1.1 The chapter addresses fire protection features intended to restrict or resist the spread of fire and smoke beyond the compartment of fire origin.

8.1.2 Where required by other chapters of this Code, every building shall be divided into compartments to limit the spread of fire and restrict or resist the movement of smoke.

8.1.2.1* Fire compartments shall be formed with fire barrier walls that comply with Section 8.4 or horizontal assemblies that comply with Section 8.6, or a combination of both.

8.1.2.2 Smoke compartments shall be formed with smoke barriers that comply with Section 8.11.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The definition for “concealed” in Article 100 in the 2005 NEC does not apply to the proposed text. The reference to NFPA 13 in the substantiation does not seem appropriate at this time, since putting a sprinkler head in an inaccessible location inside the wall or above a drywall ceiling would not permit access for servicing. The area above a suspended ceiling is not considered by the NEC to be a concealed space.

The panel is acting on this and other proposals related to wire and cable in plenum and other air-handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

“[S]o as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A.”

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

(760.82(H) (New))

Submitter: Ron Patridge, Arkema Inc.

Recommendation: Insert new section (H) and renumber existing sections (H) through (J) to (I) through (K). Also, renumber Table 760.82(I) to Table 760.82(J).

<u>**(H) Concealed Space Cables.** Power-limited fire alarm cables that meet the requirements for Type FPL that are also listed as having a low potential heat value, low flame spread characteristics, and low-smoke producing characteristics shall be permitted to be listed and marked as concealed space cables Type FPL-CS.</u>

<u>FPN: One method of defining a low flame spread and low smoke-producing cable is that the cable exhibits a maximum flame spread distance of 1.52 m (5 ft), a maximum peak optical density of 0.03 and a maximum average optical density of 0.01 when tested in accordance with NFPA 262-2002, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces with the cable unslit (intact) and cut through to expose the cable core. One method of defining a low potential heat cable is that the cable exhibits a maximum potential heat value of exceeding 8141 kJ/kg (3500 BTU/lb) when tested in accordance with NFPA 259, *Standard Test Method for Potential Heat of Building Materials.*</u>

Substantiation: This is an identical submittal to the one provided by Richard J. Rockosi on behalf of Arkema dated Nov. 3, 2005, but it includes additional references necessary to help substantiate the requirements proposed for a 262 Concealed Space cable.

The purpose of this proposal is to provide listing and marking for a cable that will be suitable for use in concealed spaces where there are large quantities of cables. Users would have the option of using these cables to avoid establishing a fuel load above the threshold where the quantity of cables would be considered a combustible loading. Also, these cables provide a flame spread index and a smoke developed index that correlate with the requirements for exposed materials within concealed spaces in buildings.

Cables tested using NFPA 255 and 259 establish parameters commonly used in NFPA standards and building codes: Flame spread, smoke developed index, and heat of combustion. This proposal uses the NFPA 262 test in place of NFPA 255. The Fire Protection Research Foundation’s *International Limited Combustible Plenum Cable Fire Test Project* (copy attached) has shown that both of these tests are suitable and provided data (page 18 of the report) for setting equivalent criteria in the two tests. A maximum average optical density of 0.01 in NFPA 262 is equivalent to a smoke developed index of 50 in NFPA 255. There is not an equivalent measure to peak optical density in NFPA 255, therefore the proposal given shows a peak optical density of three times the average optical density, which is similar to the existing NFPA 262 requirements. Additional data is incorporated in the other documents provided which demonstrate the applicability of the limits proposed for the peak and average smoke generation when using the 262 test. In addition, the ASHRAE initiated research project conducted by the NRCC “Full-scale fire tests for cables in plenums” demonstrates that even within the NFPA 262 cable requirements hazards exist where some cables can ignite at lower temperatures which increases smoke production due to the involvement of the cables in the fire. Also, increased smoke can occur even if some cables are not ignited but exposed to a high temperature environment. In addition some 262 cables produce much greater levels of smoke depending on the fire scenario and their materials of construction. From the ASHRAE report “The tests conducted in this study indicate that the smoke produced from the CMP cables in plenums when exposed to fire could reduce visibility for occupants restricting their ability to evacuate”. This is of particular concern for cables used in concealed spaces because these spaces can provide an unabated passage for fire-spread throughout a building.

NFPA 13 has requirements for sprinklers in a concealed space that contains a combustible loading. Combustible loading is a function of the density (number) of cables and their potential heat release determined by NFPA 259.

The following is excerpted from the Automatic Systems Sprinkler Handbook 2002 edition: In the handbook the commentary is printed in blue. Since the proposals are printed in black and white I have changed the handbook commentary to ***bold italics*** . I also underlined the text that refers to computer room raised floors.

As indicated in 8.1.1(1), sprinklers are required throughout the premises. Under certain conditions, however, the omission of sprinklers in certain areas and spaces within a building is permitted. Section 8.14 identifies these spaces and conditions.

8.14.1 Concealed Spaces.

8.14.1.1 Concealed Spaces Requiring Sprinkler Protection. All concealed spaces enclosed wholly or partly by exposed combustible construction shall be protected by sprinklers except in concealed spaces where sprinklers are not required to be installed by 8.14.1.2.1 through 8.14.1.2.15.

Concealed spaces requiring sprinkler protection are covered in 8.14.1.1. Concealed spaces, unless protected, can provide an unabated passage for firespread throughout a building. Paragraph 8.14.1 applies to those portions of a building that have construction or finish materials of a combustible nature, are used for the storage of combustible materials, and can contain combustibles associated with building system features such as computer wiring or large quantities of nonmetallic piping.

Any of these scenarios could be found in a concealed space. It is important to recognize that concealed spaces are not exclusively limited to areas above ceilings but can also be found in walls and in spaces beneath the floor. For example, a raised floor in a computer room is a . concealed space. If none of the three prescribed conditions exists, the space is defined as a concealed, noncombustible space with respect to combustible objects and requires no additional sprinkler protection.

Some minor quantities of combustible materials, such as communication wiring, can be present in some concealed spaces but should not typically be viewed as requiring sprinklers (see 8.14.1.1). The threshold value at which sprinklers become necessary in the concealed space is not defined. For example, the usual amounts of data or telephone wiring found above a ceiling would not typically constitute a threat. If bundles of unsheathed computer wiring are installed above the ceiling or beneath the floor in a manner where fire propagation in all directions is likely, then the concealed space should be treated the same as a combustible space, thereby requiring appropriate sprinkler protection. If some other protection measure is provided, such as a CO, system, then the concealed space is considered to be protected, and sprinklers are not required.

Users of this article need to be aware of the requirements of NFPA 13 so they can provide the appropriate fire protection where these is a build-up of combustible cables that constitute a combustible loading, or preferably avoid the buildup of combustible cables that would result in a combustible loading. Use of concealed space cables would be an option in a strategy to avoid establishing a combustible loading.

A flame-spread index of 25 is a typical requirement for materials permitted in concealed spaces or exposed in buildings. A smoke developed index of 50 is typical of material not requiring additional protection. These values exist in several NFPA documents and Building codes and define the requirements for materials not requiring additional fire protection.

The following requirements are from NFPA 5000-2003 identify heat of combustion, flame spread, and smoke as major concerns:

C hapter 4 General

4.4.7 Limiting Fire Spread.

4.4.7.1 Interior Finishes. The interior surfaces of the building shall not contribute to an unacceptable rate and magnitude of fire spread and generation of heat and smoke.

4.4.7.2 Concealed Spaces. The construction of concealed spaces shall not contribute to an unacceptable rate of the spread of fire, hot gases, and smoke to areas of the building remote from the fire source and shall limit their spread beyond the immediate area of the origin of the fire.

4.4.7.3 Compartmentation. The building shall be compartmented, as appropriate, by walls and floors, including their associated openings with proper closures, to limit the spread of fire, hot gases, and smoke to an acceptable area beyond the immediate area of fire origin.

Chapter 7 Construction Types and Area Requirements

Chapter 8 Fire-Resistive Materials and Construction

8.1 General.

8.1.1 The chapter addresses fire protection features intended to restrict or resist the spread of fire and smoke beyond the compartment of fire origin.

8.1.2 Where required by other chapters of this Code, every building shall be divided into compartments to limit the spread of fire and restrict or resist the movement of smoke.

8.1.2.1* Fire compartments shall be formed with fire barrier walls that comply with Section 8.4 or horizontal assemblies that comply with Section 8.6, or a combination of both.

8.1.2.2 Smoke compartments shall be formed with smoke barriers that comply with Section 8.11.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: See the panel action and statement on Proposal 3-266.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

Explanation of Negative:

EGESDAL, S.: See my Explanation of Negative for Proposal 3-269.

3-268 Log #3632 NEC-P03 **Final Action: Reject**

(760.82(H) (New))

Submitter: Allen C. Weidman, The Society of the Plastics Industry, Inc.

Recommendation: Insert new section (H) and renumber existing sections (H) through (J) to (I) through (K). Also, renumber Table 760.82(I) to Table 760.82(J).

<u>**(H) Concealed Space Cables.** Power-limited fire alarm cables that meet the requirements for Type FPL that are also listed as having a low potential heat value, low flame spread characteristics, and low-smoke producing characteristics shall be permitted to be listed and marked as concealed space cables Type FPL-CS.</u>

<u>FPN: One method of defining a low flame spread and low smoke-producing cable is that the cable exhibits a maximum flame spread distance of 1.52 m (5 ft), a maximum peak optical density of 0.5 and a maximum average optical density of 0.15 when tested in accordance with NFPA 262-2002, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces with the cable unslit (intact) and cut through to expose the cable core. One method of defining a low potential heat cable is that the cable exhibits a maximum potential heat value of exceeding 8141 kJ/kg (3500 BTU/lb) when tested in accordance with NFPA 259, *Standard Test Method for Potential Heat of Building Materials.*</u>

Substantiation: The purpose of this proposal is to provide listing and marking for a cable that will be suitable for use in concealed spaces where there are large quantities of cables. Users would have the option of using these cables to avoid establishing a fuel load above the threshold where the quantity of cables would be considered a combustible loading. Also, these cables provide a flame spread index and a smoke developed index that correlate with the requirements for exposed materials within concealed spaces in buildings.

Cables tested using NFPA 255 and 259 establish parameters commonly used in NFPA standards and building codes: smoke developed index, smoke developed index, and heat of combustion. This proposal uses the NFPA 262 test in place of NFPA 255. The Fire Protection Research Foundation's *International Limited Combustible Plenum Cable Fire Test Project* (copy attached) has shown that both of these tests are suitable and provided data (page 18 of the report) for setting equivalent criteria in the two tests. A maximum average optical density of 0.17 in NFPA 262 is equivalent to a smoke developed index of 450 in NFPA 255. This proposal sets the maximum optical density requirement at 0.15 to allow for a margin of error and to correlate with the existing requirements for plenum cable.

NFPA 13 has requirements for sprinklers in a concealed space that contains a combustible loading. Combustible loading is a function of the density (number) of cables and their potential heat release determined by NFPA 259.

The following is excerpted from the Automatic Systems Sprinkler Handbook 2002 edition: In the handbook the commentary is printed in blue. Since the proposals are printed in black and white I have changed the handbook commentary to ***bold italics*** . I also underlined the text that refers to computer room raised floors.

As indicated in 8.1.1(1), sprinklers are required throughout the premises. Under certain conditions, however, the omission of sprinklers in certain areas and spaces within a building is permitted. Section 8.14 identifies these spaces and conditions.

8.14.1 Concealed Spaces.

8.14.1.1 Concealed Spaces Requiring Sprinkler Protection. All concealed spaces enclosed wholly or partly by exposed combustible construction shall be protected by sprinklers except in concealed spaces where sprinklers are not required to be installed by 8.14.1.2.1 through 8.14.1.2.15.

Concealed spaces requiring sprinkler protection are covered in 8.14.1.1. Concealed spaces, unless protected, can provide an unabated passage for firespread throughout a building. Paragraph 8.14.1 applies to those portions of a building that have construction or finish materials of a combustible nature, are used for the storage of combustible materials, and can contain combustibles associated with building system features such as computer wiring or large quantities of nonmetallic piping.

Any of these scenarios could be found in a concealed space. It is important to recognize that concealed spaces are not exclusively limited to areas above ceilings but can also be found in walls and in spaces beneath the floor. For example, a raised floor in a computer room is a . concealed space. If none of the three prescribed conditions exists, the space is defined as a concealed, noncombustible space with respect to combustible objects and requires no additional sprinkler protection.

Some minor quantities of combustible materials, such as communication wiring, can be present in some concealed spaces but should not typically be viewed as requiring sprinklers (see 8.14.1.1). The threshold value at which sprinklers become necessary in the concealed space is not defined. For example, the usual amounts of data or telephone wiring found above a ceiling would not typically constitute a threat. If bundles of unsheathed computer wiring are installed above the ceiling or beneath the floor in a manner where fire propagation in all directions is likely, then the concealed space should be treated the same as a combustible space, thereby requiring appropriate sprinkler protection. If some other protection measure is provided, such as a CO, system, then the concealed space is considered to be protected, and sprinklers are not required.

Users of this article need to be aware of the requirements of NFPA 13 so they can provide the appropriate fire protection where these is a build-up of combustible cables that constitute a combustible loading, or preferably avoid the buildup of combustible cables that would result in a combustible loading. Use of concealed space cables would be an option in a strategy to avoid establishing a combustible loading.

A flame spread index of 25 is a typical requirement for materials permitted in concealed spaces or exposed in buildings.

A smoke developed index of 450 is a typical requirement for materials permitted in concealed spaces or exposed in buildings.

The following requirements are from NFPA 5000-2003 identify heat of combustion, flame spread, and smoke as major concerns:

Chapter 4 General

4.4.7 Limiting Fire Spread.

4.4.7.1 Interior Finishes. The interior surfaces of the building shall not contribute to an unacceptable rate and magnitude of fire spread and generation of heat and smoke.

4.4.7.2 Concealed Spaces. The construction of concealed spaces shall not contribute to an unacceptable rate of the spread of fire, hot gases, and smoke to areas of the building remote from the fire source and shall limit their spread beyond the immediate area of the origin of the fire.

4.4.7.3 Compartmentation. The building shall be compartmented, as appropriate, by walls and floors, including their associated openings with proper closures, to limit the spread of fire, hot gases, and smoke to an acceptable area beyond the immediate area of fire origin.

Chapter 8 Fire-Resistive Materials and Construction

8.1 General.

8.1.1 The chapter addresses fire protection features intended to restrict or resist the spread of fire and smoke beyond the compartment of fire origin.

8.1.2 Where required by other chapters of this Code, every building shall be divided into compartments to limit the spread of fire and restrict or resist the movement of smoke.

8.1.2.1* Fire compartments shall be formed with fire barrier walls that comply with Section 8.4 or horizontal assemblies that comply with Section 8.6, or a combination of both.

8.1.2.2 Smoke compartments shall be formed with smoke barriers that comply with Section 8.11.

8.16 Insulating Materials.

8.16.7 Insulation and Covering on Pipe and Tubing. Insulation and covering on pipe and tubing shall have a flame spread index of not more than 25 and a smoke developed index of not more than 450.

Chapter 10 Interior Finishes

10.3.2* Products required to be tested in accordance with NFPA 255 or ASTM E 84 shall be grouped in the classes described in 10.3.2(A) through 10.3.2(C) in accordance with their flame spread and smoke development, except as indicated in 10.3.3.

(A) Class A Interior Wall and Ceiling Finish. Class A interior wall and ceiling finishes shall be those finishes with a flame spread of 0–25 and smoke development of 0–450 and shall include any material classified at 25 or less on the flame spread test scale and 450 or less on the smoke test scale. Any element thereof, when so tested, shall not continue to propagate fire.

Panel Meeting Action: Reject

Panel Statement: See the panel action and statement on Proposal 3-266.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

Explanation of Negative:

EGESDAL, S.: See my Explanation of Negative for Proposal 3-269.

3-269 Log #2526 NEC-P03 **Final Action: Reject**
(760.82(H) and Table 760.82(i))

Submitter: Sanford Egesdal, Egesdal Associates PLC

Recommendation: Revise Section 760.82 as shown below.

Sections 760.82(A), through (G) do not change.

Insert new 760.82(H), renumber existing subsections as follows: “H” to “I”; and “I” to “J”, “J” to “K”,and renumber “Table 760.82(I) Cable Markings” to “Table 760.82(J) Cable Markings”.

(H) Type FPL50. Type FPL50 cables shall be listed as suitable for installation in concealed spaces having restrictive requirements for smoke generation, combustible loading, and flame spread and shall be listed as having very-low-smoke producing characteristics, a low potential heat release value, and low flame spread characteristics.

FPN No 1: One method of defining a low flame spread and very low smoke-producing cable is that the cable exhibits a maximum flame spread index of 25 and maximum smoke developed index of 50 when tested in accordance with NFPA 255, *Standard Method of Test of Surface Burning Characteristics of Building Materials* with the cable unslit (intact) and cut through to expose the cable core. One method of defining a low potential heat cable is that the cable exhibits a maximum potential heat value of exceeding 8141 kJ/kg (3500 BTU/lb) when tested in accordance with NFPA 259, *Standard Test Method for Potential Heat of Building Materials.*

FPN No. 2: See 8.14.1 of NFPA 13-2002, *Installation of Sprinkler Systems* , for requirements for sprinklers in concealed spaces containing exposed combustibles.

FPN No. 3: Building codes adopted by code jurisdictions may contain restrictions on permissible flame spread index and smoke developed index.

Revise renumbered Table 760.82(J) to add a new first line in the cable markings, as follows:

FPL50

power-limited fire alarm very low-smoke cable

Substantiation: This proposal establishes a listing and marking for cable permitted as an electrical wiring option in concealed spaces where a smoke developed index no greater than 50 is required or large quantities of cable may cause combustible loading. The proposed cable has very-low-smoke-producing characteristics, a low potential heat release value, and low flame spread characteristics. Presently, a number of manufacturers have cables listed to the proposed requirements.

The testing criteria are based on the requirements found in NFPA 13-2003 and the 2003 International Mechanical Code, as revised.

NFPA 13, Section 8.14.1.2.1 follows: “Noncombustible and limited combustible concealed spaces with no combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.” The proposed cable has a very low heat of combustion. While the term “combustible loading” is not defined, the fuel load can be calculated to determine the potential hazard from large quantities of cable.

The 2003 International Mechanical Code, 602.2.1, requires materials in plenums to be noncombustible or have a flame spread index no greater 25 and a smoke index no greater than 50. At the recent ICC meeting in Detroit, exception #5 to 602.2.1 was revised to include “combustible material (electrical wiring) installed in noncombustible raceways or enclosures.” The requirements in IMC 602.2.1.1 permits cables meeting NFPA 262 test requirements. Cables meeting NFPA 262 requirements, according to Fire Protection Research Foundation testing using NFPA 255, have a smoke developed index that varies between 450 and 850. The proposed cable meets the requirements of the base paragraph, 602.2.1.

The following (change is underlined) shows the result of action on IMC public comment on M 77 (floor actions in Detroit, September 2005).

602.2.1 Materials exposed within plenums. Except as required by Sections 602.2.1.1 through 602.2.1.5, materials within plenums shall be noncombustible or shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84.

Exceptions:

1. Rigid and flexible ducts and connectors shall conform to Section 603.
2. Duct coverings, linings, tape and connectors shall conform to Sections 603 and 604.
3. This section shall not apply to materials exposed within plenums in one- and two-family dwellings.
4. This section shall not apply to smoke detectors.
5. Combustible materials enclosed in noncombustible raceways or enclosures, approved gypsum board assemblies or enclosed in materials listed and labeled for such application.

602.2.1.1 Wiring. Combustible electrical or electronic wiring methods and materials, optical fiber cable, and optical fiber raceway exposed within a plenum shall have a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread not greater than 5 feet (1524 mm) when tested in accordance with NFPA 262. Only type OFNP (plenum rated nonconductive optical fiber cable) shall be installed in plenum-rated optical fiber raceways. Wiring, cable, and raceways addressed in this section shall be listed and labeled as plenum rated and shall be installed in accordance with ICC *Electrical Code* .

The Fire Protection Research Foundation report demonstrated that NFPA 255, *Standard Method of Test of Surface Burning Characteristics of Building Materials* , provides a suitable test method for establishing the cable characteristics (flame spread index & smoke developed index) specified in the FPN.

Establishing a listing and marking for a Type FPL50 cable provides a wiring option for complying with requirements of other standards and building codes. The NEC has previously established listings and markings for cable to correlate with other codes and standards. Additionally, the listing and marking may or may not have a specific application. Specific examples follow:

1. Type CMG cable was included in the 1993 NEC to correlate with the Canadian Electrical Code. The change was proposed by the Chair of NEC TCC, Harold Ware and Roy Hicks from Canada. Type CMG has a listing and marking in the NEC. Article 800 permits “Type CM or Type CMG” to be installed as a general purpose cable. Note: Type CMG does not have a unique application, and neither cable is considered a minimum requirement.
2. Types MP, MPR, and MPP cable was included in the 1990 NEC. The cables had a listing and marking. The multiple-purpose cables were permitted to substitute for similar cables in Articles 725, 760, & 800. Note: Types MP, MPR, and MPP cables do not have a unique application, just a listing and marking.
3. A change to the 1999 NEC permitted Types NPLF, NPLFR, NPLFP, FPL, FPLR, and FPLP to have a “-CI” suffix. The change included only listing and marking requirements. This change to the NEC correlated with NFPA 72, National Fire Alarm Code, requirements for a circuit integrity cable. Note: Cables with a “-CI” suffix did not have an application, until changes were made to the 2005 NEC.
4. A change to the 2005 NEC permitted Types CM, CMR and CMP to have a “-CI” suffix. As of today, no company has a listed circuit integrity using the permitted markings. Note: Types CM-CI, CMR-CI, and CMP-CI do not have an application, just a listing and marking.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 3-266.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

Explanation of Negative:

EGESDAL, S.: Referencing the NFPA 90A directive on NFPA 90A as a reason to reject this proposal is in error. The proposed cable marking clearly indicates the cable could not be installed in a plenum, and could only be installed in spaces permitted by 760.61(C), Other Wiring Within Buildings. Section 760.82 provides for listing and marking requirements for cables referenced in Seciton 760.61. The marking requirements in the various 760.82 sections correlate with the various applications in the various 760.61 sections. For example 760.82(A) provides the listing and marking requirements for plenum cable that correlates with the application requirements in 760.61(A).

The Panel is in error by stating that the proposed Type FPL50 cable could be used in a plenum. Again, Section 760.61(A) requires a Type CL2P or CL3P cable. The proposed cable does not have a "P" in the marking. Likewise, the proposed cable does not have an "R" in the marking, so could not be installed in a riser.

3-270 Log #2391 NEC-P03 **Final Action: Reject**
(760.82(I))

Submitter: Allen C. Weidman, The Society of the Plastics Industry, Inc.
Recommendation: Revise 760.82(I) as follows:

(I) Cable Marking. The cable type shall be marked in accordance with Table 760.82(I). The voltage rating shall not be marked on the cable. The temperature rating shall be marked on the cable . Cables that are listed for circuit integrity shall be identified with the suffix CI as defined in 760.82(G).

FPN: Voltage ratings on cables may be misinterpreted to suggest that the cables may be suitable for Class 1, electric light, and power applications.

Exception: Voltage markings shall be permitted where the cable has multiple listings and voltage marking is required for one or more of the listings.

Substantiation: The cables and conductors in this article do not have a temperature rating requirement. It is important for the system designer, installer, local authority, and building owners to know the temperature rating of cables and conductors for proper application.
Panel Meeting Action: Reject
Panel Statement: This proposal does not add any new requirement except for marking, which is already covered by the product standard and general directory.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:

EGESDAL, S.: See my Explanation of Negative for Proposal 3-222.

3-271 Log #3236 NEC-P03 **Final Action: Reject**
(760.82(I))

Submitter: Frank Peri, Communications Design Corporation
Recommendation: Add FPLD to the top of the cable list in Table 760.82(I), preceding FPLP, as shown.

Type FPLD
Power-limited air duct cable

Substantiation: This addition to the table correlates with the listing and marking of air duct cable.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 3-252.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-272 Log #78 NEC-P03 **Final Action: Reject**
(760.82(J))

Submitter: Brian Cummins, Proline Protection Systems LTD
Recommendation: Add new text to read:

Digital Line Type Heat Detection. Acceptable for wiring similar switching alarm devices on the same fire detection zone. Typically, conventional two wire (Class B) point type heat detectors and manual call point devices.

Substantiation: Unfavorable airflows (i.e., point type heat detectors affected) and unmanned buildings (i.e., no call point operation). Wiring of these Class B switching alarm devices by another similar device - digital line type heat sensor cable - will provide additional detection/protection at little extra cost to end users.
Panel Meeting Action: Reject
Panel Statement: There was no technical substantiation provided in the proposal for this new type of heat detector. A fact finding study would provide the information necessary for possible insertion into the NEC.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-273 Log #3237 NEC-P03 **Final Action: Reject**
(760.82(K))

Submitter: Frank Peri, Communications Design Corporation
Recommendation: Add new 760.82(K), as shown.

(K) Type FPLD. Type FPLD air duct cable shall be listed as being suitable for use in ducts, plenums, and other spaces used for environmental air and shall also be listed as having adequate fire-resistant, very low smoke-producing characteristics, and very low potential heat release.

FPN No: One method of defining a low flame spread and very low smoke-producing cable is that the cable exhibits a maximum flame spread index of 25 and maximum smoke developed index of 50 when tested in accordance with NFPA 255, *Standard Method of Test of Surface Burning Characteristics of Building Materials* with the cable unslit (intact) and cut through to expose the cable core. One method of defining a low potential heat cable is that the cable exhibits a maximum potential heat value of exceeding 8141 kJ/kg (3500 BTU/lb) when tested in accordance with NFPA 259, *Standard Test Method for Potential Heat of Building Materials.*

Substantiation: The purpose of this proposal is to correlate with NFPA 5000-2006. NFPA 5000-2006, recently issued by the NFPA Standards Council, incorporates extracted plenum requirements from NFPA 90A-2002. Consequently, the plenum requirements in NFPA 5000-2006 are identical to the ceiling cavity plenum requirements in NFPA 90A-2002. This proposal provides listing requirements for a cable with characteristics that complies with the NFPA 90A-2002, 4.3.10.2.6: requirements for limited combustible materials exposed to the airflow. This proposal provides a listing and marking for a cable that complies with the NFPA 90A-2002, 4.3.10.2.6.1:a requirement for a listed limited combustible cable with a maximum smoke developed index of 50. The proposed cable meets the NFPA Standards Council's directive to not identify cable as "limited combustible," because it is not a building construction material. The cable name and listing requirements meets guidance from the NFPA Standards Council to identify cable characteristics in terms of flame spread index, smoke developed index, and potential heat release.

As compared to a combustible plenum cable that is listed using NFPA 262, air duct cable is a much "safer" cable. Air duct cable provides users with an opportunity to significantly reduce the potential hazard from smoke during a fire emergency. Additionally, the much lower potential heat release of air duct cable provides much lower combustible loading than found in combustible plenum cable listed using NFPA 262.

Air duct cables are available on the market today. Presently, there is air duct cable available to meet the plenum installation requirements of Articles 725, 760, 770, and 800. Unfortunately, the only marking available in the NEC is for a combustible plenum cable. The NEC decides what marking is permitted, and listing organizations correlate. That is, it would be inappropriate for a listing organization to mark cable with a "Type XXX" that is not published in the NEC.

The following is an example of air duct cable information from the UL Web Site:

OWKZ.GuideInfoLimited Combustible Cable
Guide Information for Electrical Equipment for Use in Ordinary Locations
GENERAL

This category covers electrical and optical fiber cable that meets the limited combustible and smoke developed requirements for cable in ceiling cavity and raised floor plenums in accordance with NFPA 90A, "Standard for the Installation of Air Conditioning and Ventilating Systems." This cable also meets the requirements for cable used in ducts, plenums and other spaces used for environmental air in accordance with Articles 725, 760, 770, 800, 820 and 830 of ANSI/NFPA 70, "National Electrical Code".

This cable has a maximum Potential Heat value of 3500 Btu/lb when tested in accordance with NFPA 259, "Standard Test Method for Potential Heat of Building Materials." This cable has a maximum smoke developed index of 50 and a maximum flame spread index of 25 when tested in accordance with UL 723 (NFPA 255), "Test for Surface Burning Characteristics of Building Materials" before and after exposure to elevated temperature and humidity. The cable also meets the requirements for plenum cable in one or more of the following product categories:

- Power-limited Circuit Cable (**QPTZ**) - Types CL2P or CL3P
- Communications Cable (**DUZX**) - Type CMP
- Power-limited Fire Alarm Cable (**HNIR**) - Type FPLP
- Nonpower-limited Fire Alarm Cable (**HNHT**) - Type NPLFP
- Optical Fiber Cable (**QAYK**) - Types OFNP or OFCP
- Community Antenna Television Cable (**DVCS**) - Type CATVP
- Network-powered Broadband Communications Cable (**PWIP**) - Type BLP

PRODUCT MARKINGS

This cable is identified by the marking "Limited Combustible FHC 25/50" on the surface of the jacket or on a marker tape under the jacket. This marking is immediately followed by one of the Type designations shown above. The cable also has the required markings including optional markings as indicated in the product categories referenced above. This cable may also be Verified for transmission performance if authorized in the product categories referenced above, and will bear the appropriate performance verification marking.

ADDITIONAL INFORMATION

For additional information, see Electrical Equipment for Use in Ordinary Locations (**AALZ**).

REQUIREMENTS

The basic requirements used to investigate products in this category are contained in Subject 2424, "Outline of Investigation for Cable Marked 'Limited Combustible.'"

UL MARK

The UL symbol on the product and the Listing Mark of Underwriters Laboratories Inc. on the attached tag, the reel, or the smallest unit container in which the product is packaged is the only method provided by UL to identify products manufactured under its Listing and Follow-Up Service. The Listing Mark for these products includes the UL symbol (as illustrated in the Introduction of this Directory) together with the word "LISTED," a control number, and the product name "Limited Combustible Cable."

Cable which is also Verified to the UL Data Transmission Performance Category Marking Program has the marking "Verified to UL Performance Category Program," or the UL Verification Mark along with the words "Performance Category Program" together with the Listing Mark information on the tag, the reel, or the smallest unit container. Cable which is also Verified to another transmission performance specification has the marking "Verified in Accordance with [Specification name and/or number]" or the UL Verification Mark along with the applicable Specification name and/or number together with the Listing Mark information on the tag, the reel, or the smallest unit container.

Ballot Results: Affirmative: 13

ARTICLE 770 — OPTICAL FIBER CABLES AND RACEWAYS

16-2 Log #695 NEC-P16 **Final Action: Accept in Principle**
(770)

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.

Recommendation: Revise the numbering of the parts of Article 700 as shown in the table below:

Article 770- 2005 NEC	Proposal for 2008 NEC
I. General	I. General
	II. Cables Outside and Entering Buildings
II. Protection	III. Protection
	IV. Grounding Methods
III. Cables Within Buildings	V. Cables Within Buildings
IV. Listing Requirements	VI. Listing Requirements

Substantiation: This is an editorial proposal. (Task Group No.770-01)

The task group has submitted many proposals to improve the parallelism between articles 770, 800, 820 and 830. Several of these proposals introduce text for the new parts; "II. Cables Outside and Entering Buildings" and "IV. Grounding Methods". Renumbering of the parts of the article is necessary to accommodate the new parts.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.

The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.

Panel Meeting Action: Accept in Principle

In the submittter's recommendation, change 700 to 770.

Part V to be titled Installation Methods Within Buildings.

Panel Statement: The panel notes a typo in the Proposal; change 700 to 770.

See panel Action on Proposal 16-58.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-3 Log #1864 NEC-P16 **Final Action: Reject**
(770)

TCC Action: The Technical Correlating Committee advises that Article locations are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industry Solutions

Recommendation: Relocate Article 770 to Chapter 8 and renumber appropriately.

Substantiation: A number of telecommunications utilities have either begun, or are contemplating, a "fiber-to-the-home" program whereby they will be bringing optical fiber directly to the customer's premises. The optical fiber cable will be attached to, and possibly installed within the customer's building. Although optical fiber cable may also be used in signaling and remote control applications, the preponderance of applications today are in the area of telecommunications. Where the optical fibers are associated with power conductors (i.e., in composite cables) they are presently required to be classified as electrical cables in accordance with the type of electrical conductors contained in the composite cable [see 770.9(C)]. It is therefore appropriate that Article 770 be incorporated in Chapter 8. Relocation of Article 770 to Chapter 8 will facilitate usability of the NEC and have no impact on existing requirements.

Panel Meeting Action: Reject

Panel Statement: It is more appropriate to remain in Chapter 7. Optical fiber cable is also used for applications other than communications (e.g. control).

Number Eligible to Vote: 15

Ballot Results: Affirmative: 12 Negative: 3

Explanation of Negative:

BRUNSSEN, J.: This proposal should be accepted. The preponderance of optical fiber cable applications today is in the telecommunications industry. A number of telecommunications utilities have either begun, or are contemplating, a "fiber-to-the-home" program whereby optical fiber will be provided directly to the customer's premises. The optical fiber cable will be attached to, and possibly installed within the customer's building. While optical fiber cable is also used for data and control circuits, many of these circuits are similar in nature to communications circuits with respect to their installation and safety requirements. It is therefore appropriate that Article 770 be incorporated in Chapter 8. Relocation of Article 770 to Chapter 8 will facilitate usability of the NEC and have no impact on existing requirements.

JOHNSON, S.: I agree with the submitter's points in his proposal. Optical fibers, when not associated with power conductors, more closely resemble the wiring methods of telecommunications and CATV than wiring methods of power circuits. Moving this article into Chapter 8 with telecommunications and CATV, therefore appear to be the appropriate location. I vote against the Panel's action to reject.

JONES, R.: Cables that carry optical fiber are classified according to their usage – Article 770 covers optical fiber cables that are more like communications cables than electrical. The applications in article 770 are the same as Chapter 8 applications, therefore the panel erred by not voting to move the Article to Chapter 8.

16-4 Log #1527 NEC-P16 **Final Action: Accept in Principle**
(770, 800, 810, 820 and 830)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to the Technical Correlating Committee Grounding and Bonding Task Group for comment. The Technical Correlating Committee understands that the Panel Action on this Proposal should be "Accept in Principle" and further understands the Panel Action text in Proposal 16-4a and Proposal 16-25 provides the additional accepted and modified text. It is also the action of the Technical Correlating Committee that further consideration be given to the comments on the affirmative vote. This action will be considered by the panel as a public comment.

Submitter: Technical Correlating Committee on National Electrical Code,

Recommendation: Revise Articles 770, 800, 810, 820 and 830 as described in the following, relative to the terms bonding and grounding.

Article 770 In 770.2 Definition change:

Point of Entrance. The point at which the cable emerges from an external wall, from a concrete floor slab, or from a rigid metal conduit or an intermediate metal conduit ~~grounded~~ connected by a grounding conductor to an electrode in accordance with 800.100(B).

In 770.93 Grounding of Entrance Cables change:

Where exposed to contact with electric light or power conductors, the non–current-carrying metallic members of optical fiber cables entering buildings shall be ~~grounded~~ connected to an electrode by a grounding conductor as close to the point of entrance as practicable or shall be interrupted as close to the point of entrance as practicable by an insulating joint or equivalent device.

Article 800 In 800.93 Cable Grounding change:

The metallic sheath of communications cables entering buildings shall be grounded as specified in 800.100 as close as practicable to the point of entrance or shall be interrupted as close to the point of entrance as practicable by an insulating joint or equivalent device.

FPN: See 800.2 for the definition of point of entrance.

In 800.100(A)(4) Exception change:

Exception: In one- and two-family dwellings where it is not practicable to achieve an overall maximum primary protector grounding conductor length of 6.0 m (20 ft), a separate communications ground rod meeting the minimum dimensional criteria of 800.100(B)(2)(2) shall be driven, the primary protector shall be ~~grounded~~ connected to the communications ground rod in accordance with 800.100(C), and the communications ground rod shall be bonded to the power grounding electrode system in accordance with 800.100(D).

In 800.90(A)(2) change:

(2) Interbuilding cable runs of 42 m (140 ft) or less, directly buried or in underground conduit, where a continuous metallic cable shield or a continuous metallic conduit containing the cable is ~~bonded~~ connected to each building grounding electrode system.

In 800.100(A)(4) Exception change:

Exception: In one- and two-family dwellings where it is not practicable to achieve an overall maximum primary protector grounding conductor length of 6.0 m (20 ft), a separate communications ground rod meeting the minimum *dimensional criteria of 800.100(B)(2)(2) shall be driven, the primary protector shall be grounded to the communications ground rod in accordance with 800.100(C), and the communications ground rod shall be ~~bonded~~ connected to the power grounding electrode system in accordance with 800.100(D).*

In 800.106(B) change:

(B) Bonding. The primary protector grounding terminal or grounding electrode shall be ~~bonded~~ connected to the metal frame or available grounding terminal of the mobile home with a copper grounding conductor not smaller than 12 AWG under either of the following conditions:

(1) Where there is no mobile home service equipment or disconnecting means as in 800.106(A)

(2) Where the mobile home is supplied by cord and plug

Article 810 In 810.71(A) change:

(A) Enclosing. The transmitter shall be enclosed in a metal frame or grille, or separated from the operating space by a barrier or other equivalent means, all metallic parts of which are effectively connected to ~~ground~~ a grounding conductor .

Article 820 In 820.93 change where first appears:

820.93 Grounding of Outer Conductive Shield of a Coaxial Cable. The outer conductive shield of the coaxial cable shall be grounded as specified by 820.100 at the building premises as close to the point of cable entrance or attachment as practicable …

In 820.100(A)(4) Exception change:

Exception: In one- and two-family dwellings where it is not practicable to achieve an overall maximum grounding conductor length of 6.0 m (20 ft), a separate ground ing electrode as specified in 250.52(A)(5), (A)(6), or (A)(7) shall be used, the grounding conductor shall be ~~grounded~~ connected to the separate ground ing electrode in accordance with 250.70, and the separate ground ing electrode shall be bonded to the power grounding electrode system in accordance with 820.100(D).

In 820.100(B)(1)(7) change:

The grounding conductor or the grounding electrode of a building or structure disconnecting means that is ~~grounded~~ connected to an electrode as covered in 250.32

In 820.106(A) change:

(A) Grounding. Where there is no mobile home service equipment located in sight from, and not more than 9.0 m (30 ft) from, the exterior wall of the mobile home it serves or there is no mobile home disconnecting means grounded in accordance with 250.32 and located within sight from, and not more than 9.0 m (30 ft) from, the exterior wall of the mobile home it serves, the coaxial cable shield ground, or surge arrester ground, shall be connected to a grounding conductor in accordance with 820.100(B)(2).

In 820.100(A)(4) Exception change:

Exception: In one- and two-family dwellings where it is not practicable to achieve an overall maximum grounding conductor length of 6.0 m (20 ft), a separate ground as specified in 250.52(A)(5), (A)(6), or (A)(7) shall be used, the grounding conductor shall be grounded to the separate ground in accordance with 250.70, and the separate ground ~~bonded~~ connected to the power grounding electrode system in accordance with 820.100(D).

In 820.106(B) change:

(B) Bonding. The coaxial cable shield grounding terminal, surge arrester grounding terminal, or grounding electrode shall be ~~bonded~~ connected to the metal frame or available grounding terminal of the mobile home with a copper grounding conductor not smaller than 12 AWG under any of the following conditions:

(1) Where there is no mobile home service equipment or disconnecting means as in 820.106(A)

(2) Where the mobile home is supplied by cord and plug

Article 830 In 830.93 change:

830.93 Grounding or Interruption of Metallic Members of Network-Powered Broadband Communications Cables. The shields of network-powered broadband communications cables used for communications or powering shall be grounded at the building as specified by 830.100 as close as practicable to the point of entrance or attachment of the NIU. Metallic cable members not used for communications or powering shall be grounded as specified by 830.100 or interrupted by an insulating joint or equivalent device as close as practicable to the point of entrance or attachment of the NIU.

In 830.151(C) Exception change:

Exception: Type BMU cable where the cable enters the building from the outside and is run in rigid metal conduit or intermediate metal conduit, and such conduits are ~~grounded~~ connected by a grounding conductor to an electrode in accordance with 830.100(B).

In 830.154(D)(3) change:

(3) Type BLU Cable Type BLU cable entering the building from outside shall be permitted to be run in rigid metal conduit or intermediate metal conduit. Such conduits shall be ~~grounded~~ connected by a grounding conductor to an electrode in accordance with 830.100(B).

Substantiation: Article 770: These changes clarify the present requirement in more prescriptive language and to clarify the connection referred to in the section. Connected is proposed to work cooperatively with the proposed revision of the definition of grounded (grounding) and equipment grounding conductor.

Article 800: These changes clarify the present requirement in more prescriptive language and to clarify the connection referred to in the section. Connected is proposed to work cooperatively with the proposed revision of the definition of grounded (grounding) and equipment grounding conductor.

Article 800.90(A)(2): These changes clarify the present requirement in more prescriptive language and to clarify the connection referred to in the section. Connected is proposed to work cooperatively with the proposed revision of the definition of bonded (bonding).

Article 810: These changes clarify the present requirement in more prescriptive language and to clarify the connection referred to in the section. Connected is proposed to work cooperatively with the proposed revision of the definition of grounded (grounding) and equipment grounding conductor.

Article 820: These changes clarify the present requirement in more prescriptive language and to clarify the connection referred to in the section. Connected is proposed to work cooperatively with the proposed revision of the definition of grounded (grounding) and equipment grounding conductor.

Article 820.100(A)(4) Exception: These changes clarify the present requirement in more prescriptive language and to clarify the connection referred to in the section. Connected is proposed to work cooperatively with the proposed revision of the definition of bonded (bonding).

Article 830: These changes clarify the present requirement in more prescriptive language and to clarify the connection referred to in the section. Connected is proposed to work cooperatively with the proposed revision of the definition of bonded (bonding).

This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to the proposed revision to the terms "bonded", "grounded", and "equipment grounding conductor" in Article 100 relative to this Task Group's recommendations. These changes clarify the present requirement in more prescriptive language.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept

Revise 770.2, Point of Entrance as follows:

Point of Entrance. The point within a building at which the cable emerges from an external wall, from a concrete floor slab, or from a rigid metal conduit (Type RMC) or an intermediate metal conduit (Type IMC) grounded connected by a grounding conductor to an electrode in accordance with 800.100(B).

FPN No 1: See 342.2 for a definition of Intermediate Metal Conduit (Type IMC).

FPN No.2: See 344.4 for a definition of Rigid Metal Conduit (Type RMC).

Revise 800.93 as follows:

800.93 Cable Grounding or Interruption of Metallic Sheath Members of Communications Cables. The metallic sheath members of communications cables entering or attached to buildings shall be grounded as specified in 800.100 as close as practicable to the point of entrance as practicable or shall be interrupted as close to the point of entrance or attachment as practicable by an insulating joint or equivalent device.

FPN: See 800.2 for definition of Point of Entrance.

Revise 820.93 as follows:

820.93 Grounding of the Outer Conductive Shield of a Coaxial Cable Cables. The outer conductive shield of the coaxial cable cables entering or attached to buildings shall be grounded as specified by 820.100 at the building premises as close to the point of cable entrance or attachment as practicable.

For purposes of this section, grounding located at mobile home service equipment located in sight from, and not more than within 9.0 m (30 ft) from, the exterior wall of the mobile home it serves, or at a mobile home disconnecting means grounded in accordance with 250.32 and located in sight from and not more than within 9.0 m (30 ft) from the exterior wall of the mobile home it serves, shall be considered to meet the requirements of this section.

FPN No. 1: See 820.2 for definition of Point of Entrance.

FPN No. 2: Selecting a grounding location to achieve the shortest practicable grounding conductor helps limit potential differences between CATV and other metallic systems.

Revise 820.100(B)(1)7 as follows: (7) The grounding conductor or the grounding electrode of a building or structure disconnecting means that is grounded connected to an electrode as covered in 250.32.

For purposes of this section, the mobile home service equipment or the mobile home disconnecting means, as described in 820.93, shall be considered accessible.

Revise 820.106(A) as follows:

(A) Grounding. Grounding shall comply with 820.106(A)(1) and (A)(2).

(1) Where there is no mobile home service equipment located in sight from, and not more than within 9.0 m (30 ft) from, of the exterior wall of the mobile home it serves, the coaxial cable shield around, or surge arrester around, shall be connected to a grounding conductor in accordance with 820.100(B)(2).

(2) Where there is no mobile home disconnecting means grounded in accordance with 250.32 and located within sight from, and not more than 9.0 m (30 ft) from, the exterior wall of the mobile home it serves, the coaxial cable

shield ground, or surge arrester ground, shall be connected to a grounding conductor in accordance with 820.100(B)(2).

Panel Statement: The panel accepts the direction of the TCC to review 770, 800, 810, 820, and 830.

The panel developed a harmonized proposal and coordinated across all articles.

See panel action on Proposal 16-25. The revised text provides editorial consistency across Articles 770, 800, 820, and 830 as proposed by the Panel 16 Editorial Task Group.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

OHDE, H.: The panel action does not reflect what the panel action should indicate. The panel revised this proposal therefore the action should be other than accept.

Comment on Affirmative:

BRUNSSEN, J.: The Panel Action should be "Accept in Principle" as the Panel made a number of changes to the submitter's text. There are also typographical errors in the Panel Meeting Action text as follows:

1. Under "Revise 770.2, Point of Entrance as follows:", delete the word "grounded" in the proposed revised definition as follows: "…. metal conduit (Type IMC) ~~grounded~~ connected by a grounding conductor ….".

2. Under "Revise 800.93 as follows:", revise the text as follows: " **800.93 ~~Cable~~ Grounding or Interruption of Metallic Sheath Members of Communications Cables.** The metallic sheath members of communications cables entering or attached to buildings shall be grounded as specified in 800.100 as close ~~as practicable~~ to the point of entrance as practicable or shall be interrupted …..."

3. Under "Revise 820.93 as follows:", revise the text as follows: " **820.93 Grounding of the Outer Conductive Shield of ~~a~~ Coaxial ~~Cable~~ Cables.** The outer conductive shield of ~~the~~ coaxial ~~cable~~ cables entering or attached …." Also revise the text concerning mobile homes as follows: "For purposes of this section, grounding located at mobile home service equipment located ~~in sight from, and not more than~~ within 9.0 m (30 ft) from, the exterior wall of the mobile home it serves, or at a mobile home disconnecting means grounded in accordance with 250.32 and located ~~in sight from and not more than~~ within 9.0 m (30 ft) from …."

4. Under "Revise 820.100(B)(7) as follows:", delete the word "grounded" as follows: "…. disconnecting means that is ~~grounded~~ connected to an electrode as covered in 250.32."

5. Under "Revise 820.106(A) as follows:", revise the text as follows: "(1) Where there is no mobile home service equipment located ~~in sight from, and not more than~~ within 9.0 m (30 ft) from ~~,~~ ~~of~~ the exterior wall of the mobile home it serves , the coaxial cable shield ground, or surge arrester ground , shall be connected to a grounding conductor in accordance with 820.100(B)(2).

(2) Where there is no mobile home disconnecting means grounded in accordance with 250.32 and located within ~~sight from, and not more than~~ 9.0 m (30 ft) from ~~,~~ the exterior wall of the mobile home it serves, the coaxial cable shield ground, or surge arrester ground, shall be connected to a grounding conductor in accordance with 820.100(B)(2).

DORNA, G.: The panel action on this proposal should have been accept in principle.

KAHN, S.: This proposal should have been reported as "accept in principle". The proposal included a number of individual items, some of which were modified by other proposals accepted by the panel on the same items.

16-4a Log #701 NEC-P16 **Final Action: Accept in Principle**
(770.2)

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.

Recommendation: Add the phrase as shown:

Point of Entrance. The point within a building at which the cable emerges from an external wall, from a concrete floor slab, or from a rigid metal conduit or an intermediate metal conduit grounded to an electrode in accordance with 800.100(B).

Substantiation: This proposal is a clarification. (Task Group No. 770-07)

Adopting this change will make the definition of point of entrance editorially consistent with the definitions in articles 820 and 830. A corollary proposal has been submitted for article 800.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.

Panel Meeting Action: Accept in Principle

Change Point of Entrance in 770.2 to read as follows:

Point of Entrance. The point within a building at which the cable emerges from an external wall, from a concrete floor slab, or from a rigid metal conduit (Type RMC) or an intermediate metal conduit (Type IMC) ~~grounded~~ connected by a grounding conductor to an electrode in accordance with 800.100(B).

FPN No 1: See 342.2 for a definition of Intermediate Metal Conduit (Type IMC).

FPN No.2: See 344.4 for a definition of Rigid Metal Conduit (Type RMC).

Panel Statement: The text inserted by the panel "connected by a grounding conductor" provides for editorial consistency across Articles 770, 800, 820, and 830. See panel action on Proposals 16-4 (770.2) and 16-21.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

OHDE, H.: This proposal should be rejected. Section 90.1 (C) of the NEC states " *This Code is not intended as a design specification or an instruction manual for the untrained persons* ." The addition of the two FPN's referencing the definitions of IMC raceway in 342.2 and RMC raceway in 344.4 is not needed nor warranted. In the submitter's substantiation he states these Fine Print Notes will help installers who are not Code experts. A trained installer will know the Code content and how the Code book is to be used.

16-5 Log #700 NEC-P16 **Final Action: Accept**
(770.2)

TCC Action: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the Panel as a Public Comment.

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.

Recommendation: Add the wording as shown:

770.2 Definitions. See Article 100. For purposes of this article, the following additional definitions apply.

Substantiation: This is an editorial change. (Task Group No. 770-06)

Adopting this change will make Article 770 editorially consistent with Articles 800, 820 and 830, which read:

800.2 Definitions. See Article 100. For purposes of this article, the following additional definitions apply.

820.2 Definitions. See Article 100. For the purposes of this article, the following additional definitions apply.

830.2 Definitions. See Article 100. For purposes of this article, the following additional definitions apply.

This change will alert optical fiber cable installers to refer to Article 100. Also, if Article 770 is moved to Chapter 8, this change will be required.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

OHDE, H.: This proposal should be rejected. 4.1 – References to Other NEC Rules of the 2003 NEC Style Manual states to avoid redundant use of references and do not use a reference if it already covered by 90.3. 90.3 - Code Arrangement states that Chapter 8 covers communications systems and is not subject to the requirements of Chapters 1 through 7 except where the requirements are specifically referenced in Chapter 8. This is the reason why in those Chapter 8 Articles that Article 100 is referenced for additional definitions. There is no reason for this to be indicated in Article 770 as Chapters 1-4 apply generally.

16-6 Log #43 NEC-P16 **Final Action: Accept**
(770.2.Abandoned Fiber Optical Cable)

TCC Action: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the Panel as a Public Comment.

Submitter: Stanley Kaufman, Cable Safe Inc.

Recommendation: Add a fine print note to the definition of Abandoned Optical Fiber Cable

Abandoned Optical Fiber Cable. Installed optical fiber cable that is not terminated at equipment other than a connector and not identified for future use with a tag.

FPN: See Article 100 for a definition of equipment.

Substantiation: The addition of a fine print note alerting installers that equipment is defined in Article 100 will help installers who are not Code experts.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

JENSEN, R.: Propose to remove the FPN from the definition and to clarify the term being defined, thereby making the committee action "Accept in Principle" rather than an "Accept".

The title section of the proposal states "(770.2, Abandoned Fiber Optical Cable)" while the recommendation stated "Abandoned Optical Fiber Cable". "Abandoned Optical Fiber Cable" is the proper term to be defined.

CMP 16 accepted proposal 16-5 which will harmonize 770.2, 800.2, 820.2, and 830.2 by including a normative reference to "See Article 100". Adding a FPN to again "See Article 100" is redundant, especially since this FPN will be two lines down from the identical wording in normative text. Additionally the 2003 NEC Style Guide specifically states to avoid redundant use of references.

OHDE, H.: This proposal should be rejected. Section 90.1 (C) of the NEC states " *This Code is not intended as a design specification or an instruction manual for the untrained persons* ." In the submitter's substantiation he states this FPN will help installers who are not Code experts. The addition of the FPN referencing Article 100 for the definition of equipment is not needed nor warranted. A trained installer will know the Code content and how the Code book is to be used.

16-7 Log #2363 NEC-P16 **Final Action: Reject**
(770.2.Abandoned Optical Fiber Cable)

Submitter: John H. Schmidt, ABC Television Network
Recommendation: In the definition for Abandoned Optical Fiber Cable, after the words "and not identified for future use with a tag" add the words "or in a database."
Substantiation: In modern large systems, cables are often identified with a number at each end, and the function of the cable is listed in a database referencing that number. This database should be adequate to identify cables for future use.
Panel Meeting Action: Reject
Panel Statement: See panel action on Proposal 16-1.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:

BRUNSSEN, J.: The Panel Statement, "See panel action on Proposal 16-1" does not address the submitter's concern, i.e., establishing a data base identifying abandoned cables. A more appropriate panel statement might be: "Panel Statement: An AHJ is unlikely to have access to the database for every building under their jurisdiction. The majority of communications technicians (installation/repair) work at multiplicity of locations. Database administrative responsibility is not identified in the proposal. Maintaining and referencing a database for every location is cumbersome, unwieldy and impractical." This is the Panel Statement that was used for similar Proposals 16-101, -102, -240 and –347.

16-8 Log #3031 NEC-P16 **Final Action: Reject**
(770.2.Abandoned Optical Fiber Cable)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Recommendation: Revise text to read as follows:

770.2 Definitions.

Abandoned Optical Fiber Cable. Installed optical fiber cable that is not terminated at equipment ~~other than a connecto~~ r and not identified for future use with a tag.

Substantiation: The definitions of abandoned cable in every article should be identical. The relevant articles are: 640, 645, 725, 760, 770, 800, 820 and 830. The definitions at articles 640 and 725 are already correct as follows:

640.2: Abandoned Audio Distribution Cable. Installed audio distribution cable that is not terminated at equipment and not identified for future use with a tag.

725.2: Abandoned Class 2, Class 3, and PLTC Cable. Installed Class 2, Class 3, and PLTC cable that is not terminated at equipment and not identified for future use with a tag.

The additional wording in this definition causes confusion. Proposals are being made to make changes to the definitions in articles 770, 800, 820 and 830, and to add a general definition into article 645 and into article 100

Panel Meeting Action: Reject
Panel Statement: See panel action on Proposal 16-1.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:

OHDE, H.: This proposal should be accepted as submitted. The submitter substantiates that the definitions of abandoned cables in Articles 640, 645, 725, 760, 770, 800, 820, and 830 should be identical. This proposal deletes unnecessary language in the present definitions and provides consistent language throughout the above articles mentioned. The panel statement does not explain the reason for rejecting this proposal other than to see panel action on Proposal 16-1.

16-9 Log #52 NEC-P16 **Final Action: Reject**
(770.2.Air Duct)

Submitter: Stanley Kaufman, Cable Safe Inc.
Recommendation: Add a definition to read as follows:

Air Duct. A conduit or passageway for conveying air to or from heating, cooling, air conditioning, or ventilating equipment, but not including the plenum. [NFPA 97:1.2.6]

Substantiation: The definition of air duct is in the definitions section of Articles 800 and 820. Add it to this article for editorial consistency.
Panel Meeting Action: Reject
Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:

JENSEN, R.: We agree with rejecting this as it was evidently an oversight to be removed during the last code cycle. Air duct was introduced for use with "air duct cable" which was not to be used in the 2005 code. Additionally, the term is not used within Article 770 even though the substantiation says it is. To further not using this term, in proposal 16-29, the panel revised the proposal to not use "air duct", but instead to harmonize code language by using the term "ventilation or air handling ducts".

16-10 Log #697 NEC-P16 **Final Action: Reject**
(770.2.Air Duct (New))

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Add the definition of "Air Duct" to Section 770.2 as follows: <u>Air Duct. A conduit or passageway for conveying air to or from heating, cooling, air conditioning,</u>
<u>or ventilating equipment, but not including the plenum. [NFPA 97:1.2.6]</u>

Substantiation: This is a technical proposal. (Task Group No. 770-03)

The tem "air duct" is now used in 770.113 Exception No. 1 and should be defined. This is a companion proposal to that for 770.113 Exception No 1.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.

The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.

Panel Meeting Action: Reject
Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:

JENSEN, R.: We agree with rejecting this as it was evidently an oversight to be removed during the last code cycle. Air duct was introduced for use with "air duct cable" which was not to be used in the 2005 code. Additionally, the term is not used within Article 770. To further not using this term, in proposal 16-29, the panel revised the proposal to not use "air duct", but instead to harmonize code language by using the term "ventilation or air handling ducts".

16-11 Log #1860 NEC-P16 **Final Action: Reject**
(770.2.Air Duct (New))

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industry Solutions
Recommendation: Add the definition of "Air Duct" to Section 770.2 as follows:
Air Duct. A conduit or passageway for conveying air to or from heating, cooling, air conditioning,
or ventilating equipment, but not including the plenum.
Substantiation: The term "air duct" is now used in 770.113 *Exception No. 1* and should be defined. This is a companion proposal to that for 770.113 *Exception No 1* .
Panel Meeting Action: Reject
Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

16-12 Log #699 NEC-P16 **Final Action: Accept**
(770.2. Cable Sheath (New))

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Add the following definition:
<u>Cable Sheath. A covering over the optical fiber assembly that includes one or more jackets and may include one or more metallic members or strength members.</u>
Substantiation: This is a technical proposal. (Task Group No. 770-05)
The term "sheath" is used in Article 770. It should be defined.
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-13 Log #26 NEC-P16 **Final Action: Reject**
(770.2.Concealed Space)

Submitter: Stanley Kaufman, Cable Safe Inc.
Recommendation: Revise as follows:
Concealed Space. That portion(s) of a building behind walls, over suspended ceilings, in pipe chases, attics, and in whose size might normally range from 44.45 mm (1 3/4 in.) stud spaces to 2.44 m (8 ft) interstitial truss spaces and that might contain combustible materials such as building structural members, thermal and/or electrical insulation, and ducting. <u>[NFPA 96:3.3.42.1]</u>
Substantiation: The term concealed space is used in 770.154(A). This definition is an extract from NFPA 96, Standard for Ventilation Control and Fire Protection of Commercial Cooking Operations. It is the only definition of concealed space in the NFPA Glossary.
Panel Meeting Action: Reject
Panel Statement: The definition may involve combustible material in environmental air spaces and, therefore, may fall under the Standards Council Decision 05-24 (SC #05-7-4).
The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:
"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."
This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
OHDE, H.: We agree with panel action and believe that the panel statement should also reflect the latest NFPA 13 Technical Committee actions since the submitter is trying to define the term "concealed spaces". We would like to add that NFPA 13 just completed their balloting process for the 2006 NFPA 13 Standard. The Technical Committee on Sprinkler Installation submitted a comment on Proposal 13-284.
This comment reworded proposed A.8.14.1.2.1 to read " *Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc…can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1) For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined* ."
In the NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

16-14 Log #4 NEC-P16 **Final Action: Reject**
(770.2.Exposed)

Submitter: Stanley Kaufman, CableSafe, Inc.
Recommendation: Delete as follows:
~~**Exposed.** The circuit is in such a position that, in case of failure of supports and insulation, contact with another circuit may result.~~
~~FPN: See Article 100 for two other definitions of *Exposed* .~~
Substantiation: There are no optical fiber circuits in Article 770. The term "exposed" used three times in Article 770. See below:
770.24 Mechanical Execution of Work. Optical fiber cables shall be installed in a neat and workmanlike manner. <u>Cables installed exposed</u> on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be secured by straps, staples, hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also conform with 300.4(D) and 300.11.
770.93 Grounding of Entrance Cables. <u>Where exposed to contact with electric light or power conductors</u> , the non-current-carrying metallic members of optical fiber cables entering buildings shall be grounded as close to the point of entrance as practicable or shall be interrupted as close to the point of entrance as practicable by an insulating joint or equivalent device.
770.154(A)
FPN: See 8.14.1 of NFPA 13 (2002), *Installation of Sprinkler Systems* , for requirements for sprinklers in concealed spaces <u>containing exposed combustibles</u> .
The above text is clear without any additional definition. Furthermore, the definition only applies to 770.93. It clearly dos not apply to 770.24 and 770.154(A)
Panel Meeting Action: Reject
Panel Statement: See panel action on Proposal 16-17.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-15 Log #702 NEC-P16 **Final Action: Accept in Principle**
(770.2.Exposed)

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Revise the definition of "Exposed" as follows:
" **Exposed <u>(to Accidental Contact)</u> .** ~~The circuit is~~ <u>A conductive optical fiber cable</u> in such a position that, in case of failure of supports ~~and~~ <u>or</u> insulation, contact <u>between the cable's non-current-carrying conductive members</u> ~~with another~~ <u>and an</u> electrical circuit may resultThis proposal is a clarification. (Task Group No. 770-08)
Substantiation: It clarifies the term "Exposed" as used in Article 770 to indicate possible contact with another circuit, as opposed to the definitions of "Exposed" contained in Article 100, i.e., live parts or wiring methods. The style used to differentiate the term is identical to that of Article 100 for consistency. The word "and" is deleted and replaced by the word "or" as either of the conditions, failure of supports or failure of insulation, may result in accidental contact. Replacing of the phrase "The circuit is" with the phrase "A circuit"

provides a consistent definition throughout Articles 770, 800, 820 and 830. This is a companion proposal to 800.2, 820.2 and 830.2.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

Panel Statement: See panel action on Proposal 16-17.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-17 Log #1940 NEC-P16 **Final Action: Accept**

(770.2.Exposed (to Accidental Contact))

Submitter: Stanley D. Kahn, Tri-City Electric Co., Inc.

Recommendation: Revise the definition of "Exposed" as follows:

"Exposed (to Accidental Contact). ~~The circuit is~~ A conductive optical fiber cable in such a position that, in case of failure of supports ~~and~~ or insulation, contact between the cable's noncurrent-carrying conductive members ~~with another~~ and an electrical circuit may result."

FPN: See Article 100 for two other definitions of Exposed.

Substantiation: This proposal is clarification. (Task Group No. 770-08A)

It clarifies the term "Exposed" as used in Article 770 to indicate possible contact with an electrical circuit, as opposed to the definitions of "Exposed" contained in Article 100, i.e., live parts or wiring methods. The style used to differentiate the term is identical to that of Article 100 for consistency. The word "and" is deleted and replaced by the word "or" as either of conditions, failure of supports or failure of insulation, may result in accidental contact. Replacing of the phrase "The circuit is" with the phrase "A conductive optical fiber cable" is appropriate as: 1) contact between an optical fiber cable and an electrical circuit is only of concern for a conductive optical fiber cable (i.e., one having non-current-carrying conductive members) and 2) the term "circuit" is typically associated with electrically conductive metallic media and not with optical (light) media. This is a companion proposal to 800.2, 820.2 and 830.2 and provides consistency and correlation in the definition of "exposed" across 770, 800, 820 and 830.

This is one of a group of proposals prepared by the CMP 16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related articles such that similar requirements are stated the same way in each article;

3) make the articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand sections.

The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

JENSEN, R.: Propose to remove the FPN from the definition, thereby making the committee action "Accept in Principle" rather than an "Accept".

CMP 16 accepted proposal 16-5 which will harmonize 770.2, 800.2, 820.2, and 830.2 by including a normative reference to "See Article 100". Adding a FPN to again "See Article 100" is redundant, especially since this FPN will be four lines down from the identical wording in normative text. Additionally, the 2003 NEC Style Manual specifically states to avoid redundant use of references.

16-18 Log #698 NEC-P16 **Final Action: Accept**

(770.2.Optical Fiber Cable (New))

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.

Recommendation: Add the following new definition:

Optical Fiber Cable. A factory assembly of one or more optical fibers having an overall covering.

Substantiation: This is a technical proposal. (Task Group No. 770-04)

The term "optical fiber cable" is used throughout Article 770. It should be defined. The proposed definition is similar to the definition of cable in Article 800

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.

Panel Meeting Action: Accept

Ballot Results: Affirmative: 15

16-19 Log #1378 NEC-P16 **Final Action: Accept in Principle**

(770.2.Optical Fiber Cables)

Submitter: Mike Holt, Mike Holt Enterprises

Recommendation: Move definition of optical fiber cables from 770.6 to 770.2

Optical Fiber Cables. Optical fiber cables transmit light for control, signaling, and communications through an optical fiber.

Substantiation: This proposal is being made to supplement my proposed deletion of section 770.6. Because the language of the existing section 770.6 is in fact a definition, it belongs in 770.2, not 770.6

Panel Meeting Action: Accept in Principle

Panel Statement: The panel agrees that a definition belongs in 770.2.

The panel does not agree that "Optical Fiber Cables" as described 770.6 is a definition.

The panel accepted the definition that was submitted in Proposal 16-18. See panel action on Proposal 16-18.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-20 Log #44 NEC-P16 **Final Action: Accept in Principle**

(770.2.Optical Fiber Raceway)

TCC Action: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the Panel as a Public Comment. It is the intention of Fine Print Notes to provide explanatory information and they are not intended as a vehicle to provide unnecessary cross-references.

Submitter: Stanley Kaufman, Cable Safe Inc.

Recommendation: Add a fine print note to the definition of Optical Fiber Raceway.

Optical Fiber Raceway. A raceway designed for enclosing and routing listed optical fiber cables.

FPN: See Article 100 for a definition of raceway.

Substantiation: The addition of a fine print note alerting installers that raceway is defined in Article 100 will help installers who are not Code experts.

Panel Meeting Action: Accept in Principle

Revise the definition of Optical Fiber Raceway as follows:

Optical Fiber Raceway. A raceway for enclosing and routing optical fiber cables.

Add a fine print note following the definition of Optical Fiber Raceway as follows:

FPN: See Article 100 for a definition of Raceway.

Panel Statement: The panel removed "design," as specification does not belong in a definition.

The panel moved "listed," as specification does not belong in a definition per NEC Manual of Style.

The change meets the submitter's intent.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

JENSEN, R.: Propose to remove the FPN from the definition, thereby expanding the committee action of "Accept in Principle".

CMP 16 accepted proposal 16-5 which will harmonize 770.2, 800.2, 820.2, and 830.2 by including a normative reference to "See Article 100". Adding a

FPN to again "See Article 100" is redundant, especially since this FPN will be six lines down from the identical wording in normative text. Additionally, the 2003 NEC Style Manual specifically states to avoid redundant use of references.

OHDE, H.: This proposal should be rejected. Section 90.1 (C) of the NEC states " *This Code is not intended as a design specification or an instruction manual for the untrained persons* ." In the submitter's substantiation he states this FPN will help installers who are not Code experts. The addition of the FPN referencing Article 100 for the definition of a raceway is not needed nor warranted. A trained installer will know the Code content and how the Code book is to be used.

16-21 Log #45 NEC-P16 **Final Action: Accept in Principle**
(770.2.Point of Entrance)

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action with respect to the panel action on Proposal 16-4a.

In addition, it was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. It is the intention of Fine Print Notes to provide explanatory information and they are not intended as a vehicle to provide unnecessary cross-references.

This action will be considered by the Panel as a Public Comment.

Submitter: Stanley Kaufman, Cable Safe Inc.

Recommendation: Revise to read as follows:

Point of Entrance. The point at which the cable emerges from an external wall, from a concrete floor slab, or from a rigid metal conduit (Type RMC) or an intermediate metal conduit (Type IMC) grounded to an electrode in accordance with 800.100(B).

FPN: See 342.2 for a definition of Intermediate Metal Conduit (Type IMC).

FPN: See 344.4 for a definition of Rigid Metal Conduit (Type RMC).

Substantiation: The addition of a fine print notes pointing installers to the definitions of intermediate metal conduit and rigid metal conduit will help installers who are not Code experts. Use of the type designations will promote consistency throughout the code.

Panel Meeting Action: Accept in Principle

The panel accepts the submitter's proposal with the following revisions:
Number the FPNs.

Panel Statement: Multiple FPNs are required to be numbered per NEC Manual of Style.

See Action on Proposal 16-4.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

OHDE, H.: This proposal should be rejected. Section 90.1 (C) of the NEC states " *This Code is not intended as a design specification or an instruction manual for the untrained persons* ." The addition of the two FPN's referencing the definitions of IMC raceway in 342.2 and RMC raceway in 344.4 is not needed nor warranted. In the submitter's substantiation he states these Fine Print Notes will help installers who are not Code experts. A trained installer will know the Code content and how the Code book is to be used.

Comment on Affirmative:

JENSEN, R.: The panel action accepts the FPNs to be renumbered. The FPN for Rigid Metal Conduit should refer to 344.2, not 344.4.

16-22 Log #5 NEC-P16 **Final Action: Reject**
(770.3)

Submitter: Stanley Kaufman, CableSafe, Inc.

Recommendation: Revise as follows:

770.3 Other Articles. ~~Circuits and equipment shall comply with 770.3(A) and 770.3(B).~~ Only those sections of Article 300 referenced in this article shall apply to optical fiber cables and raceways.

Substantiation: The scope of Article 770 does not cover circuits and equipment.

Panel Meeting Action: Reject

Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-23 Log #704 NEC-P16 **Final Action: Reject**
(770.3)

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.

Recommendation: Make the following changes:

770.3 Other Articles.

Installations of optical fiber cables and raceways ~~Circuits and equipment~~ shall comply with 770.3(A) ~~and~~ 770.3(B) . Only those sections of Article 300 referenced in this article shall apply to optical fiber cables and raceways.

Substantiation: This proposal is a clarification. (Task Group No. 770-10)

There are no circuits and equipment in Article 770 which only covers optical fiber cables and raceways. The proposed wording is more accurate. Reference to 770.3(B) has been deleted to correlate with other proposals from the task group.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.

Panel Meeting Action: Reject

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-24 Log #3106 NEC-P16 **Final Action: Reject**
(770.3)

Submitter: Donald Hall, Corning Cable Systems

Recommendation: Revise text to read as follows:

770.3 Other Articles.

Circuits and equipment shall comply with 770.3(A) and 770.3(B). Only those sections of Article 300 referenced in this article shall apply to optical fiber cables and raceways.

(A) Spread of Fire or Products of Combustion. The requirements of 300.21 for electrical installations shall also apply to optical fiber cables and raceways. ~~The accessible portion of a~~ Abandoned audio distribution cables shall be removed.

Also, add the following FPN to 770.3(A):

FPN: ANSI/NECA/BICSI 568-2001, Standard for Installing Commercial Building Telecommunications Cabling, and other industry standards provide recommended cable installation practices which facilitate the eventual removal of cables as they become abandoned.

Substantiation: Abandoned cable should be removed to reduce unnecessary accumulation of fuel load and promote electrical safety. It is not reasonable or necessary to install cables in a manner that prevents their eventual removal.

The proposed FPN will provide useful information to architects, system designers, and installers to help minimize the cost and inconvenience of removing abandoned cable.

Panel Meeting Action: Reject

Panel Statement: The proposal would require all abandoned cable to be removed, irrespective of accessibility, presenting a compliance conundrum to installers. Without access, it is impossible to remove cables that are securely fastened without damaging the building or adjacent cables. The submitter's substantiation states: "It is not reasonable or necessary to install cables in a manner that prevents their eventual removal." However, the panel previously imposed additional securing and supporting requirements by referencing 300.11 in 770.24. Gaining access may sometimes require disassembly of part of the building. This is not the intent of the panel. The current requirement to remove only the accessible portion is reasonable. The submitter further proposes to add an FPN following 770.3(A) that is already contained in 770.24.

Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:

OHDE, H.: We concur with submitter's substantiation and believe a change of wording will ensure that are abandoned cables are remove and prevent confusion in future. We suggest that the submitter resubmit his recommendation in the 2008 ROC stage in a more appropriate section with Part 1 – General so these requirements will apply throughout the entire Article. The FPN that the submitter submitted is not required as this Standard is very basic and really does not provide enough information that is applicable to the removal of abandoned cables.

16-25 Log #713 NEC-P16 **Final Action: Accept in Principle**
(770.3, 770.133(C) and 770.100 (new))

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal with respect to the use of the word "and" in the sentence "The grounding conductor shall be connected in accordance with 770.100(B)(1), (B)(2), and (B)(3)."

It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 5-20. This action will be considered by the Panel as a Public Comment.

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Make the following changes:

770.3 Other Articles.
Circuits and equipment shall comply with 770.3(A) and 770.3(B). Only those sections of Chapter 2 and Article 300 referenced in this article shall apply to optical fiber cables and raceways.

770.101 ~~133(C)~~ Grounding of Cables Within Buildings . NonÐcurrent-carrying conductive members of optical fiber cables within buildings shall be grounded in accordance with Article 250.

770.133(C) Support of Cables. Raceways shall be used for their intended purpose. Optical fiber cables shall not be strapped, taped, or attached by any means to the exterior of any conduit or raceway as a means of support.
Exception: Overhead (aerial) spans of optical fiber cables shall be permitted to be attached to the exterior of a raceway-type mast intended for the attachment and support of such cables .

IV. Grounding Methods

770.100 Entrance Cable Grounding.
Where required by 770.93, the non-current-carrying metallic members of optical fiber cables entering buildings shall be grounded as specified in 770.100(A) through 770.100(D).

(A) Grounding Conductor.

(1) Insulation. The grounding conductor shall be insulated and shall be listed as suitable for the purpose.

(2) Material. The grounding conductor shall be copper or other corrosion-resistant conductive material, stranded or solid.

(3) Size. The grounding conductor shall not be smaller than 14 AWG.

(4) Length. The grounding conductor shall be as short as practicable.

(5) Run in Straight Line. The grounding conductor shall be run to the grounding electrode in as straight a line as practicable.

(6) Physical Protection. Where necessary, the grounding conductor shall be guarded from physical damage. Where the grounding conductor is run in a metal raceway, both ends of the raceway shall be bonded to the grounding conductor or the same terminal or electrode to which the grounding conductor is connected.

(B) Electrode. The grounding conductor shall be connected in accordance with 770.100(B)(1) and (B)(2).

(1) In Buildings or Structures with Grounding Means. To the nearest accessible location on the following:

(1) The building or structure grounding electrode system as covered in 250.50
(2) The grounded interior metal water piping system, within 1.5 m (5 ft) from its point of entrance to the building, as covered in 250.52
(3) The power service accessible means external to enclosures as covered in 250.94
(4) The metallic power service raceway
(5) The service equipment enclosure
(6) The grounding electrode conductor or the grounding electrode conductor metal enclosure
(7) The grounding conductor or the grounding electrode of a building or structure disconnecting means that is grounded to an electrode as covered in 250.32

(2) In Buildings or Structures Without Grounding Means. If the building or structure served has no grounding means, as described in 770.100(B)(1), the grounding conductor shall be connected to either of the following:

(1) To any one of the individual electrodes described in 250.52(A)(1), (A)(2), (A)(3), or (A)(4)
(2) If the building or structure served has no grounding means, as described in 770.100(B)(1) or (B)(2)(1), to an effectively grounded metal structure or to a ground rod or pipe not less than 1.5 m (5 ft) in length and 12.7 mm (in.) in diameter, driven, where practicable, into permanently damp earth and separated from lightning conductors and at least 1.8 m (6 ft) from electrodes of other systems. Steam or hot water pipes or air terminal conductors (lightning-rod conductors) shall not be employed as electrodes for optical fiber cables.

(C) Electrode Connection. Connections to grounding electrodes shall comply with 250.70.

(D) Bonding of Electrodes. A bonding jumper not smaller than 6 AWG copper or equivalent shall be connected between the optical fiber cable grounding electrode and power grounding electrode system at the building or structure served where separate electrodes are used.

FPN No. 1: See 250.60 for use of air terminals (lightning rods).

FPN No. 2: Bonding together of all separate electrodes limits potential differences between them and between their associated wiring systems.

Substantiation: This proposal contains technical as well as editorial changes. (Task Group No. 770-19)

Section 770.93 requires the grounding or interruption of the non-current-carrying metallic members of optical fiber entrance cables. However, Article 770 does not provide any guidance on how to carry out the grounding. Proposed new section 770.100 provides that guidance; it is based on 800.100. It is technically sound to treat fiber optics cables similarly to communications cables, with the exception of the "20-foot rule" as contained in 800.100(A)(4) that is appropriate where there is a metallic (electrically conductive) communications circuit and the electrical conductors connect to the utilization equipment. In the case of OF cable, it is unlikely that the metallic member will be electrically connected to the utilization equipment. Hence, this added restriction (requirement) is unnecessary for OF cables.

The current 770.133(C) has been renumbered to move the grounding requirement into the new Part IV, Grounding Methods. Article 250, which is referenced in Article 770, is the only part of Chapter 2 that is relevant to optical fiber cable, so this proposal states that only those sections of Chapter 2 that are referenced in Article 770 shall apply to Article 770. Chapter 2 deals with electrical installation wiring and protection, while Article 770 is nonelectrical.

The new text for 770.133(C) provides guidance on support of conductors that was missing from Article 770 but present in Articles 800, 820 and 830.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.

The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.

Panel Meeting Action: Accept in Principle

Accept the submitter's proposed revisions to 770.3.

Relocate current 770.133(C) Grounding to new Section 770.101 as follows:

770.101 Grounding. Non–current-carrying conductive members of optical fiber cables shall be grounded according to the grounding methods specified by 770.100.

Replace current 770.133(C) with new text to 770.133(C) Support of Cables.

Accept proposed text to 770.100 (new) in principle.

Change 770.93 as follows:

770.93 Grounding or Interruption of Non-Current-Carrying Metallic Members of Optical Fiber Cables. Where exposed to contact with electric light or power conductors, the non–current-carrying metallic members of optical fiber cables entering or attached to buildings shall be connected to an electrode by a grounding conductor as close to the point of entrance or attachment as practicable or shall be interrupted as close to the point of entrance or attachment as practicable by an insulating joint or equivalent device.

Add new Part IV as follows:

Part IV. Grounding Methods.

770.100 Entrance Cable Grounding. Where grounded, the non–current-carrying metallic members of optical fiber cables entering buildings shall be grounded as specified in 770.100(A) through 770.100(D).

(A) Grounding Conductor.

(1) Insulation. The grounding conductor shall be insulated and shall be listed.

(2) Material. The grounding conductor shall be copper or other corrosion-resistant conductive material, stranded or solid.

(3) Size. The grounding conductor shall not be smaller than 14 AWG. It shall have a current-carrying capacity approximately equal to or greater than that of the metallic member(s). The grounding conductor shall not be required to exceed 6 AWG.

(4) Run in Straight Line. The grounding conductor shall be run to the grounding electrode in as straight a line as practicable.

(5) Physical Damage. Where necessary, the grounding conductor shall be guarded from physical damage. Where the grounding conductor is run in a metal raceway, both ends of the raceway shall be bonded to the grounding conductor or the same terminal or electrode to which the grounding conductor is connected.

(B) Electrode. The grounding conductor shall be connected in accordance with 770.100(B)(1), (B)(2), and (B)(3).

(1) In Buildings or Structures with an Intersystem Grounding Termination. If the building or structure served has an intersystem grounding termination, the grounding conductor shall be connected to the intersystem grounding termination.

(2) In Buildings or Structures with Grounding Means. If the building or structure served has no intersystem grounding termination, the grounding conductor shall be connected to the nearest accessible location on the following:

(1) The building or structure grounding electrode system as covered in 250.50

(2) The grounded interior metal water piping system, within 1.5 m (5 ft) from its point of entrance to the building, as covered in 250.52

(3) The power service accessible means external to enclosures as covered in 250.94

(4) The metallic power service raceway

(5) The service equipment enclosure

(6) The grounding electrode conductor or the grounding electrode conductor metal enclosure

(7) The grounding conductor or the grounding electrode of a building or structure disconnecting means that is grounded to an electrode as covered in 250.32

(3) In Buildings or Structures Without Intersystem Grounding Termination or Grounding Means. If the building or structure served has no intersystem grounding termination or grounding means, as described in 770.100(B)(2), the grounding conductor shall be connected to either of the following:

(1) To any one of the individual electrodes described in 250.52(A)(1), (A)(2), (A)(3), or (A)(4)

(2) If the building or structure served has no grounding means, as described in 770.100(B)(2) or (B)(3)(1), to an effectively grounded metal structure or to a ground rod or pipe not less than 1.5 m (5 ft) in length and 12.7 mm (in.) in diameter, driven, where practicable, into permanently damp earth and separated from lightning conductors as covered in 800.53 and at least 1.8 m (6 ft) from electrodes of other systems. Steam or hot water pipes or air terminal conductors (lightning-rod conductors) shall not be employed as electrodes for protectors.

(C) Electrode Connection. Connections to grounding electrodes shall comply with 250.70.

(D) Bonding of Electrodes. A bonding jumper not smaller than 6 AWG copper or equivalent shall be connected between the grounding electrode and power grounding electrode system at the building or structure served where separate electrodes are used.

Exception: At mobile homes as covered in 770.106.

FPN No. 1: See 250.60 for use of air terminals (lightning rods).

FPN No. 2: Bonding together of all separate electrodes limits potential differences between them and between their associated wiring systems.

Add new section 770.106 as follows:

770.106 Grounding of Entrance Cables at Mobile Homes.

Where grounded as required by 770.100 at a mobile home, the non–current-carrying metallic members of optical fiber cables entering buildings shall be grounded as specified in 770.106(A) and (B).

(A) Grounding. Where there is no mobile home service equipment located within 9.0 m (30 ft) from the exterior wall of the mobile home it serves, or there is no mobile home disconnecting means grounded in accordance with 250.32 and located within 9.0 m (30 ft) from the exterior wall of the mobile home it serves, the ground for non–current-carrying metallic members of optical fiber cables entering buildings shall be in accordance with 770.100(B)(3).

(B) Bonding. The primary protector grounding terminal or grounding electrode shall be bonded to the metal frame or available grounding terminal of the mobile home with a copper grounding conductor not smaller than 12 AWG under either of the following conditions:

(1) Where there is no mobile home service equipment or disconnecting means as in 770.106(A)

(2) Where the mobile home is supplied by cord and plug

Panel Statement: The panel incorporated into the proposal material from Proposals 16-55 and 16-66. The changes clarified the submitter's intent.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-26 Log #1379 NEC-P16 **Final Action: Reject**
(770.3(A))

Submitter: Mike Holt, Mike Holt Enterprises

Recommendation: Delete text concerning abandoned cables

770.3 Other Articles.

Circuits and equipment shall comply with 770.3(A) and 770.3(B). Only those sections of Article 300 referenced in this article shall apply to optical fiber cables and raceways.

(A) Spread of Fire or Products of Combustion. The requirements of 300.21 for electrical installations shall also apply to installations of optical fiber cables and raceways. ~~The accessible portion of abandoned optical fiber cables shall be removed.~~

(B) Ducts, Plenums, and Other Air-Handling Spaces. The requirements of 300.22 for electric wiring shall also apply to installations of optical fiber cables and raceways where they are installed in ducts or plenums or other space used for environmental air.

Exception: As permitted in 770.154(A).

Substantiation: The NEC is an installation standard, not a maintenance standard. Because of this, this rule should not be a part of the NEC. Furthermore, this provision does not accomplish its intent, as the code is not a retroactive document. To require abandoned cables to be removed is similar to requiring facilities to update their receptacles to the new GFCI provision every three years. With that said, the only time this rule applies is when an installer creates an abandoned cable. Also, this provision does not fall within the purpose of the NEC 90.1(A). The NEC is concerned with the hazards created from the use of electricity…this rule seems to imply that a cable with a voltage applied to it is safe, but a cable with no voltage applied to it is dangerous.

This proposal is also being made to 725.3(B), 760.3(A), 800.3(C), 820.3(A) and 830.3(A).

Panel Meeting Action: Reject

Panel Statement: Abandoned cable removal requirements do belong in the NEC. Removal of abandoned cables is a difficult and somewhat controversial issue. The concern is not for a cable with no voltage applied, but for the accumulation of combustible material in concealed spaces should a fire be initiated by electrical or other means.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-27 Log #2807 NEC-P16 **Final Action: Accept in Part**
(770.3(A))

Submitter: Harold C. Ohde, IBEW #134

Recommendation: Revise text to read as follows:

770.3 Other Articles. No change.

(A) Spread of Fire or Products of Combustion. ~~The requirements of~~ 300.21 ~~for electrical installations shall also apply to installations of optical fiber cables and raceways~~ shall apply . ~~The accessible portion of abandoned optical fiber cables shall be removed.~~

Substantiation: The requirements for removal of abandoned optical fiber cables would be better suited in appropriate code section within Article 770. I have submitted another proposal that would move the abandoned optical fiber cables requirements to 770.24 - Mechanical Execution of Work. The abandoned optical fiber cables requirements are out of place in 770.3 - Other Articles. The requirements are not part of another Article as they are part of Article 770 and are located within Article 770.

The addition of the words “shall apply” would incorporate language that is consistent with 800.3, 820.3 and 830.3.

Similar proposals have been submitted for 640.3, 725.3, 760.3, 800.3, 820.3, and 830.3 to revise these sections as well.

Panel Meeting Action: Accept in Part

The panel accepts the part that deletes the second sentence of 770.3(A) concerning abandoned cables. The Panel rejects the proposed revisions to the first sentence.

Panel Statement: The panel agrees that the requirement to remove abandoned cable does not belong in 770.3 and should be relocated. A direct reference to Section 300.21 is inappropriate, as it applies to electrical installations; optical fiber cables are not electrical cables. See panel action on Proposal 16-31 that relocates the requirement to remove abandoned cable to 770.25 (new) and restates the spread of fire requirements in optical fiber terms in 770.26 (new).

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

OHDE, H.: This proposal should have been accepted as originally submitted. The panel statement seems to be in conflict as it states the provisions of 300.21 will work well in the new proposed section 770.26 but not in 770.3(A) where it has always been properly located. The panel accepted the same 300.21 requirements whose concern is the spread of fire and products of combustion in hollow spaces, vertical shafts and ventilation and air- handling ducts caused by electrical installations and located them in 770.26.

16-28 Log #3006 NEC-P16 **Final Action: Reject**
(770.3(A))

Submitter: Marcelo M. Hirschler, GBH International

Recommendation: Revise text to read as follows:

770.2 Definitions.

Abandoned Optical Fiber Cable. Installed optical fiber cable that is not terminated at equipment other than a connector and not identified for future use with a tag.

770.3 Other Articles.

Circuits and equipment shall comply with 770.3(A) and 770.3(B). Only those sections of Article 300 referenced in this article shall apply to optical fiber cables and raceways.

(A) Spread of Fire or Products of Combustion. The requirements of 300.21 for electrical installations shall also apply to installations of optical fiber cables and raceways. ~~The accessible portion of abandoned~~ Abandoned optical fiber cables shall be removed. Removal of abandoned cables shall not damage the building structure or finish and shall not compromise the performance of adjacent wiring systems or components.

Substantiation: This comment recommends a change in wording to ensure that abandoned cables are removed and to prevent confusion in future. There have been multiple proposals that would permit some cables to remain in "inaccessible spaces". This is not conducive to safe electrical practice; this the key change is the elimination of the words "the accessible portion of".

If the intent of the code-making panel was to clarify that removal of cable should not be done if such removal would damage the building, which is obviously not the intent, a second sentence can be added stating that removal of abandoned cables shall not be performed if it would damage the building structure or finish or in any way compromise the functional performance of any other wiring systems or components. This would be accomplished by the optional added sentence.

Consistent wording on removal of abandoned cables is being proposed for sections: 640.3, 725.3, 770.3, 770.154, 800.3, 800.154, 820.3, 820.154 and 830.3.

For information, see the relevant definitions in the NEC.

Accessible (as applied to equipment). Admitting close approach; not guarded by locked doors, elevation, or other effective means.

Accessible (as applied to wiring methods). Capable of being removed or exposed without damaging the building structure or finish or not permanently closed in by the structure or finish of the building.

Accessible, Readily (Readily Accessible). Capable of being reached quickly for operation, renewal, or inspections without requiring those to whom ready access is requisite to climb over or remove obstacles or to resort to portable ladders, and so forth.

Concealed. Rendered inaccessible by the structure or finish of the building. Wires in concealed raceways are considered concealed, even though they may become accessible by withdrawing them.

Isolated (as applied to location). Not readily accessible to persons unless special means for access are used.

Panel Meeting Action: Reject

Panel Statement: The proposal neither enhances nor clarifies the existing requirements. The submitter basically would expand the text of 770.3(A) by repeating much of the text of the Article 100 definition of "Accessible (as applied to wiring methods)". The proposed requirement presents a compliance conundrum to installers. Without access, it is impossible to remove cables that are securely fastened without damaging the building or adjacent cables. Gaining access may sometimes require disassembly of part of the building. This is not the intent of the panel. The current requirement to remove only the accessible portion is reasonable.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

OHDE, H.: We concur with submitter's substantiation and believe a change of wording will ensure that are abandoned cables are remove and prevent confusion in future. We suggest that the submitter resubmit his recommendation in the 2008 ROC stage in a more appropriate section with Part 1 – General so these requirements will apply throughout the entire Article.

16-29 Log #2774 NEC-P16 **Final Action: Accept in Principle in Part (770.3(A), 770.25 (new) & 770.26 (new))**

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal with the Panel Action in Proposal 16-25 since there was accepted text for 770.3(A) in Proposal 16-25 and this Proposal 16-29 deletes 770.3(A). This action will be considered by the Panel as a Public Comment.

Submitter: Allen C. Weidman, The Society of the Plastics Industry, Inc.

Recommendation: Delete 770.3(A) and relocate material in new 770.25 and 770.26 as shown:

~~**770.3(A) Spread of Fire or Products of Combustion.** The requirements of 300.21 for electrical installations shall also apply to installations of optical fiber cables and raceways. The accessible portion of abandoned optical fiber cables shall be removed.~~

770.25. Abandoned Cables. The accessible portion of abandoned optical fiber cables shall be removed.

770.26 Spread of Fire or Products of Combustion. Installations of optical fiber cables and raceways in hollow spaces, concealed spaces, vertical shafts, and air ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations of optical fiber cables and raceways through fire-resistant–rated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating.

FPN No. 1: Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made. Building codes also contain restrictions on membrane penetrations on opposite sides of a fire-resistance–rated wall assembly. An example is the 600-mm (24-in.) minimum horizontal separation that usually applies between boxes installed on opposite sides of the wall. Assistance in complying with 770.26 can be found in building codes, fire resistance directories, and product listings.

FPN No. 2: FPN: See 8.14.1 of NFPA 13-2002, *Installation of Sprinkler Systems* , for requirements for sprinklers in concealed spaces containing exposed combustibles.

Substantiation: The title of Section 770.3 is "Other Articles". The requirement for the removal of abandoned cables is not in another article; it is in Article 770. It is out of place in section 770.3. This proposal will move it to a new section of Article 770. The reference to section 300.21 for optical fiber cables and raceways is awkward because section 300.21 deals with electrical installations. The text of proposed section 770.26 is based on section 300.21 but modified to apply to optical fiber cables and raceways. For clarity, "ventilation or air-handling ducts" has been simplified by replacing it with "air ducts". Also, "concealed spaces" have been added to the list of areas requiring fire protection vigilance (hollow spaces, vertical shafts, and air ducts) to correlate with NFPA 13, *Installation of Sprinkler Systems,* which has requirements for protecting concealed spaces. A FPN is included to refer users to the NFPA 13 requirements.

Panel Meeting Action: Accept in Principle in Part

Panel Statement: The panel accepts the submitter's deletion of 770.3(A), the addition of 770.25 (new), and the addition of 770.26 (new), but revises "air ducts" to "ventilation or air handling ducts" in keeping with the existing NEC text. The panel accepts FPN No. 1.

See panel action and panel statement on Proposal 16-31.

The panel rejects the addition of FPN No. 2 because it introduces undefined terminology. "Concealed spaces" should be adequately defined. See panel action on Proposals 16-13, 16-110, and 16-247 where the proposed definition was determined to be unacceptable.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

OHDE, H.: This proposal should be deleted in its entirety. We agree that the requirements for the removal of abandoned cables are out of place in 770.3(A) and needs to be located in another section within Part 1 –General. There are other proposed proposals with the same intent to locate the abandoned cable requirements that seem better suited and make good enforceable code.

The substantiation provided to delete 770.3(A) which contains the requirements of 300.21 is unclear. Substantiation indicated the reference of 300.21 for optical fiber cables and raceways was awkward because 300.21 deal with electrical installation. Yet with the submitter's new 770.26 (which is the language of 300.21 in its entirety) talks about installations of electrical equipment such as optical fiber cables and raceways. In addition there is no need for the FPN No.1 to be mentioned as the language in 770.3(A) clearly states the requirements of 300.21 apply. 300.21 has the identical FPN that is being proposed.

We believe that the panel statement should also reflect the latest NFPA 13 Technical Committee actions. Included in the submitter's substantiation was the 2002 Section 8.14 which since has been revised. We would like to add that NFPA 13 just completed their balloting process for the 2006 NFPA 13 Standard. The Technical Committee on Sprinkler Installation submitted a comment on Proposal 13-284.

This comment reworded proposed A.8.14.1.2.1 to read " *Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc…can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1) For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined* ."

In the NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

16-30 Log #3312 NEC-P16 **Final Action: Accept in Principle in Part (770.3(A), 770.25 (new) & 770.26 (new))**

Submitter: William E. Koffel, Koffel Assoc., Inc. / Rep. Society of the Plastics Industry

Recommendation: Delete 770.3(A) and relocate material in new 770.25 and 770.26 as shown:

~~**770.3(A) Spread of Fire or Products of Combustion.** The requirements of 300.21 for electrical installations shall also apply to installations of optical fiber cables and raceways. The accessible portion of abandoned optical fiber cables shall be removed.~~

770.25 Abandoned Cables. The accessible portion of abandoned optical fiber cables shall be removed.

770.26 Spread of Fire or Products of Combustion. Installations of optical fiber cables and raceways in hollow spaces, concealed spaces, vertical shafts, and air ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations of optical fiber cables and raceways through fire-resistant–rated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating.

FPN No. 1: Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made. Building codes also contain restrictions on membrane penetrations on opposite sides of a fire-resistance–rated wall assembly. An example is the 600-mm (24-in.) minimum horizontal separation that usually applies between boxes installed on opposite sides of the wall. Assistance in complying with 770.26 can be found in building codes, fire resistance directories, and product listings.

FPN No. 2: FPN: See 8.14.1 of NFPA 13, *Installation of Sprinkler Systems*, for requirements for sprinklers in concealed spaces containing exposed combustibles.

Substantiation: The title of Section 770.3 is "Other Articles". The requirement for the removal of abandoned cables is not in another article; it is in Article 770. It is out of place in Section 770.3. This proposal will move it to a new section of Article 770. The reference to Section 300.21 for optical fiber cables and raceways is awkward because Section 300.21 deals with electrical installations. The text of proposed Section 770.26 is based on Section 300.21 but modified to apply to optical fiber cables and raceways. For clarity, "ventilation or air-handling ducts" has been simplified by replacing it with "air ducts". Also, "concealed spaces" have been added to the list of areas requiring fire protection vigilance (hollow spaces, vertical shafts, and air ducts) to correlate with NFPA 13, *Installation of Sprinkler Systems*, which has requirements for protecting concealed spaces. A FPN is included to refer users to the NFPA 13 requirements. It should be noted that the section number may need to be revised once the 2006 Edition of NFPA 13 is published.

Panel Meeting Action: Accept in Principle in Part

Panel Statement: See panel action and statement on Proposal 16-29.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

OHDE, H.: See my Explanation of Negative on Proposal 16-29.

16-31 Log #705 NEC-P16 **Final Action: Accept in Principle**
(770.3(A), 770.25 (new) and 770.26 (new))

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal and that further consideration be given to the comments expressed in the affirmative voting. This action will be considered by the Panel as a Public Comment.

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.

Recommendation: Delete 770.3(A) and relocate material in new 770.25 and 770.26 as shown:

~~**770.3(A) Spread of Fire or Products of Combustion.** The requirements of 300.21 for electrical installations shall also apply to installations of optical fiber cables and raceways. The accessible portion of abandoned optical fiber cables shall be removed.~~

770.25. Abandoned Cables. The accessible portion of abandoned optical fiber cables shall be removed.

770.26 Spread of Fire or Products of Combustion.Ê Installations of optical fiber cables and raceway in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations of optical fiber cables and raceways through fire-resistantÐrated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating.

FPN: Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made. Building codes also contain restrictions on membrane penetrations on opposite sides of a fire-resistanceÐrated wall assembly. An example is the 600-mm (24-in.) minimum horizontal separation that usually applies between boxes installed on opposite sides of the wall. Assistance in complying with 770.26 can be found in building codes, fire resistance directories, and product listings.

Substantiation: This proposal is editorial. (Task Group No. 770-11)

The title of Section 770.3 is "Other Articles". The requirement for the removal of abandoned cables is not in another article; it is in Article 770. It is out of place in section 770.3. This proposal will move it to a new section of Article 770. The reference to section 300.21 for optical fiber cables and raceways is awkward because section 300.21 deals with electrical installations. The text of proposed section 770.26 is based on section 300.21 but modified to apply to optical fiber cables and raceways

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.

The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.

Panel Meeting Action: Accept in Principle

The panel accepts the submitter's direction.

In addition, delete alpha reference (B) to 770.3 only so there are not two separate subsections. Retain the exception.

Add a new subsection 770.26 to read as follows:

770.26 Spread of Fire or Products of Combustion. Installations of optical fiber cables and rac eways in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations of optical fiber cables and raceways through fire-resistant-rated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating.

Panel Statement: The panel edited the submitter's text for editorial clarity.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

OHDE, H.: This proposal should be deleted in its entirety. We agree that the requirements for the removal of abandoned cables are out of place in 770.3(A) and needs to be located in another section within Part 1 –General. There are other proposed proposals with the same intent to locate the abandoned cable requirements that seem better suited and make good enforceable code.

The substantiation provided to delete 770.3(A) which contains the requirements of 300.21 is unclear. Substantiation indicated the reference of 300.21 for optical fiber cables and raceways was awkward because 300.21 deal with electrical installation. Yet with the submitter's new 770.26 (which is the language of 300.21 in its entirety) talks about installations of electrical equipment such as optical fiber cables and raceways. In addition there is no need for the FPN No.1 to be mentioned as the language in 770.3(A) clearly states the requirements of 300.21 apply. 300.21 has the identical FPN that is being proposed.

Comment on Affirmative:

BRUNSSEN, J.: The Panel Meeting Action needs to be clarified to indicate that the Panel also accepted the FPN associated with 770.26 (new). See Panel Action on Proposals 16-128 and –259.

DORNA, G.: The panel action needs to be clarified. The panel accepted the FPN. See panel action on parallel Proposals 16-128 and 16-259.

KAHN, S.: The panel action requires correction as the FPN was accepted. See parallel Proposals 16-128 and 16-259.

16-32 Log #32 NEC-P16 **Final Action: Reject**
(770.3(B))

Submitter: Stanley Kaufman, Cable Safe Inc.

Recommendation: Delete as follows:

~~**(B) Ducts, Plenums, and Other Air-Handling Spaces.** The requirements of 300.22 for electric wiring shall also apply to installations of optical fiber cables and raceways where they are installed in ducts or plenums or other space used for environmental air.~~

~~*Exception: As permitted in 770.154(A).*~~

Substantiation: Section 770.3(B) provides no additional guidance or requirements that are not already in 770.154(A). It's redundant and perhaps confusing to send a optical fiber cable installer to section 300.22 to look for requirements that are already in Article 770. Section 800.3 does not have a similar requirement. Elimination of 770.3(B) will improve the parallelism between the articles.

Panel Meeting Action: Reject

Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-33 Log #706 NEC-P16 **Final Action: Reject**
(770.3(B))

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Delete the following:
~~**(B) Ducts, Plenums, and Other Air-Handling Spaces.** The requirements of 300.22 for electric wiring shall also apply to installations of optical fiber cables and raceways where they are installed in ducts or plenums or other space used for environmental air.~~
~~*Exception: As permitted in 770.154(A).*~~
Substantiation: This proposal is editorial. (Task Group No.770-12)
Section 770.3(B) provides no additional guidance or requirements that are not already in 770.154(A). It's redundant and perhaps confusing. Section 800.3 does not have a similar requirement.
Acceptance of this proposal will make Articles 770, 800, 820 and 830 consistent and in compliance with section 3.3.5 of the NEC Style Manual, shown below:
3.3.5 Parallel Construction. Parallel construction means stating similar requirements in similar ways for greater consistency. This helps makes the *NEC* clear for users. Lack of consistency often creates confusion, causing users to ask: *Does this difference in wording represent a different requirement? Or is it simply two different ways of trying to say the same thing?* There are several kinds of parallel construction:
Organization and Numbering . If practicable, the subsections of similar articles should be numbered in the same order (see 2.4.1).
Sections. Different sections, within the same article, that reflect similar or closely related subjects, should have similar structures.
Lists. All items in a list should be parallel (that is, singular or plural, written in the same verb tense, using phrases or sentences but not a mix).
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.
Panel Meeting Action: Reject
Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:
"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-34 Log #897 NEC-P16 **Final Action: Reject**
(770.4)

Submitter: Noel Williams, Noel Williams Consulting
Recommendation: Revise 770.4 as follows:
"...Cables installed exposed ~~on the surface of ceilings and sidewalls~~ shall be supported in such a manner...The installations shall also conform to 300. 4 ~~(D)~~ and 300.11." (Other portions to remain unchanged.)
Substantiation: Current cable support rules apply only to cables exposed to view (on surfaces). Cables above ceilings are "exposed" as defined, but such cables are only required to be "neat and workmanlike." All of 300.4 should apply (or none of it). 300.4(D) is only for cables run parallel to framing.
Panel Meeting Action: Reject
Panel Statement: The panel recognizes that the proposal is intended to address 770.24. There are multiple definitions of "exposed" in the NEC. The appropriate Article 100 definition in this case is "Exposed (as applied to wiring methods). On or attached to the surface or behind panels designed to allow access". The phrase "on the surface of ceilings and sidewalls" is appropriate to which portion of the definition is being addressed. Compliance with 300.4(D) has been a Code requirement for many years, resulting in an exemplary safety record. It is inappropriate and poor workmanship to permit damage to optical cable by nails, screws or other construction/decorative attachments.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-35 Log #1380 NEC-P16 **Final Action: Reject**
(770.6)

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Move definition of optical fiber cables from 770.6 to 770.2
~~**770.6 Optical Fiber Cables.** Optical fiber cables transmit light for control, signaling, and communications through an optical fiber.~~
Substantiation: This section contains no requirements and is inconsistent with the rest of the National Electrical Code.
An additional proposal is being submitted to 770.2 to add a definition of Optical Fiber Cables, using the existing language of 770.6
Panel Meeting Action: Reject
Panel Statement: Section 770.6 describes the function of optical fiber cables.
See panel action on Proposal 16-19.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-36 Log #703 NEC-P16 **Final Action: Accept**
(770.9, 770.2 and 770.3)

TCC Action: The Technical Correlating Committee understands that the accepted text for 770.3(A) replaces the text deleted by the Panel Action on Proposal 16-29.
Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Make the following changes:
~~**770.9 Types.**~~
~~Optical fiber cables can be grouped into three types.~~
~~**(A) Nonconductive.** These cables contain no metallic members and no other electrically conductive materials.~~
~~**(B) Conductive.** These cables contain nonÐcurrent-carrying conductive members such as metallic strength members, metallic vapor barriers, and metallic armor or sheath.~~
~~**(C) Composite.** These cables contain optical fibers and current-carrying electrical conductors, and shall be permitted to contain nonÐcurrent-carrying conductive members such as metallic strength members and metallic vapor barriers. Composite optical fiber cables shall be classified as electrical cables in accordance with the type of electrical conductors.~~
Establish three new definitions in 770.2 Definitions.
<u>**Cable, Nonconductive Optical Fiber.** These optical fiber cables contain no metallic members and no other electrically conductive materials.</u>
<u>**Cable, Conductive Optical Fiber.** These optical fiber cables contain nonÐcurrent-carrying conductive members such as metallic strength members, metallic vapor barriers, and metallic armor or sheath.</u>
<u>**Cable, Composite Optical Fiber.** These cables contain optical fibers and current-carrying electrical conductors.</u>
Revise 770.3 Other Articles.
<u>**(A) Composite Cables** . Composite optical fiber cables shall be classified as electrical cables in accordance with the type of electrical conductors. They shall be constructed, listed and marked in accordance with the appropriate article for each type of electrical cable.</u>
Substantiation: This is an editorial proposal. (Task Group No. 770-09)
The components of Section 770.9 are in the wrong place. The definitions belong in the definitions section. The requirement that composite cable be classified as electrical cable belongs in the other articles section. This proposal moves the components of 770.9 to the correct places. A definition of optical fiber cable has been proposed separately. The new text for 770.3 has been lettered (A) to correlate with another proposal from the task group that deleted the existing (A).
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
OHDE, H.: This proposal should be rejected as the new lettered 770.3(A) is in conflict with the present lettered 770.3(A).

16-37 Log #59 NEC-P16 **Final Action: Accept in Principle**
(770.12)

Submitter: Stanley Kaufman, Cable Safe Inc.
Recommendation: Revise as follows;

770.12 ~~Raceways for Optical Fiber Cables.~~
I ~~nstallations of raceways shall comply with 770.12(A) through.~~
~~**(A) Listed Chapter 3 Raceways.** Listed optical fiber cable shall be permitted to be installed in any type of listed raceway permitted in Chapter 3 where that listed raceway is installed in accordance with Chapter 3. Where optical fiber cables are installed within raceway without current-carrying conductors, the raceway fill tables of Chapter 3 and Chapter 9 shall not apply. Where nonconductive optical fiber cables are installed with electric conductors in a raceway, the raceway fill tables of Chapter 3 and Chapter 9 shall apply.~~
~~**(B) Optical Fiber Raceways.** Listed optical fiber cable shall be permitted to be installed in listed plenum optical fiber raceway, listed riser optical fiber raceway, or listed general-purpose optical fiber raceway installed in accordance with 770.154 and 362.24 through 362.56, where the requirements applicable to electrical nonmetallic tubing shall apply.~~
~~**(C)**~~ **Innerduct.** Listed plenum optical fiber raceway, listed riser optical fiber raceway, or listed general-purpose optical fiber raceway installed in accordance with 770.154 shall be permitted to be installed as innerduct in any type of listed raceway permitted in Chapter 3.
~~**(D) Entering Buildings.** Unlisted underground or outside plant construction plastic innerduct entering the building from the outside shall be terminated and firestopped at the point of entrance.~~

Substantiation: This is a corollary proposal to proposals that move the requirements of 77012(A), (B) and (C) to other sections leaving only 770.12(C) in 770.12.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 16-38.

Explanation of Negative:
OHDE, H.: See my Explanation of Negative on Proposal 16-38.

16-38 Log #707 NEC-P16 **Final Action: Accept in Principle**
(770.12 and 770.110 (New))

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Make the following changes:

770.12 ~~Raceways~~ Innerduct for Optical Fiber Cables.
~~Installations of raceways shall comply with 770.12(A) through 770.12(D).~~
~~770.12(A) Listed Chapter 3 Raceways. Listed optical fiber cable shall be permitted to be installed in any type of listed raceway permitted in Chapter 3 where that listed raceway is installed in accordance with Chapter 3 . Where optical fiber cables are installed within raceway without current-carrying conductors, the raceway fill tables of Chapter 3 and Chapter 9 shall not apply. Where nonconductive optical fiber cables are installed with electric conductors in a raceway, the raceway fill tables of Chapter 3 and Chapter 9 shall apply .~~
~~770.12(B) Optical Fiber Raceways. Listed optical fiber cable shall be permitted to be installed in listed plenum optical fiber raceway, listed riser optical fiber raceway, or listed general-purpose optical fiber raceway installed in accordance with 770.154 and 362.24 through 362.56 , where the requirements applicable to electrical nonmetallic tubing shall apply.~~
~~**(C) Innerduct.**~~ Listed plenum optical fiber raceway, listed riser optical fiber raceway, or listed general-purpose optical fiber raceway installed in accordance with 770.154 shall be permitted to be installed as innerduct in any type of listed raceway permitted in Chapter 3.
~~**(D) Entering Buildings.** Unlisted underground or outside plant construction plastic innerduct entering the building from the outside shall be terminated and firestopped at the point of entrance~~
770.110 Raceways for Communications Wires and Cables.
Where optical fiber cables are installed in a raceway, the raceway shall be either of a type permitted in Chapter 3 and installed in accordance with Chapter 3 or listed plenum optical fiber raceway, listed riser optical fiber raceway, or listed general-purpose optical fiber raceway installed in accordance with 770.154, and with 362.24 through 362.56, where the requirements applicable to electrical nonmetallic tubing apply.ÊWhere optical fiber cables are installed in raceway without current-carrying conductors, the raceway fill tables of Chapter 3 and Chapter 9 shall not apply. Where nonconductive optical fiber cables are installed with electric conductors in a raceway, the raceway fill tables of Chapter 3 and Chapter 9 shall apply.

Substantiation: This is an editorial proposal. (Task Group No. 770-13)
Installation requirements for optical fiber, communications and CATV raceways are:
770.12(A) Listed Chapter 3 Raceways. Listed optical fiber cable shall be permitted to be installed in any type of listed raceway permitted in Chapter 3 where that listed raceway is installed in accordance with Chapter 3 . Where optical fiber cables are installed within raceway without current-carrying conductors, the raceway fill tables of Chapter 3 and Chapter 9 shall not apply. Where nonconductive optical fiber cables are installed with electric conductors in a raceway, the raceway fill tables of Chapter 3 and Chapter 9 shall apply.
770.12(B) Optical Fiber Raceways. Listed optical fiber cable shall be permitted to be installed in listed plenum optical fiber raceway, listed riser optical fiber raceway, or listed general-purpose optical fiber raceway installed in accordance with 770.154 and 362.24 through 362.56 , where the requirements applicable to electrical nonmetallic tubing shall apply.
770.12(C) Innerduct. Listed plenum optical fiber raceway, listed riser optical fiber raceway, or listed general-purpose optical fiber raceway installed in accordance with 770.154 shall be permitted to be installed as innerduct in any type of listed raceway permitted in Chapter 3.Ê
770.12(D) Entering Buildings. Unlisted underground or outside plant construction plastic innerduct entering the building from the outside shall be terminated and firestopped at the point of entrance.
800.110 Raceways for Communications Wires and Cables.
Where communications wires and cables are installed in a raceway, the raceway shall be either of a type permitted in Chapter 3 and installed in accordance with Chapter 3 or a listed nonmetallic raceway complying with 800.182, and installed in accordance with 362.24 through 362.56, where the requirements applicable to electrical nonmetallic tubing apply.
Exception: Conduit fill restrictions shall not apply.
820.110 Raceways for Coaxial Cables.
Where coaxial cables are installed in a raceway, the raceway shall be either of a type permitted in Chapter 3 and installed in accordance with Chapter 3 or a listed nonmetallic raceway complying with 820.182(A), (B), or (C), as applicable, and installed in accordance with 362.24 through 362.56, where the requirements applicable to electrical nonmetallic tubing apply.
Exception: Conduit fill restrictions shall not apply.
Article 770 is not editorially consistent with Articles 800 and 820. This proposal will relocate 770.12(A) and 770.12(B) to 770.110 in order for the location on these requirements to be consistent with the Articles 800 and 820. Corollary proposals are being submitted for Articles 800 and 820 to use similar text. Specifically mentioning each plenum, riser and general-purpose raceway, rather that using the term “nonmetallic raceway” is more user-friendly. Section (D) has been deleted to correlate with another task group proposal has been submitted to place the requirements for entrance raceway in a new Part II, in section 770.48 Unlisted Cables and Raceways Entering Buildings. Since section (C) is the only part left in 770.12, it will no longer be a subsection; it has been renumbered accordingly.
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) mprove the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.
Panel Meeting Action: Accept in Principle
Delete 770.12(A), (B), (C), and (D).
Change 770.12 to read as follows:
770.12 Innerduct for Optical Fiber Cables. Listed plenum optical fiber raceway, listed riser optical fiber raceway, or listed general-purpose optical fiber raceway selected in accordance with the provisions of 770.154 shall be permitted to be installed as innerduct in any type of listed raceway permitted in Chapter 3.
Add new 770.110 as follows:
770.110 Raceways for Optical Fiber Cables. Where optical fiber cables are installed in a raceway, the raceway shall be of a type either permitted in Chapter 3 and installed in accordance with Chapter 3 or listed plenum optical fiber raceway, listed riser optical fiber raceway, or listed general-purpose optical fiber raceway selected in accordance with the provisions of 770.154, and installed in accordance with 362.24 through 362.56, where the requirements applicable to electrical nonmetallic tubing apply. Where optical fiber cables are installed in raceway without current-carrying conductors, the raceway fill tables of Chapter 3 and Chapter 9 shall not apply. Where nonconductive optical fiber cables are installed with electric conductors in a raceway, the raceway fill tables of Chapter 3 and Chapter 9 shall apply.
Panel Statement: The panel has revised the submitter’s text for clarity.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
OHDE, H.: This proposal should be modified. Change the last part of the first sentence of the new 770.110 as follows: “and installed in accordance with 362.10, 362.12 and 362.24 through 362.56, where the requirements applicable to electrical nonmetallic tubing apply”.
The Chapter 3 raceways must be installed in accordance with all of the requirements of Chapter 3. These raceways (general-purpose, riser) should also have to be installed in accordance with 362.10 and 362.12 since they have the same or similar characteristics to ENT.

16-39 Log #68 NEC-P16 **Final Action: Reject**
(770.12(A) (New))

Submitter: Michael Rytelewski, Rytel Electric #8372
Recommendation: Add new text to read:
The maximum fill capacity of all conduit raceways used with optical fiber cables shall not exceed 50 percent fill capacity.
Substantiation: This is to ensure that the installer does not over fill the conduit raceways which could lead to premature fiber failure because of the installation.
Panel Meeting Action: Reject
Panel Statement: See 770.12 of the Code.
The submitter has not provided adequate substantiation that there is a safety issue.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
OHDE, H.: We agree with the submitter's intent that there should be a maximum fill capacity of conduit raceways with optical fibers, however he has not provided any substantiation to the panel to review. The submitter should submit such substantiation for the panel to review in the 2008 NEC ROC stage.

16-40 Log #61 NEC-P16 **Final Action: Accept in Principle**
(770.12(A), 770.12(B) and 770.110 (New))

Submitter: Stanley Kaufman, Cable Safe Inc.
Recommendation: Revise as follows:
~~**(A) Listed Chapter 3 Raceways.** Listed optical fiber cable shall be permitted to be installed in any type of listed raceway permitted in Chapter 3 where that listed raceway is installed in accordance with Chapter 3. Where optical fiber cables are installed within raceway without current-carrying conductors, the raceway fill tables of Chapter 3 and Chapter 9 shall not apply. Where nonconductive optical fiber cables are installed with electric conductors in a raceway, the raceway fill tables of Chapter 3 and Chapter 9 shall apply.~~
~~**770.12(B) Optical Fiber Raceways.** Listed optical fiber cable shall be permitted to be installed in listed plenum optical fiber raceway, listed riser optical fiber raceway, or listed general-purpose optical fiber raceway installed in accordance with 770.154 and 362.24 through 362.56, where the requirements applicable to electrical nonmetallic tubing shall apply~~ .
770.110 Raceways for Communications Wires and Cables. Where optical fiber cables are installed in a raceway, the raceway shall be either of a type permitted in Chapter 3 and installed in accordance with Chapter 3 or listed plenum optical fiber raceway, listed riser optical fiber raceway, or listed general-purpose optical fiber raceway installed in accordance with 770.154, and with 362.24 through 362.56, where the requirements applicable to electrical nonmetallic tubing apply. Where optical fiber cables are installed in raceway without current-carrying conductors, the raceway fill tables of Chapter 3 and Chapter 9 shall not apply. Where nonconductive optical fiber cables are installed with electric conductors in a raceway, the raceway fill tables of Chapter 3 and Chapter 9 shall apply.
Substantiation: Installation requirements for optical fiber, communications and CATV raceways are:
770.12(A) Listed Chapter 3 Raceways. Listed optical fiber cable shall be permitted to be installed in any type of listed raceway permitted in Chapter 3 where that listed raceway is installed in accordance with Chapter 3. Where optical fiber cables are installed within raceway without current-carrying conductors, the raceway fill tables of Chapter 3 and Chapter 9 shall not apply. Where nonconductive optical fiber cables are installed with electric conductors in a raceway, the raceway fill tables of Chapter 3 and Chapter 9 shall apply.
770.12(B) Optical Fiber Raceways. Listed optical fiber cable shall be permitted to be installed in listed plenum optical fiber raceway, listed riser optical fiber raceway, or listed general-purpose optical fiber raceway installed in accordance with 770.154 and 362.24 through 362.56, where the requirements applicable to electrical nonmetallic tubing shall apply.
770.12(C) Innerduct. Listed plenum optical fiber raceway, listed riser optical fiber raceway, or listed general-purpose optical fiber raceway installed in accordance with 770.154 shall be permitted to be installed as innerduct in any type of listed raceway permitted in Chapter 3.
770.12(D) Entering Buildings. Unlisted underground or outside plant construction plastic innerduct entering the building from the outside shall be terminated and firestopped at the point of entrance.
800.110 Raceways for Communications Wires and Cables. Where communications wires and cables are installed in a raceway, the raceway shall be either of a type permitted in Chapter 3 and installed in accordance with Chapter 3 or a listed nonmetallic raceway complying with 800.182, and installed in accordance with 362.24 through 362.56, where the requirements applicable to electrical nonmetallic tubing apply.
Exception: Conduit fill restrictions shall not apply.
820.110 Raceways for Coaxial Cables. Where coaxial cables are installed in a raceway, the raceway shall be either of a type permitted in Chapter 3 and installed in accordance with Chapter 3 or a listed nonmetallic raceway complying with 820.182(A), (B), or (C), as applicable, and installed in accordance with 362.24 through 362.56, where the requirements applicable to electrical nonmetallic tubing apply.
Exception: Conduit fill restrictions shall not apply.
Article 770 is not editorially consistent with Articles 800 and 820. This proposal will relocate 770.12(A) and 770.12(B) to 770.100 in order for the location on these requirements to be consistent with the Articles 800 and 820. Corollary proposals are being submitted for Articles 800 and 820 to use similar text. Specifically mentioning each plenum, riser and general-purpose raceway, rather that using the term "nonmetallic raceway" is more user-friendly. Another proposal has been submitted to place the requirements for entrance raceway in a new Part II, in section 770.48 Unlisted Cables and Raceways Entering Buildings.

(770.24)

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Delete requirement to comply with 300.4(D)
770.24 Mechanical Execution of Work.
Optical fiber cables shall be installed in a neat and workmanlike manner. Cables installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be secured by straps, staples, hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also conform with ~~300.4(D) and~~ 300.11.
Substantiation: There is no reason to protect limited energy circuits from accidental contact with nails or screws. Limited energy circuits are considered to be inherently safe from a fire and electric shock perspective, hence the allowances of lesser wiring methods and allowances for open splicing with out boxes. The protection of these circuits is a design and/or performance issue, not a safety issue. The requirement found in the existing *Code* text does not fit into the purpose of the NEC, as addressed in 90.1(A).
Panel Meeting Action: Reject
Panel Statement: Compliance with 300.4(D) has been a Code requirement for many years, resulting in an exemplary safety record. While optical fiber cables generally do not contain power and there is little or no shock hazard, it is inappropriate and poor workmanship to permit damage to the optical fiber cable by nails, screws, or other construction/decorative attachments.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-43 Log #1382 NEC-P16 **Final Action: Accept in Principle**
(770.24)

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Add "Cable Ties" to the list of supporting methods
770.24 Mechanical Execution of Work.
Optical fiber cables shall be installed in a neat and workmanlike manner. Cables installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be secured by straps,

staples, <u>cable ties</u> , hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also conform with 300.4(D) and 300.11.

Substantiation: This is being proposed in an effort to create uniform language with the chapter three cable wiring method support sections, specifically, 230.30(A), 330.30(A) and 334.30. Similar proposals are also being made to 725.8, 640.6, 760.8, 800.24, 820.24 and 830.24

Panel Meeting Action: Accept in Principle

Change 770.24 to read as follows:

770.24 Mechanical Execution of Work.

Optical fiber cables shall be installed in a neat and workmanlike manner. Cables installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be secured by <u>listed hardware including</u> straps, staples, <u>cable ties,</u> hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also conform to 300.4(D) and 300.11.

Panel Statement: The panel accepted the requirement for listing in accordance with Proposal 16-45 and includes a clear requirement for listed hardware.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 11 Negative: 3 Abstain: 1

Explanation of Negative:

BOYER, J.: NEMA does not believe that all such product used for the securement of communications circuits need be listed. Code Panel 8 has steadily rejected similar proposals relating to the support of conduit and cables. UL 1565 provides requirements for listed cable ties intended for primary support of flexible conduits and cables in accordance with the NEC. Such cable ties must have a minimum loop tensile strength rating of 23 kg (50 lbs) or greater. NEMA proposes that the panel reconsider its action and ACCEPT the proposal in principle and in part with the following action. Accept the proposed addition of “cable ties” in the third sentence, reject the requirement that all such hardware be “listed”, and add the following new fourth sentence. “ <u>Cable ties that provide primary support for such cables shall have a minimum loop tensile strength of 23 kg (50 lbs.</u>)”

BRUNSSEN, J.: Listed hardware including cable ties, cable tie mounts, staples, conduit straps and similar hardware are covered under specific UL categories and are listed as suitable for use in air handling spaces. This proposal should have been rejected per the Standards Council directive relative to such proposals. The Standards Council directive should be applied consistently to all applicable proposals.

DORNA, G.: See my explanation of negative vote on Proposal 16-45.

Explanation of Abstention:

KAHN, S.: Though I agree with the proposal and the submitter’s intent to introduce consistency, the material is used in plenums and other air handling spaces and the proposal should be subjected to the direction given by the Standards Council relative to such proposals and rejected. The directive of the Standards Council, as interpreted, must be applied consistently.

16-44 Log #1862 NEC-P16 **Final Action: Reject**
(770.24)

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industry Solutions

Recommendation: In the final sentence, delete the reference to 300.11 as follows:

“The installation shall also conform with 300.4(D) ~~and 300.11~~ .”

Substantiation: The requirement added by Panel 16 during the 2005 revision cycle is overly restrictive and inappropriate for optical fiber cables. The Fine Print Note associated with 770.24 presently directs the reader to the appropriate installation practices for such cables. Section 300.11 is directed toward power cable assemblies that are heavier and larger than optical fiber cables. Further, optical fiber cables typically contain no electrical power. Deletion of the reference to 300.11 will yield consistency throughout the NEC as Panel 3 did not see fit to adopt this reference in Articles 760 and 725.

Panel Meeting Action: Reject

Panel Statement: The requirements of 300.11 are applicable to optical fiber cables.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

BRUNSSEN, J.: This proposal should be accepted. The requirement added by Panel 16 during the 2005 revision cycle is overly restrictive and inappropriate for optical fiber cables. The Fine Print Note associated with 770.24 directs the reader to the appropriate installation standards. The Panel has enhanced the Fine Print Note during this cycle by the addition of a reference to ANSI/NECA/FOA 301-2004 covering the installation of optical fiber cables (see Proposal 16-46). These references are all that is necessary and sufficient for such cables without imposing the burdensome requirements of 300.11. Section 300. 11 is directed toward power cable assemblies that are heavier and larger than optical fiber cables. Optical fiber cables contain no power. (Where composite optical fiber cables are used, they are classified as electrical cables in accordance with the type of electrical conductors.)

JOHNSON, S.: I agree with the submitter’s points in his proposal. 300.11 deals with cables that are larger and heavier than optical fiber cables. Referencing 300.11 also creates an inconsistency with Sections 760 and 725, which deal with similar sized cables and do not make this reference. I vote against the Panel’s action to reject.

16-45 Log #3052 NEC-P16 **Final Action: Accept in Principle in Part**
(770.24)

Submitter: Harold C. Ohde, IBEW #134

Recommendation: Revise 770.24 as follows:

770.24 Mechanical Execution of Work

(A) <u>**Neat and Workmanlike Manner.**</u> Optical fiber <u>equipment</u> , cables <u>and circuits</u> shall be installed in a neat and workmanlike manner.

(B) <u>**Installation of Optical Fiber Cables.**</u> Optical fiber cables installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the optical fiber cable will not be damaged by normal building use. Such cables shall be secured by <u>listed</u> straps, stapes, hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also comply with 300.4(D) and 300.11.

FPN: Accepted industry practices are described in ANSI/NECA/BICSI 568-2001, *Standard for Installing Commercial Building Telecommunications Cabling,* and other ANSI- approved installation standards.

(C) <u>Abandoned Optical Fiber Cables. Abandoned optical fiber cables shall be removed.</u>

<u>FPN: Accepted industry practices are described in ANSI/NECA/BICSI 568-2001, Standard for Installing Commercial Building Telecommunications Cabling, and other ANSI- approved standards which provide cable installation that facilitates the removal of abandoned cables.</u>

Substantiation: This proposal revises this section into a practical working tool which will assist in making 770.24 a clear, usable and enforceable code. Each first level subdivision contains a code rule that requires action and the required action has been presented din clear, usable and enforceable manner.

In the electrical industry, the electrician, contractor and AHJ have been taught the importance and significance of the concept of mechanicla execution of work. I am an electrical instructor who teaches this important concept to the people involved. This is one of the basis for 90.1(A) which serves as the purpose of this Code. The Code’s purpose is to provide a safe installation from hazards arising from the use of electricity.

The revised text in 770.24(A) will require all optical fiber equipment, cables and circuits to be installed in a neat and workmanlike manner.

770.24(B) is an editorial change with additional language to require the means of securing and supporting to be listed for the purpose.

The addition of 770.24(C) would replace the requirements that were located in 770.3(A), 770.154(A), and 770.154(B). It makes sense to have the requirements of both the installation of cable and the removal of cable in the same Code section. This would provide the proper guidance to everyone involved. The installer, contractor and the AHJ would gain from this revised section as the rules are centrally located in one Code section. If optical fiber cable is installed properly then the removal of optical fiber cable should be no problem if it is not needed anymore or abandoned. The proposed FPN will provide useful guidance and information to everyone involved regarding correct installation practices which would facilitate the removal of the cable as well.

Similar proposals have been submitted for 640.6, 725.8, 760.8 800.24, 820.24, and 830.24.

Panel Meeting Action: Accept in Principle in Part

Panel Statement: The panel accepts the incorporation of the term “listed”. See panel action on Proposal 16-43.

The panel accepts in principle the part of the proposal that recommends relocating requirements for abandoned cable. See panel Action on Proposal 16-31 for the correct text.

The panel does not accept the breaking up of 770.24 and the changes to the FPN.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 10 Negative: 4 Abstain: 1

Explanation of Negative:

BRUNSSEN, J.: See my explanation of negative vote on Proposal 16-43.

DORNA, G.: The UL Directory (2005), shows that category ZODZ covers “cable ties, cable tie mounts and similar types of related hardware”. Likewise, Conduit and Fittings, category DWFV covers “cable ties, conduit straps, staples and similar hardware...”. Both categories list as “Suitable for use in air handling spaces in accordance with 300.22(C) and (D) of the National Electrical Code.” This proposal should have been rejected because of the Standards Council decision concerning NFPA 90A.

OHDE, H.: This proposal should have been accepted in part. The FPN located after 770.24 (C) is not required as this Standard is very basic and really does not provide enough information that is applicable to the removal of abandoned cables.

PREZIOSO, L.: The proposal adds a Fine Print Note (FPN) identifying an ANSI/NECA/BICSI Standard as the source for identifying accepted industry practices. While FPNs are not enforceable, referencing these standards in a FPN as a means for determining the acceptable industry standard is, at best, misleading. I fully support these standards, but on many projects these standards are not incorporated as requirements into the design or the construction of the system or the building. The owners and tenants often waive compliance with these standards as a means of reducing costs. In this situation, the installation of wires and cables cannot be completed in accordance with the standards, and it is therefore unfair to reference these standards as accepted industry practices. Accordingly, the proposal should be rejected and the FPN should not be added to the NEC.

Explanation of Abstention:

KAHN, S.: Though I agree with the proposal and the submitter's intent to introduce consistency, the material is used in plenums and other air handling spaces and the proposal should be subjected to the direction given by the Standards Council relative to such proposals and rejected. The directive of the Standards Council, as interpreted, must be applied consistently.

16-46 Log #2274 NEC-P16 **Final Action: Accept in Principle**
(770.24, FPN)

Submitter: H. Brooke Stauffer, National Electrical Contractors Assn. (NECA)
Recommendation: 770.24 Revise the Fine Print Note to read as follows:

FPN: Accepted industry practices are described in ANSI/NECA/FOA 301-2004, Standard for Installing and Testing Fiber Optic Cables, and other ANSI-approved installation standards.

Substantiation: This standard, which was published after the 2002 National Electrical Code, provides more detailed guidance for optical fiber installations than ANSI/NECA/BICSI 568-2001.

Panel Meeting Action: Accept in Principle

Change FPN to read as follows:

FPN: Accepted industry practices are described in ANSI/NECA/BICSI 568-2001, Standard for Installing Commercial Building Telecommunications Cabling, ANSI/NECA/FOA 301-2004, Standard for Installing and Testing Fiber Optic Cables, and other ANSI-approved installation standards.

Panel Statement: The panel combined the submitter's FPN with the existing text.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 12 Negative: 3

Explanation of Negative:

BOYER, J.: See NEMA's negative comment on Proposal 16-136.

OHDE, H.: This proposal should have been rejected because CMP 16 members were not provided a copy of this standard to review prior the 2008 ROP.

PREZIOSO, L.: The proposal adds a Fine Print Note (FPN) identifying an ANSI/NECA/BICSI Standard as the source for identifying accepted industry practices. While FPNs are not enforceable, referencing these standards in a FPN as a means for determining the acceptable industry standard is, at best, misleading. I fully support these standards, but on many projects these standards are not incorporated as requirements into the design or the construction of the system or the building. The owners and tenants often waive compliance with these standards as a means of reducing costs. In this situation, the installation of wires and cables cannot be completed in accordance with the standards, and it is therefore unfair to reference these standards as accepted industry practices. Accordingly, the proposal should be rejected and the FPN should not be added to the NEC.

16-47 Log #2888 NEC-P16 **Final Action: Reject**
(770.24, FPN)

Submitter: Ron Alley, ELECTRICO
Recommendation: Delete the following FPN:

~~FPN: Accepted industry practices are described in ANSI/NECA/BICSI 568-2001, Standard for Installing Commercial Building Telecommunications Cabling, and other ANSI approved installation standards.~~

Substantiation: Numerous consensus standards from organizations such as Electronics Industry Association (EIA), Telecommunication Industry Association (TIA), Underwriters Laboratories Inc. (UL), NEMA, IEEE, and IEC/ISO could be added as a Fine Print Note throughout the Code to assist the reader of the NEC as the existing FPN notes do. There are just as many publications such as Telecommunications Cabling Installation, Network Cabling, Telecommunications Cable Splicing, Communications Cabling, Telecommunications Internetworking and too many others to mention, that could be listed in a FPN that would benefit the reader. Also, there are safety regulations, pertaining to telecommunication systems such as OSHA 1910 and OSHA 1926 that could be added as a Fine Print Note to assist readers to make their companies and workers safer. Adding a Fine Print Note for the purpose of informing the reader of all related standard and publications would be cumbersome. The FPN should be deleted unless it lists all pertinent standards and publications.

The particular standard mentioned in the FPN, (ANSI/NECA/BICSI 568-2001 (Installing Commercial Building Telecommunications Cabling) contains only 46 pages. The Standard mentioned in the FPN is very basic. It lists only a small percentage of the terminations used in the industry. Also, only a limited number of communications cables are shown and their limitations are not discussed. The standard does not contain enough information to be used as a stand alone document without the use of other standards and text books that are not mentioned in the FPN. In my opinion the ANSI standard listed in the FPN should never be used instead of manufacturer's instructions.

Manufacturer's instructions are sometimes required to be included as a condition of listing or labeling of telecommunications equipment and are sent wit the listed or labeled products or can be requested from the manufacturer prior to installation. The FPN in the 2005 Code most likely will not be as up to date as the manufacturer's instructions.

If the committee decides to keep the FPN, please consider modifying the FPN as follows:

ANSI/NECA/BICSI 568-2001 Standard for Installing Commercial Building Telecommunications Cabling is one source of many that can be used along with manufacturer's instructions.

Panel Meeting Action: Reject

Panel Statement: The references provided in the FPN provide guidance for installation in a neat and workmanship like manner.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

OHDE, H.: This proposal should have been accepted. The submitter substantiates that there are numerous consensus standards from reputable organization that also could be added to assist the reader of the NEC as existing FPN do. The ANSI/NECA/BICSI 568-2001 Standard is also a very basic and non-informative document that does not provide much guidance to the installer.

PREZIOSO, L.: The proposal removes a Fine Print Note (FPN) identifying an ANSI/NECA/BICSI Standard as the source for identifying accepted industry practices. While FPNs are not enforceable, referencing these standards in a FPN as a means for determining the acceptable industry standard is, at best, misleading. I fully support these standards, but on many projects these standards are not incorporated as requirements into the design or the construction of the system or the building. The owners and tenants often waive compliance with these standards as a means of reducing costs. In this situation, the installation of wires and cables cannot be completed in accordance with the standards, and it is therefore unfair to reference these standards as accepted industry practices. Accordingly the proposal should be accepted and the FPN should be removed.

16-48 Log #1761 NEC-P16 **Final Action: Reject**
(770.24 Exception)

Submitter: Percy E. Pool, Verizon NS
Recommendation: Add the following exception to 770.24:

"Exception: 300.11(C) shall not apply."

Substantiation: 300.11(C) is clearly not applicable to optical fiber (OF) cables. OF cables are typically lashed together to form a "cable assembly". This frequently occurs during modifications or additions to an existing installation. OF cables are physically smaller and lighter than power cables and carry no power. It is overly restrictive to prohibit lashing of OF cables together to form a cable assembly. OF cables secured in this manner have adequate support (see 300.11(A)), are supported independently of the suspended ceiling grid, and are not likely to collapse in the event the suspended ceiling collapses. Such restriction imposes additional installation costs with no improvement in safety.

Panel Meeting Action: Reject

Panel Statement: The requirements of 300.11(C) are applicable to optical fiber cables.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

BRUNSSEN, J.: This proposal should be accepted. If the Panel continues to support the addition of the requirements of 300.11 to 770.24, then at the very least, the requirements of 300.11(C) should be waived. Section 300.11(C) is clearly not applicable to optical fiber cables. Typical installation practice is to lash optical fiber cables together to form a "cable assembly". This frequently occurs during modifications or additions to an existing installation. Optical fiber cables are physically smaller and lighter than power cables and carry no power. Application of 300.11(C) is overly restrictive and will preclude lashing of optical fiber cables together to form a cable assembly. Optical fiber cables secured in this manner have adequate support (see 300.11(A)), are supported independently of the suspended ceiling grid, and are not likely to collapse in the event the suspended ceiling collapses. Such restriction imposes additional installation costs with no improvement in safety.

JOHNSON, S.: I agree with the submitter's points in his proposal. There is no safety issue that should preclude the long-standing practice of lashing an additional optical cable to an existing bundle that is already installed and supported properly where it is owned by the same entity. These cables are lightweight, and carry no voltage or current. No evidence has been shown that this practice has not been used safely and successfully in the past and should not continue to be allowed. I vote against the Panel's action to reject.

16-49 Log #54 NEC-P16 **Final Action: Accept in Principle**
(770.25 (New), 770.26 (New), & 770.3(A))

Submitter: Stanley Kaufman, Cable Safe Inc.
Recommendation: Revise as follows:
770.25. Abandoned Cables. The accessible portion of abandoned optical fiber cables shall be removed.
FPN: See Article 100 for a definition of "accessible"
770.26 Spread of Fire or Products of Combustion. Installations of optical fiber cables and optical fiber raceways in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations of optical fiber cables and optical fiber raceways through fire-resistant-rated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating.
FPN: See Article 100 for the definition of "approved".
~~**770.3(A) Spread of Fire or Products of Combustion.** The requirements of 300.21 for electrical installations shall also apply to installations of optical fiber cables and raceways. The accessible portion of abandoned optical fiber cables shall be removed.~~
Substantiation: The title of Section 770.3 is "Other Articles". The requirement for the removal of abandoned cables is not in another article; it is in Article 770. It is out of place in section 770.3. This proposal will move it to a new section of Article 770. The reference to section 300.21 for optical fiber cables and raceways is awkward because section 300.21 deals with electrical installations . The text of proposed section 770.26 is based on section 300.21 but modified to apply to optical fiber cables and optical fiber raceways. The fine print notes are intended to assist installers who are not code experts and may not be aware of Article 100. The fine print note in 300.21 was not copied because does not provide sufficient guidance for an optical fiber cable installer.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 16-31.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
OHDE, H.: This proposal should be deleted in its entirety. We agree that the requirements for the removal of abandoned cables are out of place in 770.3(A) and needs to be located in another section within Part 1 –General. There are other proposed proposals with the same intent to locate the abandoned cable requirements that seem better suited and make good enforceable code.
The substantiation provided to delete 770.3(A) which contains the requirements of 300.21 is unclear. Substantiation indicated the reference of 300.21 for optical fiber cables and raceways was awkward because 300.21 deal with electrical installation. Yet with the submitter's new 770.26 (which is the language of 300.21 in its entirety) talks about installations of electrical equipment such as optical fiber cables and raceways.
In addition, Section 90.1 (C) of the NEC states " *This Code is not intended as a design specification or an instruction manual for the untrained persons* ." In the submitter's substantiation he states these FPN's will help installers who are not Code experts. The addition of the FPN following 770.25 referencing Article 100 for the definition of accessible the FPN following 770.26 referencing Article 100 for the definition of approved is not needed nor warranted. A trained installer will know the Code content and how the Code book is to be used.

16-50 Log #2653 NEC-P16 **Final Action: Accept in Principle in Part**
(770.30)

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action and Statement on this Proposal and that further consideration be given to the comments expressed in the affirmative votes. This action will be considered by the Panel as a Public Comment.
Submitter: Robert W. Jensen, dbi / Rep. BICSI, A Telecommunications Association
Recommendation: Consolidated from various areas to a new section:
770.30. Abandoned Cables. The accessible portion of abandoned optical fiber cables shall be removed.
Remove wording in 770.154(A), Abandoned cables shall not be permitted to remain.
Remove wording in 770-154(B)(1), Abandoned cables shall not be permitted to remain.
Substantiation: The title of Section 770.3 is "Other Articles". The requirement for the removal of abandoned cables is not in another article; it is in Article 770. It is out of place in section 770.3. This proposal will move it to a new section of Article 770. The deletion of the requirements to remove abandoned cable in 770.154(A) and (B) corrects an error.
Panel Meeting Action: Accept in Principle in Part
The panel accepts in principle the recommendation to move the abandoned cable requirements. See panel action on Proposal 16-31.
Panel Statement: The panel rejects the submitter's action on 770.154(A) and accepts the change to 770.154(B)(1). See panel action on Proposal 16-184.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
OHDE, H.: We agree with the submitter's intent to locate all abandoned cable requirements to a new section in Part 1- General within the Article. Part 1-General applies to the entire article and therefore would reduce the confusion. We believe that not just the accessible portion of abandoned cables but all abandoned cables be removed to reduce the fuel load.
Comment on Affirmative:
BRUNSSEN, J.: The reference to Proposal 16-184 in the Panel Statement is incorrect. The correct reference is 16-84.
DORNA, G.: The reference to 16-184 in the panel statement is incorrect. It should be 16-84.
KAHN, S.: The panel statement requires correction as the proper reference is to Proposal 16-84.

16-51 Log #709 NEC-P16 **Final Action: Accept in Principle**
(770.48 (new), 770.113 Exception No.1 Parts II, III and IV, & 770.12(D))

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Renumber existing parts II, III and IV as shown:
III ~~II.~~ Protection
IV ~~III.~~ Cables Within Buildings
V ~~IV~~ . Listing Requirements
Create a new Part II. Cables Outside and Entering Buildings.
770.48 Unlisted Cables and Raceways Entering Buildings.
(A) Conductive and Nonconductive Cables. Unlisted conductive and nonconductive outside plant optical fiber cables shall be permitted in building spaces other than air ducts, plenums and other spaces used for environmental air, where the length of the cable within the building, measured from its point of entrance, does not exceed 15 m (50 ft) and the cable enters the building from the outside and is terminated in an enclosure.
FPN No. 1: Splice cases or terminal boxes, both metallic and plastic types, typically are used as enclosures for splicing or terminating optical fiber cables.
FPN No. 2: See 770.2 for the definition of point of entrance.
FPN No. 3: See 770.2 for a definition of air duct.
FPN No. 4: See Article 100 for a definition of plenum.
FPN No. 5: See 300.22(C) for information on other space used for environmental air.
(B) Nonconductive Cables. Unlisted nonconductive outside plant optical fiber cables shall be permitted to enter the building from the outside and run in raceway systems installed in compliance with any of the following articles in Chapter 3: Article 342, Intermediate Metal Conduit: Type IMC; Article 344, Rigid Metal Conduit: Type RMC; Article 352, Rigid Nonmetallic Conduit: Type RNC; and Article 358, Electrical Metallic Tubing: Type EMT.
(C) Raceway. Unlisted underground or outside plant construction plastic innerduct entering the building from the outside shall be terminated and firestopped at the point of entrance.
_Change 770.113 Exceptions as follows:
770.113 Exception: As permitted in 770.48 . ~~Optical fiber cables shall not be required to be listed and marked where the length of the cable within the building, measured from its point of entrance, does not exceed 15 m (50 ft) and the cable enters the building from the outside and is terminated in an enclosure.~~ Ê
~~FPN: Splice cases or terminal boxes, both metallic and plastic types, typically are used as enclosures for splicing or terminating optical fiber cables.~~
~~770.113 Exception No. 2: Nonconductive optical fiber cables shall not be required to be listed and marked where the cable enters the building from the outside and is run in raceway systems installed in compliance with any of the following articles in Chapter 3: Article 342, Intermediate Metal Conduit: Type IMC; Article 344, Rigid Metal Conduit: Type RMC; Article 352, Rigid Nonmetallic Conduit: Type RNC; and Article 358, Electrical Metallic Tubing: Type EMT.~~
—Delete 770.12(D).
~~770.12(D) Entering Buildings. Unlisted underground or outside plant construction plastic innerduct entering the building from the outside shall be terminated and firestopped at the point of entrance.~~
Substantiation: This is an editorial and technical proposal. (Task Group No. 770-15)
This is a companion proposal to similar proposals made for articles 800 and 820. It adds a new Part II, "Cables Outside and Entering Buildings", thereby improving the parallelism between the three articles. Exceptions No. 1 and No. 2 to 770.113 deal with entrance cables and therefore this proposal moves them to the new Part II.
The proposed new fine print notes 2, 3, 4 & 5 are provided to help the reader by pointing to the definitions of "point of entrance", "air duct" and "plenum" and a description of "other space used for environmental air". This proposal also moves 770.12(D), which deals with unlisted innerduct entering buildings, to the new Part II.
The proposal has a noneditorial requirement prohibiting outside plant cables from running in risers or in the air distribution system; thereby correcting an omission in the current code.
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.

The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action on Proposal 16-52.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-52 Log #28 NEC-P16 **Final Action: Accept in Principle**
(770.48 (New), & 770.113, Exception No. 1, Parts II, III, & IV)

TCC Action: The Technical Correlating Committee understands that the proposed title of 770.48 is also changed by the panel action.

Submitter: Stanley Kaufman, Cable Safe Inc.

Recommendation: Renumber existing parts II, III and IV as shown:

III ~~II~~ . Protection
IV ~~III~~ . Cables Within Buildings
V I ~~V~~ . Listing Requirements

Create a new **Part II. Cables Outside and Entering Buildings.**

770.48 Unlisted Cables Entering Buildings.

(A) Conductive and Nonconductive Cables. Unlisted conductive and nonconductive outside plant optical fiber cables shall be permitted in building spaces other than risers, air ducts, concealed spaces, plenums and other spaces used for environmental air, where the length of the cable within the building, measured from its point of entrance, does not exceed 15 m (50 ft) and the cable enters the building from the outside and is terminated in an enclosure.

FPN No. 1: Splice cases or terminal boxes, both metallic and plastic types, typically are used as enclosures for splicing or terminating optical fiber cables.

FPN No, 2: See 770.2 for the definition of point of entrance.

FPN No. 3: See 770.2 for a definition of air duct.

FPN No. 4: See Article 100 for a definition of plenum.

FPN No. 5: See 300.22(C) for a information on other space used for environmental air.

(B) Nonconductive Cables. Unlisted nonconductive optical fiber outside plant optical fiber cables shall be permitted to enter the building from the outside and run in raceway systems installed in compliance with any of the following articles in Chapter 3: Article 342, Intermediate Metal Conduit: Type IMC; Article 344, Rigid Metal Conduit: Type RMC; Article 352, Rigid Nonmetallic Conduit: Type RNC; and Article 358, Electrical Metallic Tubing: Type EMT.

770.113 Exception No. 1: As permitted in 770.48 . ~~Optical fiber cables shall not be required to be listed and marked where the length of the cable within the building, measured from its point of entrance, does not exceed 15 m (50 ft) and the cable enters the building from the outside and is terminated in an enclosure. FPN: Splice cases or terminal boxes, both metallic and plastic types, typically are used as enclosures for splicing or terminating optical fiber cables.~~

~~770.113 Exception No. 2: Nonconductive optical fiber cables shall not be required to be listed and marked where the cable enters the building from the outside and is run in raceway systems installed in compliance with any of the following articles in Chapter 3: Article 342, Intermediate Metal Conduit: Type IMC; Article 344, Rigid Metal Conduit: Type RMC; Article 352, Rigid Nonmetallic Conduit: Type RNC; and Article 358, Electrical Metallic Tubing: Type EMT.~~

Substantiation: This is a companion proposal to similar proposals made for articles 800 and 820, It adds a new Part II, "Cables Outside and Entering Buildings", thereby improving the parallelism between the three articles. Exceptions No. 1 and No. 2 to 770.113 deal with entrance cables and therefore this proposal moves them to the new Part II.

In addition to editorially changing the exception to positive language and moving it to Part II, this proposal deals with the issue of the fire hazard of unlisted outside plant cables in buildings. Unlisted outside plant entrance cables are sometimes run in risers, air ducts, concealed spaces and plenums. When the 50-foot exemption for outside plant cable was adopted, it was assumed that the entrance cable would go into an equipment room. It was not envisioned that the unlisted cable, which is not fire resistant, would run up a riser, in an air duct, in concealed spaces or a plenum. The proposed new fine print notes 2, 3, 4 & 5 are provided to help the reader by pointing to the definitions of "point of entrance", "air duct" and "plenum" and a description of "other space used for environmental air".

Panel Meeting Action: Accept in Principle

The panel accepts the submitter's proposal with the following revisions:

770.48(A) to read as follows:

770.48 Unlisted Cables and Raceways Entering Buildings.

(A) Conductive and Nonconductive Cables. Unlisted conductive and nonconductive outside plant optical fiber cables shall be permitted to be installed in locations as described in 770.154(C), where the length of the cable within the building, measured from its point of entrance, does not exceed 15 m (50 ft) and the cable enters the building from the outside and is terminated in an enclosure.

Delete FPNs 3, 4, and 5.

770.113 Exception No.1 to be Exception.

Panel Statement: The panel made changes to the submitter's text to correlate with the language in the remainder of the Article.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Recommendation: Renumber existing parts II, III and IV as shown:

III ~~II~~ . Protection
IV ~~III~~ . Cables Within Buildings
V ~~IV~~ . Listing Requirements

Create a new **Part II. Cables Outside and Entering Buildings.**

770.48 Unlisted Cables Entering Buildings.

(A) Conductive and Nonconductive Cables. Unlisted conductive and nonconductive outside plant optical fiber cables shall be permitted in building spaces other than risers, air ducts, concealed spaces, plenums and other spaces used for environmental air, where the length of the cable within the building, measured from its point of entrance, does not exceed 15 m (50 ft) and the cable enters the building from the outside and is terminated in an enclosure.

FPN No. 1: Splice cases or terminal boxes, both metallic and plastic types, typically are used as enclosures for splicing or terminating optical fiber cables.

FPN No, 2: See 770.2 for the definition of point of entrance.

FPN No. 3: See 770.2 for a definition of air duct.

FPN No. 4: See Article 100 for a definition of plenum.

FPN No. 5: See 300.22(C) for a information on other space used for environmental air.

(B) Nonconductive Cables. Unlisted nonconductive optical fiber outside plant optical fiber cables shall be permitted to enter the building from the outside and run in raceway systems installed in compliance with any of the following articles in Chapter 3: Article 342, Intermediate Metal Conduit: Type IMC; Article 344, Rigid Metal Conduit: Type RMC; Article 352, Rigid Nonmetallic Conduit: Type RNC; and Article 358, Electrical Metallic Tubing: Type EMT.

(C) **Raceway.** Unlisted underground or outside plant construction plastic innerduct entering the building from the outside shall be terminated and firestopped at the point of entrance.

770.113 Exception No. 1: As permitted in 770.48 . ~~Optical fiber cables shall not be required to be listed and marked where the length of the cable within the building, measured from its point of entrance, does not exceed 15 m (50 ft) and the cable enters the building from the outside and is terminated in an enclosure.~~

~~FPN: Splice cases or terminal boxes, both metallic and plastic types, typically are used as enclosures for splicing or terminating optical fiber cables.~~

~~770.113 Exception No. 2: Nonconductive optical fiber cables shall not be required to be listed and marked where the cable enters the building from the outside and is run in raceway systems installed in compliance with any of the following articles in Chapter 3: Article 342, Intermediate Metal Conduit: Type IMC; Article 344, Rigid Metal Conduit: Type RMC; Article 352, Rigid Nonmetallic Conduit: Type RNC; and Article 358, Electrical Metallic Tubing: Type EMT.~~

~~**770.12(D) Entering Buildings.** Unlisted underground or outside plant construction plastic innerduct entering the building from the outside shall be terminated and firestopped at the point of entrance.~~

Substantiation: This is a companion proposal to similar proposals made for articles 800 and 820, It adds a new Part II, "Cables Outside and Entering Buildings", thereby improving the parallelism between the three articles. Exceptions No. 1 and No. 2 to 770.113 deal with entrance cables and therefore this proposal moves them to the new Part II.

In addition to editorially changing the exception to positive language and moving it to Part II, this proposal deals with the issue of the fire hazard of unlisted outside plant cables in buildings. Unlisted outside plant entrance cables are sometimes run in risers, air ducts, concealed spaces and plenums. When the 50-foot exemption for outside plant cable was adopted, it was assumed that the entrance cable would go into an equipment room. It was not envisioned that the unlisted cable, which is not fire resistant, would run up a riser, in an air duct, in concealed spaces or a plenum. The proposed new fine print notes 2, 3, 4 & 5 are provided to help the reader by pointing to the definitions of "point of entrance", "air duct" and "plenum" and a description of "other space used for environmental air".

This proposal also moves 770.12(D), which deals with unlisted innerduct entering buildings, to the new Part II.

(770.93)

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Revise the title of 770.93 as follows:
770.93 Grounding or Interruption of ~~Entrance Cables~~ Non-Current-Carrying Metallic Members of Optical Fiber Cables Entering Buildings .
Where exposed to contact with electric light or power conductors, the nonÐcurrent-carrying metallic members of optical fiber cables entering buildings shall be grounded ……..
Substantiation: This is an editorial change. (Task Group No. 770-17)
It will provide consistency between 770.93, 800.93, 820.93 and 830.93. This is a companion proposal to 800.93, 820.93 and 830.93.
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.
Panel Meeting Action: Accept in Part
Revise the title of 770.93 as follows:
770.93 Grounding or Interruption of ~~Entrance Cables~~ Non-Current-Carrying Metallic Members of Optical Fiber Cables .
Panel Statement: "Entering Buildings" is inappropriate as the cable may not actually enter the building.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
BRUNSSEN, J.: The Panel Action should be "Accept in Principle" as the panel accepted the submitter's proposal with a modification in text.

16-55 Log #1884 NEC-P16 **Final Action: Accept in Principle**
(770.93)

Submitter: Jeffrey Boksiner, Telcordia Technologies, Inc.
Recommendation: Revise 770.93 **Grounding of Entrance Cables** by adding text as follows:
770.93 Grounding of Entrance Cables.
Where exposed to contact with electric light or power conductors, the non–current-carrying metallic members of optical fiber cables entering buildings shall be grounded as close to the point of entrance as practicable or shall be interrupted as close to the point of entrance as practicable by an insulating joint or equivalent device.
Where grounded, the non–current-carrying metallic members of optical fiber cables entering buildings shall be grounded as specified in 770.93(A) through 770.93(D).
(A) Grounding Conductor.
(1) Insulation. The grounding conductor shall be insulated and shall be listed.
(2) Material . The grounding conductor shall be copper or other corrosion-resistant conductive material, stranded or solid.
(3) Size. The grounding conductor shall not be smaller than 14 AWG.
(4) Run in Straight Line. The grounding conductor shall be run to the grounding electrode in as straight a line as practicable.
(5) Physical Damage. Where necessary, the grounding conductor shall be guarded from physical damage. Where the grounding conductor is run in a metal raceway, both ends of the raceway shall be bonded to the grounding conductor or the same terminal or electrode to which the grounding conductor is connected.
(B) Electrode. The grounding conductor shall be connected in accordance with 700.93(B)(1), (B)(2) and (B)(3).
(1) In Buildings or Structures with an Intersystem Grounding Termination. If the building or structure served has an intersystem grounding termination the grounding conductor shall be connected to the intersystem grounding termination.
(2) In Buildings or Structures with Grounding Means. If the building or structure served has no intersystem grounding termination, the grounding conductor shall be connected to the nearest accessible location on the following:
(1) The building or structure grounding electrode system as covered in 250.50
(2) The grounded interior metal water piping system, within 1.5 m (5 ft) from its point of entrance to the building, as covered in 250.52
(3) The power service accessible means external to enclosures as covered in 250.94
(4) The metallic power service raceway
(5) The service equipment enclosure
(6) The grounding electrode conductor or the grounding electrode conductor metal enclosure
(7) The grounding conductor or the grounding electrode of a building or structure disconnecting means that is grounded to an electrode as covered in 250.32
(3) In Buildings or Structures Without Intersystem Grounding Termination or Grounding Means. If the building or structure served has no intersystem grounding termination or grounding means , as described in 770.93(B)(2), the grounding conductor shall be connected to either of the following
(1) To any one of the individual electrodes described in 250.52(A)(1), (A)(2), (A)(3), or (A)(4)
(2) If the building or structure served has no grounding means, as described in 770.93(B)(2) or (B)(3)(1), to an effectively grounded metal structure or to a ground rod or pipe not less than 1.5 m (5 ft) in length and 12.7 mm (in.) in diameter, driven, where practicable, into permanently damp earth and separated from lightning conductors as covered in 800.53 and at least 1.8 m (6 ft) from electrodes of other systems. Steam or hot water pipes or air terminal conductors (lightning-rod conductors) shall not be employed as electrodes for protectors.
(C) Electrode Connection . Connections to grounding electrodes shall comply with 250.70.
(D) Bonding of Electrodes . A bonding jumper not smaller than 6 AWG copper or equivalent shall be connected between the grounding electrode and power grounding electrode system at the building or structure served where separate electrodes are used.
Exception: At mobile homes as covered in 770.95.
FPN No. 1: See 250.60 for use of air terminals (lightning rods).
FPN No. 2: Bonding together of all separate electrodes limits potential differences between them and between their associated wiring systems.
770.95 Grounding of Entrance Cables at Mobile Homes .
Where grounded as required by 770.93 at a mobile home, the non–current-carrying metallic members of optical fiber cables entering buildings shall be grounded as specified in 770.95(A) and (B).
(A) Grounding . Where there is no mobile home service equipment located in sight from, and not more than 9.0 m (30 ft) from, the exterior wall of the mobile home it serves, or there is no mobile home disconnecting means grounded in accordance with 250.32 and located within sight from, and not more than 9.0 m (30 ft) from, the exterior wall of the mobile home it serves, the ground for non–current-carrying metallic members of optical fiber cables entering buildings shall be in accordance with 770.93(B)(3).
(B) Bonding . The primary protector grounding terminal or grounding electrode shall be bonded to the metal frame or available grounding terminal of the mobile home with a copper grounding conductor not smaller than 12 AWG under either of the following conditions:
(1) Where there is no mobile home service equipment or disconnecting means as in 770.95(A)
(2) Where the mobile home is supplied by cord and plug
Substantiation: This is one of several correlated proposals (100 Definitions, 250.95, Chapter 8 Articles) to improve the requirements related to intersystem bonding and grounding of communication systems. The intent is to create a dedicated and well-defined location for terminating the grounding conductors required in Chapter 8 Articles and 770.93. These grounding conductors also provide between communication and power systems (intersystem bonding). The proposed termination would have sufficient capacity to handle multiple communication systems (telecom, satellite, CATV) on premises. See the figures which I have provided.
Intersystem bonding accomplished by connection of a communication grounding conductor to the power system is an important safety measure to prevent occurrences of voltages between communication system and power system. However, the existing requirements are not adequate. Bonding is becoming difficult to implement due to changes in building construction practices such as increased prevalence of flush construction and use of PVC conduits. Frequently, in new construction, the grounding electrode, the raceway and the grounding electrode conductor are hidden behind walls and not accessible for bonding connection.
Even in older construction with accessible equipment, the requirement for installation of intersystem bonding connection is subject to varying interpretation because there is not a clearly defined dedicated bonding location. The connection to the power system is sometimes haphazard. Installers are sometimes confused over where the connection should be made especially if multiple Communication Systems are present on premises.
The existing 770.93 does not provide a prescriptive method for grounding of the building entrance cables. The procedures should be similar to those required in Chapter 8 articles. The proposed revision parallels the existing text in Article 800 (including grounding at mobile homes), but makes the intersystem grounding terminal the preferred destination for the grounding conductor. The only difference with Chapter 8 Articles is that the limitation of the grounding conductor length to 6 m (20 ft) is not relevant since the metallic members of optical fiber cable do not extend to the circuits of utilization equipment.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 16-25.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-56 Log #710 NEC-P16 **Final Action: Accept**
(770.93, FPN (New))

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Add a Fine Print Note (FPN) to 770.93 as follows:
FPN: See 770.2 for the definition of *point of entrance* .
Substantiation: This is an editorial proposal. (Task Group No.)
The editorial addition of the FPN will provide consistency between 770.93, 800.93, 820.93 and 830.93. This is a companion proposal to 820.93 and 830.93, and to 770.2 adding the definition of "point of entrance".
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
OHDE, H.: This proposal should be rejected. Section 90.1 (C) of the NEC states " *This Code is not intended as a design specification or an instruction manual for the untrained persons* ." In the submitter's substantiation he states this FPN will help installers who are not Code experts. The addition of the FPN referencing 770.2 for the definition of point of entrance is not needed nor warranted. A trained installer will know the Code content and how the Code book is to be used.

16-57 Log #6 NEC-P16 **Final Action: Accept**
(770.113)

Submitter: Stanley Kaufman, CableSafe, Inc.
Recommendation: Revise as follows:
770.113 Installation and Marking of Listed Optical Fiber Cables. ~~Listed optical fiber cables shall be installed as wiring within buildings.~~ Optical fiber cables installed in buildings shall be listed . Optical fiber cables shall be marked in accordance with Table 770.113.
Substantiation: The proposed text is an editorial improvement. It removes the term wiring, thereby avoiding the implication optical fiber cables are "wiring". It is also editorially consistent with the exception.
Panel Meeting Action: Accept
Number Eligible to Vote: 15

(770.113 Exception No. 1)

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industry Solutions
Recommendation: Revise 770.113, Exception No. 1 as follows:
Exception No. 1: Unlisted optical fiber cables shall be permitted within buildings in spaces other than risers, air ducts, plenums and other spaces used for environmental air. ~~*Optical fiber cables shall not be required to be listed and marked where the*~~ *The length of the unlisted cable permitted within the building, measured from its point of entrance,* ~~*does*~~ *shall not exceed 15 m (50 ft) .* ~~*and the*~~ *The unlisted cable* ~~*enters*~~ *shall enter the building from the outside and* ~~*is*~~ *shall be terminated in an enclosure.*
Substantiation: The NEC presently permits up to 50 ft of unlisted optical fiber cable to be run into a building, but places no restriction on installing the unlisted cables in air handling spaces where they could contribute to fire and smoke hazard. This proposal adds that restriction, further contributing to fire and smoke safety. This is a companion proposal and is intended to correlate with similar proposals for 800.113 Ex. No. 2 and 820.113 Ex. No. 2, and 770.2.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 16-52.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-62 Log #1936 NEC-P16 **Final Action: Reject**
(770.113 Exception No. 2)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposals 8-53 and 8-78. See Technical Correlating Committee action on Proposals 8-53 and 8-78. It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 8 for comment. This action will be considered by the Panel as a Public Comment.
Submitter: William Wagner, Certification Solutions
Recommendation: Revise 770.113 Exception No. 2 as follows:
Exception No. 2: Nonconductive optical fiber cables shall not be required to be listed and marked where the cable enters the building from the outside and is run in raceway systems installed in compliance with any of the following articles in Chapter 3; Article 342, Intermediate Metal Conduit; Type IMC;

Article 344, Rigid Metal Conduit; Type RMC; Article 352, Rigid ~~Nonmetallic~~ PVC Conduit; Type PVC ~~RNC~~ ; Article 355, Reinforced Thermosetting Resin Conduit; type RTRC ; and Article 358, Electrical Metallic Tubing: Type EMT.
Substantiation: This is a companion proposal for the new definition of Rigid Nonmetallic Conduit in Article 100, the revised Article 352 for Type PVC Conduit and the new Article 355 for RTRC. Rigid Nonmetallic Conduit (Type RNC), which includes PVC, HDPE and RTRC, was previously covered under a single Article (352). However, with the acceptance of the companion proposals, each of these types will now be located in a separate Article. This proposal revises Exception No. 2 of 770.113 in order to reference the Articles for Type PVC and Type RTRC conduits, which are acceptable wiring methods for this application. Type HDPE conduit is prohibited from use within a building by 353.12, and, therefore, would not be included.
Panel Meeting Action: Reject
Panel Statement: The panel cannot make a determination regarding Type RTRC until the disposition of proposed new Article 355 is known.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-63 Log #35 NEC-P16 **Final Action: Accept**
(770.133(A))

Submitter: Stanley Kaufman, Cable Safe Inc.
Recommendation: Revise as follows:
770.133 Installation of Optical Fibers and Electrical Conductors.
(A) With Conductors for Electric Light, Power, Class 1, Non-Power-Limited Fire Alarm, or Medium Power Network-Powered Broadband Communications Circuits. When optical fibers are ~~Optical fibers shall be permitted~~ within the same composite cable for electric light, power, Class 1, non-power-limited fire alarm, or medium power network-powered broadband communications circuits operating at 600 volts or less, they shall be permitted to be installed only where the functions of the optical fibers and the electrical conductors are associated.

Nonconductive optical fiber cables shall be permitted to occupy the same cable tray or raceway with conductors for electric light, power, Class 1, non-power-limited fire alarm, Type ITC, or medium power network-powered broadband communications circuits, operating at 600 volts or less. Conductive optical fiber cables shall not be permitted to occupy the same cable tray or raceway with conductors for electric light, power, Class 1, non-power-limited fire alarm, Type ITC, or medium power network-powered broadband communications circuits.

Optical fibers in composite ~~Composite~~ optical fiber cables containing only current-carrying conductors for electric light, power, Class 1 circuits rated 600 volts or less shall be permitted to occupy the same cabinet, cable tray, outlet box, panel, raceway, or other termination enclosure with conductors for electric light, power, or Class 1 circuits operating at 600 volts or less.

Nonconductive optical fiber cables shall not be permitted to occupy the same cabinet, outlet box, panel, or similar enclosure housing the electrical terminations of an electric light, power, Class 1, non-power-limited fire alarm, or medium power network-powered broadband communications circuit.

Exception No. 1: Occupancy of the same cabinet, outlet box, panel, or similar enclosure shall be permitted where nonconductive optical fiber cable is functionally associated with the electric light, power, Class 1, non-power-limited fire alarm, or medium power network-powered broadband communications circuit.

Exception No. 2: Occupancy of the same cabinet, outlet box, panel, or similar enclosure shall be permitted where nonconductive optical fiber cables are installed in factory- or field-assembled control centers.

Exception No. 3: In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified persons service the installation, nonconductive optical fiber cables shall be permitted with circuits exceeding 600 volts.

Exception No. 4: In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified persons service the installation, optical fibers in composite optical fiber cables s ~~hall be permitted to~~ contain ing current-carrying conductors operating over 600 volts shall be permitted to be installed.

Substantiation: Section 770.133 covers the installation of optical fibers along with electrical conductors. Parts of this section can easily be misinterpreted to cover the construction of composite optical fiber cables. According to 770.9(C), "Composite optical fiber cables shall be classified as electrical cables in accordance with the type of electrical conductors. The proposed rewording is editorial. It attempts to clarify that this section is about installation and not composite cable construction.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-64 Log #1260 NEC-P16 **Final Action: Accept in Principle**
(770.133(A) Exception (New))

Submitter: Nicholas Alger, Modjeski and Masters Inc.
Recommendation: Add an exception to 770.133(A) as follows:
Conductive optical fiber cables shall be permitted to occupy the same cable tray or raceway with conductors for electric light, power, Class 1, nonpower-limited fire alarm, Type ITC, or medium power network-powered broadband communication circuits where the functions of the optical cables and the electrical conductors are associated and the optical cables are separated from such circuits by a solid barrier. Where the cable tray or raceway is metallic, the conductive members of the optical cable shall also be solidly bonded to the cable tray or raceway.
Substantiation: In industrial installations, the use of armored optical fiber cables may be desirable to help protect the fibers from physical damage. The requirements of 770.133(A), as currently written, require the use of a separate cable tray or raceway for armored optical fiber cable(s), even if the optical fiber cables are functionally associated with power and/or control circuits already installed in an existing cable tray or raceway (such as when an existing control system is upgraded from hardwired circuits to a communications network based system using optical fiber links). Class 2 and Class 3 circuits are already permitted to be installed in the same cable tray or raceway with these higher powered circuits by 725.55(B) and (H). Similarly, communications circuits are permitted to be installed in the same cable tray or raceway with such circuits when separated by a divider per 800.133(A)(1)(c) Exception No. 1.

Futhermore, when a metallic cable tray or raceway is used, it is unlikely that the presence of a non-current-carrying conductive member in an optical fiber cable installed with such circuits will create a safety hazard if it is solidly bonded to the metallic cable tray or raceway so as to prevent a difference of potential between the two.

This change would simply installations involving armored optical fiber cables by avoiding the need to provide separate cable trays or raceways to serve armored optical fiber cables, as well as increase consistency between Articles 725, 770, and 800.

Panel Statement: See panel action on Proposal 16-65.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-65 Log #2627 NEC-P16 **Final Action: Accept**
(770.133(A) Exception (New))

Submitter: David H. Kendall, Carlon
Recommendation: Add a new exception to 770.133(A) to read as follows:
Exception: Where all of the conductors of electric light, power, Class 1, nonpower-limited fire alarm, and medium power network-powered broadband communications circuits are separated from all of the optical fiber cables by a permanent barrier or listed divider.
Substantiation: This is a new exception for 770.133(A) that would allow a optical fiber cable to share the same raceway, outlet box or enclosure as long as a barrier was in place. This language is similar to the language found in 800.133(A)(1)(c) Exception No. 1. Metal Clad Optical Fiber cable can become energized if it comes in contact with electrical conductors. This proposal defines the barrier as a permanent function of the enclosure or that it may be a removable or field installed listed divider. These barriers are used to divide the optical fiber cable from the power circuits.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-66 Log #1865 NEC-P16 **Final Action: Accept in Principle**
(770.133(C))

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industry Solutions
Recommendation: Revise 770.133 (C) as follows:
(C) Grounding. Non–current-carrying conductive members of optical fiber cables ~~shall be grounded in accordance with Article 250.~~ that are likely to become energized shall be bonded to the service equipment enclosure, the grounded conductor at the service, the grounding electrode conductor where of sufficient size, or to the one or more grounding electrodes used. The bonding conductor(s) shall be sized in accordance with 250.122, using the rating of the circuit that is likely to energize the conductive members of optical fiber cables. The equipment grounding conductor for the circuit that is likely to energize non–current-carrying conductive members of optical fiber cables shall be permitted to serve as the bonding means. The grounding required in 770.93 shall be permitted to serve as the bonding required in this section. The points of attachment of the bonding conductor(s) shall be accessible.

Substantiation: The reference to the entire Article 250 presently contained in 770.133(C) violates the NEC Style Manual. In addition, it is difficult to locate the pertinent section of 250 since it does not mention optical fiber cables explicitly. This proposal is intended to clarify the required grounding and is based on existing rules of Article 250.

Non–current-carrying conductive members of optical fiber cables are not part of an electrical circuit or system and therefore should be classified as Electrically Conductive Materials and Other Equipment in the context of Article 250. The general principle for grounding of these parts is contained in 250.4(A)(4) as follows:

(4) Bonding of Electrically Conductive Materials and Other Equipment. Electrically conductive materials that are likely to become energized shall be connected together and to the electrical supply source in a manner that establishes an effective ground-fault current path.

The proposed prescriptive language is based on the language of 250.104(B) Other Metal Piping:

(B) Other Metal Piping. Where installed in or attached to a building or structure, metal piping system(s), including gas piping, that is likely to become energized shall be bonded to the service equipment enclosure, the grounded conductor at the service, the grounding electrode conductor where of sufficient size, or to the one or more grounding electrodes used. The bonding jumper(s) shall be sized in accordance with 250.122, using the rating of the circuit that is likely to energize the piping system(s). The equipment grounding conductor for the circuit that is likely to energize the piping shall be permitted to serve as the bonding means. The points of attachment of the bonding jumper(s) shall be accessible.

The proposal also clarifies that grounding required in Section 770.93 also provides the bonding that would be required in 770.133(C).

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action on Proposal 16-25.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-67 Log #2628 NEC-P16 **Final Action: Reject**

(770.135 (New))

Submitter: David H. Kendall, Carlon

Recommendation: Add a new section to read as follows:

770.135 Optical Fiber Device and Equipment Mounting. Optical fiber devices or equipment shall be mounted in listed boxes, brackets or assemblies designed for the purpose, and such boxes or assemblies shall be securely fastened in place. Boxes or brackets can be completely enclosed or backless.

(A) Optical Fiber Devices and Equipment Mounted to Boxes or Brackets. Optical Fiber devices or equipment shall be mounted to a listed boxes or bracket and installed per 314.20.

(B) Optical Fiber Devices and Equipment Mounted on Covers. Optical Fiber devicse and equipment mounted to and supported by a cover shall be held rigidly against the cover which is mounted to the box or bracket.

Substantiation: This proposal adds a new section to Article 770 addressing the mounting of devices or equipment to listed boxes and brackets. Currently, depending on the quality of workmanship, Optical Fiber devices or equipment have not been mounted to boxes or brackets that can support them. After several years device and/or covers that are mounted directly to the dry wall will become hazard because they have become loose and exposed. Conductive optical fiber cable can become energized by coming in incidental contact with electrical conductors.

770.135 was only a suggestion for the location of this new section. (A) addresses devices mounted directly to boxes or devices where as (B) address devices mounted to covers.

Panel Meeting Action: Reject

Panel Statement: Optical fiber devices and equipment are beyond the scope of Article 770.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-68 Log #714 NEC-P16 **Final Action: Accept**

(770.154)

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.

Recommendation: Renumber 770.154 subsections (D) through (F) as follows:

Renumber 770.154 subsections (D) through (F) as follows:

770.154 Applications of Listed Optical Fiber Cables and Raceways. Nonconductive and conductive optical fiber cables shall comply with any of the requirements given in 770.154(A) through ~~770.154(E)~~ 770.154(D) and 770.154(F), or where cable substitutions are made as shown in ~~770.154(F)~~ 770.154(E).

(A) Plenums. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type OFNP or OFCP. Abandoned cables shall not be permitted to remain. Types OFNR, OFCR, OFNG, OFN, OFCG, and OFC cables installed in compliance with 300.22 shall be permitted. Listed plenum optical fiber raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only type OFNP and OFCP cables shall be permitted to be installed in these raceways.

FPN: See 8.14.1 of NFPA 13 (2002), *Installation of Sprinkler Systems*, for requirements for sprinklers in concealed spaces containing exposed combustibles.

(B) Riser. Cables installed in risers shall be as described in any of the following:

(1) Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type OFNR or OFCR. Floor penetrations requiring Type OFNR or OFCR shall contain only cables suitable for riser or plenum use. Abandoned cables shall not be permitted to remain. Listed riser optical fiber raceways shall be permitted to be installed in vertical riser runs in a shaft from floor to floor. Only Type OFNP, OFCP, OFNR, and OFCR cables shall be permitted to be installed in these raceways.

(2) Type OFNG, OFN, OFCG, and OFC cables shall be permitted to be encased in a metal raceway or located in a fireproof shaft having firestops at each floor.

(3) Type OFNG, OFN, OFCG, and OFC cables shall be permitted in one- and two-family dwellings.

FPN: See 300.21 for firestop requirements for floor penetrations.

(C) Other Wiring Within Buildings. Cables installed in building locations other than the locations covered in 770.154(A) and 770.154(B) shall be Type OFNG, OFN, OFCG, or OFC. Such cables shall be permitted to be installed in listed general-purpose optical fiber raceways.

~~(D)~~ (F) **Hazardous (Classified) Locations.** Cables installed in hazardous (classified) locations shall be any type indicated in Table 770.154.

~~(E)~~ (D) **Cable Trays.** Optical fiber cables of the types listed in Table 770.113 shall be permitted to be installed in cable trays.

FPN: It is not the intent to require that these optical fiber cables be listed specifically for use in cable trays.

~~(F)~~ (E) **Cable Substitutions.** The substitutions for optical fiber cables listed in Table 770.154 shall be permitted.

Table 770.154 Cable Substitutions

Cable Type	Permitted Substitutions
OFNP	None
OFCP	OFNP
OFNR	OFNP
OFCR	OFNP, OFCP, OFNR
OFNG, OFN	OFNP, OFNR
OFCG, OFC	OFNP,OFCP,OFNR,OFCR, OFNG, OFN

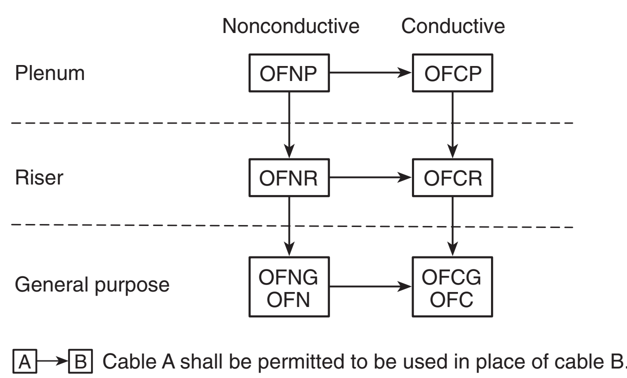

Figure 770.154 Cable Substitution Hierarchy.

Substantiation: This is an editorial revision. (Task Group No. 770-20)

It will align similar paragraphs in Sections 770.154, 800.154, 820.154 and 830.154. It will provide consistency between similar sections in the affected four articles and improve usability of the Code. This is a companion proposal to similar proposals concerning Sections 800.154, 820.154 and 830.154.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.

Panel Meeting Action: Accept

Panel Statement: See panel action on Proposal 16-41a (Log #CP-1602).

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

BRUNSSEN, J.: The reference to Proposal 16-41a in the Panel Statement is incorrect. The correct reference is 16-411a.

DORNA, G.: The reference to 16-41a in the panel statement is incorrect. It should be 16-411a.

KAHN, S.: The panel statement requires correction as the proper reference is to Proposal 16-411a.

16-69 Log #2527 NEC-P16 **Final Action: Reject**
(770.154)

Submitter: Sanford Egesdal, Egesdal Associates PLC

Recommendation: Revise 770.154, as shown.

Nonconductive and conductive optical fiber cables shall comply with any of the requirements given in 770.154(A) through 770.154(E) or where cable substitutions are made as shown in 770.154(F). Types OFN50 and OFC50 very-low-smoke cables shall be permitted to be installed meet requirements for very-low-smoke producing characteristics, low potential heat release, and low flame spread characteristics.

Substantiation: NFPA 13-2002 has requirements for installation of sprinklers where a concealed space has combustible loading. The proposed very-low-smoke producing cables have a heat release that is significantly lower than combustible plenum cable listed using NFPA 262-2002, *Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces* .

The 2003 International Mechanical Code (IMC), 602.2.1 requires a smoke developed index less than 25 and a smoke developed index less than 50 for materials in plenums.

The Fine Print Note provides guidance to system designers, installers, and code officials. Over the past few decades, there has been a significant increase in the quantity of combustible cables installed in concealed spaces (hollow spaces and HVAC system spaces).

NFPA 13-2002, Installation of Sprinkler Systems, requires installation of a sprinkler system in concealed spaces where combustible loading is present. Because other NFPA documents reference NFPA 13, it is important for correlation for the NEC to include a pointer to NFPA 13. The following requirements are from NFPA 13-2002:

"8.14.1.5 Localized Protection of Exposed Combustible Construction or Exposed Combustibles. In concealed spaces having exposed combustible construction, or containing exposed combustibles, in localized areas, the combustibles shall be protected as follows:

(1) If the exposed combustibles are in the vertical partitions or walls around all or a portion of the enclosure, a single row of sprinklers spaced not over 12 ft (3.7 m) apart nor more than 6 ft (1.8 m) from the inside of the partition shall be permitted to protect the surface. The first and last sprinklers in such a row shall not be over 5 ft (1.5 m) from the ends of the partitions.

(2) If the exposed combustibles are in the horizontal plane, the area of the combustibles shall be permitted to be protected with sprinklers on a light hazard spacing. Additional sprinklers shall be installed no more than 6 ft (1.8 m) outside the outline of the area and not more than 12 ft (1.8 m) on center along the outline. When the outline returns to a wall or other obstruction, the last sprinkler shall not be more than 6 ft (1.8 m) from the wall or obstruction."

"8.14.1.2.1 Noncombustible and limited combustible concealed spaces with no combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum."

The definition of combustible, from NFPA 5000 is:

"3.3.340.2 Combustible (Material). A material that, in the form in which it is used and under the conditions anticipated, will ignite and burn; a material that does not meet the definition of noncombustible or limited-combustible."

During the 2005 NEC code cycle, the proposed Fine Print Note was added to 800.154(A). Because communications cables are permitted to substitute for Class 2 and Class 3 circuit cables, it is important to have parallel requirements in both NEC Sections. Additionally, the Fine Print Note applies to all concealed spaces.

In July of 2004, an appeal to the NFPA Standards Council requested deletion of the Fine Print Note to 800.154(A), prior to publication of the 2005 NEC. The appeal was denied.

There is a companion proposal for the listing and marking of Types OFN50 and OFC50.

Panel Meeting Action: Reject

Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

OHDE, H.: We agree with panel action and believe that the panel statement should also reflect the latest NFPA 13 Technical Committee actions. Included in the submitter's substantiation was the 2002 Section 8.14 which since has been revised. We would like to add that NFPA 13 just completed their balloting process for the 2006 NFPA 13 Standard. The Technical Committee on Sprinkler Installation submitted a comment on Proposal 13-284.

This comment reworded proposed A.8.14.1.2.1 to read " *Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc…can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1) For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined* ."

In the NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

16-70 Log #2652 NEC-P16 **Final Action: Reject**
(770.154)

Submitter: Robert W. Jensen, dbi / Rep. BICSI, A Telecommunications Association

Recommendation: Delete the following text:

~~FPN: See 8.14.1 of NFPA 13 (2002), Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.~~

Substantiation: This FPN is being misinterpret and used in aggressive marketing attempts to require the installation of "limited combustible cable" (one such example is found at http://www.dupont.com/cablingsolutions/products/codes.html). The FPN has had a profound effect in which it is used in misleading the AHJ to require limited combustible cable, conduit, or a sprinkler system to be installed within the concealed space.

As an example, an AHJ Massachusetts would not provide a certificate of occupancy until the communications cabling was either replaced with limited combustible cable, the CMP cable was placed in conduit, or a sprinkler system installed above the suspended ceiling.. Although the installer had met the requirements of the NEC, the FPN misled the AHJ causing project delays and the potential of inordinate cost to the project. A plea to the NFPA aided the communications installer in which clarification was given that the CMP cabling was indeed sufficient to meet code and that NFPA 13 allowed some quantities (which is not defined) of communications cabling within concealed spaces. The installation of the CMP cable was allowed.

To further the removal of this FPN, the Report on Proposals A2006 from NFPA 13 (see attached), the NFPA committee specifically added an annex A.8.14.1.2.1 in 13-284 log #551 stating that, "Some minor quantities of combustible materials, such as communication wiring, can be present in some concealed spaces but should not typically be viewed as requiring sprinklers (see 8.14.1.1). The threshold value at which sprinklers become necessary in the concealed space is not defined. For example, the usual amounts of data or telephone wiring found above a ceiling would not typically constitute a threat. If bundles of unsheathed computer wiring are installed above the ceiling or beneath the floor in a manner where fire propagation in all directions is likely, then the concealed space should be treated the same as a combustible space, thereby requiring appropriate sprinkler protection."

In addition to the above, Panel 3 rejected the last minute introduction of this proposal that was made in the ROC stage. BICSI, which represents 24,000 installers, designers and manufacturers, feels that this last minute interjection of a FPN was not sufficiently vetted to industry and that the TCC should review this matter.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The Panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

JENSEN, R.: We believe that the interpretation of whether being allowed to address this proposal in view of the NFPA Standards Council Long Decision 05-24 (SC #05-7-4) was misunderstood.

The proposal to delete this FPN is not involved with NFPA 90A and should be deleted for the reasons given in the submitter's substantiation. To further acceptance of removing this FPN, refer to several comments within the 2006 NFPA 13 ROC and in particular to 13-389a.

OHDE, H.: We do not believe that the NFPA Standards Council Long Decision 05-24 (SC #05-7-4) would prohibit this Fine Print Note from being deleted. We do believe that expansion of or new Fine Print Notes referencing NFPA 13 would be in violation of NFPA Standards Council Long Decision 05-24 (SC #05-7-4). This proposal should have been accepted. This Fine Print Note referencing NFPA 13 offers no value to the user of NFPA 70 and in fact misleads the user and AHJ.

16-71 Log #2998 NEC-P16 **Final Action: Reject**
(770.154)

Submitter: Marcelo M. Hirschler, GBH International

Recommendation: Revise text to read as follows:

770.154 Applications of Listed Optical Fiber Cables and Raceways. Nonconductive and conductive optical fiber cables shall comply with any of the requirements given in 770.154(A) through 770.154(E) or where cable substitutions are made as shown in 770.154(F).

(A) Plenums. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type OFNP or OFCP. Abandoned cables shall not be permitted to remain. Types OFNR, OFCR, OFNG, OFN, OFCG, and OFC cables installed in compliance with 300.22 shall be permitted. Listed plenum optical fiber raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only type OFNP and OFCP cables shall be permitted to be installed in these raceways.

~~FPN: See 8.14.1 of NFPA 13 (2002), Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.~~

Substantiation: This is one of three references to NFPA 13 (it is repeated identically in articles 770, 800 and 820) included in the code that is a meaningless reference. Other references to NFPA 13, in Article 362, are properly included in mandatory sections of the code (section 362.10). Whenever a jurisdiction adopts NFPA 13 they need to adopt it for mandatory sections and not for an unenforceable FPN in one section, which is intended to mislead the user. In fact, there have been several documented examples already of misrepresentation in that authorities having jurisdiction have been told that this means that sprinklers are required in plenum areas unless "limited combustible cable" is installed. I have been personally involved in two cases to date, and have heard of many more cases where this is being stated.

Section 8.14.1 of NFPA 13 (2002) reads as follows:

8.14.1 Concealed Spaces.

8.14.1.1 Concealed Spaces Requiring Sprinkler Protection. All concealed spaces enclosed wholly or partly by exposed combustible construction shall be protected by sprinklers except in concealed spaces where sprinklers are not required to be installed by 8.14.1.2.1 through 8.14.1.2.15.

8.14.1.2 Concealed Spaces Not Requiring Sprinkler Protection.*

8.14.1.2.1 Noncombustible and limited combustible concealed spaces with no combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.

8.14.1.2.2 Noncombustible and limited combustible concealed spaces with limited access and not permitting occupancy or storage of combustibles shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.

8.14.1.2.3 Concealed spaces formed by studs or joists with less than 6 in. (152 mm) between the inside or near edges of the studs or joists shall not require sprinkler protection. (See Figure 8.6.4.1.5.1.)

8.14.1.2.4 Concealed spaces formed by bar joists with less than 6 in. (152 mm) between the roof or floor deck and ceiling shall not require sprinkler protection.

8.14.1.2.5 Concealed spaces formed by ceilings attached directly to or within 6 in. (152 mm) of wood joist construction shall not require sprinkler protection.

8.14.1.2.6 Concealed spaces formed by ceilings attached to composite wood joist construction either directly or onto metal channels not exceeding 1 in. in depth, provided the joist channels are firestopped into volumes each not exceeding 160 ft3 (4.53 m3) using materials equivalent to the web construction and at least 3½ in. of batt insulation is installed at the bottom of the joist channels when the ceiling is attached utilizing metal channels, shall not require sprinkler protection.*

8.14.1.2.7 Concealed spaces entirely filled with noncombustible insulation shall not require sprinkler protection.

8.14.1.2.8 Concealed spaces within wood joist construction and composite wood joist construction having noncombustible insulation filling the space from the ceiling up to the bottom edge of the joist of the roof or floor deck, provided that in composite wood joist construction the joist channels are firestopped into volumes each not exceeding 160 ft3 (4.53 m3) to the full depth of the joist with material equivalent to the web construction, shall not require sprinkler protection.

8.14.1.2.9 Concealed spaces over isolated small rooms not exceeding 55 ft2 (4.6 m2) in area shall not require sprinkler protection.

8.14.1.2.10 Concealed spaces where rigid materials are used and the exposed surfaces have a flame spread rating of 25 or less and the materials have been demonstrated not to propagate fire in the form in which they are installed shall not require sprinkler protection.

8.14.1.2.11 Concealed spaces in which the exposed materials are constructed entirely of fire-retardant treated wood as defined by NFPA 703, Standard for Fire Retardant Impregnated Wood and Fire Retardant Coatings for Building Materials, shall not require sprinkler protection.

8.14.1.2.12 Noncombustible concealed spaces having exposed combustible insulation where the heat content of the facing and substrate of the insulation material does not exceed 1000 Btu/ft2 (11,356 kJ/m2) shall not require sprinkler protection.

8.14.1.2.13 Concealed spaces below insulation that is laid directly on top of or within the ceiling joists in an otherwise sprinklered attic shall not require sprinkler protection.

8.14.1.2.14 Vertical pipe chases under 10 ft2 (0.93 m2), where provided that in multifloor buildings the chases are fire stopped at each floor using materials equivalent to the floor construction, and where such pipe chases shall contain no sources of ignition, piping shall be noncombustible, and pipe penetrations at each floor shall be properly sealed and shall not require sprinkler protection.

8.14.1.2.15 Exterior columns under 10 ft2 in area formed by studs or wood joist, supporting exterior canopies that are fully protected with a sprinkler system, shall not require sprinkler protection.

8.14.1.3 Concealed Space Design Requirements. Sprinklers in concealed spaces having no access for storage or other use shall be installed in accordance with the requirements for light hazard occupancy.

8.14.1.4 Heat Producing Devices with Composite Wood Joist Construction. Where heat-producing devices such as furnaces or process equipment are located in the joist channels above a ceiling attached directly to the underside of composite wood joist construction that would not otherwise require sprinkler protection of the spaces, the joist channel containing the heat-producing devices shall be sprinklered by installing sprinklers in each joist channel, on each side, adjacent to the heat-producing device.

8.14.1.5 Localized Protection of Exposed Combustible Construction or Exposed Combustibles. In concealed spaces having exposed combustible construction, or containing exposed combustibles, in localized areas, the combustibles shall be protected as follows:

(1) If the exposed combustibles are in the vertical partitions or walls around all or a portion of the enclosure, a single row of sprinklers spaced not over 12 ft (3.7 m) apart nor more than 6 ft (1.8 m) from the inside of the partition shall be permitted to protect the surface. The first and last sprinklers in such a row shall not be over 5 ft (1.5 m) from the ends of the partitions.

(2) If the exposed combustibles are in the horizontal plane, the area of the combustibles shall be permitted to be protected with sprinklers on a light hazard spacing. Additional sprinklers shall be installed no more than 6 ft (1.8 m) outside the outline of the area and not more than 12 ft (3.7 m) on center along the outline. When the outline returns to a wall or other obstruction, the last sprinkler shall not be more than 6 ft (1.8 m) from the wall or obstruction.

8.14.1.6 Sprinklers used in horizontal combustible concealed spaces (with a slope not exceeding 2 in 12) having a combustible upper surface where the assembly or supporting members channel heat and where the depth of the space is less than 36 in. from deck to deck or with double wood joist construction with a maximum of 36 in. between the top of the bottom joist and the bottom of the upper joist shall be listed for such use.*

Moreover, the NFPA13 ROP indicates the following change:

8.14.1.1 Concealed Spaces Requiring Sprinkler Protection. All concealed spaces enclosed wholly or partly by exposed combustible construction shall be protected by sprinklers except in concealed spaces where sprinklers are not required to be installed by 8.14.1.2.1 through 8.14.1.2.15 and 8.14.6.

8.14.1.2.1 Concealed spaces of noncombustible and limited combustible construction with minimal combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum. (For additional information on combustible loading See 8.14.1.2.1)*

8.14.1.2.2 Conceal d spaces of noncombustible and limited combustible construction with limited access and not permitting occupancy or storage of combustibles shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.

A.8.14.1.2.1 Some minor quantities of combustible materials, such as communication wiring, can be present in some concealed spaces but should not typically be viewed as requiring sprinklers (see 8.14.1.1). The threshold value at which sprinklers become necessary in the concealed space is not defined. For example, the usual amounts of data or telephone wiring found above a ceiling would not typically constitute a threat. If bundles of unsheathed computer wiring are installed above the ceiling or beneath the floor in a manner where fire propagation in all directions is likely, then the concealed space should be treated the same as a combustible space, thereby requiring appropriate sprinkler protection.

This FPN is being misinterpreted by authorities having jurisdiction to indicate that these concealed spaces require sprinkler protection. Moreover, I have come across at least two cases (one in Massachusetts and one in California), where the authority having jurisdiction was informed by a vendor that the only cabling alternative to using sprinklers was the installation of “limited combustible cable”. In fact, in one case I have worked on, the concealed space was an 8 inch high underfloor space of totally non combustible construction, which had no ducts or other parts of an air distribution system, and yet the code official had been led to the belief that cables could only be used if the space was sprinklered or the cable was “limited combustible cable”.

Examples of misinformation exist and some are attached for committee members’ use.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The Panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

“So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A.”

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

JENSEN, R.: We believe that the interpretation of whether being allowed to address this proposal in view of the NFPA Standards Council Long Decision 05-24 (SC #05-7-4) was misunderstood.

The proposal to delete this FPN is not involved with NFPA 90A and should be deleted for the reasons given in the submitter’s substantiation. To further acceptance of removing this FPN, refer to several comments within the 2006 NFPA 13 ROC and in particular to 13-389a.

OHDE, H.: See my Explanation of Negative on Proposal 16-70.

16-72 Log #3005 NEC-P16 **Final Action: Reject**
(770.154)

Submitter: Marcelo M. Hirschler, GBH International

Recommendation: Revise text to read as follows:

770.2 Definitions.

Abandoned Optical Fiber Cable. Installed optical fiber cable that is not terminated at equipment other than a connector and not identified for future use with a tag.

770.154 Applications of Listed Optical Fiber Cables and Raceways. Nonconductive and conductive optical fiber cables shall comply with any of the requirements given in 770.154(A) through 770.154(E) or where cable substitutions are made as shown in 770.154(F).

(A) Plenums. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type OFNP or OFCP. Abandoned optical fiber cables shall be removed. Removal of abandoned cables shall not damage the building structure or finish and shall not compromise the performance of adjacent wiring systems or components. ~~not be permitted to remain.~~ Types OFNR, OFCR, OFNG, OFN, OFCG, and OFC cables installed in compliance with 300.22 shall be permitted. Listed plenum optical fiber raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only type OFNP and OFCP cables shall be permitted to be installed in these raceways.

FPN: See 8.14.1 of NFPA 13 (2002), Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.

(B) Riser. Cables installed in risers shall be as described in any of the following:

(1) Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type OFNR or OFCR. Floor penetrations requiring Type OFNR or OFCR shall contain only cables suitable for riser or plenum use. Abandoned optical fiber cables shall be removed. Removal of abandoned cables shall not damage the building structure or finish and shall not compromise the performance of adjacent wiring systems or components. ~~not be permitted to remain.~~ Listed riser optical fiber raceways shall be permitted to be installed in vertical riser runs in a shaft from floor to floor. Only Type OFNP, OFCP, OFNR, and OFCR cables shall be permitted to be installed in these raceways.

Substantiation: This comment recommends a change in wording to ensure that abandoned cables are removed and to prevent confusion in future. There have been multiple proposals that would permit some cables to remain in “inaccessible spaces”. This is not conducive to safe electrical practice; this the key change is the elimination of the words “the accessible portion of”.

If the intent of the code-making panel was to clarify that removal of cable should not be done if such removal would damage the building, which is obviously not the intent, a second sentence can be added stating that removal of abandoned cables shall not be performed if it would damage the building structure or finish or in any way compromise the functional performance of any other wiring systems or components. This would be accomplished by the optional added sentence.

Consistent wording on removal of abandoned cables is being proposed for sections: 640.3, 725.3, 770.3, 770.154, 800.3, 800.154, 820.3, 820.154 and 830.3.

For information, see the relevant definitions in the NEC.

Accessible (as applied to equipment). Admitting close approach; not guarded by locked doors, elevation, or other effective means.

Accessible (as applied to wiring methods). Capable of being removed or exposed without damaging the building structure or finish or not permanently closed in by the structure or finish of the building.

Accessible, Readily (Readily Accessible). Capable of being reached quickly for operation, renewal, or inspections without requiring those to whom ready access is requisite to climb over or remove obstacles or to resort to portable ladders, and so forth.

Concealed. Rendered inaccessible by the structure or finish of the building. Wires in concealed raceways are considered concealed, even though they may become accessible by withdrawing them.

Isolated (as applied to location). Not readily accessible to persons unless special means for access are used.

Panel Meeting Action: Reject

Panel Statement: See panel action on Proposal 16-28.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

OHDE, H.: We concur with submitter’s substantiation and believe a change of wording will ensure that are abandoned cables are remove and prevent confusion in future. We suggest that the submitter resubmit his recommendation in the 2008 ROC stage in a more appropriate section with Part 1 – General so these requirements will apply throughout the entire Article.

16-73 Log #2198 NEC-P16 **Final Action: Reject**
(770.154, 770.179)

Submitter: Frank Peri, Communications Design Corporation

Recommendation:

In 770.154 revise and re-letter the existing section (A) to (B) and introduce a new (A) as shown below. Also revise (G) as shown below. Re-letter the remaining sections, (B) to (C), (C) to (D) etc.

(A)Air Ducts. Cables installed in air ducts shall be Type OFND or OFCD and shall be associated with the air distribution system and shall be as short as practicable. Types OFND, OFCD, OFNP, OFCP, OFNG, OFN, OFCG and OFC cables installed in raceway that is installed in compliance with 300.22(B) shall also be permitted.

(B~~A~~) Plenum. Cables installed in ~~ducts,~~ plenums~~,~~ and other space~~s~~ used for environmental air shall be Types OFND, OFCD, OFNP or OFCP. Abandoned cables shall not be permitted to remain. Types OFND, OFCD, OFNP, OFCP, OFNR, OFCR, OFNG, OFN, OFCG, and OFC cables installed in compliance with 300.22 shall be permitted. Listed plenum optical fiber raceways shall be permitted to be installed in ~~ducts and~~ plenums as described in 300.2(b) and in other space~~s~~ used for environmental air as described in 300-22(C). Only Types OFND, OFCD, OFNP and OFCP cables shall be permitted to be installed in ~~these~~ listed plenum communications raceways.

FPN: See 8.14.1 of NFPA13-2002, *Installation of Sprinkler Systems*, for requirements for sprinklers in concealed spaces containing exposed combustibles.

(G~~F~~) Cable Substitutions. The substitutions for optical fiber cables listed in Table 770.154 shall be permitted.

Table 770.154 Cable Substitutions

Cable Type	Permitted Substitutions
OFNP	OFND ~~None~~
OFCP	OFND, OFCD, OFNP
OFNR	OFND, OFNP
OFCR	OFND, OFCD, OFNP, OFCP, OFNR
OFNG, OFN	OFND OFNP, OFNR
OFCG, OFC	OFND, OFCD, OFNP,OFCP,OFNR,OFCR, OFNG, OFN

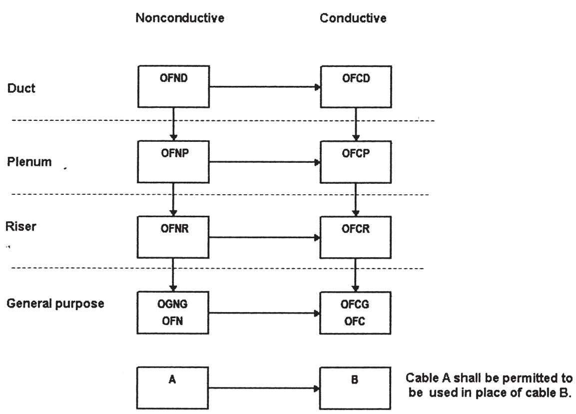

Figure 770.154 Cable substitution hierarchy.

In 770.179 revise and re-letter the existing section (A) to (B) and introduce a new (A) as shown below. Re-letter the remaining sections, (B) to (C), (C) to (D) etc.

(A)Types OFND and OFCD. Types OFND and OFCD nonconductive and conductive optical fiber air duct cables shall be listed as suitable for use in air ducts and shall be rated for continuous use at 121°C. Types OFND and OFCD nonconductive and conductive optical fiber air duct cables shall also be listed as having a low potential heat value, low flame spread characteristics, and very low smoke-producing characteristics.

FPN: One method of defining a low potential heat cable is establishing an acceptable value of potential heat when tested in accordance with NFPA 259, *Standard Test Method for Potential Heat of Building Materials*, to a maximum potential heat value not exceeding 8141 kJ/kg (3500 BTU/lb). One method of defining low flame spread cable is establishing an acceptable value of flame spread when tested in accordance with NFPA 255, *Standard Method of Test of Surface Burning Characteristics of Building Materials*, to a maximum flame spread index of 25, with the cable unslit (intact) and slit. Similarly, one method of defining very low smoke-producing cable is establishing an acceptable value when tested in accordance with NFPA 255, *Standard Method of Test of Surface Burning Characteristics of Building Materials*, to maximum smoke developed index of 50, with the cable unslit (intact) and slit. These test methods and resultant values correlate with the requirements of NFPA 90A-2002, *Standard for the Installation of Air-Conditioning and Ventilating Systems* for materials installed in ducts and plenums. *For additional testing information see Underwriters Laboratories Subject 2424, Outline of Investigation For Cable Marked Limited Combustible.*

(B~~A~~)Types OFNP and OFCP. Types OFNP and OFCP nonconductive and conductive optical fiber plenum cables shall be listed as being suitable for use in ~~ducts,~~ plenums~~,~~ and other space used for environmental air and shall also be listed as having adequate fire resistant and low smoke producing characteristics.

FPN: One method of defining a cable that is low smoke-producing cable and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262-2002, *Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces.*

Substantiation: Summary

This proposal is submitted to accomplish four things:

1.) Change the code to not allow the dangerous practice of using air ducts as a cable pathway.

2.) Code recognition that there may be instances where a small amount of in-duct cable is necessary for air handling equipment, dampers, security, temperature control, fire protection, etc.

3.) Establish minimum requirements for flame spread, smoke, and potential heat for in-duct (CL2D, CL3D, FPLP, OFND, OFCD, CMD and CATVD) cables used in this special hazard space.

4.) Include air duct "D" cables as permissible substitute for plenum "P" cables for installation in ceiling cavity and raised floor plenums (other space used for environmental air).

This proposal correlates with a TIA that I submitted for NFPA 90A-2002, *Standard for the Installation of Air-Conditioning and Ventilating Systems.* Similar proposals have been submitted for Articles 725, 760, 770, 800 and 820.

The substantiation for the TIA is shown below:

"This TIA is being submitted in accordance with Section 5 of the *2005 NFPA REGULATIONS GOVERNING COMMITTEE PROJECTS.* In particular, it addresses a hazard meeting the criteria of section 5-2(d), which states:

(d) The proposed TIA intends to offer to the public a benefit that would lessen a recognized (known) hazard or ameliorate a continuing dangerous condition or situation.

The purpose of this TIA is to address the dangerous practice of installing combustible communications/data cables in air ducts.

NFPA 90A-2002 does not have explicit requirements for electrical wiring in air ducts. While there is a need for some limited amount of wiring in air ducts where the function of the wiring is associated with the function of the air handling system, use of air duct instead of an electrical raceway for routing wiring unassociated with the air handling system is a dangerous practice. It introduces unlimited quantities of combustible cable into an air handling system and thus unacceptability increases the potential for the spread of fire and smoke through the air distribution system.

This TIA would greatly reduce the amount of wiring in air ducts by only permitting wiring and raceways associated with the air distribution system and also requiring that they be as short as practicable. It would require that the wiring and nonmetallic raceway in the ducts have the appropriate temperature rating for hot air ducts; NFPA 90A permits the supplied air to be at 121 °C (250 °F). The permitted wiring and nonmetallic raceway would be required to have initial flame spread and smoke requirements identical to those for supplementary materials in an air duct (flame spread index =25, smoke developed index =50). In addition to these initial requirements, there are slitting and ageing requirements to assure that the cables installed in air ducts meet the flame spread, smoke and potential heat requirements equivalent to those for limited combustible materials. Essentially they would be required to be listed to the UL 2424.

Combustible plenum cable is unsuitable and dangerous for this application. Typically, combustible plenum cable has a temperature rating of 60° C, which is significantly less that the 121° C air permitted in the air duct. Furthermore, according to Fire Protection Research Foundation tests, these cables can have smoke developed index (SDI) of up to 850. This SDI is an order of magnitude greater than permitted for supplementary materials installed in an air duct.

It is essential that these requirements be adopted now in NFPA 90A."

Section 770.154(A) in the 2005 NEC permits unlimited amounts of Types OFNP and OFCP cableS in air ducts. While there is a need for some limited amount of wiring in air ducts where the function of the wiring is associated with the function of the air handling system, use of an air duct instead of an electrical raceway for routing wiring unassociated with the air handling system is a dangerous practice. It introduces unlimited quantities of combustible cables into an air handling system and thus unacceptability increases the potential for the spread of fire and smoke through the air distribution system.

This proposal would greatly reduce the amount of wiring in air ducts by only permitting wiring associated with the air duct and as short as practicable. It would require that the wiring in the ducts have the appropriate temperature rating for hot air ducts; NFPA 90A-2002, *Standard for the Installation of Air-Conditioning and Ventilating Systems*, permits the supplied air to be at 121 °C (250 °F). The permitted wiring would be required to have flame spread and smoke requirements identical to those in NFPA 90A-2002 section 4.3.3.1 for supplementary materials in an air duct (flame spread index =25, smoke developed index =50). Essentially they would be required to be listed to the UL 2424, *Outline of Investigation For Cable Marked Limited Combustible* (copy attached) .

"P" type plenum cables are unsuitable and dangerous for this application. Typically, they have a temperature rating of 60 °C, which is significantly less that the 121 °C air permitted in the air duct. Furthermore, according to Fire Protection Research Foundation tests (copy attached), these cables can have smoke developed index (SDI) of up to 850. This SDI is an order of magnitude greater than permitted for supplementary materials installed in an air duct.

"D" type air duct cables will meet the NFPA 90A listing requirements for use in ceiling cavity and raised floor plenums (other space used for environmental air) and therefore will be able to safely substitute for "P" type plenum cables. "D" type air duct cables have approximately 1/20 the smoke production of "P" type plenum cables.

In order to be consistent with the applications of plenum cable, this proposal will also prohibit the installation of plenum communications raceways in air ducts.

The cable substitution table and figure have been revised to permit air duct cables to substitute for plenum cables since air duct cables are superior cables. “D” type air duct cables also meet the requirements in NFPA 90A for use in ceiling cavity plenums and raised floor plenums (other space used for environmental air).

Some of the applications that require the installation of cables in air ducts are fire alarm (Article 760), temperature sensing and control (Article 725), security (Articles 725 and 820) and communications (Article 800). Optical fiber cables (Article 770) could be used in place of copper conductor cables. Communications cables are permitted to substitute for Class 2 & 3, fire alarm and CATV cables. I am submitting similar proposals for each of these articles.

Note: Supporting Material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

“So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A.”

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Only type OFNP and OFCP cables shall be permitted to be installed in these raceways.

Substantiation: This is a technical proposal. (Task Group No. 770-27)

It is a corollary proposal to the task group proposal to have the listing requirements for plenum optical fiber raceway changed to be for use in other space used for environmental air only.

The applications of plenum optical fiber raceways should be consistent with the listing requirements.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

16-78 Log #3098 NEC-P16 **Final Action: Reject**
(770.154(A))

Submitter: Donald Hall, Corning Cable Systems

Recommendation: This is a companion proposal to two similiar proposals addressing the same NFPA 13 reference in Articles 800 and 820.

Delete FPN text as follows:

~~FPN: See 8.14.1 of NFPA 13 (2002), Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.~~

Substantiation: The reference to 8.14.1 of NFPA 13 is misleading and should be removed for the following reasons:

(1) The reference is related to sprinkler protection of combustible concealed spaces and their stored content. The use of a concealed space as a pathway for cables and raceway in a manner permitted by the NEC does not constitute a storage condition.

(2) The Technical Committee for NFPA 13 has never provided any useful guidance to indicate what quantity of cable/raceway or other circumstance might trigger requirement for communications cables to be protected by sprinklers. The Technical Committee for NFPA 13 proposed a new annex for addition to the next revision of NFPA 13 (shown below). The proposed annex is non binding, contains vague terminology, and does not add any new clarifying information, because it is identical to the existing language of the NFPA 13 Handbook. For normal circumstances in which cables and raceway are installed in accordance with the NEC and are listed by a Nationally Recognized Test Laboratory "as suitable for use in ducts, plenums, and other spaces used for environmental air and as having adequate fire resistant and low smoke producing characteristics" it is understood that these cables and raceways are safe and do not require additional protection from sprinklers.

(3) The cited portion of NFPA 13 is broadly applicable to all concealed spaces, not just those which handle environmental air. The selective placement of this FPN within three sections of the NEC all pertaining to plenum spaces, creates a perceived encumbrance to the permitted use of plenum cables and plenum cables alone. This perceived encumbrance is being aggressively exploited through the marketing efforts of multiple commercial interests to create a new market for their products.

NFPA 13 ROP indicates the following proposed change:

A.8.14.1.2.1 Some minor quantities of combustible materials, such as communication wiring, can be present in some concealed spaces but should not typically be viewed as requiring sprinklers (see 8.14.1.1). The threshold value at which sprinklers become necessary in the concealed space is not defined. For example, the usual amounts of data or telephone wiring found above a ceiling would not typically constitute a threat. If bundles of unsheathed computer wiring are installed above the ceiling or beneath the floor in a manner where fire propagation in all directions is likely, then the concealed space should be treated the same as a combustible space, thereby requiring appropriate sprinkler protection.

Panel Meeting Action: Reject

Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

JENSEN, R.: We believe that the interpretation of whether being allowed to address this proposal in view of the NFPA Standards Council Long Decision 05-24 (SC #05-7-4) was misunderstood.

The proposal to delete this FPN is not involved with NFPA 90A and should be deleted for the reasons given in the submitter's substantiation. To further acceptance of removing this FPN, refer to several comments within the 2006 NFPA 13 ROC and in particular to 13-389a.

OHDE, H.: See my Explanation of Negative on Proposal 16-70.

16-79 Log #3238 NEC-P16 **Final Action: Reject**
(770.154(A))

Submitter: Frank Peri, Communications Design Corporation

Recommendation: Revise 770.154(A), as shown.

(A) Plenums. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type OFND, OFCD , OFNP or OFCP. Abandoned cables shall not be permitted to remain. Types OFND, OFCD, OFNP, OFCP, OFNR, OFCR, OFNG, OFN, OFCG, and OFC cables installed in compliance with 300.22 shall be permitted. Listed plenum optical fiber raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only Type OFND, OFCD, OFNP and OFCP cables shall be permitted to be installed in these raceways.

Substantiation: The purpose of this proposal is to correlate with NFPA 5000-2006. NFPA 5000-2006, recently issued by the NFPA Standards Council, incorporates extracted plenum requirements from NFPA 90A-2002. Consequently, the plenum requirements in NFPA 5000-2006 are identical to the ceiling cavity plenum requirements in NFPA 90A-2002. This proposal provides listing requirements for a cable with characteristics that complies with the NFPA 90A-2002, 4.3.10.2.6: requirements for limited combustible materials exposed to the airflow. This proposal provides a listing and marking for a cable that complies with the NFPA 90A-2002, 4.3.10.2.6.1: a requirement for a listed limited combustible cable with a maximum smoke developed index of 50. The proposed cable meets the NFPA Standards Council's directive to not identify cable as "limited combustible," because it is not a building construction material. The cable name and listing requirements meets guidance from the NFPA Standards Council to identify cable characteristics in terms of flame spread index, smoke developed index, and potential heat release.

As compared to a combustible plenum cable that is listed using NFPA 262, air duct cable is a much "safer" cable. Air duct cable provides users with an opportunity to significantly reduce the potential hazard from smoke during a fire emergency. Additionally, the much lower potential heat release of air duct cable provides much lower combustible loading than found in combustible plenum cable listed using NFPA 262.

Air duct cables are available on the market today. Presently, there is air duct cable available to meet the plenum installation requirements in Articles 725, 760, 770, and 800. Unfortunately, the only marking available in the NEC is for a combustible plenum cable. The NEC decides what marking is permitted, and listing organizations correlate. That is, it would be inappropriate for a listing organization to mark cable with a "Type XXX" that is not published in the NEC.

Panel Meeting Action: Reject

Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Ballot Results: Affirmative: 15

16-80 Log #2811 NEC-P16 **Final Action: Accept in Part**
(770.154(A) and (B))

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal and that further consideration be given to the comments expressed in the voting. This action will be considered by the Panel as a Public Comment.

Submitter: Harold C. Ohde, IBEW #134

Recommendation: Delete the wording "Abandoned cables shall not be permitted to remain." in the following areas:

770.154 Applications of Listed Optical Fiber Cables and Raceways. No change.

Revise text to read as follows:

(A) Plenums. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type OFNP or OFCP.

~~Abandoned cables shall not be permitted to remain.~~ Types OFNR, OFCR, OFNG, OFN, OFCG, and OFC cables installed in compliance with 300.22 shall be permitted to remain. List plenum optical fiber raceways shall be permitted to be installed in ducts and plenums as described in ducts in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only Types OFNP and OFCP cables shall be permitted to be installed in these raceways.

(B) Riser. Cables installed in risers shall be described in any of the following:

(1) Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type OFNR or OFCR, floor penetrations requiring Type OFNR or OFNR shall contain only cables suitable for riser or plenum use. ~~Abandoned cables shall not be permitted to remain.~~ Listed riser optical fiber raceways shall be permitted to be installed in vertical riser runs in a shaft from floor to floor. Only Type OFNG, OFN, OFCG, and OFC cables shall be permitted to be installed in these raceways.

(2) No change.

(3) No change.

Substantiation: I have submitted a proposal that would move the abandoned optical fiber cable requirements to a more appropriate and central section within Article 770. The abandoned optical fiber cable requirements belong in 770.24 - Mechanical Execution of Work. 770.24 is located within Part I, General which would apply to the entire Article 770.

Panel Meeting Action: Accept in Part

The panel accepts the submitter's deletion of subsection (B).

The panel rejects the submitter's revision of subsection (A).

Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air-handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

BRUNSSEN, J.: Under "Panel Meeting Action:", revise the first sentence as follows: "The panel accepts the submitter's deletion of the sentence <u>'Abandoned cables shall not be permitted to remain.' in</u> subsection (B)." It was this sentence that was deleted, not the entire subsection (B).

DORNA, G.: The panel statement contains an error. The panel accepted the deletion in subsection (B), not of subsection (B).

KAHN, S.: The panel statement requires correction as the panel accepted the submitter's deletion "in" subsection (B), not the deletion "of" subsection (B).

16-81 Log #2817 NEC-P16 **Final Action: Reject**
(770.154(A), FPN)

Submitter: Ronald E. Hackett, Village of Buffalo Grove

Recommendation: Delete the FPN text that follows: 770.154(A)

~~FPN: See 8.14.1 of NFPA 13 (2002). Installation of Sprinkler Systems for requirements for sprinklers in concealed spaces containing exposed combustibles.~~

Substantiation: As chief electrical inspector of Buffalo Grove, I do not see any reason or any technical support as why this FPN referencing 8.14.1 of NFPA 13(2002), Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles was added to the 2005 NEC. This FPN is very misleading and inappropriate as well. My own personal experience as the AHJ has found that this FPN being a negative effect on the National Electrical Code which is used as an installation documentation to be in conflict with the NFPA 13.

NFPA 13 Technical Committee added new Annex A8.14.1.2.1 in the 2006 ROP #13-284, Log #551 which should provide guidance to both the installer and AHJ for cabling in concealed spaces.

Panel Meeting Action: Reject

Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

Ballot Results: Affirmative: 15

16-85 Log #8 NEC-P16 **Final Action: Accept in Principle**

(770.154(C))

Submitter: Stanley Kaufman, CableSafe, Inc.

Recommendation: Revise as follows:

(C) Other Wiring Within Buildings. Cables installed in building locations other than the locations covered in 770.154(A) and 770.154(B) shall be Type OFNG, OFN, OFCG, or OFC. Such cables shall be permitted to be installed in listed general-purpose optical fiber raceways <u>listed riser optical fiber raceways and plenum optical fiber raceways</u> .

Substantiation: Plenum and riser raceways should be permitted to substitute for general purpose raceways just as plenum and riser cables are permitted to substitute for general purpose cables.

Panel Meeting Action: Accept in Principle

Revise 770.154(C) to read as follows:

(C) Other Wiring Within Buildings. Cables installed in building locations other than the locations covered in 770.154(A) and 770.154(B) shall be Type OFNG, OFN, OFCG, or OFC. Such cables shall be permitted to be installed in listed general-purpose optical fiber raceways, <u>listed riser optical fiber raceways, and listed plenum optical fiber raceways</u> .

Panel Statement: The addition clarifies the submitter's intent.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

OHDE, H.: This proposal should be rejected as this new code language could be confusing to code-users. The revised language allows all of the cables listed to be used in riser and plenum optical fiber raceways. As long as it is clear that these riser and plenum raceways are not being used in riser and plenum applications, the use of those cables in those raceways in not a problem. However, why would anyone want to use the more expensive raceways in " other wiring within buildings" locations? This language is also in conflict with 770.154(A) which states "Only Type OFNP and OFCP cables shall be permitted to be installed in these raceways" and with 770.154 (B) which requires either plenum or riser cables to be installed in riser optical fiber raceways.

16-86 Log #718 NEC-P16 **Final Action: Accept**

(770.154(C))

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.

Recommendation: Change the title as shown:

(C) Other ~~Wiring~~ <u>Cabling</u> Within Buildings. Cables installed in building locations other than the locations covered in 770.154(A) and 770.154(B) shall be Type OFNG, OFN, OFCG, or OFC. Such cables shall be permitted to be installed in listed general-purpose optical fiber raceways.

Substantiation: This is an editorial proposal. (Task Group No. 770-24)

There are no optical fiber wires, only cables. Hence, the proposed title change.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

OHDE, H.: We agree with panel action and believe that the panel statement should also reflect the latest NFPA 13 Technical Committee actions. Included in the submitter's substantiation was the 2002 Section 8.14 which since has been revised. We would like to add that NFPA 13 just completed their balloting process for the 2006 NFPA 13 Standard. The Technical Committee on Sprinkler Installation submitted a comment on Proposal 13-284.

This comment reworded proposed A.8.14.1.2.1 to read " *Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc…can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1) For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined* ."

In the NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

16-90 Log #719 NEC-P16 **Final Action: Accept in Principle**
(770.179 and Table 770.179)

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.

Recommendation: Revise 770.179 and transfer Table 770.113 and the Table FPN's to 770.179.

770.179 Optical Fiber Cables.

Optical fiber cables shall be listed in accordance with 770.179(A) through 770.179(D) and shall be marked in accordance with Table 770.179.

Move Table 770.113 and Table FPN's to 770.179 and renumber to Table 770.179.

Substantiation: This change is editorial. (Task Group No. 770-25)

It moves the cable marking requirements from 770.133 to 770.179.

There is a companion proposal to make appropriate changes to 770.113.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

Recommendation: Revise text to read as follows:

FPN: One method of defining *resistant to the spread of fire* is that the cables do not spread fire to the top of the tray in the " <u>UL Flame Exposure</u> , Vertical Tray Flame Test" in ~~ANSI/UL 1581-2001, Standard for Electrical Wires, Cables, and Flexible Cords~~ . <u>UL 1685-2000 Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables. The smoke measurements in the test method are not applicable.</u>

Another method of defining resistant to the spread of fire is for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing the CSA "Vertical Flame Test - Cables in Cable Trays," as described in CSA C22.2 No. 0.3-M- ~~1985~~ <u>2001</u> , Test Methods for Electrical Wires and Cables.

Substantiation: The revised wording is an update of the standard references and not a change in the test methods. UL 1581 now references UL 1685 for the text of the test method.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-93 Log #2529 NEC-P16 **Final Action: Reject**
(770.179(E))

Submitter: Sanford Egesdal, Egesdal Associates PLC

Recommendation: Insert new 770.179(E).

<u>(E) Types OFN50 and OFC50. Types OFN50 and OFC50 optical fiber cables shall be listed as suitable for installation in concealed spaces having restrictive requirements for smoke generation, combustible loading, and flame spread and shall be listed as having very-low-smoke producing characteristics, a low potential heat release value, and low flame spread characteristics.</u>

<u>FPN: One method of defining a low flame spread and very low smoke-producing cable is that the cable exhibits a maximum flame spread index of 25 and maximum smoke developed index of 50 when tested in accordance with NFPA 255, *Standard Method of Test of Surface Burning Characteristics of Building Materials* with the cable unslit (intact) and cut through to expose the cable core. One method of defining a low potential heat cable is that the cable exhibits a maximum potential heat value of exceeding 8141 kJ/kg (3500 BTU/lb) when tested in accordance with NFPA 259, *Standard Test Method for Potential Heat of Building Materials.*</u>

<u>FPN No. 2: See 8.14.1 of NFPA 13-2002, *Installation of Sprinkler Systems* , for requirements for sprinklers in concealed spaces containing exposed combustibles.</u>

<u>FPN No. 3: Building codes adopted by code jurisdictions may contain restrictions on permissible flame spread index and smoke developed index.</u>

Substantiation: This proposal establishes a listing and marking for cables permitted as an electrical wiring option in concealed spaces where a smoke developed index no greater than 50 is required or large quantities of cable may cause combustible loading. The proposed cable has very-low-smoke-producing characteristics, a low potential heat release value, and low flame spread characteristics. Presently, a number of manufacturers have cables listed to the proposed requirements.

The testing criteria are based on the requirements found in NFPA 13-2003 and the 2003 International Mechanical Code, as revised.

NFPA 13, Section 8.14.1.2.1 follows: "Noncombustible and limited combustible concealed spaces with no combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum." The proposed cable has a very low heat of combustion. While the term "combustible loading" is not defined, the fuel load can be calculated to determine the potential hazard from large quantities of cable.

The 2003 International Mechanical Code, 602.2.1, requires materials in plenums to be noncombustible or have a flame spread index no greater 25 and a smoke index no greater than 50. At the recent ICC meeting in Detroit, exception #5 to 602.2.1 was revised to include "combustible material (electrical wiring) installed in noncombustible raceways or enclosures." The requirements in IMC 602.2.1.1 permits cables meeting NFPA 262 test requirements. Cables meeting NFPA 262 requirements, according to Fire Protection Research Foundation testing using NFPA 255, have a smoke developed index that varies between 450 and 850. The proposed cable meets the requirements of the base paragraph, 602.2.1.

The following (change is underlined) shows the result of action on IMC public comment on M 77 (floor actions in Detroit, September 2005).

602.2.1 Materials exposed within plenums. Except as required by Sections 602.2.1.1 through 602.2.1.5, materials within plenums shall be noncombustible or shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84.

Exceptions:

1. Rigid and flexible ducts and connectors shall conform to Section 603.
2. Duct coverings, linings, tape and connectors shall conform to Sections 603 and 604.

3. This section shall not apply to materials exposed within plenums in one- and two-family dwellings.
4. This section shall not apply to smoke detectors.
5. Combustible materials enclosed in noncombustible raceways or enclosures, approved gypsum board assemblies or enclosed in materials listed and labeled for such application.

602.2.1.1 Wiring. Combustible electrical or electronic wiring methods and materials, optical fiber cable, and optical fiber raceway exposed within a plenum shall have a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread not greater than 5 feet (1524 mm) when tested in accordance with NFPA 262. Only type OFNP (plenum rated nonconductive optical fiber cable) shall be installed in plenum-rated optical fiber raceways. Wiring, cable, and raceways addressed in this section shall be listed and labeled as plenum rated and shall be installed in accordance with ICC *Electrical Code* .

The Fire Protection Research Foundation report demonstrated that NFPA 255, *Standard Method of Test of Surface Burning Characteristics of Building Materials* , provides a suitable test method for establishing the cable characteristics (flame spread index & smoke developed index) specified in the FPN.

Establishing a listing and marking for a Type FPL50 cable provides a wiring option for complying with requirements of other standards and building codes. The NEC has previously established listings and markings for cable to correlate with other codes and standards. Additionally, the listing and marking may or may not have a specific application. Specific examples follow:

1. Type CMG cable was included in the 1993 NEC to correlate with the Canadian Electrical Code. The change was proposed by the Chair of NEC TCC, Harold Ware and Roy Hicks from Canada. Type CMG has a listing and marking in the NEC. Article 800 permits "Type CM or Type CMG" to be installed as a general purpose cable. Note: Type CMG does not have a unique application, and neither cable is considered a minimum requirement.
2. Types MP, MPR, and MPP cable was included in the 1990 NEC. The cables had a listing and marking. The multiple-purpose cables were permitted to substitute for similar cables in Articles 725, 760, & 800. Note: Types MP, MPR, and MPP cables do not have a unique application, just a listing and marking.
3. A change to the 1999 NEC permitted Types NPLF, NPLFR, NPLFP, FPL, FPLR, and FPLP to have a "-CI" suffix. The change included only listing and marking requirements. This change to the NEC correlated with NFPA 72, National Fire Alarm Code, requirements for a circuit integrity cable. Note: Cables with a "-CI" suffix did not have an application, until changes were made to the 2005 NEC.
4. A change to the 2005 NEC permitted Types CM, CMR and CMP to have a "-CI" suffix. As of today, no company has a listed circuit integrity using the permitted markings. Note: Types CM-CI, CMR-CI, and CMP-CI do not have an application, just a listing and marking.

Panel Meeting Action: Reject

Panel Statement: The submitter did not provide adequate technical substantiation to support a need for a cable listed for concealed spaces.

Concealed spaces should be adequately defined. Seeaction on Proposals 16-13, 16-110, and 16-247 where the proposed definition was determined to be unacceptable.

"The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"[S]o as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

OHDE, H.: We agree with panel action and believe that the panel statement should also reflect the latest NFPA 13 Technical Committee actions. Included in the submitter's substantiation was the 2002 Section 8.14 which since has been revised. We would like to add that NFPA 13 just completed their balloting process for the 2006 NFPA 13 Standard. The Technical Committee on Sprinkler Installation submitted a comment on Proposal 13-284.

This comment reworded proposed A.8.14.1.2.1 to read " *Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc…can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1) For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined* ."

In the NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

16-94 Log #3240 NEC-P16 **Final Action: Reject**
(770.179(E))

Submitter: Frank Peri, Communications Design Corporation

Recommendation: Add new 770.179(E).

(E) Types OFCD and OFND. Types OFND and OFCD air duct cable shall be listed as being suitable for use in ducts, plenums, and other spaces used for environmental air and shall also be listed as having adequate fire-resistant, very low smoke-producing characteristics, and very low potential heat release.

FPN No: One method of defining a low flame spread and very low smoke-producing cable is that the cable exhibits a maximum flame spread index of 25 and maximum smoke developed index of 50 when tested in accordance with NFPA 255, *Standard Method of Test of Surface Burning Characteristics of Building Materials* with the cable unslit (intact) and cut through to expose the cable core. One method of defining a low potential heat cable is that the cable exhibits a maximum potential heat value of exceeding 8141 kJ/kg (3500 BTU/lb) when tested in accordance with NFPA 259, *Standard Test Method for Potential Heat of Building Materials.*

Substantiation: The purpose of this proposal is to correlate with NFPA 5000-2006. NFPA 5000-2006, recently issued by the NFPA Standards Council, incorporates extracted plenum requirements from NFPA 90A-2002. Consequently, the plenum requirements in NFPA 5000-2006 are identical to the ceiling cavity plenum requirements in NFPA 90A-2002. This proposal provides listing requirements for a cable with characteristics that complies with the NFPA 90A-2002, 4.3.10.2.6: requirements for limited combustible materials exposed to the airflow. This proposal provides a listing and marking for a cable that complies with the NFPA 90A-2002, 4.3.10.2.6.1:a requirement for a listed limited combustible cable with a maximum smoke developed index of 50. The proposed cable meets the NFPA Standards Council's directive to not identify cable as "limited combustible," because it is not a building construction material. The cable name and listing requirements meets guidance from the NFPA Standards Council to identify cable characteristics in terms of flame spread index, smoke developed index, and potential heat release.

As compared to a combustible plenum cable that is listed using NFPA 262, air duct cable is a much "safer" cable. Air duct cable provides users with an opportunity to significantly reduce the potential hazard from smoke during a fire emergency. Additionally, the much lower potential heat release of air duct cable provides much lower combustible loading than found in combustible plenum cable listed using NFPA 262.

Air duct cables are available on the market today. Presently, there is air duct cable available to meet the plenum installation requirements of Articles 725, 760, 770, and 800. Unfortunately, the only marking available in the NEC is for a combustible plenum cable. The NEC decides what marking is permitted, and listing organizations correlate. That is, it would be inappropriate for a listing organization to mark cable with a "Type XXX" that is not published in the NEC.

The following is an example of air duct cable information from the UL Web Site:

OWKZ.GuideInfoLimited Combustible Cable

Guide Information for Electrical Equipment for Use in Ordinary Locations

GENERAL

This category covers electrical and optical fiber cable that meets the limited combustible and smoke developed requirements for cable in ceiling cavity and raised floor plenums in accordance with NFPA 90A, "Standard for the Installation of Air Conditioning and Ventilating Systems." This cable also meets the requirements for cable used in ducts, plenums and other spaces used for environmental air in accordance with Articles 725, 760, 770, 800, 820 and 830 of ANSI/NFPA 70, "National Electrical Code".

This cable has a maximum Potential Heat value of 3500 Btu/lb when tested in accordance with NFPA 259, "Standard Test Method for Potential Heat of Building Materials." This cable has a maximum smoke developed index of 50 and a maximum flame spread index of 25 when tested in accordance with UL 723 (NFPA 255), "Test for Surface Burning Characteristics of Building Materials" before and after exposure to elevated temperature and humidity. The cable also meets the requirements for plenum cable in one or more of the following product categories:

· Power-limited Circuit Cable (**QPTZ**) - Types CL2P or CL3P
· Communications Cable (**DUZX**) - Type CMP
· Power-limited Fire Alarm Cable (**HNIR**) - Type FPLP
· Nonpower-limited Fire Alarm Cable (**HNHT**) - Type NPLFP
· Optical Fiber Cable (**QAYK**) - Types OFNP or OFCP
· Community Antenna Television Cable (**DVCS**) - Type CATVP
· Network-powered Broadband Communications Cable (**PWIP**) - Type BLP

PRODUCT MARKINGS

This cable is identified by the marking "Limited Combustible FHC 25/50" on the surface of the jacket or on a marker tape under the jacket. This marking is immediately followed by one of the Type designations shown above. The cable also has the required markings including optional markings as indicated in the product categories referenced above. This cable may also be Verified for transmission performance if authorized in the product categories referenced above, and will bear the appropriate performance verification marking.

ADDITIONAL INFORMATION

For additional information, see Electrical Equipment for Use in Ordinary Locations (**AALZ**).

REQUIREMENTS

The basic requirements used to investigate products in this category are contained in Subject 2424, "Outline of Investigation for Cable Marked 'Limited Combustible.'"

UL MARK

The UL symbol on the product and the Listing Mark of Underwriters Laboratories Inc. on the attached tag, the reel, or the smallest unit container in which the product is packaged is the only method provided by UL to identify products manufactured under its Listing and Follow-Up Service. The Listing Mark for these products includes the UL symbol (as illustrated in the Introduction of this Directory) together with the word "LISTED," a control number, and the product name "Limited Combustible Cable."

Cable which is also Verified to the UL Data Transmission Performance Category Marking Program has the marking "Verified to UL Performance Category Program," or the UL Verification Mark along with the words "Performance Category Program" together with the Listing Mark information on the tag, the reel, or the smallest unit container. Cable which is also Verified to another transmission performance specification has the marking "Verified in Accordance with [Specification name and/or number]" or the UL Verification Mark along with the applicable Specification name and/or number together with the Listing Mark information on the tag, the reel, or the smallest unit container.

Last Updated on 2004-03-24

Panel Meeting Action: Reject

Panel Statement: "The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-95 Log #3633 NEC-P16 **Final Action: Reject**
(770.179(E) (New))

Submitter: Allen C. Weidman, The Society of the Plastics Industry, Inc.

Recommendation: Add new text as follows:

<u>**(E) Concealed Space Cables.** Optical fiber cables that meet the requirements for Types OFN and OFC that are also listed as having a low potential heat value, low flame spread characteristics, and low smoke producing characteristics shall be permitted to be listed and marked as concealed space cables Type OFN-CS and OFC-CS.</u>

<u>FPN: One method of defining a low flame spread and low smoke-producing cable is that the cable exhibits a maximum flame spread distance of 1.52 m (5 ft), a maximum peak optical density of 0.5 and a maximum average optical density of 0.15 when tested in accordance with NFPA 262-2002, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces with the cable unslit (intact) and cut through to expose the cable core. One method of defining a low potential heat cable is that the cable exhibits a maximum potential heat value of exceeding 8141 kJ/kg (3500 BTU/lb) when tested in accordance with NFPA 259, *Standard Test Method for Potential Heat of Building Materials.*</u>

Substantiation: The purpose of this proposal is to provide listing and marking for a cable that will be suitable for use in concealed spaces where there are large quantities of cables. Users would have the option of using these cables to avoid establishing a fuel load above the threshold where the quantity of cables would be considered a combustible loading. Also, these cables provide a flame spread index and a smoke developed index that correlate with the requirements for exposed materials within concealed spaces in buildings.

Cables tested using NFPA 255 and 259 establish parameters commonly used in NFPA standards and building codes: smoke developed index, smoke developed index, and heat of combustion. This proposal uses the NFPA 262 test in place of NFPA 255. The Fire Protection Research Foundation's *International Limited Combustible Plenum Cable Fire Test Project* (copy attached) has shown that both of these tests are suitable and provided data (page 18 of the report) for setting equivalent criteria in the two tests. A maximum average optical density of 0.17 in NFPA 262 is equivalent to a smoke developed index of 450 in NFPA 255. This proposal sets the maximum optical density requirement at 0.15 to allow for a margin of error and to correlate with the existing requirements for plenum cable.

NFPA 13 has requirements for sprinklers in a concealed space that contains a combustible loading. Combustible loading is a function of the density (number) of cables and their potential heat release determined by NFPA 259.

The following is excerpted from the Automatic Systems Sprinkler Handbook 2002 edition: In the handbook the commentary is printed in blue. Since the proposals are printed in black and white I have changed the handbook commentary to ***bold italics*** . I also underlined the text that refers to computer room raised floors.

As indicated in 8.1.1(1), sprinklers are required throughout the premises. Under certain conditions, however, the omission of sprinklers in certain areas and spaces within a building is permitted. Section 8.14 identifies these spaces and conditions.

8.14.1 Concealed Spaces.

8.14.1.1 Concealed Spaces Requiring Sprinkler Protection. All concealed spaces enclosed wholly or partly by exposed combustible construction shall be protected by sprinklers except in concealed spaces where sprinklers are not required to be installed by 8.14.1.2.1 through 8.14.1.2.15.

Concealed spaces requiring sprinkler protection are covered in 8.14.1.1. Concealed spaces, unless protected, can provide an unabated passage for firespread throughout a building. Paragraph 8.14.1 applies to those portions of a building that have construction or finish materials of a combustible nature, are used for the storage of combustible materials, and can contain combustibles associated with building system features such as computer wiring or large quantities of nonmetallic piping.

Any of these scenarios could be found in a concealed space. It is important to recognize that concealed spaces are not exclusively limited to areas above ceilings but can also be found in walls and in spaces beneath the floor. For example, a raised floor in a computer room is a . concealed space. If none of the three prescribed conditions exists, the space is defined as a concealed, noncombustible space with respect to combustible objects and requires no additional sprinkler protection.

Some minor quantities of combustible materials, such as communication wiring, can be present in some concealed spaces but should not typically be viewed as requiring sprinklers (see 8.14.1.1). The threshold value at which sprinklers become necessary in the concealed space is not defined. For example, the usual amounts of data or telephone wiring found above a ceiling would not typically constitute a threat. If bundles of unsheathed computer wiring are installed above the ceiling or beneath the floor in a manner where fire propagation in all directions is likely, then the concealed space should be treated the same as a combustible space, thereby requiring appropriate sprinkler protection. If some other protection measure is provided, such as a CO, system, then the concealed space is considered to be protected, and sprinklers are not required.

Users of this article need to be aware of the requirements of NFPA 13 so they can provide the appropriate fire protection where these is a build-up of combustible cables that constitute a combustible loading, or preferably avoid the buildup of combustible cables that would result in a combustible loading. Use of concealed space cables would be an option in a strategy to avoid establishing a combustible loading.

A flame spread index of 25 is a typical requirement for materials permitted in concealed spaces or exposed in buildings.

A smoke developed index of 450 is a typical requirement for materials permitted in concealed spaces or exposed in buildings.

The following requirements are from NFPA 5000-2003 identify heat of combustion, flame spread, and smoke as major concerns:

Chapter 4 General

4.4.7 Limiting Fire Spread.

4.4.7.1 Interior Finishes. The interior surfaces of the building shall not contribute to an unacceptable rate and magnitude of fire spread and generation of heat and smoke.

4.4.7.2 Concealed Spaces. The construction of concealed spaces shall not contribute to an unacceptable rate of the spread of fire, hot gases, and smoke to areas of the building remote from the fire source and shall limit their spread beyond the immediate area of the origin of the fire.

4.4.7.3 Compartmentation. The building shall be compartmented, as appropriate, by walls and floors, including their associated openings with proper closures, to limit the spread of fire, hot gases, and smoke to an acceptable area beyond the immediate area of fire origin.

Chapter 8 Fire-Resistive Materials and Construction

8.1 General.

8.1.1 The chapter addresses fire protection features intended to restrict or resist the spread of fire and smoke beyond the compartment of fire origin.

8.1.2 Where required by other chapters of this Code, every building shall be divided into compartments to limit the spread of fire and restrict or resist the movement of smoke.

8.1.2.1* Fire compartments shall be formed with fire barrier walls that comply with Section 8.4 or horizontal assemblies that comply with Section 8.6, or a combination of both.

8.1.2.2 Smoke compartments shall be formed with smoke barriers that comply with Section 8.11.

8.16 Insulating Materials.

8.16.7 Insulation and Covering on Pipe and Tubing. Insulation and covering on pipe and tubing shall have a flame spread index of not more than 25 and a smoke developed index of not more than 450.

Chapter 10 Interior Finishes

10.3.2* Products required to be tested in accordance with NFPA 255 or ASTM E 84 shall be grouped in the classes described in 10.3.2(A) through 10.3.2(C) in accordance with their flame spread and smoke development, except as indicated in 10.3.3.

(A) Class A Interior Wall and Ceiling Finish. Class A interior wall and ceiling finishes shall be those finishes with a flame spread of 0–25 and smoke development of 0–450 and shall include any material classified at 25 or less on the flame spread test scale and 450 or less on the smoke test scale. Any element thereof, when so tested, shall not continue to propagate fire.

Panel Meeting Action: Reject

Panel Statement: The submitter did not provide adequate technical substantiation to support a need for a concealed space listed cable.

Concealed spaces should be adequately defined. See action on Proposals 16-13, 16-110, and 16-247 where the proposed definition was determined to be unacceptable.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

OHDE, H.: We agree with panel action and believe that the panel statement should also reflect the latest NFPA 13 Technical Committee actions. Included in the submitter's substantiation was the 2002 Section 8.14 which since has been revised. We would like to add that NFPA 13 just completed their balloting process for the 2006 NFPA 13 Standard. The Technical Committee on Sprinkler Installation submitted a comment on Proposal 13-284.

This comment reworded proposed A.8.14.1.2.1 to read " *Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc…can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1) For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined* ."

In the NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

16-96 Log #720 NEC-P16 **Final Action: Reject**
(770.182)

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.

Recommendation: Make the changes in the text as shown:

770.182 Optical Fiber Raceways.

Optical fiber raceways shall be listed in accordance with 770.182(A) through 770.182(C) .

(A) Plenum Optical Fiber Raceway s . Plenum optical fiber raceways shall be listed for use in other spaces used for environmental air and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.

FPN: One method of defining that an optical fiber raceway is a low smoke producing raceway and a fire-resistant raceway is that the raceway exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with the plenum test in UL 2024, *Standard for Optical Fiber Cable Raceway* .

(B) Riser Optical Fiber Raceway s . Riser optical fiber raceways shall be listed as having fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.

FPN: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the raceways pass the requirements of the test for Flame Propagation (riser) in UL 2024, *Standard for Optical Fiber Cable Raceway* .

(C) General-Purpose Optical Fiber ~~Cable~~ Raceway s . General-purpose optical fiber ~~cable~~ raceway s shall be listed as being resistant to the spread of fire.

FPN: One method of defining resistance to the spread of fire is that the raceways pass the requirements of the Vertical-Tray Flame Test (General Use) in UL 2024, *Standard for Optical Fiber Cable Raceway* .

Substantiation: This proposal is a technical change. (Task Group No. 770-26)

It arose because the Task Group noticed that the listing requirements for plenum raceway were not consistent across the CMP-16 articles.

The word "Cable" was changed to "cables" because section 3.3.3 of the NEC Style Manual states "references to electrical components and parts shall be plural rather than singular". Also the word "cable" was deleted from the title of general-purpose raceways for editorial consistency. Furthermore listing these raceways for use in "other space used for environmental air" and not for use in ducts or other plenums in consistent with the requirements of NFPA 90A. The term "other space used for environmental air" is equivalent to the spaces in NFPA 90A as ceiling cavity plenums plus raised floor plenums.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.

Panel Meeting Action: Reject

Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

TCC Action: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action of deleting Article 780.

It was the action of the Technical Correlating Committee that this Proposal be correlated with Code-Making Panel 7 for consideration of how to handle the reference to 780.5 in 334.104. This action will be considered by Code-Making Panel 7 as a public comment.

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: Delete this article.

Substantiation: This article has not proved to be economically viable since it first went into the 1987 NEC. Other than a few demonstration homes, the "Smart House" concept has not been shown to integrate with market realities. The noninterchangeability requirement in 780.7 is a major impediment to acceptance, and yet without that requirement the assumptions that underlie this article are invalid. Unfortunately, the only consequence of this article has been confusion, because many users think it has something to do with "smart" devices that talk to some digital control module using line carrier signaling protocols. Proposal 10-111 of the 1995 cycle was one such example; clearly the proponent thought the article covered programmed power as distinct from closed loop systems. It does not; programmed power systems use conventional overcurrent protective devices and are covered under the customary rules of the Code. Unless there is some compelling need, the article should be withdrawn.

Panel Meeting Action: Accept

Panel Statement: While there were a significant number of product offerings covered by this article at one time, currently there are no such products being manufactured or listed. Both the listings and the product categories have been withdrawn from UL.

The panel agrees to remove the article. Based on the lack of use, this a no longer serves a purpose.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

10-60 Log #2995 NEC-P10 **Final Action: Reject**
(780.3(A) and 780.6(A))

Submitter: Ole Nilssen, Innovention Center

Recommendation: Add the following statement to 780.3(A)

The term "shall not be energized" shall be interpreted to include a situation where the voltage and/or current available from and outlet shall be manifestly limited so as not to represent a fire-initiation hazard.

Add the following statement to 780.6(A)

For purposes of protection against fire-initiation hazard, the term "Hybrid Cable" shall be deemed suitable for installation under Article 725, Class 3 provided such "Hybrid Cable" is powered from a source manifestly prevented from supplying power to any load other than a load that is continuously supervised and manifestly prevented from constituting a fire-initiation hazard.

Substantiation: Products developed for use under the current Article 780 are not being manufactured. The proposed modification to the standard will permit the development of innovative products and systems that provide a much higher degree of safety with respect to fire initiation hazards than currently

exits under this article, while also providing a dramatic reduction in the installed cost of the system. This will provide an incentive for products to be developed for use under Article 780.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 10-59.

ARTICLE 800 — COMMUNICATIONS CIRCUITS

16-97 Log #1550 NEC-P16 **Final Action: Accept in Part**
(800)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to the Technical Correlating Committee Grounding and Bonding Task Group for comment.
Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Delete the term "effectively" from the terms "effectively grounded" and "effectively bonded" from Articles 800 and revise text as shown for the affected NEC sections.

800.90(A)(1)(b):

(b) Where insulated conductors in accordance with 800.50(A) are used to extend circuits to a building from a cable with a ~~n effectively~~ solidly grounded metallic sheath member(s) and where the conductors in the cable or cable stub, or the connections between the insulated conductors and the exposed plant, safely fuse on all currents greater than the current-carrying capacity of the primary protector, or the associated insulated conductors and of the primary protector grounding conductor.

800.90(A)(1)(e):

(e) Where insulated conductors in accordance with 800.50(A) are used to extend circuits to a building from cable with a ~~n effectively~~ solidly grounded metallic sheath member(s), and where (1) the combination of the primary protector and insulated conductors is listed as being suitable for this purpose for application with circuits extending from a cable with a ~~n effectively~~ solidly grounded metallic sheath member(s), and (2) the insulated conductors safely fuse on all currents greater than the current-carrying capacity of the primary protector and of the primary protector grounding conductor.

800.100(B)(2)(2:)

(2) If the building or structure served has no grounding means, as described in 800.100(B)(1) or (B)(2)(1), ~~to an effectively grounded metal structure~~ to any one of the individual electrodes described in 250.52 (A)(6), and (A)(7) or to a ground rod or pipe not less than 1.5 m (5 ft) in length and 12.7 mm (in.) in diameter, driven, where practicable, into permanently damp earth and separated from lightning conductors as covered in 800.53 and at least 1.8 m (6 ft) from electrodes of other systems. Steam or hot water pipes or air terminal conductors (lightning-rod conductors) shall not be employed as electrodes for protectors.

Substantiation: 800.90(A)(1)(b): The definition of "effectively grounded" is ambiguous and very subjective without any defined values or parameters for one to judge as either "effective" or "ineffective." The proposal suggests replacing "effectively" with "solidly" to emphasize that cable has to be grounded solidly.

800.90(A)(1)(e): The proposal suggests replacing "effectively" with "solidly" to emphasize that cable has to be grounded solidly.

800.100(B)(2)(2): The definition of "effectively grounded" is ambiguous and very subjective without any defined values or parameters for one to judge as either "effective" or "ineffective."

The deleted phrase is replaced by reference to underground systems and plate electrodes in 250.52.

This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to delete the term "grounded, effectively" and its definition from Article 100 and other companion proposals throughout the NEC relative to this Task Group's recommendations. The substantiation of this proposal is as follows.

The term "Effectively Grounded" is used 29 times in the NEC. It appears as though in the majority of the locations where it is used, the word "grounded" or phrase "connected to an equipment grounding conductor" could be used. Other proposals are submitted to make those changes.

The 1996 NEC in Section 250.51 used the term "effective grounding path," and those concepts were incorporated in 250.2 (1999 NEC) and then expanded in 250.4(A) and (B) in the 2002 NEC. The performance criteria of grounding and bonding are currently provided in Section 250.4 and include the concepts contained in the vague definition of the term "effectively grounded."

The definition "Effectively Grounded" is very subjective and without any defined values or parameters for one to judge grounding as either "effective" or "ineffective." "Effective" is described in Section 250.4(A) and (B), but it relates to the effective ground-fault current path as a performance criteria. Deleting the term in the NEC and the definition is logical because there are no definitive parameters for Code users to make a determination on what constitutes "effectively grounded." Systems are solidly grounded, grounded through a resistor or impedance, or ungrounded. Equipment (normally noncurrent-carrying metal parts are grounded where connected to an equipment grounding conductor.

This proposal is to change the term "Effectively Bonded" to just "Bonded" in each of the section where it is used. The term "Effectively Bonded" is currently not defined in the NEC.

The term "effectively bonded" is also used a few times in the NEC and is undefined. The same situation exists. There are no defined parameters for Code users to judges what the difference between "Effectively Bonded" and "Bonded" really is. Where the term appears in the NEC, it is revised to just "bonded" and still has the same meaning in each rule.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Part

Accept the proposed revision to 800.100(B)(2)(2).

Reject the proposed revisions to 800.90(A)(1)(b) and 800.90(A)(1)(e).

Panel Statement: The term "effectively grounded" should remain unchanged in NEC sections 800.100 (A) (1)(b) and 800.100 (A)(1)(e).

The National Electrical Safety Code uses this term in Section 215(C)(I) where it is stated: "Metal or metal-reinforced supporting structures, including...cable sheaths, messengers.... shall be effectively grounded". This has been the telecommunications utility practice for many, many years. Use of the term "effectively grounded" provides for consistency between the NEC and the NESC. It promotes the understanding that grounding is to be accomplished in a manner sufficient to safely carry anticipated fault current while minimizing voltages that may be developed during fault conditions.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-98 Log #651 NEC-P16 **Final Action: Accept**
(800.1)

TCC Action: The Technical Correlating Committee advises that Article Scope statements and titles are the responsibility of the Technical Correlating Committee.

The Technical Correlating Committee "Rejects" the Panel Action and directs that the Proposal be reported as "Accept". This proposal was developed to resolve a scope/correlation issue between Articles 725 and 800.

The Technical Correlating Committee reaffirms that the scope of Article 800 is not based upon the wire or cable to be used, but upon the application.
Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Revise 800.1, Scope as follows:

800.1 Scope. This Article covers ~~telephone, telegraph (except radio), outside wiring for fire alarm and burglar alarm, and similar central station systems ; and telephone systems not connected to a central station system but using similar type of equipment, method of installation, and maintenance~~ communications circuits and equipment.

FPN No. 1: For further information for fire alarm, sprinkler waterflow, and sprinkler supervisory systems, see Article 760.

FPN No. 2: For installation requirements of optical fiber cables, see Article 770.

FPN No. 3: For installation requirements for network-powered broadband communications circuits, see Article 830.

FPN No. 4: For installation requirements for equipment and circuits in an information technology equipment room, see Article 645.

FPN No. 5: For further information on remote-control, signaling, and powerlimited circuits, see Article 725.

Add the following definition of "Communications Circuit" to 800.2:

800.2 Communications Circuit (new). The circuit that extends voice, audio, video, data, interactive services, telegraph (except radio), outside wiring for fire alarm and burglar alarm from the communications utility to the customer's communications equipment .

Substantiation: The term "telephone" implies a single, limited medium for the transmission of voice that is no longer valid in today's complex world of telecommunications. "Telephone" has evolved to the point where it is a communications system transporting information in various forms including voice, data, audio, video, and interactive services, and using varied technologies including copper wire, coaxial cable, optical fiber, and radio links, as well as high frequency carrier systems and advanced data processing and switching techniques. The proposed revision is needed to convey the concept of modern-day telecommunications to the user of the NEC. The addition of the definition of "communications circuit" helps clarify the scope as covering communications services and equipment provided by a communications utility, including the associated services.

Note: Supporting Material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The focus needs to be based on the wire/cable and the wiring method applied to the wire/cable rather than on individual applications.
Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
BRUNSSEN, J.: This proposal should be accepted. This proposal was an effort by a task group (TG) formed by the Technical Correlating Committee and charged with the review and possible revision of the scope of Articles 725 and 800. The TG deemed the scope of 725 to be adequate as currently written, but endeavored to encompass modern communications technology in the proposed revised 800.1, Scope, as contained in this proposal. The term "telephone" as used in the current text of 800.1 implies a single, limited medium for the transmission of voice. This limited view is no longer applicable in today's world of complex communications circuits that include voice, data, alarm, audio, video and interactive services. The TG attempted to encompass all aspects of a modern communications circuit by proposing a very broad, yet simple, scope statement: "This Article covers communications circuits and equipment." The TG then proceeded to define a modern "communications circuit" through the proposed new definition. While the proposed revised scope statement and new definition of communications equipment may not be "perfect", the combination of the two provide a major improvement in conveying the true scope of Article 800 to the reader.

16-99 Log #2657 NEC-P16 **Final Action: Reject**
(800.2)

Submitter: Robert W. Jensen, dbi / Rep. BICSI, A Telecommunications Association
Recommendation: Delete the following text:
~~**800.2 Air Duct.** A conduit or passageway for conveying air to or from heating, cooling, air conditioning, or ventilating equipment, but not including the plenum. [NFPA 97:1.2.6]~~
Substantiation: Air duct is not a term used in Article 800. This was an apparent miss in the 2005 editorial review under the Standards Council mandate to remove content related to "air duct cable".
Panel Meeting Action: Reject
Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:
"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."
This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
JENSEN, R.: We believe that the interpretation of whether being allowed to address this proposal in view of the NFPA Standards Council Long Decision 05-24 (SC #05-7-4) was misunderstood.
We agree with deleting the term "air duct" as it was evidently an oversight that it was not removed during the last code cycle. Air duct was introduced for use with "air duct cable" which was not to be used in the 2005 code. Additionally, the term is not used within Article 800. To further not using this term, in proposal 16-29, the panel revised the proposal to not use "air duct", but instead to harmonize code language by using the term "ventilation or air handling ducts".
OHDE, H.: We do not believe that the NFPA Standards Council Long Decision 05-24 (SC #05-7-4) would prohibit this definition of Air Duct from being deleted. We do believe that expansion of or new definition of Air Duct would be in violation of NFPA Standards Council Long Decision 05-24 (SC #05-7-4). This proposal should have been accepted.
This proposal was to remove the definition of "Air Duct" from 800.2 as this term is not used in Article 800.

16-100 Log #2694 NEC-P16 **Final Action: Reject**
(800.2)

Submitter: Harold C. Ohde, IBEW #134
Recommendation: Delete the following:
~~800.2 Air Duct. A conduit or passageway for conveying air to or from heating, cooling, air conditioning, or ventilating equipment, but not including the plenum [NFPA 97:1.2.6]~~
Substantiation: This is an editorial proposal to remove the term "air duct" as this term is not used in Article 800. the term "air duct" should not be defined in the article, as per the National Electrical Code Style Manual.
Panel Meeting Action: Reject
Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:
"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

Maintaining and referencing a database for every location is cumbersome, unwieldy, and impractical.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-103 Log #2680 NEC-P16 **Final Action: Reject**
(800.2. Abandoned Communications Cable)

Submitter: Charles M. Trout, Maron Electric Co. Inc.
Recommendation: Revise 800.2 Abandoned Communications Cable to read:
Installed communications cable that is not terminated at both ends at a connector or other equipment and not identified for future use with a tag which is of a material impervious to the deleterious effects of temperature and dampness. The tag shall be resistant to the effects of gnawing by rodents. The tag shall contain the following information:
(1) Date tag was installed.
(2) Date of intended use of disconnected cable.
(3) Drawing or file number containing information relating to intended future use of disconnected cable.
The date of intended use of disconnected cable shall not exceed 90 days from date of disconnection.

Substantiation: Abandoned cables are a growing problem in the industry. These cables are left for others to deal with when present users discontinue their operation. Understanding this problem, the removal of abandoned cables, is required by Articles 640, 645, 725, 760, 770, 800, 820, and 830. 800.3(C) requires the removal of abandoned communications cables. Tagging of cables intended for future use without a method of ensuring the intention of future use invites tagging of cables to avoid the responsibility of their proper removal.
Panel Meeting Action: Reject
Panel Statement: While the submitter makes the point that the "tagging" requirements may be used to circumvent abandoned cable removal, the proposed additional requirements are impractical, burdensome, and preclude the pre-wiring of buildings. For example, buildings are often "pre-wired" for telecommunications. While the current tenant may not require all the communications pre-wiring, future tenants may have additional needs and require the additional wiring. Allowing only "90 days" is insufficient to support pre-wiring. A tag that is immune to temperature, dampness and rodents needs to be of special material and would likely require special means to mark the tag. Adding a file number implies the existence of a database. No suggestion is provided as to who is responsible for populating and maintaining the database.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-104 Log #3012 NEC-P16 **Final Action: Reject**
(800.2.Abandoned Communications Cable)

Submitter: Marcelo M. Hirschler, GBH International
Recommendation: Revise text to read as follows:
800.2 Definitions.
Abandoned Communications Cable. Installed communications cable that is not terminated at ~~both ends at a connector or other~~ equipment and not identified for future use with a tag.
Substantiation: The definitions of abandoned cable in every article should be identical. The relevant articles are: 640, 645, 725, 760, 770, 800, 820 and 830. The definitions at articles 640 and 725 are already correct as follows:
640.2: Abandoned Audio Distribution Cable. Installed audio distribution cable that is not terminated at equipment and not identified for future use with a tag.
725.2: Abandoned Class 2, Class 3, and PLTC Cable. Installed Class 2, Class 3, and PLTC cable that is not terminated at equipment and not identified for future use with a tag.
The additional wording in this definition causes confusion. Proposals are being made to make changes to the definitions in articles 770, 800, 820 and 830, and to add a general definition into article 645 and into article 100.
Panel Meeting Action: Reject
Panel Statement: See panel action on Proposal 16-1.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
OHDE, H.: This proposal should be accepted as submitted. The submitter substantiates that the definitions of abandoned cables in Articles 640, 645, 725, 760, 770, 800, 820, and 830 should be identical. This proposal deletes unnecessary language in the present definitions and provides consistent language throughout the above articles mentioned. The panel statement does not explain the reason for rejecting this proposal other than to see panel action on Proposal 16-1.

16-105 Log #2656 NEC-P16 **Final Action: Reject**
(800.2.Block)

Submitter: Robert W. Jensen, dbi / Rep. BICSI, A Telecommunications Association
Recommendation: Delete the following text:
~~**Block.** A square or portion of a city, town, or village enclosed by streets, including the alleys so enclosed but not any street.~~
Substantiation: This is a companion proposal to BICSI 800.47(B) and 800.90. If these proposals are accepted, this definition will no longer be needed because the concept of "block" will be removed.
Panel Meeting Action: Reject
Panel Statement: This is a companion proposal to 16-148, which was rejected.
See panel action on Proposal 16-148.
Number Eligible to Vote: 15

(800.2.Communications Equipment)

Submitter: Ronald Marts, Telcordia Technologies / Rep. BellSouth,Cincinnati Bell, SBC, Ameritech, PacBell, Qwest, Southern New England Telephone
Recommendation: Relocate the definition of "Communications Equipment" from 800.2 to Article 100, Definitions.
Substantiation: The definition of "Communications Equipment" now resides in 800.2. The term "communications equipment" appears in Articles 90, 800 and 830. In order to comply with the requirements set forth in 2.2.2.1, the definition of "communications equipment" should be relocated to Article 100.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-107 Log #1868 NEC-P16 **Final Action: Accept**
(800.2.Communications Equipment)

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industry Solutions
Recommendation: Relocate the definition of " **Communications Equipment** " from 800.2 to Article 100, Definitions.
Substantiation: The NEC Technical Correlating Committee (TCC) has assigned responsibility to the individual Code-making panels for Article 100 definitions under their purview. The definition of " **Communications Equipment** " now resides in 800.2. However, the term "communications equipment" appears in Articles 90, 800 and 830. The ***NEC Style Manual*** , section 2.2.2.1, states: "In general, Article 100 shall contain definitions of terms that appear in two or more other articles of the NEC". Thus, the definition of "communications equipment" rightfully belongs in Article 100.
Panel Meeting Action: Accept
Number Eligible to Vote: 15

16-108 Log #47 NEC-P16 **Final Action: Accept in Principle**
(800.2. Communications Raceway (New))

TCC Action: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the panel as a public comment.
Submitter: Stanley Kaufman, Cable Safe Inc.
Recommendation: Revise as follows:
<u>**Communications Raceway.** A raceway designed for enclosing and routing listed communications wires and cables.</u>
<u>FPN: See Article 100 for a definition of raceway.</u>
Substantiation: Optical Fiber Raceway is defined in Article 770. Communications raceway should be defined too.
Panel Meeting Action: Accept in Principle
Add new definition to 800.2 as follows:
<u>Communications Raceway. A raceway for enclosing and routing communications wires and cables.</u>
<u>FPN: See Article 100 for a definition of raceway.</u>
Panel Statement: The panel added a new definition.
Removed "design", as specification does not belong in a definition.
Removed "listed", as specification does not belong in a definition per NEC Manual of Style.
The changes meet the submitter's intent.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 12 Negative: 3
Explanation of Negative:
HUGHES, R.: The Panel action should have been to "reject". The definition for "Optical Fibers Raceway" was created specifically to define Innerduct. Innerduct is used only for Optical Fibers and nothing else. The definition of "raceway" in Article 100 is adequate and there is no reason to create a specific definition "Communication Raceway".
JENSEN, R.: Propose to remove the FPN from the definition, thereby extending the committee action of "Accept in Principle".
CMP 16 accepted proposal 16-5 to harmonize 770.2, 800.2, 8202, and 830.2 by including a normative reference to "See Article 100". Adding a FPN to again "See Article 100" is redundant, especially since this FPN will be a few lines down from the identical wording in normative text. Additionally, the 2003 NEC Style Manual specifically states to avoid redundant use of references.
OHDE, H.: This definition would require that any raceway that is used for enclosing and routing communications wires and cables be listed to the requirements shown 800.182. This section states "Communications raceways shall be listed in accordance with 800.182(A) through 800.182(C)."There are metal raceways, for example, that are allowed to enclose communications cables but are not required to be listed plenum raceways or riser raceways. These listings are typically for nonmetallic raceways.
In addition, Section 90.1 (C) of the NEC states "T *his Code is not intended as a design specification or an instruction manual for the untrained persons* ." The addition of the FPN referencing Article 100 for the definition of raceway is not needed nor warranted. A trained installer will know the Code content and how the Code book is to be used.

16-109 Log #723 NEC-P16 **Final Action: Accept in Principle**
(800.2.Communications Raceway (New))

TCC Action: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the panel as a public comment.
Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Add a definition as follows:

Communications Raceway. A raceway designed for enclosing and routing listed communications cables.

Substantiation: This proposal is technical. (Task Group No.800-03)

Optical fiber raceway is defined in Article 770 and should also be defined here. It will add a definition parallel to that in Article 770.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.

(800.2. Concealed Space)

Submitter: Stanley Kaufman, Cable Safe Inc.

Recommendation: Revise as follows:

Concealed Space. That portion(s) of a building behind walls, over suspended ceilings, in pipe chases, attics, and in whose size might normally range from 44.45 mm (1 3/4 in.) stud spaces to 2.44 m (8 ft) interstitial truss spaces and that might contain combustible materials such as building structural members, thermal and/or electrical insulation, and ducting. [NFPA 96:3.3.42.1] 0

Substantiation: The term concealed space is used in 800.154(A). This definition is an extract from NFPA 96, Standard for Ventilation Control and Fire Protection of Commercial Cooking Operations. It is the only definition of concealed space in the NFPA Glossary.

Panel Meeting Action: Reject

Panel Statement: The definition may involve combustible material in environmental air spaces and, therefore, may fall under the Standards Council Decision 05-24 (SC #05-7-4).

The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

OHDE, H.: We agree with panel action and believe that the panel statement should also reflect the latest NFPA 13 Technical Committee actions since the submitter is trying to define the term "concealed spaces". We would like to add that NFPA 13 just completed their balloting process for the 2006 NFPA 13 Standard. The Technical Committee on Sprinkler Installation submitted a comment on Proposal 13-284.

This comment reworded proposed A.8.14.1.2.1 to read " *Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc…can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1) For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined* ."

In the NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

16-111 Log #48 NEC-P16 **Final Action: Accept in Principle**
(800.2. Exposed)

Submitter: Stanley Kaufman, Cable Safe Inc.

Recommendation: Revise as follows:

~~**Exposed.** A circuit that is in such a position that, in case of failure of supports and insulation, contact with another circuit may result.~~
~~FPN: See Article 100 for two other definitions of *Exposed* .~~

Exposed to Accidental Contact with Electric Light or Power Conductors. A circuit in such a position that, in case of failure of supports or insulation, contact with another circuit may result.

Substantiation: This revision will make the definition of exposed consistent with Article 830 except that "Electrical Light or Power Conductors" has been changed to "Electric Light or Power Conductors" for editorial consistency with the usage in the Code.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action on Proposal 16-115.

Ballot Results: Affirmative: 15

16-113 Log #722 NEC-P16 **Final Action: Accept in Principle**
(800.2.Exposed)

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.

Recommendation: Revise the definition of "Exposed" as follows:

" **Exposed (to Accidental Contact)** . A circuit in such a position that, in case of failure of supports ~~and~~ or insulation, contact with another circuit may result."

Substantiation: This proposal is a clarification. (Task Group No. 800-02)

It clarifies the term "Exposed" as used in Article 800 to indicate possible contact with another circuit, as opposed to the definitions of "Exposed" contained in Article 100, i.e., live parts or wiring methods. The style used to differentiate the term is identical to that of Article 100 for consistency. The word "and" is deleted and replaced by the word "or" as either of the conditions, failure of supports or failure of insulation, may result in accidental contact. This is a companion proposal to 770.2, 820.2 and 830.2.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.

16-116 Log #49 NEC-P16 **Final Action: Accept in Principle**
(800.2. Point of Entrance)

TCC Action: It was the action of the Technical Correlating Committee that the panel reconsider the proposal with respect to the Fine Print Notes. It is the intention of Fine Print Notes to provide explanatory information and they are not intended as a vehicle to provide unnecessary cross-references. This action will be considered by the panel as a public comment.
Submitter: Stanley Kaufman, Cable Safe Inc.
Recommendation: Revise as follows:
Point of Entrance. Within a building, the point at which the wire or cable emerges from an external wall, from a concrete floor slab, or from a rigid metal conduit (Type RMC) or an intermediate metal conduit (Type IMC) grounded to an electrode in accordance with 800.100(B).
FPN: See 342.2 for a definition of Intermediate Metal Conduit (Type IMC).
FPN: See 344.2 for a definition of Rigid Metal Conduit (Type RMC).
Substantiation: The addition of a fine print notes pointing installers to the definitions of intermediate metal conduit and rigid metal conduit will help installers who are not Code experts. Use of the type designations will promote consistency throughout the code.
Panel Meeting Action: Accept in Principle
The Panel accepts the submitter's proposal with the following revisions:
Number the FPNs.
Panel Statement: Multiple FPNs are required to be numbered per the NEC Manual of Style.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
OHDE, H.: This proposal should be rejected. Section 90.1 (C) of the NEC states "T *his Code is not intended as a design specification or an instruction manual for the untrained persons* ." The addition of the two FPN's referencing the definitions of IMC raceway in 342.2 and RMC raceway in 344.4 is not needed nor warranted. In the submitter's substantiation he states this FPN's will help installers who are not Code experts. A trained installer will know the Code content and how the Code book is to be used.

16-117 Log #724 NEC-P16 **Final Action: Accept in Principle**
(800.2. Point of Entrance)

TCC Action: It was the action of the Technical Correlating Committee that the panel reconsider the proposal with respect to the Fine Print Notes. It is the intention of Fine Print Notes to provide explanatory information and they are not intended as a vehicle to provide unnecessary cross-references. This action will be considered by the panel as a public comment.
Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Change the wording as shown:
Point of Entrance. The point within ~~Within~~ a building ~~, the point~~ at which the wire or cable emerges from an external wall, from a concrete floor slab, or from a rigid metal conduit or an intermediate metal conduit grounded to an electrode in accordance with 800.100(B) .
Substantiation: This proposal is editorial. (Task Group No. 800-04)
It will make the definition of "Point of Entrance" editorially consistent with the definitions in articles 820 and 830. A corollary proposal has been submitted for article 770.
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.
Panel Meeting Action: Accept in Principle
Change 800.2 Point of Entrance to read as follows:
Point of Entrance. The point within ~~Within~~ a building ~~, the point~~ at which the wire or cable emerges from an external wall, from a concrete floor slab, or from a rigid metal conduit (Type RMC) or an intermediate metal conduit (Type IMC) ~~grounded~~ connected by a grounding conductor to an electrode in accordance with 800. 100(B) 800.100(B).
FPN No 1: See 342.2 for a definition of Intermediate Metal Conduit (Type IMC).
FPN No.2: See 344.4 for a definition of Rigid Metal Conduit (Type RMC).
Panel Statement: The text inserted by the panel, "connected by a grounding conductor, provides for editorial consistency across Articles 770, 800, 820 and 830. In the submitter's proposal the text "800.100(B)" was unnecessarily underlined; it is existing text. See panel action on Proposal 16-116.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
OHDE, H.: See my Explanation of Negative on Proposal 16-116.
Comment on Affirmative:
JENSEN, R.: The panel action regarding FPN No. 2 for Rigid Metal Conduit should refer to 344.2, not 344.4.

16-118 Log #3661 NEC-P16 **Final Action: Reject**
(800.2 Air Duct)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Recommendation: Delete the following text:
~~**800.2 Air Duct.** A conduit or passageway for conveying air to or from heating, cooling, air conditioning, or ventilating equipment, but not including the plenum.~~
Substantiation: The term "air duct" is not used in article 800 and should not be defined in the article, as per the manual of style of the National Electrical Code.
Panel Meeting Action: Reject
Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:
"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."
This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
JENSEN, R.: We believe that the interpretation of whether being allowed to address this proposal in view of the NFPA Standards Council Long Decision 05-24 (SC #05-7-4) was misunderstood.

We agree with deleting the term "air duct" as it was evidently an oversight that it was not removed during the last code cycle. Air duct was introduced for use with "air duct cable" which was not to be used in the 2005 code. Additionally, the term is not used within Article 800. To further not using this term, in proposal 16-29, the panel revised the proposal to not use "air duct", but instead to harmonize code language by using the term "ventilation or air handling ducts".

OHDE, H.: See my Explanation of Negative on Proposal 16-99.

16-119 Log #46 NEC-P16 **Final Action: Accept**
(800.2, FPN (New))

Submitter: Stanley Kaufman, Cable Safe Inc.
Recommendation: Add a fine print note to the definition of Abandoned Communications Cable

Abandoned Communications Cable. Installed communications cable that is not terminated at both ends at a connector or other equipment and not identified for future use with a tag.

FPN: See Article 100 for a definition of equipment.

Substantiation: The addition of a fine print note alerting installers that equipment is defined in Article 100 will help installers who are not Code experts.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:

JENSEN, R.: Propose to "Reject".

CMP 16 accepted proposal 16-5 to harmonize 770.2, 800.2, 820.2, and 830-. by including a normative reference to "See Article 100". Adding a FPN to again "See Article 100" is redundant, especially since this FPN will be a few lines down from the identical wording in normative text. Additionally, the 2003 NEC Style Manual specifically states to avoid redundant use of references.

OHDE, H.: This proposal should be rejected. Section 90.1 (C) of the NEC states " *This Code is not intended as a design specification or an instruction manual for the untrained persons* ." In the submitter's substantiation he states this FPN will help installers who are not Code experts. The addition of the FPN referencing Article 100 for the definition of equipment is not needed nor warranted. A trained installer will know the Code content and how the Code book is to be used.

16-120 Log #725 NEC-P16 **Final Action: Accept**
(800.3)

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Add the following:

800.3 Other Articles.

Installations of communications circuits and equipment shall comply with 800.3(A) through 800.3(D).

Substantiation: This proposal is editorial. (Task Group No. 800-05)

Section 800.3 does not have a lead-in sentence as 770.3, 820.3 and 830.3 do. One is needed to make the text parallel.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.

The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-121 Log #727 NEC-P16 **Final Action: Accept**
(800.3(A) and (B))

TCC Action: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting and that this Proposal be reconsidered and correlated with the action on Proposal 16-221.

The Technical Correlating Committee directs that the panel consider not only the division applications, but also the zone applications.

In addition, the Technical Correlating Committee understands that the word "and" in (A) of the Proposal was not "Accepted."

This action will be considered by the Panel as a Public Comment.
Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Make the changes as shown:

(B ~~A~~) Hybrid Power and Communications Cables. The provisions o f 780.6 shall apply for listed hybrid power and communications cables in closed-loop and programmed power distribution.

FPN: See 800.179 (~~J~~ I) for hybrid power and communications cable in other applications.

(A ~~B~~) Hazardous (Classified) Locations. Communications circuits and equipment installed in a location that is classified in accordance with ~~Article~~ 500 .5 and shall comply with the applicable requirements of Chapter 5.

Substantiation: This proposal is editorial. (Task Group No. 800-07)

It re-letters 800.3(A) and (B) so the hazardous locations requirements will be in the same place in the CMP-16 Articles. The definitions of hazardous locations are in 500.5. The reference in the FPN was changed due to renumbering when multipurpose cable was deleted.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.

The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:

DORNA, G.: The panel should have accepted this proposal in part. The relettering of 800.179(J) to 800.179(I) was intended to correlate with the acceptance of Proposal 16-221. Proposal 16-221 was rejected.

KAHN, S.: This proposal should have been "accepted in part" as the renumbering of 800.179(J) to 800.179(I) was intended to correlate to Proposal 16-221 which was rejected.

16-122 Log #1016 NEC-P16 **Final Action: Accept in Principle**
(800.3(B))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Change "Article 500" to "500.5."
Substantiation: To conform to Style Manual requirements.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 16-121.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-123 Log #1383 NEC-P16 **Final Action: Reject**
(800.3(C))

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Delete text concerning abandoned cables

800.3 Other Articles.

(A) Hybrid Power and Communications Cables. The provisions of 780.6 shall apply for listed hybrid power and communications cables in closed-loop and programmed power distribution.

FPN: See 800.179(J) for hybrid power and communications cable in other applications.

(B) Hazardous (Classified) Locations. Communications circuits and equipment installed in a location that is classified in accordance with Article 500 shall comply with the applicable requirements of Chapter 5.

(C) Spread of Fire or Products of Combustion. Section 300.21 shall apply. ~~The accessible portion of abandoned communications cables shall not be permitted to remain.~~

(D) Equipment in Other Space Used for Environmental Air. Section 300.22(C) shall apply.

Substantiation: The NEC is an installation standard, not a maintenance standard. Because of this, this rule should not be a part of the NEC. Furthermore, this provision does not accomplish its intent, as the code is not a retroactive document. To require abandoned cables to be removed is similar to requiring facilities to update their receptacles to the new GFCI provision every three years. With that said, the only time this rule applies is when an installer creates an abandoned cable. Also, this provision does not fall within the purpose of the NEC 90.1(A). The NEC is concerned with the hazards created from the use of electricity…this rule seems to imply that a cable with a voltage applied to it is safe, but a cable with no voltage applied to it is dangerous.

This proposal is also being made to 725.3(B), 760.3(A), 770.3(A), 820.3(A) and 830.3(A).
Panel Meeting Action: Reject
Panel Statement: See panel action on Proposal 16-26.

(800.3(C))

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industry Solutions
Recommendation: Revise 800.3 (C) as follows:

(C) Spread of Fire or Products of Combustion. Section 300.21 shall apply. The accessible portion of abandoned communications cables shall ~~not be permitted to remain~~ be removed .

Substantiation: The proposed revision provides consistency with 640.3(A), 725.3(B), 760.3(A), 770.3(A), 820.3(A) and 830.3(A).
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 16-128.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-125 Log #2808 NEC-P16 **Final Action: Accept in Part**
(800.3(C))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 16-128. This action will be considered by the Panel as a Public Comment.
Submitter: Harold C. Ohde, IBEW #134
Recommendation: Revise text to read as follows:
800.3 Other Articles. No change.
(C) Spread of Fire or Products of Combustion. ~~Section~~ 300.21 shall apply . ~~The accessible portion of abandoned communications cables shall be removed.~~
Substantiation: The requirements for removal of abandoned communications cables would be better suited in appropriate code section within Article 800. I have submitted another proposal that would move the abandoned communications cables requirements to 800.24 - Mechanical Execution of Work. The abandoned communications cables requirements are out of place in 800.3 - Other Articles. The requirements are not part of another Article as they are part of Article 800 and are located within Article 800.
The deletion of the word “Section” is an editorial change to comply the National Electrical Code Style Manual.
Similar proposals have been submitted for 640.3, 725.3, 760.3, 770.3, 820.3, and 830.3 to revise these sections as well.
Panel Meeting Action: Accept in Part
The panel accepts the part that deletes the second sentence of 800.3(C) concerning abandoned cables. The panel rejects the proposed revisions to the first sentence.
Panel Statement: The panel agrees that the requirement to remove abandoned cable does not belong in 800.3 and should be relocated. A direct reference to 300.21 is inappropriate, as it applies to electrical installations and not communications installations. See panel action on Proposal 16-128 that relocates the requirement to remove abandoned cable to 800.25 (new) and restates the spread of fire requirements in communications terms in 800.26 (new).
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
OHDE, H.: This proposal should have been accepted as originally submitted. The panel statement seems to be in conflict as it states the provisions of 300.21 will work well in the new proposed section 800.26 but not in 800.3(C) where it has always been properly located. The panel accepted the same 300.21 requirements whose concern is the spread of fire and products of combustion in hollow spaces, vertical shafts and ventilation and air- handling ducts caused by electrical installations and located them in 800.26.

16-126 Log #3008 NEC-P16 **Final Action: Reject**
(800.3(C))

Submitter: Marcelo M. Hirschler, GBH International
Recommendation: Revise text to read as follows:
800.2 Definitions.
Abandoned Communications Cable. Installed communications cable that is not terminated at both ends at a connector or other equipment and not identified for future use with a tag.
800.3 Other Articles.
(C) Spread of Fire or Products of Combustion. Section 300.21 shall apply. ~~The accessible portion of abandoned~~ Abandoned optical fiber cables shall be removed. Removal of abandoned cables shall not damage the building structure or finish and shall not compromise the performance of adjacent wiring systems or components.
Substantiation: This comment recommends a change in wording to ensure that abandoned cables are removed and to prevent confusion in future. There have been multiple proposals that would permit some cables to remain in “inaccessible spaces”. This is not conducive to safe electrical practice; this the key change is the elimination of the words “the accessible portion of”.
If the intent of the code-making panel was to clarify that removal of cable should not be done if such removal would damage the building, which is obviously not the intent, a second sentence can be added stating that removal of abandoned cables shall not be performed if it would damage the building structure or finish or in any way compromise the functional performance of any other wiring systems or components. This would be accomplished by the optional added sentence.
Consistent wording on removal of abandoned cables is being proposed for sections: 640.3, 725.3, 770.3, 770.154, 800.3, 800.154, 820.3, 820.154 and 830.3.
For information, see the relevant definitions in the NEC.
Accessible (as applied to equipment). Admitting close approach; not guarded by locked doors, elevation, or other effective means.
Accessible (as applied to wiring methods). Capable of being removed or exposed without damaging the building structure or finish or not permanently closed in by the structure or finish of the building.
Accessible, Readily (Readily Accessible). Capable of being reached quickly for operation, renewal, or inspections without requiring those to whom ready access is requisite to climb over or remove obstacles or to resort to portable ladders, and so forth.
Concealed. Rendered inaccessible by the structure or finish of the building. Wires in concealed raceways are considered concealed, even though they may become accessible by withdrawing them.
Isolated (as applied to location). Not readily accessible to persons unless special means for access are used.
Panel Meeting Action: Reject
Panel Statement: See panel action on Proposal 16-28.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
OHDE, H.: We concur with submitter’s substantiation and believe a change of wording will ensure that are abandoned cables are remove and prevent confusion in future. We suggest that the submitter resubmit his recommendation in the 2008 ROC stage in a more appropriate section with Part 1 – General so these requirements will apply throughout the entire Article.

16-127 Log #3104 NEC-P16 **Final Action: Reject**
(800.3(C))

Submitter: Donald Hall, Corning Cable Systems
Recommendation: Revise text to read as follows:
800.3 Other Articles.
(C) Spread of Fire or Products of Combustion. Section 300.21 shall apply. ~~The accessible portion of a~~ Abandoned communications cables shall be removed.
Also, add the following FPN to 800.3(C):
FPN: ANSI/NECA/BICSI 568-2001, Standard for Installing Commercial Building Telecommunications Cabling, and other industry standards provide recommended cable installation practices which facilitate the eventual removal of cables as they become abandoned.
Substantiation: Abandoned cable should be removed to reduce unnecessary accumulation of fuel load and promote electrical safety. It is not reasonable or necessary to install cables in a manner that prevents their eventual removal.
The proposed FPN will provide useful information to architects, system designers, and installers to help minimize the cost and inconvenience of removing abandoned cable.
Panel Meeting Action: Reject
Panel Statement: The proposal would require all abandoned cable to be removed, irrespective of accessibility, presenting a compliance conundrum to installers. Without access, it is impossible to remove cables that are securely fastened without damaging the building or adjacent cables. The submitter’s substantiation states: “It is not reasonable or necessary to install cables in a manner that prevents their eventual removal.” However, the panel previously imposed additional securing and supporting requirements by referencing 300.11 in 800.24. Gaining access may sometimes require disassembly of part of the building. This is not the intent of the panel. The current requirement to remove only the accessible portion is reasonable. The submitter further proposes to add an FPN following 800.3(C) that is already contained in 800.24.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
OHDE, H.: We concur with submitter’s substantiation and believe a change of wording will ensure that are abandoned cables are remove and prevent confusion in future. We suggest that the submitter resubmit his recommendation in the 2008 ROC stage in a more appropriate section with Part 1 – General so these requirements will apply throughout the entire Article. The FPN that the submitter submitted is not required as this Standard is very basic and really does not provide enough information that is applicable to the removal of abandoned cables.

16-128 Log #728 NEC-P16 **Final Action: Accept in Principle**
(800.3(C), 800.25 (new) & 800.26 (new))

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Delete 800.3(C) and replace with new 800.25 and 800.26 as follows:
~~**800.3(C) Spread of Fire or Products of Combustion.** Section 300.21 shall apply. The accessible portion of abandoned communications cables shall not be permitted to remain~~ .
800.25. Abandoned Cables. The accessible portion of abandoned communications cables shall be removed.
800.26 Spread of Fire or Products of Combustion. Installations of communications cables and communications raceways in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially

increased. Openings around penetrations of communications cables and communications raceways through fire-resistantÐrated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating.

FPN: Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made. Building codes also contain restrictions on membrane penetrations on opposite sides of a fire-resistanceÐrated wall assembly. An example is the 600-mm (24-in.) minimum horizontal separation that usually applies between boxes installed on opposite sides of the wall. Assistance in complying with 800.26 can be found in building codes, fire resistance directories, and product listings.

Substantiation: This proposal is editorial and technical. (Task Group No. 800-08)

The title of Section 800.3 is "Other Articles". The requirement for the removal of abandoned cables is not in another article; it is in Article 800. It is out of place in section 800.3. This proposal will move it to a new section of Article 800 and make it editorially consistent with Articles 770 and 820 by substituting "shall be removed" for "shall not be permitted to remain". Rather than refer section 300.21 requirements for the prevention of the spread of fire, it is better to have the requirements in Article 800 which should be familiar to communications installers. The text of proposed section 800.26 is based on section 300.21 but modified to apply to communications cables and raceways.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.

Panel Meeting Action: Accept in Principle

D elete 800.3(C).

Reorder subsections.

Add new 800.25 and 800.26 as submitted.

Panel Statement: The panel accepts the deletion of 800.3(C) and the addition of new 800.25 and 800.26.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

OHDE, H.: This proposal should be deleted in its entirety. We agree that the requirements for the removal of abandoned cables are out of place in 800.3(C) and needs to be located in another section within Part 1 –General. There are other proposed proposals with the same intent to locate the abandoned cable requirements that seem better suited and make good enforceable code.

The substantiation provided to delete 800.3(C) which contains the requirements of 300.21 is unclear. The submitter stated the proposed 800.26 is based on the requirements of 300.21. There was no substantiation submitted for this change. In addition there is no need for the FPN to be mentioned as the language in 800.3(C) clearly states the requirements of 300.21 apply. 300.21 has the identical FPN that is being proposed.

16-129 Log #2775 NEC-P16 **Final Action: Accept in Principle in Part (800.3(C), 800.25 (new) & 800.26 (new))**

Submitter: Allen C. Weidman, The Society of the Plastics Industry, Inc.

Recommendation: Delete 800.3(C) and replace with new 800.25 and 800.26 as follows:

~~**800.3(C) Spread of Fire or Products of Combustion.** Section 300.21 shall apply. The accessible portion of abandoned communications cables shall not be permitted to remain~~ .

800.25. Abandoned Cables. The accessible portion of abandoned communications cables shall be removed.

800.26 Spread of Fire or Products of Combustion. Installations of communications cables and communications raceways in hollow spaces, concealed spaces, vertical shafts and air ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations of communications cables and communications raceways through fire-resistant–rated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating.

FPN No. 1: Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made. Building codes also contain restrictions on membrane penetrations on opposite sides of a fire-resistance–rated wall assembly. An example is the 600-mm (24-in.) minimum horizontal separation that usually applies between boxes installed on opposite sides of the wall. Assistance in complying with 800.26 can be found in building codes, fire resistance directories, and product listings.

FPN No. 2: FPN: See 8.14.1 of NFPA 13-2002, *Installation of Sprinkler Systems* , for requirements for sprinklers in concealed spaces containing exposed combustibles.

Substantiation: The title of Section 800.3 is "Other Articles". The requirement for the removal of abandoned cables is not in another article; it is in Article 800. It is out of place in section 800.3. This proposal will move it to a new section of Article 800 and make it editorially consistent with Articles 770 and 820 by substituting "shall be removed" for "shall not be permitted to remain". Rather than refer to section 300.21 requirements for the prevention of the spread of fire, it is better to have the requirements in Article 800 which should be familiar to communications installers. The text of proposed section 800.26 is based on section 300.21 but modified to apply to communications cables and raceways. For clarity, "ventilation or air-handling ducts" has been simplified by replacing it with "air ducts". Also, "concealed spaces" have been added to the list of areas requiring fire protection vigilance (hollow spaces, vertical shafts, and air ducts) to correlate with NFPA 13, *Installation of Sprinkler Systems*, which has requirements for protecting concealed spaces. A FPN is included to refer users to the NFPA 13 requirements.

Panel Meeting Action: Accept in Principle in Part

Panel Statement: The panel accepts the submitter's deletion of 800.3(C), the addition of 800.25 (new) and the addition of 800.26 (new), but revises "air ducts" to "ventilation or air handling duct" in keeping with the existing NEC text. The panel accepts FPN No. 1.

See panel Action on Proposal 16-128.

The Panel rejects the addition of FPN No. 2 because it introduces undefined terminology. "Concealed spaces" should be adequately defined. See action on Proposals 16-13, 16-110, and 16-247 where the proposed definition was determined to be unacceptable.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

OHDE, H.: This proposal should be deleted in its entirety. We agree that the requirements for the removal of abandoned cables are out of place in 800.3(C) and needs to be located in another section within Part 1 –General. There are other proposed proposals with the same intent to locate the abandoned cable requirements that seem better suited and make good enforceable code.

The substantiation provided to delete 800.3(C) which contains the requirements of 300.21 is unclear. The submitter stated the proposed 800.26 is based on the requirements of 300.21 but modified to apply to communications cables and raceways. There was no substantiation submitted for this change. In addition there is no need for the FPN No.1 to be mentioned as the language in 800.3(C) clearly states the requirements of 300.21 apply. 300.21 has the identical FPN that is being proposed.

We believe that the panel statement should also reflect the latest NFPA 13 Technical Committee actions. Included in the submitter's substantiation was the 2002 Section 8.14 which since has been revised. We would like to add that NFPA 13 just completed their balloting process for the 2006 NFPA 13 Standard. The Technical Committee on Sprinkler Installation submitted a comment on Proposal 13-284.

This comment reworded proposed A.8.14.1.2.1 to read " *Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc…can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1) For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined* ."

In the NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

16-130 Log #3313 NEC-P16 **Final Action: Accept in Principle in Part (800.3(C), 800.25 (new) & 800.26 (new))**

Submitter: William E. Koffel, Koffel Assoc., Inc. / Rep. Society of the Plastics Industry

Recommendation: Delete 800.3(C) and replace with new 800.25 and 800.26 as follows:

~~**800.3(C) Spread of Fire or Products of Combustion.** Section 300.21 shall apply. The accessible portion of abandoned communications cables shall not be permitted to remain~~ .

800.25 Abandoned Cables. The accessible portion of abandoned communications cables shall be removed.

800.26 Spread of Fire or Products of Combustion. Installations of communications cables and communications raceways in hollow spaces, concealed spaces, vertical shafts and air ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations of communications cables and communications raceways through fire-resistant–rated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating.

FPN No. 1: Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made. Building codes also contain restrictions on membrane penetrations on opposite sides of a fire-resistance–rated wall assembly. An example is the 600-mm (24-in.) minimum horizontal separation that usually applies between boxes installed on opposite sides of the wall. Assistance in complying with 800.26 can be found in building codes, fire resistance directories, and product listings.

FPN No. 2: FPN: See 8.14.1 of NFPA 13, *Installation of Sprinkler Systems* , for requirements for sprinklers in concealed spaces containing exposed combustibles.

Substantiation: The title of Section 800.3 is “Other Articles”. The requirement for the removal of abandoned cables is not in another article; it is in Article 800. It is out of place in Section 800.3. This proposal will move it to a new section of Article 800 and make it editorially consistent with Articles 770 and 820 by substituting “shall be removed” for “shall not be permitted to remain”. Rather than refer to Section 300.21 requirements for the prevention of the spread of fire, it is better to have the requirements in Article 800 which should be familiar to communications installers. The text of proposed Section 800.26 is based on Section 300.21 but modified to apply to communications cables and raceways. For clarity, “ventilation or air-handling ducts” has been simplified by replacing it with “air ducts”. Also, “concealed spaces” have been added to the list of areas requiring fire protection vigilance (hollow spaces, vertical shafts, and air ducts) to correlate with NFPA 13, *Installation of Sprinkler Systems*, which has requirements for protecting concealed spaces. A FPN is included to refer users to the NFPA 13 requirements. It should be noted that the section number may need to be revised once the 2006 Edition of NFPA 13 is published.

Panel Meeting Action: Accept in Principle in Part

The panel accepts the submitter’s deletion of 800.3(C), the addition of 800.25 (new), and the addition of 800.26 (new), but revises “air ducts” to “ventilation or air handling duct” in keeping with the existing NEC text. The panel accepts FPN No. 1, but rejects the addition of FPN No. 2.

Panel Statement: See panel action on Proposal 16-128.

The panel rejects the addition of FPN No. 2 because it introduces undefined terminology. “Concealed spaces” should be adequately defined. See action on Proposals 16-13, 16-110, and 16-247 where the proposed definition was determined to be unacceptable.

Ballot Results: Affirmative: 15

16-133 Log #1384 NEC-P16 **Final Action: Reject**

(800.24)

Submitter: Mike Holt, Mike Holt Enterprises

Recommendation: Delete requirement to comply with 300.4(D)

800.24 Mechanical Execution of Work.

Communications circuits and equipment shall be installed in a neat and workmanlike manner. Cables installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be secured by straps, staples, hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also conform with ~~300.4(D) and~~ 300.11.

Substantiation: There is no reason to protect limited energy circuits from accidental contact with nails or screws. Limited energy circuits are considered to be inherently safe from a fire and electric shock perspective, hence the allowances of lesser wiring methods and allowances for open splicing with out boxes. The protection of these circuits is a design and/or performance issue, not a safety issue. The requirement found in the existing *Code* text does not fit into the purpose of the NEC, as addressed in 90.1(A).

Panel Meeting Action: Reject

Panel Statement: Compliance with 300.4(D) has been a Code requirement for many years, resulting in an exemplary safety record. While the submitter points out that communications circuits are energy-limited circuits and “…considered, to be inherently safe from a fire and electric shock perspective”, it is inappropriate and poor workmanship to permit the potential energization of nails, screws, or other construction/decorative attachment devices at any level.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-134 Log #1385 NEC-P16 **Final Action: Accept in Principle**

(800.24)

Submitter: Mike Holt, Mike Holt Enterprises

Recommendation: Add “Cable Ties” to the list of supporting methods

800.24 Mechanical Execution of Work.

Communications circuits and equipment shall be installed in a neat and workmanlike manner. Cables installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be secured by straps, staples, cable ties, hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also conform with 300.4(D) and 300.11.

Substantiation: This is being proposed in an effort to create uniform language with the chapter three cable wiring method support sections, specifically, 230.30(A), 330.30(A) and 334.30. Similar proposals are also being made to 725.8, 640.6, 760.8, 770.24, 820.24 and 830.24

Panel Meeting Action: Accept in Principle

Change 800.24 to read as follows:

800.24 Mechanical Execution of Work. Communications circuits and equipment shall be installed in a neat and workmanlike manner. Cables installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be secured by listed hardware including straps, staples, cable ties , hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also conform with 300.4(D) and 300.11.

Panel Statement: The panel accepted the requirement for listing in accordance with Proposal 16-137 and includes a clear requirement for listed hardware.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 11 Negative: 3 Abstain: 1

Explanation of Negative:

BOYER, J.: NEMA does not believe that all such product used for the securement of communications circuits need be listed. Code Panel 8 has steadily rejected similar proposals relating to the support of conduit and cables. UL 1565 provides requirements for listed cable ties intended for primary support of flexible conduits and cables in accordance with the NEC. Such cable ties must have a minimum loop tensile strength rating of 23 kg (50 lbs) or greater. NEMA proposes that the panel reconsider its action and ACCEPT the proposal in principle and in part with the following action. Accept the proposed addition of "cable ties" in the third sentence, reject the requirement that all such hardware be "listed", and add the following new fourth sentence. " Cable ties that provide primary support for such cables shall have a minimum loop tensile strength of 23 kg (50 lbs.)"

BRUNSSEN, J.: See my explanation of negative vote on Proposal 16-43.

DORNA, G.: See my explanation of negative vote on Proposal 16-45.

Explanation of Abstention:

KAHN, S.: Though I agree with the proposal and the submitter's intent to introduce consistency, the material is used in plenums and other air handling spaces and the proposal should be subjected to the direction given by the Standards Council relative to such proposals and rejected. The directive of the Standards Council, as interpreted, must be applied consistently.

16-135 Log #1869 NEC-P16 **Final Action: Reject**
(800.24)

TCC Action: The Technical Correlating Committee notes that neither the panel statement nor the revised statement shown in the affirmative vote are responsive to the submitter's substantiation for the recommendation. The Technical Correlating Committee directs the panel to act on the merits of the recommendation. This action will be considered by the Panel as a Public Comment.

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industry Solutions

Recommendation: In the final sentence, delete the reference to 300.11 as follows:

"The installation shall also conform with 300.4(D) ~~and 300.11~~ ."

Substantiation: The requirement added by Panel 16 during the 2005 revision cycle is overly restrictive and inappropriate for communications conductors. The Fine Print Note associated with 800.24 presently directs the reader to the appropriate installation practices for communications wiring and cabling. Section 300.11 is directed toward power cable assemblies that are heavier, larger and operate at greater voltage and current levels than communications cables. A communications cable used for premises wiring is typically less than one-quarter inch in diameter, contains four separately insulated 26 AWG conductors, and operates at 48 volts DC with available power of less than 100 volt-amperes. Deletion of the reference to 300.11 will yield consistency throughout the NEC as Panel 3 did not see fit to adopt this reference in Articles 760 and 725.

Panel Meeting Action: Reject

Panel Statement: The requirements of 300.11 are applicable to optical fiber cables.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

BRUNSSEN, J.: This proposal should be accepted. The requirement added by Panel 16 during the 2005 revision cycle is overly restrictive and inappropriate for communications cables. The Fine Print Note associated with 800.24 directs the reader to the appropriate installation standards. The Panel has enhanced the Fine Print Note during this cycle by the addition of three new references covering the installation of communications cables (see Proposal 16-139). These references are all that is necessary and sufficient for such cables without imposing the burdensome requirements of 300.11. Section 300.11 is directed toward power cable assemblies that are heavier and larger than communications cables, operate at much greater power levels, and present a greater risk of injury if not properly installed.

JOHNSON, S.: I agree with the submitter's points in his proposal. 300.11 deals with cables that are larger and heavier than communications cables. Referencing 300.11 also creates an inconsistency with Sections 760 and 725, which deal with similar sized cables and do not make this reference. I vote against the Panel's action to reject.

Comment on Affirmative:

JENSEN, R.: The panel statement should read:

The requirements of 300.11 are applicable to communications cables.

This appears as though it was copied from another panel statement regarding optical fiber.

STENE, S.: The panel statement should be revised to state "The requirements of 300.11 are applicable to ~~optical fiber cables~~ communication cables. "

16-136 Log #2658 NEC-P16 **Final Action: Accept in Principle**
(800.24)

Submitter: Robert W. Jensen, dbi / Rep. BICSI, A Telecommunications Association

Recommendation: Add:

FPN: One way to determine accepted industry practice is to refer to nationally recognized standards such as ANSI/TIA—570—B—2004, Residential Telecommunications Infrastructure Standard, or other ANSI-approved installation standards.

Substantiation: Currently there is no guidance for installations in residences.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action on Proposal 16-139.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

BOYER, J.: This proposal would provide a Fine Print Note referencing the reader to ANSI (and other unspecified) standards. NEMA considers that this material would be more appropriate in an NEC handbook (if at all) and is unnecessary in the Code. For consistency with other similar panels actions, this proposal must also be rejected.

PREZIOSO, L.: The proposal adds a Fine Print Note (FPN) identifying an ANSI/NECA/BICSI Standard as the source for identifying accepted industry practices. While FPNs are not enforceable, referencing these standards in a FPN as a means for determining the acceptable industry standard is, at best, misleading. I fully support these standards, but on many projects these standards are not incorporated as requirements into the design or the construction of the system or the building. The owners and tenants often waive compliance with these standards as a means of reducing costs. In this situation, the installation of wires and cables cannot be completed in accordance with the standards, and it is therefore unfair to reference these standards as accepted industry practices. Accordingly, the proposal should be rejected and the FPN should not be added to the NEC.

16-137 Log #3053 NEC-P16 **Final Action: Accept in Principle in Part**
(800.24)

Submitter: Harold C. Ohde, IBEW #134

Recommendation: Revise 800.24 as follows:

800.24 Mechanical Execution of Work

(A) Neat and Workmanlike Manner. Communications equipment, cables, and circuits shall be installed in a neat and workmanlike manner.

(B) Installation of Communications Cables. Communications cables installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the communications cables will not be damaged by normal building use. Such cables shall be secured by listed straps, staples, hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also comply with 300.4(D) and 300.11.

FPN: Accepted industry practices are described in ANSI/NECA/BICSI 568-2001, *Standard for Installing Commercial Building Telecommunications Cabling,* and other ANSI- approved installation standards.

(C) Abandoned Communications Cables. Abandoned communications cables shall be removed.

FPN: Accepted industry practices are described in ANSI/NECA/BICSI 568-2001, Standard for Installing Commercial Building Telecommunications Cabling, and other ANSI- approved standards which provide cable installation that facilitates the removal of abandoned cables.

Substantiation: This proposal revises this section into a practical working tool which will assist in making 800.24 a clear, usable and enforceable code. Each first level subdivision contains a code rule that requires action and the required action has been presented in clear, usable and enforceable manner.

In the electrical industry, the electrician, contractor and AHJ have been taught the importance and significance of the concept of mechanical execution of work. I am an electrical instructor who teaches this important concept to the people involved. This is one of the basis for 90.1(A) which serves as the purpose of this Code. The Code's purpose is to provide a safe installation from hazards arising from the use of electricity.

The revised text in 800.24(A) will require all communications equipment, cables and circuits to be installed in a neat and workmanlike manner.

800.24(B) is an editorial change with additional language to require the means of securing and supporting to be listed for the purpose.

The addition of 820.24(C) would replace the requirements that were located in 800.3(C), 800.154(A), and 800.154(B). It makes sense to have the requirements of both the installation of cable and the removal of cable in the same Code section. This would provide the proper guidance to everyone involved. The installer, contractor and the AHJ would gain from this revised section as the rules are centrally located in one Code section. If communications cables are installed properly then the removal of communications cables should be no problem if it is not needed anymore or abandoned. The proposed FPN will provide useful guidance and information to everyone involved regarding correct installation practices which would facilitate the removal of the cable as well

Similar proposals have been submitted for 640.6, 725.8, 760.8, 770.24, 820.24, and 830.24.

Panel Meeting Action: Accept in Principle in Part

The panel accepts the incorporation of the term "listed".

See panel action on Proposal 16-134.

The panel accepts in principle the part of the proposal that recommends relocating requirements for abandoned cable. See panel action on Proposal 16-128 for the correct text.

The panel does not accept the breaking up of 800.24 and the changes to the FPN.

Panel Statement: See panel action on Proposals 16-134 and 16-128.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 10 Negative: 4 Abstain: 1

Explanation of Negative:

BRUNSSEN, J.: See my explanation of negative vote on Proposal 16-43.

DORNA, G.: See my explanation of negative vote on Proposal 16-45.

OHDE, H.: This proposal should have been accepted in part. The FPN located after 800.24 (C) is not required as this Standard is very basic and really does not provide enough information that is applicable to the removal of abandoned cables.

PREZIOSO, L.: The proposal adds a Fine Print Note (FPN) identifying an ANSI/NECA/BICSI Standard as the source for identifying accepted industry practices. While FPNs are not enforceable, referencing these standards in a FPN as a means for determining the acceptable industry standard is, at best, misleading. I fully support these standards, but on many projects these standards are not incorporated as requirements into the design or the construction of the system or the building. The owners and tenants often waive compliance with these standards as a means of reducing costs. In this situation, the installation of wires and cables cannot be completed in accordance with the standards, and it is therefore unfair to reference these standards as accepted industry practices. Accordingly, the proposal should be rejected and the FPN should not be added to the NEC.

Explanation of Abstention:

KAHN, S.: Though I agree with the proposal and the submitter's intent to introduce consistency, the material is used in plenums and other air handling spaces and the proposal should be subjected to the direction given by the Standards Council relative to such proposals and rejected. The directive of the Standards Council, as interpreted, must be applied consistently.

16-138 Log #2275 NEC-P16 **Final Action: Reject**
(800.24, FPN)

Submitter: H. Brooke Stauffer, National Electrical Contractors Assn. (NECA)
Recommendation: Update the publication date of the referenced standard as follows:

FPN: Accepted industry practices are described in ANSI/NECA/BICSI 568-2006, Standard for Installing Commercial Building Telecommunications Cabling, and other ANSI-approved installation standards.

Substantiation: ANSI/NECA/BISCI 568-2001 is currently being revised, and the 2008 NEC should reference the latest edition.

ANSI/NECA/BICSI 568-2006 will be completed prior to the Public Comment deadline.

Panel Meeting Action: Reject
Panel Statement: The panel cannot act on ANSI/NECA/BICSI 568-2006, as it has not yet been issued.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-139 Log #2336 NEC-P16 **Final Action: Accept in Principle**
(800.24, FPN)

Submitter: James W. Romlein, MV Labs LLC / Rep. TIA
Recommendation: Add an FPN to read:

FPN: Accepted industry practices are described in:

ANSI/TIA/EIA-568-B.1 2004 - Part 1 General Requirements Commercial Building Telecommunications Cabling Standard, ANSI/TIA-569-B 2004 - Commercial Building Standard for Telecommunications Pathways and Spaces, ANSI/TIA-570-B - Residential Telecommunications Infrastructure.

(List Other Documents Here) and other ANSI-approved installation standards.

Substantiation: TIA standards contain the source specifications that drive the performance-related industry practices. These TIA documents have a long history of demonstrated successful guidance to the installation, inspection, and network ownership communities. TIA wiring standards have been recognized by the Federal Communications Commission since before 2000 as the appropriate industry standards to be used for new and revised wiring, and are encouraged to be called out in building codes. (See, "Third Report and Order" in CC Docket No. 88-57 (FCC 99-405) (2000), released January 10, 2000, and 47 CFR section 68.213(c) of the FCC Rules.)

Panel Meeting Action: Accept in Principle

Change FPN to read as follows:

FPN: Accepted industry practices are described in ANSI/NECA/BICSI 568–2001, Standard for Installing Commercial Building Telecommunications Cabling; ANSI/TIA/EIA-568-B.1 2004 - Part 1, General Requirements Commercial Building Telecommunications Cabling Standard; ANSI/TIA-569-B--2004, Commercial Building Standard for Telecommunications Pathways and Spaces; ANSI/TIA-570-B, Residential Telecommunications Infrastructure, and other ANSI-approved installation standards.

Panel Statement: The panel combined the submitter's FPN with the existing text.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:

BOYER, J.: See NEMA's negative comment on Proposal 16-136.

PREZIOSO, L.: The proposal adds a Fine Print Note (FPN) identifying an ANSI/NECA/BICSI Standard as the source for identifying accepted industry practices. While FPNs are not enforceable, referencing these standards in a FPN as a means for determining the acceptable industry standard is, at best, misleading. I fully support these standards, but on many projects these standards are not incorporated as requirements into the design or the construction of the system or the building. The owners and tenants often waive compliance with these standards as a means of reducing costs. In this situation, the installation of wires and cables cannot be completed in accordance with the standards, and it is therefore unfair to reference these standards as accepted industry practices. Accordingly, the proposal should be rejected and the FPN should not be added to the NEC.

16-140 Log #2889 NEC-P16 **Final Action: Reject**
(800.24, FPN)

Submitter: Ron Alley, ELECTRICO
Recommendation: Delete the following FPN:

~~FPN: Accepted industry practices are described in ANSI/NECA/BICSI 568-2001, Standard for Installing Commercial Building Telecommunications Cabling, and other ANSI approved installation standards.~~

Substantiation: Numerous consensus standards from organizations such as Electronics Industry Association (EIA), Telecommunication Industry Association (TIA), Underwriters Laboratories Inc. (UL), NEMA, IEEE, and IEC/ISO could be added as a Fine Print Note throughout the Code to assist the reader of the NEC as the existing FPN notes do. There are just as many publications such as Telecommunications Cabling Installation, Network Cabling, Telecommunications Cable Splicing, Communications Cabling, Telecommunications Internetworking and too many others to mention, that could be listed in a FPN that would benefit the reader. Also, there are safety regulations, pertaining to telecommunication systems such as OSHA 1910 and OSHA 1926 that could be added as a Fine Print Note to assist readers to make their companies and workers safer. Adding a Fine Print Note for the purpose of informing the reader of all related standard and publications would be cumbersome. The FPN should be deleted unless it lists all pertinent standards and publications.

The particular standard mentioned in the FPN, (ANSI/NECA/BICSI 568-2001 (Installing Commercial Building Telecommunications Cabling) contains only 46 pages. The Standard mentioned in the FPN is very basic. It lists only a small percentage of the terminations used in the industry. Also, only a limited number of communications cables are shown and their limitations are not discussed. The standard does not contain enough information to be used as a stand alone document without the use of other standards and text books that are not mentioned in the FPN. In my opinion the ANSI standard listed in the FPN should never be used instead of manufacturer's instructions.

Manufacturer's instructions are sometimes required to be included as a condition of listing or labeling of telecommunications equipment and are sent wit the listed or labeled products or can be requested from the manufacturer prior to installation. The FPN in the 2005 Code most likely will not be as up to date as the manufacturer's instructions.

If the committee decides to keep the FPN, please consider modifying the FPN as follows:

ANSI/NECA/BICSI 568-2001 Standard for Installing Commercial Building Telecommunications Cabling is one source of many that can be used along with manufacturer's instructions.

Panel Meeting Action: Reject
Panel Statement: The references provided in the FPN provide guidance for installation in a neat and workmanship like manner.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:

OHDE, H.: This proposal should have been accepted. The submitter substantiates that there are numerous consensus standards from reputable organization that also could be added to assist the reader of the NEC as existing FPN do. The ANSI/NECA/BICSI 568-2001 Standard is also a very basic and non-informative document that does not provide much guidance to the installer.

PREZIOSO, L.: The proposal removes a Fine Print Note (FPN) identifying an ANSI/NECA/BICSI Standard as the source for identifying accepted industry practices. While FPNs are not enforceable, referencing these standards in a FPN as a means for determining the acceptable industry standard is, at best, misleading. I fully support these standards, but on many projects these standards are not incorporated as requirements into the design or the construction of the system or the building. The owners and tenants often waive compliance with these standards as a means of reducing costs. In this situation, the installation of wires and cables cannot be completed in accordance with the standards, and it is therefore unfair to reference these standards as accepted industry practices. Accordingly the proposal should be accepted and the FPN should be removed.

16-141 Log #1762 NEC-P16 **Final Action: Reject**
(800.24 Exception)

TCC Action: The Technical Correlating Committee notes that neither the panel statement nor the revised statement shown in the affirmative vote are responsive to the submitter's substantiation for the recommendation. The Technical Correlating Committee directs the panel to act on the merits of the recommendation. This action will be considered by the Panel as a Public Comment.
Submitter: Percy E. Pool, Verizon NS
Recommendation: Add the following exception to 800.24:
"Exception: 300.11(C) shall not apply."
Substantiation: 300.11(C) is clearly not applicable to communications cabling. communications cables are typically lashed together to form a "cable assembly". This frequently occurs during modifications or additions to an existing installation. Communications cables are physically smaller, lighter and carry less voltage and current than power cables. It is overly restrictive to prohibit lashing of communications cables together to form a cable assembly. Communications cables secured in this manner have adequate support (see 300.11(A)), are supported independently of the suspended ceiling grid, and are not likely to collapse in the event the suspended ceiling collapses. Such restriction imposes additional installation costs with no improvement in safety.
Panel Meeting Action: Reject
Panel Statement: The requirements of 300.11(C) are applicable to optical fiber cables.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
BRUNSSEN, J.: This proposal should be accepted. If the Panel continues to support the addition of the requirements of 300.11 to 800.24, then at the very least, the requirements of 300.11(C) should be waived. Section 300.11(C) is clearly not applicable to communications cables. Installation practice is to lash communications cables together to form a "cable assembly". This frequently occurs during modifications or additions to an existing installation. Communications cables are physically smaller and lighter than power cables, operate at much lower voltages and are power-limited. Application of 300.11(C) is overly restrictive and will preclude lashing of communications cables together to form a cable assembly. Communications cables secured in this manner have adequate support (see 300.11 (A)), are supported independently of the suspended ceiling grid, and are not likely to collapse in the event the suspended ceiling collapses. Such restriction imposes additional installation costs with no improvement in safety.
JOHNSON, S.: I agree with the submitter's points in his proposal. There is no safety issue that should preclude the long-standing practice of lashing an additional communication drop cable to an existing bundle that is already installed and supported properly where it is owned by the same entity. These cables are lightweight, and carry much less voltage and current than power cables. No evidence has been shown that this practice has not been used safely and successfully in the past and should not continue to be allowed. I vote against the Panel's action to reject.
Comment on Affirmative:
JENSEN, R.: The panel statement should read:
The requirements of 300.11 are applicable to communications cables.
This appears as though it was copied from another panel statement regarding optical fiber.
STENE, S.: The panel statement should be revised to state "The requirements of 300.11 are applicable to ~~optical fiber cables~~ communication cables."

16-142 Log #55 NEC-P16 **Final Action: Accept in Principle**
(800.25 (New), 800.26 (New), & 800.3(C))

Submitter: Stanley Kaufman, Cable Safe Inc.
Recommendation: Revise as follows:
800.25. Abandoned Cables. The accessible portion of abandoned communications cables shall be removed.
FPN: See Article 100 for a definition of "accessible"
800.26 Spread of Fire or Products of Combustion. Installations of communications cables and communications raceways in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations of communications cables and communications raceways through fire-resistant-rated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating.
FPN: See Article 100 for the definition of "approved".
~~**800.3(C) Spread of Fire or Products of Combustion.** Section 300.21 shall apply. The accessible portion of abandoned communications cables shall not be permitted to remain.~~
Substantiation: The title of Section 800.3 is "Other Articles". The requirement for the removal of abandoned cables is not in another article; it is in Article 800. It is out of place in section 800.3. This proposal will move it to a new section of Article 800 and make it editorially consistent with Articles 770 and 820 by substituting "shall be removed" for "shall not be permitted to remain". Rather than refer section 300.21 requirements for the prevention of the spread of fire, it is better to have the requirements in Article 800 which should be familiar to communications installers. The text of proposed section 800.26 is based on section 300.21 but modified to apply to communications cables and communications raceways. The fine print notes pointing to definitions are intended to assist installers who are not code experts and may not be aware of Article 100. The fine print note in 300.21 was not copied because does not provide sufficient guidance for a communications cable installer.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 16-128.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
OHDE, H.: This proposal should be deleted in its entirety. We agree that the requirements for the removal of abandoned cables are out of place in 800.3(C) and needs to be located in another section within Part 1 –General. There are other proposed proposals with the same intent to locate the abandoned cable requirements that seem better suited and make good enforceable code.
The substantiation provided to delete 800.3(C) which contains the requirements of 300.21 is unclear. The submitter stated the proposed 800.26 is based on the requirements of 300.21 but modified to apply to communications cables and raceways. There was no substantiation submitted for this change.
In addition, Section 90.1(C) of the NEC states " *This Code is not intended as a design specification or an instruction manual for the untrained persons* ." In the submitter's substantiation he states these FPN's will help installers who are not Code experts. The addition of the FPN following 800.25 referencing Article 100 for the definition of accessible the FPN following 800.26 referencing Article 100 for the definition of approved is not needed nor warranted. A trained installer will know the Code content and how the Code book is to be used.

16-143 Log #2659 NEC-P16 **Final Action: Accept in Principle in Part**
(800.30)

Submitter: Robert W. Jensen, dbi / Rep. BICSI, A Telecommunications Association
Recommendation: Consolidated from various areas to a new section:
800.30 Abandoned Cables. The accessible portion of abandoned communications cables shall be removed.
Remove wording in 800.3(C) "The accessible portion of abandoned communications cables shall not be permitted to remain."
Remove wording in 800.154(A), "Abandoned cables shall not be permitted to remain."
Remove wording in 800.154(B)(1), "Abandoned cables shall not be permitted to remain."
Substantiation: The title of Section 800.3 is "Other Articles". The requirement for the removal of abandoned cables is not in another article; it is in Article 800. It is out of place in section 800.3. This proposal will move it to a new section of Article 800. The deletion of the requirements to remove abandoned cable in 800.154(A) and (B) corrects an error.
Panel Meeting Action: Accept in Principle in Part
See panel actions on Proposals 16-128 and 16-201.
Panel Statement: The panel accepts the change pertaining to 800.3(C).
The panel accepts in principle the recommendation to move the abandoned cable requirements. See panel action on Proposal 16-128.
The panel rejects the submitter's action on 800.154(A) and accepts the change to 800.154(B)(1). See panel action on Proposal 16-201.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
OHDE, H.: We agree with the submitter's intent to locate all abandoned cable requirements to a new section in Part 1- General within the Article. Part 1- General applies to the entire article and therefore would reduce the confusion. We believe that not just the accessible portion of abandoned cables but all abandoned cables be removed to reduce the fuel load.

16-144 Log #2660 NEC-P16 **Final Action: Reject**
(800.47(B))

Submitter: Robert W. Jensen, dbi / Rep. BICSI, A Telecommunications Association
Recommendation: Revise text to read:
800.47 Underground Circuits Entering Buildings.
~~(B) Underground Block Distribution. Where the entire street circuit is run underground and the circuit within the block is placed so as to be free from the likelihood of accidental contact with electric light or power circuits of over 300 volts to ground, the insulation requirements of 800.50(A) and 800.50(C) shall not apply, insulating supports shall not be required for the conductors, and bushings shall not be required where the conductors enter the building.~~

Substantiation: Section 800.47(B) is not in keeping with workmanlike manner as defined in section 800-24. There should never be an exception to 800.50(A) which requires listed drop wire. This section is an outdated exception to good practice in 800.50.
Panel Meeting Action: Reject
Panel Statement: There continues to exist today many urban communities and neighborhoods where dwellings are served from an underground communications plant that is contained within a block, circuits are unexposed to possible contact with power, and lightning exposure is minimal. No increase in safety is achieved by requiring such communications circuits to meet the insulation requirements of 800.50(A) and (C).
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-145 Log #29 NEC-P16 **Final Action: Accept in Principle**
(800.48 (New) & 800.113, Exception No. 2)

Submitter: Stanley Kaufman, Cable Safe Inc.
Recommendation: Revise as follows:
800.48. Unlisted Cables Entering Buildings. Unlisted outside plant communications cables shall be permitted in building spaces other than risers, air ducts, concealed spaces, plenums and other spaces used for environmental air, where the length of the cable within the building, measured from its point of entrance, does not exceed 15 m (50 ft) and the cable enters the building from the outside and is terminated in an enclosure or on a listed primary protector.
FPN No. 1: Splice cases or terminal boxes, both metallic and plastic types, are typically used as enclosures for splicing or terminating telephone cables.
FPN No. 2: This section limits the length of unlisted outside plant cable to 15 m (50 ft), while 800.90(B) requires that the primary protector be located as close as practicable to the point at which the cable enters the building. Therefore, in installations requiring a primary protector, the outside plant cable may not be permitted to extend 15 m (50 ft) into the building if it is practicable to place the primary protector closer than 15 m (50 ft) to the entrance point.
FPN No, 3: See 800.2 for the definition of point of entrance.
FPN No. 4: See 800.2 for the definition of air duct.
FPN No. 5: See Article 100 for the definition of plenum.
FPN No. 6: See 300.22(C) for information on other space used for environmental air.
800.113 Exception No. 2: *As permitted in 800.48.* L ~~*isting and marking shall not be required where the length of the cable within the building, measured from its point of entrance, does not exceed 15 m (50 ft) and the cable enters the building from the outside and is terminated in an enclosure or on a listed primary protector.*~~
~~FPN No. 1 to Exception No. 2:~~
~~Splice cases or terminal boxes, both metallic and plastic types, are typically used as enclosures for splicing or terminating telephone cables.~~
~~FPN No. 2 to Exception No. 2:~~
~~This exception limits the length of unlisted outside plant cable to 15 m (50 ft), while 800.90(B) requires that the primary protector be located as close as practicable to the point at which the cable enters the building. Therefore, in installations requiring a primary protector, the outside plant cable may not be permitted to extend 15 m (50 ft) into the building if it is practicable to place the primary protector closer than 15 m (50 ft) to the entrance point.~~
Substantiation: Part II of Article 800 covers “Wires and Cables Outside and Entering Buildings”. Part VI covers “Communications Wires and Cables Within Buildings”. Exception No. 2 to 800.113 deals with cables entering buildings and logically belongs in Part II.
In addition to editorially changing the exception to positive language and moving it to Part II, this proposal deals with the issue of the fire hazard of unlisted outside plant cables in buildings. Unlisted outside plant entrance cables are sometimes run in risers, air ducts, concealed spaces and plenums. When the 50-foot exemption for outside plant cable was adopted, it was assumed that the entrance cable would go into an equipment room. It was not envisioned that the unlisted cable, which is not fire resistant, would run up a riser, in an air duct, in concealed spaces or a plenum. The proposed new fine print notes (3, 4, 5 & 6) are provided to help the reader by pointing to the definitions of “point of entrance”, “air duct” and “plenum” and a description of “other space used for environmental air”.
Panel Meeting Action: Accept in Principle
The panel accepts the submitter’s proposal with the following revisions:
800.48 to read as follows:
800.48. Unlisted Cables Entering Buildings. Unlisted outside plant communications cables shall be permitted to be installed in locations as described in 800.154(E) where the length of the cable within the building, measured from its point of entrance, does not exceed 15 m (50 ft) and the cable enters the building from the outside and is terminated in an enclosure or on a listed primary protector.
Delete FPNs 4, 5, and 6.
Change 800.113 Exception No. 2: to be Exception.
Panel Statement: The panel made changes to the submitter’s text to correlate with the language in the remainder of the article.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-146 Log #731 NEC-P16 **Final Action: Accept in Principle**
(800.48, (New) & 800.113, Exception No.2)

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Make the following changes:
800.48. Unlisted Cables Entering Buildings. Unlisted outside plant communications cables shall be permitted in building spaces other than risers, air ducts, plenums and other spaces used for environmental air, where the length of the cable within the building, measured from its point of entrance, does not exceed 15 m (50 ft) and the cable enters the building from the outside and is terminated in an enclosure or on a listed primary protector.
FPN No. 1: Splice cases or terminal boxes, both metallic and plastic types, are typically used as enclosures for splicing or terminating telephone cables.
FPN No. 2: This section limits the length of unlisted outside plant cable to 15 m (50 ft), while 800.90(B) requires that the primary protector be located as close as practicable to the point at which the cable enters the building. Therefore, in installations requiring a primary protector, the outside plant cable may not be permitted to extend 15 m (50 ft) into the building if it is practicable to place the primary protector closer than 15 m (50 ft) to the entrance point.
FPN No, 3: See 800.2 for the definition of point of entrance.
FPN No. 4: See 800.2 for the definition of air duct.
FPN No. 5: See Article 100 for the definition of plenum.
FPN No. 6: See 300.22(C) for information on other space used for environmental air.
800.113 Exception No. 2: *As permitted in 800.48.* ~~*Listing and marking shall not be required where the length of the cable within the building, measured from its point of entrance, does not exceed 15 m (50 ft) and the cable enters the building from the outside and is terminated in an enclosure or on a listed primary protector.*~~
~~FPN No. 1 to Exception No. 2:~~
~~Splice cases or terminal boxes, both metallic and plastic types, are typically used as enclosures for splicing or terminating telephone cables.~~
~~FPN No. 2 to Exception No. 2:~~
~~This exception limits the length of unlisted outside plant cable to 15 m (50 ft), while 800.90(B) requires that the primary protector be located as close as practicable to the point at which the cable enters the building. Therefore, in installations requiring a primary protector, the outside plant cable may not be permitted to extend 15 m (50 ft) into the building if it is practicable to place the primary protector closer than 15 m (50 ft) to the entrance point.~~
Substantiation: This is an editorial and technical proposal. (Task Group No. 800-11)
It is a companion proposal to similar ones made for articles 770 and 820. Part II of Article 800 covers “Wires and Cables Outside and Entering Buildings”. Part VI covers “Communications Wires and Cables Within Buildings”. Exception No. 2 to 800.113 deals with cables entering buildings and logically belongs in Part II.
The proposed new fine print notes (3, 4, 5 & 6) are provided to help the reader by pointing to the definitions of “point of entrance”, “air duct” and “plenum” and a description of “other space used for environmental air”.
The technical portion is a requirement prohibiting outside plant cables from running in risers or in the air distribution system; thereby correcting an omission in the current code.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 145.

16-148 Log #2661 NEC-P16 **Final Action: Reject**
(800.90)

Submitter: Robert W. Jensen, dbi / Rep. BICSI, A Telecommunications Association
Recommendation: Revise text as follows:
800.90 Protective Devices.
(A) Application. A listed primary protector shall be provided on each circuit entering a building. Installation of primary protectors shall also comply with 110.3(B).
Remove FPN #1 and 2.
Substantiation: Utility companies are providing protection on entrance cables to buildings whereas unregulated and private companies use this as an escape from providing protection where it is needed.
All circuits have the potential to be exposed to one or more of the following: 1) accidental contact with power conductors, 2) lightning, and; 3) above-normal voltages induced by fault currents on power circuits in proximity to the communications circuit.
Induction typically involves power conductors that are run parallel to communications cabling. Power cables typically are routed in the same path as communications cables even after communications cables are installed, causing induction issues.
Even if there is no direct lightning exposure, induction is enough of an issue to require protection.
The current provisions of 800.90A are too complex for many of the nontelco personnel. Even though the telephone companies routinely install primary protection on all their circuits, many nontelco personnel do not, even though they should be. Consequently, the requirement for primary protection needs to be greatly simplified by requiring it on all circuits. This problem is recognized by BICSI, which represents 20,000 designers, installers and manufacturers.
Panel Meeting Action: Reject
Panel Statement: Communications utilities install primary protection based upon the exposure of communications utility plant serving the customer and exposure of the customer's premises (e.g., campus wiring). Where exposure to contact with power conductors operating at over 300 volts to ground (and/or lightning – note that the NEC only incidentally covers lightning protection) is possible, electrical protection is provided. In many urban areas communications plants or customers are not exposed to power contact (e.g., are contained within a block) and primary protection is unnecessary and is not provided. This practice, in effect for many years, has produced an exemplary safety record. In urban areas, power induction is not an issue, as "parallel" runs of power and communications distribution cables are short. Further, all equipment that is connected to a telecom network is required to be listed (see 800.170). Listing standards ensure that telecom ports of such equipment demonstrate a significant level of power contact/induction and lightning immunity. It is unconscionable to penalize communications utilities that faithfully observe the NEC requirements in order to police unscrupulous individuals/companies that pursue shortcuts at the expense of safety. This is not a technical issue, but an enforcement issue that must be pursued from an inspection/enforcement perspective.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-149 Log #2829 NEC-P16 **Final Action: Reject**
(800.90(A))

Submitter: John Kacpenski, Western Telecommunications Consutling (WTC)
Recommendation: Revise text to read as follows:
800.90 Protective Devices.
FPN No. 1: ~~On a circuit not exposed to accidental contact with power conductors, providing a listed primary protector in accordance with this article helps protect against other hazards, such as lightning and above normal voltages induced by fault currents on power circuits in proximity to the communications circuit.~~
~~FPN No. 2:~~ Interbuilding circuits are considered to have a lightning exposure unless one or more of the following conditions exist:
(1) Circuits in large metropolitan areas where buildings are close together and sufficiently high to intercept lightning.
(2) ~~Interbuilding cable runs of 42 m (140 ft) or less, directly buried or in underground conduit, where a continuous metallic cable shield or a continuous metallic conduit containing the cable is bonded to each building grounding electrode system.~~
~~(3) Areas having an average of five or fewer thunderstorm days per year and earth resistively of less than 100 ohm meters. Such areas are found along the Pacific coast.~~
NFPA 780 (Standard for the Installation of Lighting Protection Systems - 2004 Edition) is to be referenced for lightning risk assessment.
Substantiation: The information in what was FPN No. 1 needs to be removed. All circuits have the potential to be exposed to utility service power from induction. Even if utility service power is not present at the time of communications-cable installation, the communications cables need to be protected because experience teaches that there is a high probability that power service in the immediate proximity of the communications cables at a later date.
Sneak current and indirect lighting strikes are also potential exposure issues.
The NFPA 780 Working Group members are the subject matter experts in this area; we need to pull from their many years of research and investigation in this area of electric hazard.
Panel Meeting Action: Reject
Panel Statement: FPN No. 1 is informative and alerts the reader that application of a primary protector may protect against overvoltages resulting from lightning and power fault induction. It should not be removed. It is not universally true that all circuits are exposed to power fault induction. There are instances where it is unlikely that power will be overbuilt, such as a campus environment.
FPN No. 2, item (2) is an important electrical protection consideration. Extensive computer modeling at Bell Telephone Laboratories, Inc. in the mid '80s established that underground or direct buried inter-building shielded cable runs of 42 ft or less in length are not exposed to lightning. The results of this modeling have been employed extensively by telecom companies for many years with exemplary results. FPN No. 2, item (3) should not be deleted. This has been the definition of lightning exposure that has been employed successfully by the telecom industry for many years with an outstanding safety record in lightning protection. Finally, Section 4.2 or the 2003 NEC Style Manual prohibits references to other standards in mandatory Code text.

16-153a Log #CP1600 NEC-P16 **Final Action: Accept**
(800.90 (B))

Submitter: Code-Making Panel 16,
Recommendation: 800.90 (B) Location. The primary protector shall be located in, on, or immediately adjacent to the structure or building served and as close as practicable to the point of entrance.
FPN: See 800.2 for the definition of *point of entrance* .
For purposes of this section, primary protectors located at mobile home service equipment located ~~in sight from and not more than~~ within 9.0 m (30 ft) ~~from~~ of the exterior wall of the mobile home it serves, or at a mobile home disconnecting means connected to an electrode by a grounding conductor ~~grounded~~ in accordance with 250.32 and located ~~in sight from and not more than~~ within 9.0 m (30 ft) ~~from~~ of the exterior wall of the mobile home it serves, shall be considered to meet the requirements of this section.
Substantiation: Improves clarity. The existing, double-negative wording is difficult to interpret. This editorial change makes the text easier to interpret and clarifies the requirements.
For purposes of grounding or bonding telecommunications equipment, being able to see the power disconnection point is immaterial. Where as "in sight from" may be critical for disconnecting power in an emergency, maintaining a reasonable length grounding conductor is the key in a telecommunications application. This proposal does not affect service equipment placement requirements. It only clarifies where the telecommunications grounding will be done based on where the service equipment is already placed

4) improve the language in the difficult to understand Sections.
The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.

Panel Meeting Action: Accept in Part

Revise 800.93 as follows:

800.93 ~~Cable~~ Grounding or Interruption of Metallic Sheath Members of Communications Cables. The metallic sheath members of communications cables entering buildings shall be grounded as close ~~as practicable~~ to the point of entrance as practicable or shall be interrupted as close to the point of entrance as practicable by an insulating joint or equivalent device.

Panel Statement: "Entering Buildings" is inappropriate, as the cable may not actually enter the building.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-159 Log #1310 NEC-P16 **Final Action: Accept**

(800.100)

Submitter: Steven C. Johnson, Time Warner Cable / Rep. National Cable Telecommunications Association

Recommendation: Revise as follows:

800.100 Cable and Primary Protector Grounding. The primary protector and the metallic member(s) of the cable sheath ~~, where required to be grounded by 800.93, and primary protectors~~ shall be grounded as specified in 800.100(A) through 800.100(D).

Substantiation: Prior to 2002, the NEC listed criteria where grounding was required, such as exposure to lightning, exposure to accidental contact with power conductors, etc. The 2002 code removed these qualifications and just specified that the installation be grounded. Since 800.93 requires grounding without exception, the phrase "where required to be grounded by 800.93" is redundant.

Primary protectors are listed first in the requirement to avoid any misinterpretation that "metallic member" applies to primary protectors in addition to cable sheaths.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-160 Log #3509 NEC-P16 **Final Action: Reject**

(800.100)

Submitter: Paul Dobrowsky, Holley, NY

Recommendation: Revise as Follows:

800.100 Cable and Primary Protector Grounding. The metallic member(s) of the cable sheath, where required to be grounded by 800.93, and primary protectors shall be grounded as specified in 800.100(A) through 800.100(D).

(A) Grounding Electrode Conductor.

(1) Insulation. The grounding electrode conductor shall be insulated and shall be listed as suitable for wet locations ~~the purpose~~.

(2) Material. The grounding electrode conductor shall be copper or other corrosion-resistant conductive material, stranded or solid.

(3) Size. The grounding electrode conductor shall not be smaller than 14 AWG.

(4) Length. The primary protector grounding electrode conductor shall be as short as practicable. In one- and two-family dwellings, the primary protector grounding electrode conductor shall be as short as practicable, not to exceed 6.0 m (20 ft) in length.

FPN: Similar grounding electrode conductor length limitations applied at apartment buildings and commercial buildings help to reduce voltages that may be developed between the building's power and communications systems during lightning events.

Exception: In one- and two-family dwellings where it is not practicable to achieve an overall maximum primary protector grounding electrode conductor length of 6.0 m (20 ft), a ~~separate~~ communications ground rod meeting the minimum dimensional criteria of 800.100(B)(2)(2) shall be driven, the primary protector shall be grounded to the communications ground rod in accordance with 800.100(C), and the communications ground rod shall be bonded to the power grounding electrode system in accordance with 800.100(D).

(5) Run in Straight Line. The grounding electrode conductor shall be run to the grounding electrode in as straight a line as practicable.

(6) Physical Damage. Where necessary, the grounding electrode conductor shall be guarded from physical damage. Where the grounding electrode conductor is run in a metal raceway, both ends of the raceway shall be bonded to the grounding electrode conductor or the same terminal or electrode to which the grounding electrode conductor is connected.

(B) Electrode. The grounding electrode conductor shall be connected in accordance with 800.100(B)(1) and (B)(2).

(1) In Buildings or Structures with Grounding Means. To the nearest accessible location on the following:

(1) The building or structure grounding electrode system as covered in 250.50

(2) The grounded interior metal water piping system, within 1.5 m (5 ft) from its point of entrance to the building, as covered in 250.52

(3) The power service accessible means external to enclosures as covered in 250.94

(4) The metallic power service raceway

(5) The service equipment enclosure

(6) The service, system, building or structure grounding electrode conductor or the grounding electrode conductor metal enclosure

(7) The grounding electrode conductor or the grounding electrode of a building or structure disconnecting means that is grounded to an electrode as covered in 250.32

For purposes of this section, the mobile home service equipment or the mobile home disconnecting means, as described in 800.90(B), shall be considered accessible.

(2) In Buildings or Structures Without Grounding Means. If the building or structure served has no grounding means, as described in 800.100(B)(1), the grounding conductor shall be connected to either of the following:

(1) To any one of the individual electrodes described in 250.52(A)(1), (A)(2), (A)(3), or (A)(4)

(2) If the building or structure served has no grounding means, as described in 800.100(B)(1) or (B)(2)(1), to an effectively grounded metal structure or to a ground rod or pipe not less than 1.5 m (5 ft) in length and 12.7 mm (½ in.) in diameter, driven, where practicable, into permanently damp earth and separated from lightning conductors as covered in 800.53 and at least 1.8 m (6 ft) from electrodes of other systems. Steam or hot water pipes or air terminal conductors (lightning-rod conductors) shall not be employed as electrodes for protectors.

(C) Electrode Connection. Connections to grounding electrodes shall comply with 250.70.

(D) Bonding of Electrodes. A bonding jumper not smaller than 6 AWG copper or equivalent shall be connected between the communications grounding electrode and power grounding electrode system at the building or structure served where separate electrodes are used.

Exception: At mobile homes as covered in 800.106.

FPN No. 1: See 250.60 for use of air terminals (lightning rods).

FPN No. 2: Bonding together of all separate electrodes limits potential differences between them and between their associated wiring systems.

Substantiation: The concept of listed for the purpose needs to be explained. If being suitable for a wet location is not the intent, then please describe what is.

The term grounding conductor should be replaced with grounding electrode conductor. A proposal was submitted to Article 100 to modify the existing definition of grounding electrode and to delete the term grounding conductor. to clarify this issue. The Term Grounding conductor is sometimes used to describe a connection to the earth and other times to describe any of the different types of conductors that use the term "grounding". Separate grounding electrodes are already required to be bonded together by 250.50.

Panel Meeting Action: Reject

Panel Statement: The term "grounding electrode conductor" specifically applies to the conductor that connects the grounding electrode(s) to the equipment grounding conductor or to the grounded conductor, or both at the electric service to the building. The conductor connecting the metallic members of the cable sheath and the primary protector grounding terminal to the building grounding means is not a "grounding electrode conductor", but a "grounding conductor" as determined by the TCC Grounding & Bonding Task Group.

The listing of a grounding electrode conductor does not include a special investigation for a wet location.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-161 Log #846 NEC-P16 **Final Action: Reject**

(800.100(A)(1))

Submitter: Michael J. Johnston, Plano, TX

Recommendation: Revise text to read as follows:

800.100 Cable, and Primary Protector Grounding.

The metallic member(s) of the cable sheath, where required to be grounded by 800.93, and primary protectors shall be grounded as specified in 800.100(A) through 800.100(D).

(A) Grounding Conductor

(1) Insulation. The grounding conductor shall be insulated and shall be listed and marked as a grounding protector wire. ~~as suitable for the purpose.~~

Substantiation: Under the category KDER and the UL White Book, Protector Grounding wires are addressed. The guide card information indicates that this wire is required to be marked with the manufacturer's name, size, and the words "protector grounding wire". In step with the directives to address the term listed or listed as suitable for the purpose, this proposal is an effort to be more specific in the rule to require a conductor specifically listed and marked for this purpose.

Panel Meeting Action: Reject

Panel Statement: There is nothing special about the conductor used to ground the protector. The communications industry has used listed wire to ground the protector universally and safely for many years. There is no need to specifically mark this conductor "as a grounding protector wire". Such marking may lead to confusion and misinterpretation. The submitter has demonstrated no safety issue with the present practice.

Ballot Results: Affirmative: 15

16-163 Log #372 NEC-P16 **Final Action: Reject**
(800.100(A)(6))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise text as follows:
" ~~Physical~~ damage Where necessary, the grounding conductor shall be guarded from ~~physical~~ damage...".
Substantiation: Use of the word "physical" is superfluous–the intent is obvious given the context. (I leave it to the CMP whether you want to get more specific naming some source of damage such as "blows or abrasion.")
Submitting proposals removing the adjective "physical" may strike people as about as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every unnecessary instance, as I am attempting to do, we actually cut the NEC down by up to oh, maybe a quarter-page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the unneeded use of "physical" not only is poor writing–look at William Zinsser's classic, On Writing Well–but is silly, and reflects a bit poorly on the Code process. When references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."
Panel Meeting Action: Reject
Panel Statement: The grounding conductor is potentially subject to multiple sources of damage: electrical, physical, and environmental. The word "physical" is necessary to specifically identify the type of damage that the section is addressing.

....
~~(2)~~ (3) In Buildings or Structures Without <u>Intersystem Grounding Termination or</u> Grounding Means. If the building or structure served has no <u>intersystem grounding termination or</u> grounding means ~~,~~ as described in 800.100(B)(~~1~~ <u>2</u>), the grounding conductor shall be connected to either of the following:.
(1) To any one of the individual electrodes described in 250.52(A)(1), (A)(2), (A)(3), or (A)(4)

(2) If the building or structure served has no intersystem grounding termination or has no grounding means, as described in 800.100(B)(~~1~~ 2) or (B)(~~2~~ 3)(1), to an effectively grounded metal structure or to a ground rod or pipe not less than 1.5 m (5 ft) in length and 12.7 mm (in.) in diameter, driven, where practicable, into permanently damp earth and separated from lightning conductors as covered in 800.53 and at least 1.8 m (6 ft) from electrodes of other systems. Steam or hot water pipes or air terminal conductors (lightning-rod conductors) shall not be employed as electrodes for protectors.

Substantiation: This is one of several correlated proposals (100 Definitions, 250.95, Chapter 8 Articles) to improve the requirements related to intersystem bonding and grounding of communication systems. The intent is to create a dedicated and well-defined location for terminating the grounding conductors required in Chapter 8 Articles and 770.93. These grounding conductors also provide between communication and power systems (intersystem bonding). The proposed termination would have sufficient capacity to handle multiple communication systems (telecom, satellite, CATV) on premises. The proposed revision makes the intersystem bonding terminal the preferred destination for grounding conductor in Article 800. See the figures I have provided.

Intersystem bonding accomplished by connection of a communication grounding conductor to the power system is an important safety measure to prevent occurrences of voltages between communication system and power system. However, the existing requirements are not adequate. Bonding is becoming difficult to implement due to changes in building construction practices such as increased prevalence of flush construction and use of PVC conduits. Frequently, in new construction, the grounding electrode, the raceway and the grounding electrode conductor are hidden behind walls and not accessible for bonding connection.

Even in older construction with accessible equipment, the requirement for installation of intersystem bonding connection is subject to varying interpretation because there is not a clearly defined dedicated bonding location. The connection to the power system is sometimes haphazard. Installers are sometimes confused over where the connection should be made especially if multiple Communication Systems are present on premises.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-168 Log #1991 NEC-P16 **Final Action: Accept in Principle**

(800.100(B))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 16-167 and the comments expressed in the voting on 16-168. This action will be considered by the Panel as a Public Comment.

It was also the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 5 for information.

Submitter: Neil F. LaBrake, Jr., Niagara Mohawk, a National Grid Company / Rep. Edison Electric Institute-Electric Light & Power Group

Recommendation: Add these two sentences after the last sentence of 800.100(B):

A device intended to provide a termination point for the grounding conductor (inter-system bonding) shall be prohibited from use when the installation of such device interferes with opening a service or metering equipment enclosure. An inter-system bonding device shall not be installed on an enclosure cover.

Substantiation: Poor grounding practices by installers of CATV, telephone, satellite and other communication systems using termination devices that clamp to enclosure covers have resulted in interruption of grounding continuity. This is a companion proposal to proposals to add this requirement to 810.21(F), 820.100(B), and 830.100(B).

Panel Meeting Action: Accept in Principle

Add the following after the last sentence of 800.100(B):

A device intended to provide a termination point for the grounding conductor shall not interfere with the opening of an equipment enclosure. A bonding device shall be mounted on non-removable parts. A bonding device shall not be mounted on a door or cover even if the door or cover is non-removable.

Panel Statement: The panel accepts the intent of the submitter and has reworded the text for clarity. It is requested that the TCC forward to Panel 5 for take similar action as applicable.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

BRUNSSEN, J.: The submitter's text, as modified by the Panel, should be placed following the existing text of 800.100(B)(5) rather than at the end of 800.100(B). Section 800.100(B)(5) specifically addresses connection to the service equipment enclosure and that is the issue that the submitter intended to address.

16-169 Log #1182 NEC-P16 **Final Action: Reject**

(800.100(D))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Revise as follows:

A bonding jumper shall be copper not smaller than 6 AWG ~~copper~~ or ~~equivalent~~ equally conductive corrosion-resistant material shall be...(remainder unchanged).

Substantiation: "Equivalent" is not specific whether it refers to size or material. The grounding conductor of 800.100(A)(2) is specified to be copper.

Panel Meeting Action: Reject

Panel Statement: The present text is clear. The bonding jumper can be "… not smaller than 6 AWG copper or equivalent …". An equivalent conductor is one with at least the same ampacity and corrosion-resistance capability and could be of different material and/or larger in size (AWG). The panel notes that the submitter did not see the necessity to revise "equivalent" in his proposals on similar requirements in 820.100(A)(3) and 830.100(D), Proposals 16-296 and -398.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-170 Log #1312 NEC-P16 **Final Action: Accept in Principle**

(800.106(A))

Submitter: Steven C. Johnson, Time Warner Cable / Rep. National Cable Telecommunications Association

Recommendation: Revise as follows:

800.106 Bonding and Grounding at Mobile Homes.

(A) Grounding. Grounding shall comply with (1) and (2).

(1) Where there is no mobile home service equipment located ~~in sight from, and not more~~ within 9.0 m (30 ft) of the exterior wall of the mobile home it serves , the primary protector ground shall be in accordance with 800.100(B)(2).

(2) Where ~~or~~ there is no mobile home disconnecting means grounded in accordance with 250.32 and located ~~within sight from, and not more~~ within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, the primary protector ground shall be in accordance with 800.100(B)(2).

Substantiation: Improves clarity. The existing, double-negative wording is difficult to interpret. This editorial change makes the text easier to interpret and clarifies the requirements.

For purposes of grounding or bonding telecommunications equipment, being able to see the power disconnection point is immaterial. Whereas "in sight from" may be critical for disconnecting power in an emergency, maintaining a reasonable length grounding conductor is the key in a telecommunications application. This proposal does not affect service equipment placement requirements. It only clarifies where the telecommunications grounding will be done based on where the service equipment is already placed.

Panel Meeting Action: Accept in Principle

Revise the submitter's text as follows:

(A) Grounding. Grounding shall comply with 800.106(A) (1) and (A) (2).

(1) Where there is no mobile home service equipment located ~~in sight from, and not more than~~ within 9 m (30 ft) ~~from,~~ of the exterior wall of the mobile home it serves , the primary protector ground shall be connected to a grounding conductor in accordance with 800.100(B)(2).

(2) Where there is no mobile home disconnecting means grounded in accordance with 250.32 and located within ~~sight from, and not more than~~ 9 m (30 ft) ~~from,~~ of the exterior wall of the mobile home it serves, the primary protector ground shall be connected to a grounding conductor in accordance with 800.100(B)(2).

Panel Statement: The changes made by the panel provide conformance to Section 4.2.1 of the NEC Style Manual in referencing sections of the NEC, incorporate revisions made to similar 820.106(A) by the TCC Grounding and Bonding Task Group (see panel action on Proposal 16-4, 820.106(A)), and provide editorial consistency across Articles 800, 820, and 830.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-171 Log #62 NEC-P16 **Final Action: Accept in Principle**

(800.110)

TCC Action: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the panel as a public comment.

Submitter: Stanley Kaufman, Cable Safe Inc.

Recommendation: Revise as follows:

800.110 Raceways for Communications Wires and Cables.

Where communications wires and cables are installed in a raceway, the raceway shall be either of a type permitted in Chapter 3 and installed in accordance with Chapter 3 or listed plenum communications raceway, listed riser communications raceway, or listed general-purpose communications raceway installed in accordance with 800.154, and ~~a listed nonmetallic raceway complying with 800.182, and installed in accordance~~ with 362.24

through 362.56, where the requirements applicable to electrical nonmetallic tubing apply.

Exception: Conduit fill restrictions shall not apply.

Substantiation: This is a corollary proposal to one being submitted for Article770. Specifically mentioning each plenum, riser and general-purpose raceway, rather that using the term "nonmetallic raceway" is more user-friendly. The installation requirements are in 800.154 so the reference to 820.182 (which is listing requirements) was changed to 820.154 since this section deals with installation.

Panel Meeting Action: Accept in Principle

Change 800.110 to read as follows:

800.110 Raceways for Communications Wires and Cables.

Where communications wires and cables are installed in a raceway, the raceway shall be either of a type permitted in Chapter 3 and installed in accordance with Chapter 3 or listed plenum communications raceway, listed riser communications raceway, or listed general-purpose communications raceway installed in accordance with 800.154, and a listed nonmetallic raceway complying with 800.182, and installed in accordance with 362.24 through 362.56, where the requirements applicable to electrical nonmetallic tubing apply. The raceway fill tables of Chapter 3 and Chapter 9 shall not apply.

Panel Statement: The panel changed the submitter's text to positive language to further clarify the requirements.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

OHDE, H.: This proposal should be modified. Change the last part of the first sentence of the new 800.110 as follows: "and installed in accordance with <u>362.10, 362.12 and</u> 362.24 through 362.56, where the requirements applicable to electrical nonmetallic tubing apply".

The Chapter 3 raceways must be installed in accordance with all of the requirements of Chapter 3. These raceways (general-purpose, riser) should also have to be installed in accordance with 362.10 and 362.12 since they have the same or similar characteristics to ENT.

Also not that the submitter had crossed out the existing text: " *a listed nonmetallic raceway complying with 800.182 and installed in accordance with….* " This phrase still appears in the report on the panel action and should be removed.

Comment on Affirmative:

BRUNSSEN, J.: Under the Panel Meeting Action, revise the text of **800.110 Raceways for Communications Wires and Cables** as follows: "… general-purpose communications raceway installed in accordance with 800.154, ~~and a listed nonmetallic raceway complying with 800.182,~~ and installed in accordance with 362.24 through 362.56, where …". This text is in error and is redundant. Section 800.182 contains the listing requirements for plenum, riser and general-purpose communications raceways.

DORNA, G.: There is an error in the panel action "and a listed nonmetallic raceway complying with 800.182" should be deleted because it is redundant. 800.182 contains the listing requirements for plenum, riser and general-purpose communications raceways.

KAHN, S.: There appears to be an error in the panel action. The proposer replaced the phrase "a listed nonmetallic raceway compiling with 800.182" with "listed plenum communication communications raceway, listed riser communications raceway, or listed general purpose communications raceway". The panel action retained the deleted phrase which is redundant.

16-172 Log #721 NEC-P16 **Final Action: Accept**
(800, Part V)

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.

Recommendation: Change title:

From V. Communications Wires and Cables Within Buildings

To V. Installation Methods Within Buildings

Substantiation: This proposal is editorial. (Task Group No.800-01)

The sections included under V. include more than cables and the recommended change is more descriptive. This title is consistent with similar recommendations for Articles 770, 820 and 830.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

16-178 Log #743 NEC-P16 **Final Action: Accept in Principle**
(800.113, 800.179 and Table 800.179)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposals 16-145 and 16-209. This action will be considered by the Panel as a Public Comment.

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.

Recommendation: Revise 800.179 and transfer Table 800.113 and the Table FPNs to 800.179.

800.179 Communications Wires and Cables.

Communications wires and cables ~~shall have a voltage rating of not less than 300 volts and~~ shall be listed in accordance with 800.179(A) through 800.179(J) and marked in accordance with Table 800.179. Conductors in communications cables, other than in a coaxial cable, shall be copper. Communications wires and cables shall have a voltage rating of not less than 300 volts. The cable voltage rating shall not be marked on the cable or on the undercarpet communications wire.

FPN No. 1: Voltage markings on cables may be misinterpreted to suggest that the cables may be suitable for Class 1, electric light, and power applications.

Exception No. 1: Voltage markings shall be permitted where the cable has multiple listings and voltage marking is required for one or more of the listings.

FPN No. 2 : See 800.170 for listing requirement for equipment.

800.113 Installation ~~and Marking~~ of Communications Wires and Cables.

Listed communications wires and cables and listed multipurpose cables shall be installed as wiring within buildings. ~~Communications cables and undercarpet communications wires shall be marked in accordance with Table 800.113.~~ ~~The cable voltage rating shall not be marked on the cable or on the undercarpet communications wire.~~

~~FPN: Voltage markings on cables may be misinterpreted to suggest that the cables may be suitable for Class 1, electric light, and power applications.~~

~~*Exception No. 1: Voltage markings shall be permitted where the cable has multiple listings and voltage marking is required for one or more of the listings.*~~

Exception No. 2: Listing and marking shall not be required where the length of the cable within the building, measured from its point of entrance, does not exceed 15 m (50 ft) and the cable enters the building from the outside and is terminated in an enclosure or on a listed primary protector.

FPN No. 1 to Exception No. 2:

Splice cases or terminal boxes, both metallic and plastic types, are typically used as enclosures for splicing or terminating telephone cables.

FPN No. 2 to Exception No. 2:

This exception limits the length of unlisted outside plant cable to 15 m (50 ft), while 800.90(B) requires that the primary protector be located as close as practicable to the point at which the cable enters the building. Therefore, in installations requiring a primary protector, the outside plant cable may not be permitted to extend 15 m (50 ft) into the building if it is practicable to place the primary protector closer than 15 m (50 ft) to the entrance point.

Substantiation: This proposal is editorial. (Task Group No. 800-23)

It moves the cable marking requirements from 800.113 to 800.179. There are other proposals concerning 800.113.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.

Panel Meeting Action: Accept in Principle

The Panel accepts the submitter's proposal.

"Exception No. 2" to 800.113 to be relabeled "Exception"

FPNs of 800.113 to read as follows:

FPN No. 1 to Exception:

Splice cases or terminal boxes, both metallic and plastic types, are typically used as enclosures for splicing or terminating telephone cables.

FPN No. 2 to Exception: This exception limits the length of unlisted outside plant cable to 15 m (50 ft), while 800.90(B) requires that the primary protector be located as close as practicable to the point at which the cable enters the building. Therefore, in installations requiring a primary protector, the outside plant cable may not be permitted to extend 15 m (50 ft) into the building if it is practicable to place the primary protector closer than 15 m (50 ft) to the entrance point.

Panel Statement: The Panel accepts the submitter's proposal.

Editorial changes are made to "Exception No. 2" and the FPNs to 800.113.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-179 Log #1874 NEC-P16 **Final Action: Accept in Principle**
(800.113 Exception No. 2)

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industry Solutions

Recommendation: Revise 800.113, Exception No. 2 as follows:

Exception No. 2: Unlisted outside plant communications cables shall be permitted within buildings in spaces other than risers, air ducts, plenums, and other spaces used for environmental air. ~~Listing and marking shall not be required where the~~ The length of the unlisted cable permitted within the building, measured from its point of entrance, ~~does~~ shall not exceed 15 m (50 ft) . ~~and the~~ The unlisted cable ~~enters~~ shall enter the building from the outside and ~~is~~ shall be terminated in an enclosure or on a listed primary protector.

Substantiation: The NEC presently permits up to 50 ft of unlisted outside plant communications cable to be run into a building, but places no restriction on installing the unlisted cables in air handling spaces where they could contribute to fire and smoke hazard. This proposal adds that restriction, further contributing to fire and smoke safety. This is a companion proposal and is intended to correlate with similar proposals for 770.113 Ex. No. 1 and 820.113 Ex. No. 2.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action on Proposal 16-145.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-180 Log #1288 NEC-P16 **Final Action: Accept**
(800.133(A)(1))

Submitter: Gerald Lee Dorna, Belden CDT. Inc.

Recommendation: Revise text to read:

(A) (1) In Raceways, Cable Trays, Boxes, and Cables.

(a) Other Power-Limited Circuits. Communications cables shall be permitted in the same raceway , cable tray or enclosure with cables of any of the following:

(1) Class 2 and Class 3 remote-control, signaling, and power-limited circuits in compliance with Article 725

(2) Power-limited fire alarm systems in compliance with Article 760

(3) Nonconductive and conductive optical fiber cables in compliance with Article 770

(4) Community antenna television and radio distribution systems in compliance with Article 820

(5) Low-power network-powered broadband communications circuits in compliance with Article 830

Substantiation: Obviously, cables that can be safely installed in the same raceway or enclosure can also be safely installed in the same cable tray. Stating that these cables are allowed "in the same cable tray" will avoid having the user assume that they are not permitted to be installed together in the same cable tray. It clarifies the use in the Code. Article 770, in section 770.133(B), has text similar to that proposed here. This is one of five similar proposals that are being submitted for Articles 725, 760, 800, 820 and 830.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

JONES, R.: The submitter is obviously in error with the assertion "Obviously, cables that can be safely installed in the same raceway or enclosure can also be safely installed in the same cable tray." O NLY cABLES LISTED FOR INSTALLATION IN CABLE TRAYS CAN BE INSTALLED IN CABLE TRAYS.

16-183 Log #3431 NEC-P16 **Final Action: Reject**
(800.133(A)(1)c. Exception No. 1)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Delete the phrase "listed divider" at the end; substitute the words "a securely installed barrier identified for the use."
Substantiation: This wording correlates with the changes made by CMP 9 to an equivalent rule in 404.8(B) in response to an equivalent proposal from the same submitter. The problem is that Article 314 does not require conventional steel outlet boxes to be listed, and therefore not all steel box dividers manufactured for this purpose are listed. In addition, none of these barriers (for outlet boxes) are permanently installed; but they certainly can be securely installed, and they certainly meet the provisions of the Article 100 definition of identified, in that they are recognizable as suitable for this purpose. This wording refers to the identical products and should therefore correlate with Article 314 requirements.
Panel Meeting Action: Reject
Panel Statement: This situation is not the same as 404.8(B). Secrion 404.8(B) deals with the grouping of snap switches with other snap switches and similar devices such as receptacles. The barriers described in 404.8(B) are used to separate these similar devices containing similar circuits.
800. 133(A)(1)c. Exception No. 1, 820. 133(A)(1)2. Exception No. 1 and 830.133(A)(1)d. Exception No. 1 deal with the separation of communications, CATV and broadband circuits from electric light, power and Class 1 circuits.
A permanent barrier as currently permitted is okay, as it is a physical part of the metal box or listed plastic boxs and its suitability can be determined by the AHJ or is covered by the listing. There are concerns associated with a non-permanent barrier or divider that cannot be easily dealt with at the point of installation. For example, compatibility with the box (fit and secureness), compatibility with the installed hardware such as power receptacles materials, ease of installation, clarity of proper installation procedures, affect on wiring space inside the box, and the like, need to be investigated and listed.
These articles do not only cover metal boxes. The proposal would allow non-listed barriers in metal and listed non-metallic boxes, voiding the listing of a non-metallic box.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-184 Log #3092 NEC-P16 **Final Action: Accept in Principle**
(800.133(B))

Submitter: Donald Hall, Corning Cable Systems
Recommendation: Revise text as follows:
(B) Cable Trays. Types CMP, CMR, CMG, and CM communications cables shall be permitted to be installed in cable trays. Communications raceways, as described in ~~800.179~~ 800.182 shall be permitted to be installed in cable trays.
Substantiation: 800.182 is the correct reference.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 16-185.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-184a Log #CP1601 NEC-P16 **Final Action: Accept**
(800.133(B))

Submitter: Code-Making Panel 16,
Recommendation: Re-letter 800.133(D) to 800.133(C).
Substantiation: This proposal is editorial. The panel accepted a series of proposals for the CMP 16 Special Editorial Task group to editorially rearrange this section. Re-lettering on 800.133(D) is required because acceptance of proposal 16-185 moved 800.133(B) to 800.133(D).
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-185 Log #740 NEC-P16 **Final Action: Accept**
(800.133(B) and 800.154 (D))

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Delete 800.133(B) as follows:
~~**(B) Cable Trays.** Types CMP, CMR, CMG, and CM communications cables shall be permitted to be installed in cable trays. Communications raceways, as described in 800.179, shall be permitted to be installed in cable trays.~~
Revise 800.154 (D) as follows:
(D) Cable Trays. Types CMP, CMR, CMG, and CM communications cables shall be permitted to be installed in cable trays. Communications raceways, as described in 800.182, shall be permitted to be installed in cable trays.
Substantiation: This is an editorial proposal. (Task Group No. 800-20)
It corrects an oversight wherein cable tray requirements were incorrectly and redundantly placed in Section 800.133(B). Cable tray requirements are more appropriately contained in Section 800.154, "Applications".
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.
Panel Meeting Action: Accept
Panel Statement: See panel action on Proposal 16-184a (Log #CP 1601).
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-186 Log #2629 NEC-P16 **Final Action: Reject**
(800.135 (New))

Submitter: David H. Kendall, Carlon
Recommendation: Add a new section to read as follows:
800.135 Communication Device and Equipment Mounting.
Communication devices or equipment shall be mounted in listed boxes, brackets or assemblies designed for the purpose, and such boxes or assemblies shall be securely fastened in place. Boxes or brackets can be completely enclosed or backless.
(A) Communication Devices and Equipment Mounted to Boxes or Brackets. Communication devices or equipment shall be mounted to listed boxes or bracket and installed per 314.20.
(B) Communication Devices and Equipment Mounted on Covers. Communication device and equipment mounted to and supported by a cover shall be held rigidly against the cover which is mounted to the box or bracket.
Substantiation: This proposal adds a new section to Article 800 addressing the mounting of devices or equipment to listed boxes and brackets. Currently, depending on the quality of workmanship, Communication devices or equipment have not been mounted to boxes or brackets that can support them. After several years, device and/or covers that are mounted directly to the dry wall will become hazard because they have become loose and exposed. Communication cable can become energized by coming in incidental contact with electrical conductors.

800.135 was only a suggestion for the location of this new section. (A) addresses devices mounted directly to boxes or devices where as (B) addresses devices mounted to covers.

Panel Meeting Action: Reject

Panel Statement: The submitter has provided no data supporting an existing hazard. The submitter offers only an individual opinion that, depending on the quality of workmanship, equipment or devices mounted directly to drywall may, over time, loosen and become a hazard. The addition of listed boxes or assemblies will not, in itself, guarantee a hazard-free installation. The same quality of workmanship is necessary to help ensure a hazard-free equipment installation whether or not listed boxes are used.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

OHDE, H.: I concur with submitter's recommendation which addresses the mounting of equipment or devices to listed boxes and brackets. However the submitter has not provided CMP 16 member any technical substantiation or data supporting the existing hazard. The submitter should resubmit the proposal in the 2008 ROC and provide CMP 16 members with such data.

16-187 Log #754 NEC-P16 **Final Action: Accept**
(800.154)

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.

Recommendation:

Include NEC L754_rec HERE

Substantiation: This proposal is editorial. (Task Group No. 800-34)

It will align similar paragraphs in Sections 770.154, 800.154, 820.154 and 830.154. It will provide consistency between similar sections in the affected four articles and improve usability of the Code. This is a companion proposal to similar proposals concerning Sections 770.154, 820.154 and 830.154.
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.

The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.

Panel Meeting Action: Accept

Panel Statement: See panel action on CP-1602.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

DORNA, G.: CP 1602 is Proposal 16-411a.

KAHN, S.: The panel statement requires correction as the proper reference is to Proposal 16-411a (which is the same as CP 1602).

16-188 Log #2530 NEC-P16 **Final Action: Reject**
(800.154)

Submitter: Sanford Egesdal, Egesdal Associates PLC

Recommendation: Add the following sentence to 800.154:

Communications cables shall comply with the requirements of 800.154(A) through 800.154(F) or where cable substitutions are made in accordance with 800.154(G). <u>Type CM50 very-low-smoke cable shall be permitted to be installed meet requirements for very-low-smoke producing characteristics, low potential heat release, and low flame spread characteristics.</u>

Substantiation: NFPA 13-2002 has requirements for installation of sprinklers where a concealed space has combustible loading. Type CM50 cable has a heat release that is significantly lower than combustible plenum cable listed using NFPA 262-2002, *Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces* .

The 2003 International Mechanical Code (IMC), 602.2.1 requires a smoke developed index less than 25 and a smoke developed index less than 50 for materials in plenums.

The Fine Print Note provides guidance to system designers, installers, and code officials. Over the past few decades, there has been a significant increase in the quantity of combustible cables installed in concealed spaces (hollow spaces and HVAC system spaces).

NFPA 13-2002, Installation of Sprinkler Systems, requires installation of a sprinkler system in concealed spaces where combustible loading is present. Because other NFPA documents reference NFPA 13, it is important for correlation for the NEC to include a pointer to NFPA 13. The following requirements are from NFPA 13-2002:

"8.14.1.5 Localized Protection of Exposed Combustible Construction or Exposed Combustibles. In concealed spaces having exposed combustible construction, or containing exposed combustibles, in localized areas, the combustibles shall be protected as follows:

(1) If the exposed combustibles are in the vertical partitions or walls around all or a portion of the enclosure, a single row of sprinklers spaced not over 12 ft (3.7 m) apart nor more than 6 ft (1.8 m) from the inside of the partition shall be permitted to protect the surface. The first and last sprinklers in such a row shall not be over 5 ft (1.5 m) from the ends of the partitions.

(2) If the exposed combustibles are in the horizontal plane, the area of the combustibles shall be permitted to be protected with sprinklers on a light hazard spacing. Additional sprinklers shall be installed no more than 6 ft (1.8 m) outside the outline of the area and not more than 12 ft (1.8 m) on center along the outline. When the outline returns to a wall or other obstruction, the last sprinkler shall not be more than 6 ft (1.8 m) from the wall or obstruction."

"8.14.1.2.1 Noncombustible and limited combustible concealed spaces with no combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum."

The definition of combustible, from NFPA 5000 is:

"3.3.340.2 Combustible (Material). A material that, in the form in which it is used and under the conditions anticipated, will ignite and burn; a material that does not meet the definition of noncombustible or limited-combustible."

During the 2005 NEC code cycle, the proposed Fine Print Note was added to 800.154(A). Because communications cables are permitted to substitute for Class 2 and Class 3 circuit cables, it is important to have parallel requirements in both NEC Sections. Additionally, the Fine Print Note applies to all concealed spaces.

In July of 2004, an appeal to the NFPA Standards Council requested deletion of the Fine Print Note to 800.154(A), prior to publication of the 2005 NEC. The appeal was denied.

There is a companion proposal for the listing and marking of Type CM50.

Panel Meeting Action: Reject

Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."
This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

OHDE, H.: We agree with panel action and believe that the panel statement should also reflect the latest NFPA 13 Technical Committee actions. Included in the submitter's substantiation was the 2002 Section 8.14 which since has been revised. We would like to add that NFPA 13 just completed their balloting process for the 2006 NFPA 13 Standard. The Technical Committee on Sprinkler Installation submitted a comment on Proposal 13-284.

This comment reworded proposed A.8.14.1.2.1 to read " *Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc…can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1) For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined* ."

In the NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

16-189 Log #2654 NEC-P16 **Final Action: Reject**
(800.154)

Submitter: Robert W. Jensen, dbi / Rep. BICSI, A Telecommunications Association

Recommendation: Delete the following text:

~~FPN: See 8.14.1 of NFPA 13 (2002), Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.~~

Substantiation: This FPN is being misinterpret and used in aggressive marketing attempts to require the installation of "limited combustible cable" (one such example is found at http://www.dupont.com/cablingsolutions/products/codes.html). The FPN has had a profound effect in which it is used in misleading the AHJ to require limited combustible cable, conduit, or a sprinkler system to be installed within the concealed space.

As an example, an AHJ Massachusetts would not provide a certificate of occupancy until the communications cabling was either replaced with limited combustible cable, the CMP cable was placed in conduit, or a sprinkler system installed above the suspended ceiling.. Although the installer had met the requirements of the NEC, the FPN misled the AHJ causing project delays and the potential of inordinate cost to the project. A plea to the NFPA aided the communications installer in which clarification was given that the CMP cabling was indeed sufficient to meet code and that NFPA 13 allowed some quantities (which is not defined) of communications cabling within concealed spaces. The installation of the CMP cable was allowed.

To further the removal of this FPN, the Report on Proposals A2006 from NFPA 13 (see attached), the NFPA committee specifically added an annex A.8.14.1.2.1 in 13-284 log #551 stating that, "Some minor quantities of combustible materials, such as communication wiring, can be present in some concealed spaces but should not typically be viewed as requiring sprinklers (see 8.14.1.1). The threshold value at which sprinklers become necessary in the concealed space is not defined. For example, the usual amounts of data or telephone wiring found above a ceiling would not typically constitute a threat. If bundles of unsheathed computer wiring are installed above the ceiling or beneath the floor in a manner where fire propagation in all directions is likely, then the concealed space should be treated the same as a combustible space, thereby requiring appropriate sprinkler protection."

In addition to the above, Panel 3 rejected the last minute introduction of this proposal that was made in the ROC stage. BICSI, which represents 24,000 installers, designers and manufacturers, feels that this last minute interjection of a FPN was not sufficiently vetted to industry and that the TCC should review this matter.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

JENSEN, R.: We believe that the interpretation of whether being allowed to address this proposal in view of the NFPA Standard Council Long Decision 05-24 (SC #05-7-4) was misunderstood.

The proposal to delete this FPN is not involved with NFPA 90A and should be deleted fro the reasons given in the submitter's substantiation. To further acceptance of removing this FPN, refer to several comments within the 2006 NFPA 13 ROC and in particular to 13-389a.

OHDE, H.: We do not believe that the NFPA Standards Council Long Decision 05-24 (SC #05-7-4) would prohibit this Fine Print Note from being deleted. We do believe that expansion of or new Fine Print Notes referencing NFPA 13 would be in violation of NFPA Standards Council Long Decision 05-24 (SC #05-7-4). This proposal should have been accepted. This Fine Print Note referencing NFPA 13 offers no value to the user of NFPA 70 and in fact misleads the user and AHJ.

16-190 Log #3007 NEC-P16 **Final Action: Reject**
(800.154)

Submitter: Marcelo M. Hirschler, GBH International

Recommendation: Revise text to read as follows:

800.2 Definitions.

Abandoned Communications Cable. Installed communications cable that is not terminated at both ends at a connector or other equipment and not identified for future use with a tag.

800.154 Applications of Listed Communications Wires and Cables and Communications Raceways.

Communications wires and cables shall comply with the requirements of 800.154(A) through 800.154(F) or where cable substitutions are made in accordance with 800.154(G)

(A) Plenum. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CMP. Abandoned communications wires and cables shall be removed. Removal of abandoned cables shall not damage the building structure or finish and shall not compromise the performance of adjacent wiring systems or components. ~~not be permitted to remain.~~ Types CMP, CMR, CMG, CM, and CMX and communications wire installed in compliance with 300.22 shall be permitted. Listed plenum communications raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only Type CMP cable shall be permitted to be installed in raceways.

FPN: See 8.14.1 of NFPA 13-2002, Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.

(B) Riser. Cables installed in risers shall comply with 800.154(B)(1), (B)(2), or (B)(3).

(1) Cables in Vertical Runs. Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type CMR. Floor penetrations requiring Type CMR shall contain only cables suitable for riser or plenum use. Abandoned communications wires and cables shall be removed. Removal of abandoned cables shall not damage the building structure or finish and shall not compromise the performance of adjacent wiring systems or components. ~~not be permitted to remain.~~ Listed riser communications raceways shall be permitted to be installed in vertical riser runs in a shaft from floor to floor. Only Type CMR and CMP cables shall be permitted to be installed in these raceways.

Substantiation: This comment recommends a change in wording to ensure that abandoned cables are removed and to prevent confusion in future. There have been multiple proposals that would permit some cables to remain in "inaccessible spaces". This is not conducive to safe electrical practice; this the key change is the elimination of the words "the accessible portion of".

If the intent of the code-making panel was to clarify that removal of cable should not be done if such removal would damage the building, which is obviously not the intent, a second sentence can be added stating that removal of abandoned cables shall not be performed if it would damage the building structure or finish or in any way compromise the functional performance of any other wiring systems or components. This would be accomplished by the optional added sentence.

Consistent wording on removal of abandoned cables is being proposed for sections: 640.3, 725.3, 770.3, 770.154, 800.3, 800.154, 820.3, 820.154 and 830.3.

For information, see the relevant definitions in the NEC.

Accessible (as applied to equipment). Admitting close approach; not guarded by locked doors, elevation, or other effective means.

Accessible (as applied to wiring methods). Capable of being removed or exposed without damaging the building structure or finish or not permanently closed in by the structure or finish of the building.

Accessible, Readily (Readily Accessible). Capable of being reached quickly for operation, renewal, or inspections without requiring those to whom ready access is requisite to climb over or remove obstacles or to resort to portable ladders, and so forth.

Concealed. Rendered inaccessible by the structure or finish of the building. Wires in concealed raceways are considered concealed, even though they may become accessible by withdrawing them.

Isolated (as applied to location). Not readily accessible to persons unless special means for access are used.

Panel Meeting Action: Reject

Panel Statement: See panel action on Proposal 16-28.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

OHDE, H.: We concur with submitter's substantiation and believe a change of wording will ensure that are abandoned cables are remove and prevent confusion in future. We suggest that the submitter resubmit his recommendation in the 2008 ROC stage in a more appropriate section with Part 1 – General so these requirements will apply throughout the entire Article.

16-191 Log #2288 NEC-P16 **Final Action: Reject**
(800.154, 800.179 & 800.182)

Submitter: Frank Peri, Communications Design Corporation

Recommendation: In 800.154 revise and re-letter the existing section (A) to (B) and introduce a new (A) as shown below. Also revise (G) as shown below. Re-letter the remaining sections, (B) to (C), (C) to (D) etc.

(A)Air Ducts. Cables installed in air ducts shall be Type CMD and shall be associated with the air distribution system and shall be as short as practicable. Types CMD, CMP, CMR, CMG, CM, and CMX cables and listed communications wires installed in raceway that is installed in compliance with 300.22(B) shall also be permitted.

(B ~~A~~) Plenum. Cables installed in ~~ducts,~~ plenums ~~,~~ and other space ~~s~~ used for environmental air shall be Type CMD or CMP. Abandoned cables shall not be permitted to remain. Types CMD, CMP, CMR, CMG, CM, and CMX cables and communications wire s installed in compliance with 300.22 shall be permitted. Listed plenum communications raceways shall be permitted to be installed in ~~ducts and~~ plenums as described in 300.22(B) and in other space ~~s~~ used for environmental air as described in 300.22(C). Only Type s CMD and CMP cable s shall be permitted to be installed in listed plenum communications raceways.

FPN: See 8.14.1 of NFPA 13-2002, *Installation of Sprinkler Systems* , for requirements for sprinklers in concealed spaces containing exposed combustibles.

(H ~~G~~) Cable Substitutions. The uses and permitted substitutions for communications cables listed in Table 800.154 shall be considered suitable for the purpose and shall be permitted.

FPN: For information on Types CMD, CMP, CMR, CMG, CM, and CMX cables, see 800.179.

Cable Type	Use	Permitted Substitutions
CMP	Communications plenum cable	CMD
CMR	Communications riser cable	CMD, CMP
CMG, CM	Communications general-purpose cable	CMD, CMP, CMR
CMX	Communications cable, limited use	CMD, CMP, CMR, CMG, CM

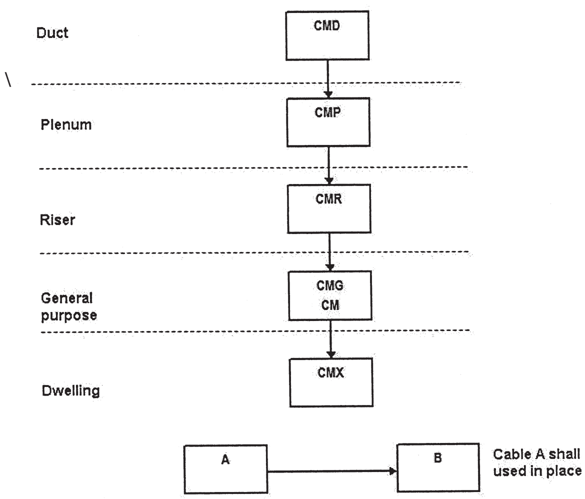

Figure 800-154 Cable substitution hierarchy.

In 800.179 revise and re-letter the existing section (A) to (B) and introduce a new (A) as shown below. Re-letter the remaining sections, (B) to (C), (C) to (D) etc.

(A)Type CMD. Type CMD communications air duct cables shall be listed as suitable for use in air ducts and shall be rated for continuous use at 121 o C. Type CMD communications air duct cables shall also be listed as having a low potential heat value, low flame spread characteristics, and very low smoke-producing characteristics.

FPN: One method of defining a low potential heat cable is establishing an acceptable value of potential heat when tested in accordance with NFPA 259, *Standard Test Method for Potential Heat of Building Materials* , to a maximum potential heat value not exceeding 8141 kJ/kg (3500 BTU/lb). One method of defining low flame spread cable is establishing an acceptable value of flame spread when tested in accordance with NFPA 255, *Standard Method of Test of Surface Burning Characteristics of Building Materials*, to a maximum flame spread index of 25, with the cable unslit (intact) and slit. Similarly, one method of defining very low smoke-producing cable is establishing an acceptable value when tested in accordance with NFPA 255, *Standard Method of Test of Surface Burning Characteristics of Building Materials*, to maximum smoke developed index of 50, with the cable unslit (intact) and slit. These test methods and resultant values correlate with the requirements of NFPA 90A-2002, *Standard for the Installation of Air-Conditioning and Ventilating Systems* for materials installed in ducts and plenums . *For additional testing information see Underwriters Laboratories Subject 2424, Outline of Investigation For Cable Marked Limited Combustible.*

(B ~~A~~) Type CMP. Type CMP communications plenum cable s shall be listed as being suitable for use in ~~ducts,~~ plenums , and other space ~~s~~ used for environmental air and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.

FPN: One method of defining a cable that is low smoke-producing cable and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262 -2002, *Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces* .

Revise 800.182(A) as shown below:

(A) Plenum Communications Raceways. Plenum communications raceways listed as plenum optical fiber raceways shall be permitted for use in ~~ducts,~~ plenums, and other spaces used for environmental air and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.

FPN: One method of defining that an optical fiber raceway is a low smoke producing raceway and a fire-resistant raceway is that the raceway exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with the plenum test in UL 2024, *Standard for Optical Fiber Cable Raceway* .

Substantiation: Summary

This proposal is submitted to accomplish four things:

1.) Change the code to not allow the dangerous practice of using air ducts as a cable pathway.

2.) Code recognition that there may be instances where a small amount of in-duct cable is necessary for air handling equipment, dampers, security, temperature control, fire protection, etc.

3.) Establish minimum requirements for flame spread, smoke, and potential heat for in-duct (CL2D, CL3D, FPLP, OFND, OFCD, CMD and CATVD) cables used in this special hazard space.

4.) Include air duct “D” cables as permissible substitute for plenum “P” cables for installation in ceiling cavity and raised floor plenums (other space used for environmental air).

This proposal correlates with a TIA that I submitted for NFPA 90A-2002, *Standard for the Installation of Air-Conditioning and Ventilating Systems.* Similar proposals have been submitted for Articles 725, 760, 770, 800 and 820.

The substantiation for the TIA is shown below:

“This TIA is being submitted in accordance with Section 5 of the *2005 NFPA REGULATIONS GOVERNING COMMITTEE PROJECTS.* In particular, it addresses a hazard meeting the criteria of section 5-2(d), which states:

(d) The proposed TIA intends to offer to the public a benefit that would lessen a recognized (known) hazard or ameliorate a continuing dangerous condition or situation.

The purpose of this TIA is to address the dangerous practice of installing combustible communications/data cables in air ducts.

NFPA 90A-2002 does not have explicit requirements for electrical wiring in air ducts. While there is a need for some limited amount of wiring in air ducts where the function of the wiring is associated with the function of the air handling system, use of air duct instead of an electrical raceway for routing wiring unassociated with the air handling system is a dangerous practice. It introduces unlimited quantities of combustible cable into an air handling system and thus unacceptability increases the potential for the spread of fire and smoke through the air distribution system.

This TIA would greatly reduce the amount of wiring in air ducts by only permitting wiring and raceways associated with the air distribution system and also requiring that they be as short as practicable. It would require that the wiring and nonmetallic raceway in the ducts have the appropriate temperature rating for hot air ducts; NFPA 90A permits the supplied air to be at 121^{o} C (250^{o} F). The permitted wiring and nonmetallic raceway would be required to have initial flame spread and smoke requirements identical to those for supplementary materials in an air duct (flame spread index =25, smoke developed index =50). In addition to these initial requirements, there are slitting and aging requirements to assure that the cables installed in air ducts meet the flame spread, smoke and potential heat requirements equivalent to those for limited combustible materials. Essentially they would be required to be listed to the UL 2424.

Combustible plenum cable is unsuitable and dangerous for this application. Typically, combustible plenum cable has a temperature rating of 60 ^{o}C, which is significantly less that the 121^{o} C air permitted in the air duct. Furthermore, according to Fire Protection Research Foundation tests, these cables can have smoke developed index (SDI) of up to 850. This SDI is an order of magnitude greater than permitted for supplementary materials installed in an air duct.

It is essential that these requirements be adopted now in NFPA 90A.”

Section 800.154(A) in the 2005 NEC permits unlimited amounts of Type CMP cable in air ducts. While there is a need for some limited amount of wiring in air ducts where the function of the wiring is associated with the function of the air handling system, use of an air duct instead of an electrical raceway for routing wiring unassociated with the air handling system is a dangerous practice. It introduces unlimited quantities of combustible cables into an air handling system and thus unacceptability increases the potential for the spread of fire and smoke through the air distribution system.

This proposal would greatly reduce the amount of wiring in air ducts by only permitting wiring associated with the air duct and as short as practicable. It would require that the wiring in the ducts have the appropriate temperature rating for hot air ducts; NFPA 90A-2002, *Standard for the Installation of Air-Conditioning and Ventilating Systems,* permits the supplied air to be at 121^{o} C (250^{o} F). The permitted wiring would be required to have flame spread and smoke requirements identical to those in NFPA 90A-2002 section 4.3.3.1 for supplementary materials in an air duct (flame spread index =25, smoke developed index =50). Essentially they would be required to be listed to the UL 2424, *Outline of Investigation For Cable Marked Limited Combustible* (copy attached) .

“P” type plenum cables are unsuitable and dangerous for this application. Typically, they have a temperature rating of 60^{o} C, which is significantly less that the 121^{o} C air permitted in the air duct. Furthermore, according to Fire Protection Research Foundation tests (copy attached), these cables can have smoke developed index (SDI) of up to 850. This SDI is an order of magnitude greater than permitted for supplementary materials installed in an air duct.

"D" type air duct cables will meet the NFPA 90A listing requirements for use in ceiling cavity and raised floor plenums (other space used for environmental air) and therefore will be able to safely substitute for "P" type plenum cables. "D" type air duct cables have approximately 1/20 the smoke production of "P" type plenum cables.

In order to be consistent with the applications of plenum cable, this proposal will also prohibit the installation of plenum communications raceways in air ducts.

The cable substitution table and figure have been revised to permit air duct cables to substitute for plenum cables since air duct cables are superior cables. "D" type air duct cables also meet the requirements in NFPA 90A for use in ceiling cavity plenums and raised floor plenums (other space used for environmental air).

Some of the applications that require the installation of cables in air ducts are fire alarm (Article 760), temperature sensing and control (Article 725), security (Articles 725 and 820) and communications (Article 800). Optical fiber cables (Article 770) could be used in place of copper conductor cables. Communications cables are permitted to substitute for Class 2 & 3, fire alarm and CATV cables. I am submitting similar proposals for each of these articles.

Panel Meeting Action: Reject

Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

16-192 Log #12 NEC-P16 **Final Action: Reject**
(800.154(A))

Submitter: Stanley Kaufman, Cable Safe Inc.

Recommendation: Revise as follows:

(A) Plenum. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CMP. ~~Abandoned cables shall not be permitted to remain.~~ Types CMP, CMR, CMG, CM, and CMX and communications wire installed in compliance with 300.22 shall be permitted. Listed plenum communications raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only Type CMP cable shall be permitted to be installed in <u>these</u> raceways.

Substantiation: Section 800.3(C) requires that "The accessible portion of abandoned communications cables shall not be permitted to remain.." The requirement in to remove all abandoned cables in 800.154(A) is an error from the 1999 NEC that the panel tried to correct in the last code cycle. The word "these" was added to the last sentence for editorial clarity.

800.154 Applications of Listed Communications Wires and Cables and Communications Raceways.
Communications wires and cables shall comply with the requirements of 800.154(A) through 800.154(F) or where cable substitutions are made in accordance with 800.154(G)
(A) Plenum. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CMP. Abandoned cables shall not be permitted to remain. Types CMP, CMR, CMG, CM, and CMX and communications wire installed in compliance with 300.22 shall be permitted. Listed plenum communications raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only Type CMP cable shall be permitted to be installed in raceways.
~~FPN: See 8.14.1 of NFPA 13 (2002), Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.~~
Substantiation: This is one of three references to NFPA 13 (it is repeated identically in articles 770, 800 and 820) included in the code that is a meaningless reference. Other references to NFPA 13, in Article 362, are properly included in mandatory sections of the code (section 362.10). Whenever a jurisdiction adopts NFPA 13 they need to adopt it for mandatory sections and not for an unenforceable FPN in one section, which is intended to mislead the user. In fact, there have been several documented examples already of misrepresentation in that authorities having jurisdiction have been told that this means that sprinklers are required in plenum areas unless "limited combustible cable" is installed. I have been personally involved in two cases to date, and have heard of many more cases where this is being stated.
Section 8.14.1 of NFPA 13 (2002) reads as follows:
8.14.1 Concealed Spaces.
8.14.1.1 Concealed Spaces Requiring Sprinkler Protection. All concealed spaces enclosed wholly or partly by exposed combustible construction shall be protected by sprinklers except in concealed spaces where sprinklers are not required to be installed by 8.14.1.2.1 through 8.14.1.2.15.
8.14.1.2 Concealed Spaces Not Requiring Sprinkler Protection.*
8.14.1.2.1 Noncombustible and limited combustible concealed spaces with no combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.
8.14.1.2.2 Noncombustible and limited combustible concealed spaces with limited access and not permitting occupancy or storage of combustibles shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.
8.14.1.2.3 Concealed spaces formed by studs or joists with less than 6 in. (152 mm) between the inside or near edges of the studs or joists shall not require sprinkler protection. (See Figure 8.6.4.1.5.1.)
8.14.1.2.4 Concealed spaces formed by bar joists with less than 6 in. (152 mm) between the roof or floor deck and ceiling shall not require sprinkler protection.
8.14.1.2.5 Concealed spaces formed by ceilings attached directly to or within 6 in. (152 mm) of wood joist construction shall not require sprinkler protection.
8.14.1.2.6 Concealed spaces formed by ceilings attached to composite wood joist construction either directly or onto metal channels not exceeding 1 in. in depth, provided the joist channels are firestopped into volumes each not exceeding 160 ft3 (4.53 m3) using materials equivalent to the web construction and at least 3½ in. of batt insulation is installed at the bottom of the joist channels when the ceiling is attached utilizing metal channels, shall not require sprinkler protection.*
8.14.1.2.7 Concealed spaces entirely filled with noncombustible insulation shall not require sprinkler protection.
8.14.1.2.8 Concealed spaces within wood joist construction and composite wood joist construction having noncombustible insulation filling the space from the ceiling up to the bottom edge of the joist of the roof or floor deck, provided that in composite wood joist construction the joist channels are firestopped into volumes each not exceeding 160 ft3 (4.53 m3) to the full depth of the joist with material equivalent to the web construction, shall not require sprinkler protection.
8.14.1.2.9 Concealed spaces over isolated small rooms not exceeding 55 ft2 (4.6 m2) in area shall not require sprinkler protection.
8.14.1.2.10 Concealed spaces where rigid materials are used and the exposed surfaces have a flame spread rating of 25 or less and the materials have been demonstrated not to propagate fire in the form in which they are installed shall not require sprinkler protection.
8.14.1.2.11 Concealed spaces in which the exposed materials are constructed entirely of fire-retardant treated wood as defined by NFPA 703, Standard for Fire Retardant Impregnated Wood and Fire Retardant Coatings for Building Materials, shall not require sprinkler protection.
8.14.1.2.12 Noncombustible concealed spaces having exposed combustible insulation where the heat content of the facing and substrate of the insulation material does not exceed 1000 Btu/ft2 (11,356 kJ/m2) shall not require sprinkler protection.
8.14.1.2.13 Concealed spaces below insulation that is laid directly on top of or within the ceiling joists in an otherwise sprinklered attic shall not require sprinkler protection.
8.14.1.2.14 Vertical pipe chases under 10 ft2 (0.93 m2), where provided that in multifloor buildings the chases are fire stopped at each floor using materials equivalent to the floor construction, and where such pipe chases shall contain no sources of ignition, piping shall be noncombustible, and pipe penetrations at each floor shall be properly sealed and shall not require sprinkler protection.
8.14.1.2.15 Exterior columns under 10 ft2 in area formed by studs or wood joist, supporting exterior canopies that are fully protected with a sprinkler system, shall not require sprinkler protection.
8.14.1.3 Concealed Space Design Requirements. Sprinklers in concealed spaces having no access for storage or other use shall be installed in accordance with the requirements for light hazard occupancy.
8.14.1.4 Heat Producing Devices with Composite Wood Joist Construction. Where heat-producing devices such as furnaces or process equipment are located in the joist channels above a ceiling attached directly to the underside of composite wood joist construction that would not otherwise require sprinkler protection of the spaces, the joist channel containing the heat-producing devices shall be sprinklered by installing sprinklers in each joist channel, on each side, adjacent to the heat-producing device.
8.14.1.5 Localized Protection of Exposed Combustible Construction or Exposed Combustibles. In concealed spaces having exposed combustible construction, or containing exposed combustibles, in localized areas, the combustibles shall be protected as follows:
(1) If the exposed combustibles are in the vertical partitions or walls around all or a portion of the enclosure, a single row of sprinklers spaced not over 12 ft (3.7 m) apart nor more than 6 ft (1.8 m) from the inside of the partition shall be permitted to protect the surface. The first and last sprinklers in such a row shall not be over 5 ft (1.5 m) from the ends of the partitions.
(2) If the exposed combustibles are in the horizontal plane, the area of the combustibles shall be permitted to be protected with sprinklers on a light hazard spacing. Additional sprinklers shall be installed no more than 6 ft (1.8 m) outside the outline of the area and not more than 12 ft (3.7 m) on center along the outline. When the outline returns to a wall or other obstruction, the last sprinkler shall not be more than 6 ft (1.8 m) from the wall or obstruction.
8.14.1.6 Sprinklers used in horizontal combustible concealed spaces (with a slope not exceeding 2 in 12) having a combustible upper surface where the assembly or supporting members channel heat and where the depth of the space is less than 36 in. from deck to deck or with double wood joist construction with a maximum of 36 in. between the top of the bottom joist and the bottom of the upper joist shall be listed for such use.*
Moreover, the NFPA13 ROP indicates the following change:
8.14.1.1 Concealed Spaces Requiring Sprinkler Protection. All concealed spaces enclosed wholly or partly by exposed combustible construction shall be protected by sprinklers except in concealed spaces where sprinklers are not required to be installed by 8.14.1.2.1 through 8.14.1.2.15 and 8.14.6.
8.14.1.2.1 Concealed spaces of noncombustible and limited combustible construction with minimal combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum. (For additional information on combustible loading See 8.14.1.2.1)*
8.14.1.2.2 Conceal d spaces of noncombustible and limited combustible construction with limited access and not permitting occupancy or storage of combustibles shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.
A.8.14.1.2.1 Some minor quantities of combustible materials, such as communication wiring, can be present in some concealed spaces but should not typically be viewed as requiring sprinklers (see 8.14.1.1). The threshold value at which sprinklers become necessary in the concealed space is not defined. For example, the usual amounts of data or telephone wiring found above a ceiling would not typically constitute a threat. If bundles of unsheathed computer wiring are installed above the ceiling or beneath the floor in a manner where fire propagation in all directions is likely, then the concealed space should be treated the same as a combustible space, thereby requiring appropriate sprinkler protection.
This FPN is being misinterpreted by authorities having jurisdiction to indicate that these concealed spaces require sprinkler protection. Moreover, I have come across at least two cases (one in Massachusetts and one in California), where the authority having jurisdiction was informed by a vendor that the only cabling alternative to using sprinklers was the installation of "limited combustible cable". In fact, in one case I have worked on, the concealed space was an 8 inch high underfloor space of totally non combustible construction, which had no ducts or other parts of an air distribution system, and yet the code official had been led to the belief that cables could only be used if the space was sprinklered or the cable was "limited combustible cable".
Examples of misinformation exist and some are attached for committee members' use.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:
"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo

in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

16-197 Log #3097 NEC-P16 **Final Action: Reject**
(800.154(A))

Submitter: Donald Hall, Corning Cable Systems

Recommendation: This is a companion proposal to two similiar proposals addressing the same NFPA 13 reference in Articles 770 and 820.

Delete FPN text as follows:

~~FPN: See 8.14.1 of NFPA 13 (2002), Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.~~

Substantiation: The reference to 8.14.1 of NFPA 13 is misleading and should be removed for the following reasons:

(1) The reference is related to sprinkler protection of combustible concealed spaces and their stored content. The use of a concealed space as a pathway for cables and raceway in a manner permitted by the NEC does not constitute a storage condition.

(2) The Technical Committee for NFPA 13 has never provided any <u>useful</u> guidance to indicate what quantity of cable/raceway or other circumstance might trigger requirement for communications cables to be protected by sprinklers. The Technical Committee for NFPA 13 proposed a new annex for addition to the next revision of NFPA 13 (shown below). The proposed annex is non binding, contains vague terminology, and does not add any new clarifying information, because it is identical to the existing language of the NFPA 13 Handbook. For normal circumstances in which cables and raceway are installed in accordance with the NEC and are listed by a Nationally Recognized Test Laboratory <u>"as suitable for use in ducts, plenums, and other spaces used for environmental air and as having adequate fire resistant and low smoke producing characteristics"</u> it is understood that these cables and raceways are safe and do not require additional protection from sprinklers.

(3) The cited portion of NFPA 13 is broadly applicable to all concealed spaces, not just those which handle environmental air. The selective placement of this FPN within three sections of the NEC all pertaining to plenum spaces, creates a perceived encumbrance to the permitted use of plenum cables and plenum cables alone. This perceived encumbrance is being aggressively exploited through the marketing efforts of multiple commercial interests to create a new market for their products.

NFPA 13 ROP indicates the following proposed change:

A.8.14.1.2.1 Some minor quantities of combustible materials, such as communication wiring, can be present in some concealed spaces but should not typically be viewed as requiring sprinklers (see 8.14.1.1). The threshold value at which sprinklers become necessary in the concealed space is not defined. For example, the usual amounts of data or telephone wiring found above a ceiling would not typically constitute a threat. If bundles of unsheathed computer wiring are installed above the ceiling or beneath the floor in a manner where fire propagation in all directions is likely, then the concealed space should be treated the same as a combustible space, thereby requiring appropriate sprinkler protection.

OHDE, H.: See my Explanation of Negative on Proposal 16-189.

16-198 Log #3241 NEC-P16 **Final Action: Reject**
(800.154(A))

Submitter: Frank Peri, Communications Design Corporation

Recommendation: Revise 800.154(A), as shown.

(A) Plenum. Cables installed in ducts, plenums, and other spaces used for environmental air shall be <u>Type CMD or</u> Type CMP. Abandoned cables shall not be permitted to remain. Types <u>CMD,</u> CMP, CMR, CMG, CM, and CMX and communications wire installed in compliance with 300.22 shall be permitted. Listed plenum communications raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only Type <u>s CMD, or</u> CMP cable shall be permitted to be installed in raceways.

FPN: See 8.14.1 of NFPA 13-2002, Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.

Substantiation: The purpose of this proposal is to correlate with NFPA 5000-2006. NFPA 5000-2006, recently issued by the NFPA Standards Council, incorporates extracted plenum requirements from NFPA 90A-2002. Consequently, the plenum requirements in NFPA 5000-2006 are identical to the ceiling cavity plenum requirements in NFPA 90A-2002. This proposal provides listing requirements for a cable with characteristics that complies with the NFPA 90A-2002, 4.3.10.2.6: requirements for limited combustible materials exposed to the airflow. This proposal provides a listing and marking for a cable that complies with the NFPA 90A-2002, 4.3.10.2.6.1: a requirement for a listed limited combustible cable with a maximum smoke developed index of 50. The proposed cable meets the NFPA Standards Council's directive to not identify cable as "limited combustible," because it is not a building construction material. The cable name and listing requirements meets guidance from the NFPA Standards Council to identify cable characteristics in terms of flame spread index, smoke developed index, and potential heat release.

As compared to a combustible plenum cable that is listed using NFPA 262, air duct cable is a much "safer" cable. Air duct cable provides users with an opportunity to significantly reduce the potential hazard from smoke during a fire emergency. Additionally, the much lower potential heat release of air duct cable provides much lower combustible loading than found in combustible plenum cable listed using NFPA 262.

Air duct cables are available on the market today. Presently, there is air duct cable available to meet the plenum installation requirements in Articles 725, 760, 770, and 800. Unfortunately, the only marking available in the NEC is for a combustible plenum cable. The NEC decides what marking is permitted, and listing organizations correlate. That is, it would be inappropriate for a listing organization to mark cable with a "Type XXX" that is not published in the NEC.

Panel Meeting Action: Reject

Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-199 Log #2812 NEC-P16 **Final Action: Accept in Part**
(800.154(A) and (B))

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal and that further consideration be given to the comments expressed in the voting. This action will be considered by the Panel as a Public Comment.

Submitter: Harold C. Ohde, IBEW #134

Recommendation: Delete the wording "Abandoned cables shall not be permitted to remain." in the following areas:

800.154 Applications of Listed Communications Wires and Cables and Communications Raceways. No change.

(A) Plenum. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CMP. ~~Abandoned cables shall not be permitted to remain.~~

Types CMP, CMR, CMG, CM and CMX and communications wire installed in compliance with 300.22 shall be permitted. Listed plenum communications raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and on other spaces used for environmental air as described in 300.22(C). Only Type CMP cable shall be permitted to be installed in raceways.

(B) Riser. Cables installed in risers shall comply with 800.154(B)(1), (B)(2), or (B)(3).

(1) Cables in Vertical Runs. Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type CMR Floor penetrations requiring Type CMR shall contain only cables suitable for riser or plenum use. ~~Abandoned cables shall not be permitted to remain.~~ Listed riser communications raceways shall be permitted to be installed in vertical riser runs in a shaft from floor to floor. Only Type CMR and CMP cables shall be permitted to be installed in these raceways.

(2) No change.

(3) No change.

Substantiation: I have submitted a proposal that would move the abandoned communications cables requirements to a more appropriate and central section within Article 800. The abandoned communications cables requirements belong in 800.24 - Mechanical Execution of Work. 800.24 is located within Part I, General which would apply to the entire Article 800.

Panel Meeting Action: Accept in Part

The panel accepts the submitter's deletion of subsection (B).

The panel rejects the submitter's revision of subsection (A).

Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

See panel action on Proposal 16-143.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

BRUNSSEN, J.: Under "Panel Meeting Action:", revise the first sentence as follows: "The panel accepts the submitter's deletion of <u>the sentence 'Abandoned cables shall not be permitted to remain.' in</u> subsection (B)." It was this sentence that was deleted, not the entire subsection (B).

DORNA, G.: The panel statement contains an error. The panel accepted the deletion in subsection (B), not of subsection (B).

KAHN, S.: The panel statement requires correction as the panel accepted the submitter's deletion in subsection (B), not the deletion of subsection (B).

16-200 Log #2818 NEC-P16 **Final Action: Reject**
(800.154(A), FPN)

Submitter: Ronald E. Hackett, Village of Buffalo Grove

Recommendation: Delete the FPN text that follows 800.154(A).

~~FPN: See 8.14.1 of NFPA 13 (2002). Installation of Sprinkler Systems for requirements for sprinklers in concealed spaces containing exposed combustibles.~~

Substantiation: As chief electrical inspector of Buffalo Grove, I do not see any reason or any technical support as why this FPN referencing 8.14.1 of NFPA 13 (2002), Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles was added to the 2005 NEC. This FPN is very misleading and inappropriate as well. MY own personal experience as the AHJ has found that this FPN being a negative effect on the National Electrical Code which is used as an installation documentation to be in conflict with the NFPA 13.

NFPA 13 Technical Committee added new Annex A8.14.1.2.1 in the 2006 ROP #13-284, Log# 551 which should provide guidance to both the installer and AHJ for cabling in concealed spaces.

Panel Meeting Action: Reject

Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

JENSEN, R.: We believe that the interpretation of whether being allowed to address this proposal in view of the NFPA Standard Council Long Decision 05-24 (SC #05-7-4) was misunderstood.

The proposal to delete this FPN is not involved with NFPA 90A and should be deleted for the reasons given in the submitter's substantiation. To further acceptance of removing this FPN, refer to several comments within the 2006 NFPA 13 ROC and in particular to 13-389a

OHDE, H.: See my Explanation of Negative on Proposal 16-189.

16-201 Log #13 NEC-P16 **Final Action: Accept**
(800.154(B)(1))

Submitter: Stanley Kaufman, Cable Safe Inc.

Recommendation: Revise to read as follows:

(1) Cables in Vertical Runs. Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type CMR. Floor penetrations requiring Type CMR shall contain only cables suitable for riser or plenum use. ~~Abandoned cables shall not be permitted to remain~~ . Listed riser communications raceways <u>and listed plenum communications raceways</u> shall be permitted to be installed in vertical riser runs in a shaft from floor to floor. Only Type CMR and CMP cables shall be permitted to be installed in these raceways.

Substantiation: Plenum raceways should be permitted to substitute for riser and general purpose raceways just as plenum cable is permitted to substitute for riser and general purpose cables.

Section 800.3(C) requires that "The accessible portion of abandoned communications cables shall not be permitted to remain.." The requirement in to remove all abandoned cables in 800.154(B) is an error from the 1999 NEC that the panel tried to correct in the last code cycle. The word "these" was added to the last sentence for editorial clarity.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-202 Log #742 NEC-P16 **Final Action: Accept**
(800.154(B)(1))

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.

Recommendation: Delete the sentence as shown:

(1) Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type CMR. Floor penetrations requiring Type CMR shall contain only cables suitable for riser or plenum use. ~~Abandoned cables shall not be permitted to remain.~~ Listed riser communications raceways shall be permitted to be installed in vertical riser runs in a shaft from floor to floor. Only Type CMR and CMP cables shall be permitted to be installed in these raceways.

Substantiation: This proposal is editorial. (Task Group No. 800-22)
The requirement is in Section 800.3(C) which states that "The accessible portion of abandoned communications cables shall be removed." The removal of all abandoned cables in 800.154(B)(1) is an error from the 1999 NEC that the panel tried unsuccessfully to correct in the last code cycle
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.
Panel Meeting Action: Accept
Panel Statement: See panel action on Proposal 16-201.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-203 Log #14 NEC-P16 **Final Action: Accept**
(800.154(D)(1))

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal and that further consideration be given to the comments expressed in the affirmative comments on voting. This action will be considered by the Panel as a Public Comment.
Submitter: Stanley Kaufman, Cable Safe Inc.
Recommendation: Revise as follows:
(1) General. Cables shall be Type CMG or Type CM. Listed communications general-purpose raceways , listed riser communications raceways and listed plenum communications raceways shall be permitted. Only Types CMG, CM, CMR, or CMP cables shall be permitted to be installed in these ~~general-purpose~~ communications raceways.
Substantiation: Plenum and riser raceways should be permitted to substitute for general purpose raceways just as plenum and riser cables are permitted to substitute for general purpose cables.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
OHDE, H.: This proposal should have been rejected by the panel as there is no 800.154(D)(1) in the 2005 NEC.
Comment on Affirmative:
BRUNSSEN, J.: The secion number as indicated on this proposal, 800.15(D)(1), is incorrect. The correct section number is 800.154.(E)(1).

16-204 Log #15 NEC-P16 **Final Action: Accept in Principle**
(800.154(E) and 800.154(E)(1))

TCC Action: The Technical Correlating Committee assumes that this proposal is directed to Article 770.
Submitter: Stanley Kaufman, Cable Safe Inc.
Recommendation: Revise as follows:
(E) Other Wiring Within Buildings. Cables installed in building locations other than the locations covered in 770.154(A) and 770.154(B) shall be Type OFNG, OFN, OFCG, or OFC. Such cables shall be permitted to be installed in listed general-purpose optical fiber raceways, listed riser optical fiber raceways and plenum optical fiber raceways .
(1) General. Cables shall be Type CMG or Type CM. Listed communications general-purpose raceways , listed riser communications raceways and plenum communications raceways shall be permitted. Only Types CMG, CM, CMR, or CMP cables shall be permitted to be installed in these ~~general-purpose~~ communications raceways.
Substantiation: Plenum and riser raceways should be permitted to substitute for general purpose raceways just as plenum and riser cables are permitted to substitute for general purpose cables.
Panel Meeting Action: Accept in Principle
Revise as follows:
(E) Other Wiring Within Buildings. Cables installed in building locations other than the locations covered in 770.154(A) and 770.154(B) shall be Type OFNG, OFN, OFCG, or OFC. Such cables shall be permitted to be installed in listed general-purpose optical fiber raceways, listed riser optical fiber raceways, and listed plenum optical fiber raceways .
(1) General. Cables shall be Type CMG or Type CM. Listed communications general-purpose raceways , listed riser communications raceways, and listed plenum communications raceways shall be permitted. Only Types CMG, CM, CMR, or CMP cables shall be permitted to be installed in these ~~general-purpose~~ communications raceways.
Panel Statement: The addition clarifies the submitter's intent.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
OHDE, H.: This proposal should be rejected as this new code language could be confusing to code-users. The revised language allows all of the cables listed to be used in riser and plenum optical fiber raceways. As long as it is clear that these riser and plenum raceways are not being used in riser and plenum applications, the use of those cables in those raceways in not a problem. However, why would anyone want to use the more expensive raceways in " other wiring within buildings" locations? This language is also in conflict with 800.154(A) which states "Only Type CMP cables shall be permitted to be installed in these raceways" and with 800.154(B)(1) which requires either plenum or riser cables to be installed in riser communications raceways.

16-205 Log #3242 NEC-P16 **Final Action: Reject**
(800.154(G))

Submitter: Frank Peri, Communications Design Corporation
Recommendation: Revise text to read:
(G) Cable Substitutions. The uses and permitted substitutions for communications cables listed in Table 800.154 shall be considered suitable for the purpose and shall be permitted. Type CMD shall be permitted to substitute for all cables in Table 800.154 and Figure 800.154.
FPN: For information on Types CMD, CMP, CMR, CMG, CM, and CMX cables, see 800.179.
Substantiation: This proposal correlates the substitution table and figure with the listing and application requirements for air duct cable.
Panel Meeting Action: Reject
Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:
"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."
This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-206 Log #2531 NEC-P16 **Final Action: Reject**
(800.154(G) and FPN to 800.154(G) (New))

Submitter: Sanford Egesdal, Egesdal Associates PLC
Recommendation: Revise 800.154(G) as shown:
(G) Cable Substitutions. The uses and permitted substitutions for communications cables listed in Table 800.154 shall be considered suitable for the purpose and shall be permitted. Type CM50 very-low-smoke cable shall be permitted to substitute for all cables in Table 800.154(G) to meet requirements for very-low-smoke producing characteristics, low potential heat release, and low flame spread characteristics.
FPN No. 1 : For information on Types CMP, CMR, CMG, CM, and CMX cables see 800.179.
FPN No. 2: See 8.14.1 of NFPA 13-2002, *Installation of Sprinkler Systems* , for requirements for sprinklers in concealed spaces containing exposed combustibles.
Substantiation: This proposal correlates with the proposal to add Type CM50 to 800.154.
There is a companion proposal for the listing and marking of Type CM50.
Panel Meeting Action: Reject
Panel Statement: Thepanel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:
"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."
This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
OHDE, H.: We agree with panel action and believe that the panel statement should also reflect the latest NFPA 13 Technical Committee actions. Included in the submitter's substantiation was the 2002 Section 8.14 which since has been revised. We would like to add that NFPA 13 just completed their balloting process for the 2006 NFPA 13 Standard. The Technical Committee on Sprinkler Installation submitted a comment on Proposal 13-284.
This comment reworded proposed A.8.14.1.2.1 to read " *Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc…can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1) For example, it is not the intent of this*

section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined ."

In the NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

16-207 Log #2655 NEC-P16 **Final Action: Accept in Principle in Part (800.156)**

Submitter: Robert W. Jensen, dbi / Rep. BICSI, A Telecommunications Association

Recommendation: Add new text to read:

800.156 Dwelling Unit Communications Outlets. For new construction, a minimum of two communications outlet shall be installed; one within the master bedroom and one within the living room or kitchen, and cabled to the service provider demarcation point.

Substantiation: Currently there is no requirement for a communications outlet in a dwelling unit. A communications outlet in the home is needed for many reasons, but most important is for emergency services such as a simple call for police, fire or rescue squad.

This proposal only affects newly constructed dwelling units. In addition to the problem it solves for communications needs in a dwelling, the proposal is also targeted at safety of technicians and emergency responding personnel while enhancing the 5 key NFPA strategies to reduce fatal home fires.

1. Reduces the safety risk of electrocution to technicians where extended length drill bits (54 to 72 inches) are typically used to install cables and penetrate unseen electrical cables in the attic, wall and ceiling space. (See pictures at end of this proposal)
2. Reduces the tripping hazard for fire protection personnel during a fire.
3. Reduces the need for home wiring for communications after occupancy which typically involves tracing, handling, and snaking through electrical cable pathways and spaces such as in attics and wall cavities which creates potentially greater hazard (e.g., electrocution).
4. Increases the use of home protection systems and automation which typically includes fire detection and direct dial-up remote monitoring systems.
5. This proposal ties directly to one of the 5 key NFPA strategies to reduce fatal home fires (see attached "Fire Loss in the United States During 2002", Michael J Karter, Jr., Fire Analysis and Research Division, NFPA).
6. Places communications outlets in homes to address fire safety needs of young high user communications groups, older adults, and ADA affected.
7. A fine print note is used as a reference to a standard that specifies installation requirements such as minimum separation from power cabling and minimum requirements for cabling in support of the FCC mandate for category 3 cable or better. In addition, this standard references several NEC Articles for meeting minimum requirements.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle in Part

Add new text to 800.156 to read as follows:

800.156 Dwelling Unit Communications Outlet. For new construction, a minimum of one communications outlet shall be installed within the dwelling and cabled to the service provider demarcation point.

Panel Statement: The requirement for at least one outlet within the dwelling meets the submitter's intent.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-208 Log #2297 NEC-P16 **Final Action: Accept (800.170, FPN)**

Submitter: Thomas J. Burke, Jr., Underwriters Laboratories

Recommendation: Revise text to read as follows:

800.170 Equipment. Communications equipment shall be listed as being suitable for electrical connection to a telecommunications network.

FPN: One way to determine applicable requirements is to refer to UL ~~1950 1993~~ 60950-1-2003 , *Standard for Safety of Information Technology Equipment* , ~~*Including Electrical Business Equipment,*~~ ~~third edition~~ ; UL 1459-1995, *Standard for Safety, Telephone Equipment,* ~~third edition;~~ or UL 1863- ~~1995~~ 2004 , *Standard for Safety, Communications Circuit Accessories* , ~~second edition~~ . For information on listing requirements for communications raceways, see UL 2024 ~~1995~~ 2004 , *Standard for Optical Fiber and Communication Cable Raceways.*

Substantiation: UL 60950-1 has replaced UL 1950 for safety of information technology equipment (ITE). The title of the Standard also has been revised. UL 1863 and UL2024 also have later editions than currently indicated.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-209 Log #1880 NEC-P16 **Final Action: Accept (800.179)**

Submitter: Jeffrey Boksiner, Telcordia Technologies, Inc. / Rep. Alliance for Telecommunications Industry Solutions

Recommendation: Revise first paragraph of 800.179 **Communications Wires and Cables** , as follows:

800.179 Communications Wires and Cables. Communications wires and cables shall have a voltage rating of not less than 300 volts and shall be listed in accordance with 800.179(A) through 800.179(J). The insulation for the individual conductors shall be rated for 300 volts minimum. Conductors in communications cables, other than in a coaxial cable, shall be copper.

Substantiation: This proposal clarifies the requirement and establishes consistent wording with 830.179(A)(1) and 830.179(A)(2). The wording in 830 is more explicit and clear. The required rating has to coordinate with the requirement for provision of a listed primary protector in 800.90. Section 800.90 requires a primary protector if the circuit is exposed to accidental contact with electric light or power conductors operating at over 300 volts to ground. This means that the insulation rating of individual conductors is the relevant parameter in this section.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-210 Log #3285 NEC-P16 **Final Action: Reject (800.179)**

Submitter: Sanford Egesdal, Egesdal Associates PLC

Recommendation: Revise 800.179 and reformat as shown.

Communications wires and cables shall have a voltage rating of not less than 300 volts , a conductor insulation rating of not less than 60ºC, and shall be listed in accordance with 800.179(A) through 800.179(J). Conductors in communications cables, other than in a coaxial cable, shall be copper. Communications cables shall be marked with the temperature rating of the insulation immediately following the Type designation.

FPN No. 1 : See 800.170 for listing requirement for equipment.

FPN No. 2: For more information, see 310.10 Temperature Limitation of Conductors.

FPN No. 3: Building codes may have a cable insulation temperature requirement as high as 200ºC.

FPN No. 4: An example of the marking is CMP 200ºC indicating a plenum cable rated at 200ºC.

Substantiation: Presently, this article does not have a temperature rating requirement on conductor insulation.

Communications cables on the market today are typically listed with a 60ºC temperature rating on the conductors. Some building codes require a temperature rating as high as 200ºC.

Communications cables are permitted to substitute for fire alarm cables so need to be permitted to have the same rating requirements as power-limited fire alarm cables.

UL 444 Communications Cables standard provides for testing and marking the conductor insulation rating: 60ºC to 250ºC.

By referencing to 310.10, users will be aware that a cable with a temperature rating higher than 60ºC is required to meet a high temperature application. For information 310.10 follows:

310.10 Temperature Limitation of Conductors.

No conductor shall be used in such a manner that its operating temperature exceeds that designated for the type of insulated conductor involved. In no case shall conductors be associated together in such a way, with respect to type of circuit, the wiring method employed, or the number of conductors, that the limiting temperature of any conductor is exceeded.

FPN No. 1: The temperature rating of a conductor (see Table 310.13 and Table 310.61) is the maximum temperature, at any location along its length, that the conductor can withstand over a prolonged time period without serious degradation. The allowable ampacity tables, the ampacity tables of Article 310 and the ampacity tables of Annex B, the correction factors at the bottom of these tables, and the notes to the tables provide guidance for coordinating conductor sizes, types, allowable ampacities, ampacities, ambient temperatures, and number of associated conductors.

The principal determinants of operating temperature are as follows:

(1) Ambient temperature — ambient temperature may vary along the conductor length as well as from time to time.

(2) Heat generated internally in the conductor as the result of load current flow, including fundamental and harmonic currents.

(3) The rate at which generated heat dissipates into the ambient medium. Thermal insulation that covers or surrounds conductors affects the rate of heat dissipation.

(4) Adjacent load-carrying conductors — adjacent conductors have the dual effect of raising the ambient temperature and impeding heat dissipation.

FPN No. 2: Conductors installed in conduit exposed to direct sunlight in close proximity to rooftops have been shown, under certain conditions, to experience a temperature rise of 17°C (30°F) above ambient temperature on which the ampacity is based.

Panel Meeting Action: Reject

Panel Statement: Manufacturers have the option to mark cables that meet a higher standard.

The panel sees no reason to make this change, since the existing requirement, which has been in existance for a long time is well established.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-211 Log #744 NEC-P16 **Final Action: Accept**
(800.179(A))

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Change cable to cables as shown:
(A) Type CMP. Type CMP communications plenum cable s shall be listed as being suitable for use in ducts, plenums, and other spaces used for environmental air and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.
FPN: One method of defining a cable that is low smoke-producing cable and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262-2002, *Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces* .
Substantiation: This is a editorial proposal. (Task Group No. 800-24)
Section 3.3.3 of the NEC Style Manual states "references to electrical components and parts shall be plural rather than singular".
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.

Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-218 Log #2384 NEC-P16 **Final Action: Reject**
(800.179(E))

Submitter: Allen C. Weidman, The Society of the Plastics Industry, Inc.
Recommendation: Revise as follows:
(E) Type CMX. Until January 1, 2011, Type CMX limited-use communications cable shall be permitted to be listed as being suitable for use

in dwellings and for use in raceway and shall also be listed as being resistant to flame spread.

FPN: One method of determining that cable is resistant to flame spread is by testing the cable to the VW-1 (vertical-wire) flame test in ANSI/UL 1581-1991, *Reference Standard for Electrical Wires, Cables and Flexible Cords.*

Substantiation: The Society of the Plastics Industry, Inc. (SPI) has a long history of supporting enhanced fire safety through our participation in codes and standards development. Type CMX cable is at the bottom of the cable fire resistance hierarchy. It has very limited use in the NEC. Elimination of CMX will simplify cable selection and reduce the potential for misuse of this minimally fire-resistant cable. Cable technology has moved beyond this cable; it's an anachronism. This proposal, if accepted, gives manufacturers, distributors and installers plenty of time to comply. If this proposal is accepted, Type CM cable will be the minimum acceptable cable from a fire resistance viewpoint.

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided sufficient technical substantiation.

(800.179(G))

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.

Recommendation: Delete the following:

~~**(G) Multipurpose (MP) Cables.** Until July 1, 2003, cables that meet the requirements for Types CMP, CMR, CMG, and CM and also satisfy the requirements of 760.82(B) for multiconductor cables and 760.82(H) for coaxial cables shall be permitted to be listed and marked as multipurpose cable Types MPP, MPR, MPG, and MP, respectively.~~

Re-letter the remaining subsections as shown:

(G ~~H~~) Communications Circuit Integrity (CI) Cable. Cables suitable for use in communications systems to ensure survivability of critical circuits during a specified time under fire conditions shall be listed as circuit integrity (CI) cable. Cables identified in 800.90(A) , (B), (C), (D), and (E) that meet the requirements for circuit integrity shall have the additional classification using the suffix "CI."

FPN: One method of defining circuit integrity (CI) cable is by establishing a minimum 2-hour fire resistance rating for the cable when tested in accordance with UL 2196-1995, *Standard for Tests of Fire Resistive Cables* .

(H ~~I~~) Communications Wires. Communications wires, such as distributing frame wire and jumper wire, shall be listed as being resistant to the spread of fire.

FPN: One method of defining *resistant to the spread of fire* is that the cables do not spread fire to the top of the tray in the vertical-tray flame test in ANSI/UL 1581-1991, *Reference Standard for Electrical Wires, Cables and Flexible Cords* . Another method of defining *resistant to the spread of fire* is for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing the vertical flame test for cables in cable trays, as described in CSA C22.2 No. 0.3-M-1985, *Test Methods for Electrical Wires and Cables* .

(I ~~J~~) Hybrid Power and Communications Cable. Listed hybrid power and communications cable shall be permitted where the power cable is a listed Type NM or NM-B conforming to the provisions of Article 334 , and the communications cable is a listed Type CM, the jackets on the listed NM or NM-B and listed CM cables are rated for 600 volts minimum, and the hybrid cable is listed as being resistant to the spread of fire.

FPN: One method of defining *resistant to the spread of fire* is that the cables do not spread fire to the top of the tray in the vertical-tray flame test in ANSI/UL 1581-1991, *Reference Standard for Electrical Wires, Cables and Flexible Cords* . Another method of defining *resistant to the spread of fire* is for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing the vertical flame test for cables in cable trays, as described in CSA C22.2 No. 0.3-M-1985, *Test Methods for Electrical Wires and Cables* .

Substantiation: This proposal is editorial. (Task Group No. 800-29)

Multipurpose cables are no longer recognized. The panel tried to eliminate multipurpose cables in the last code cycle and succeeded in removing most references to multipurpose cables. This is a cleanup proposal to remove the remaining traces.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.

Panel Meeting Action: Reject

Panel Statement: Although the listing requirements for multipurpose cables only permitted listing until July 1, 2003, the panel is not able to accept the deletion of the text dealing with multipurpose cables, because of the directives of NFPA staff and NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

STENE, S.: This proposal is editorial. This subsection should have been deleted during the removal of the other items related to multipurpose cables during the last code cycle.

16-222 Log #750 NEC-P16 **Final Action: Accept**

(800.179(J))

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.

Recommendation: Change cable to cables as shown:

(J) Hybrid Power and Communications Cable s . Listed hybrid power and communications cable s shall be permitted where the power cable is a listed Type NM or NM-B conforming to the provisions of Article334, and the communications cable is a listed Type CM, the jackets on the listed NM or NM-B and listed CM cables are rated for 600 volts minimum, and the hybrid cable is listed as being resistant to the spread of fire.

FPN: One method of defining *resistant to the spread of fire* is that the cables do not spread fire to the top of the tray in the vertical-tray flame test in ANSI/UL 1581-1991, *Reference Standard for Electrical Wires, Cables and Flexible Cords* . Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-223 Log #2532 NEC-P16 **Final Action: Reject**
(800.179(K))

Submitter: Sanford Egesdal, Egesdal Associates PLC
Recommendation: Insert new 800.179(K)
(K) Type CM50. Type CM50 cables shall be listed as suitable for installation in concealed spaces having restrictive requirements for smoke generation, combustible loading, and flame spread and shall be listed as having very-low-smoke producing characteristics, a low potential heat release value, and low flame spread characteristics.
FPN: One method of defining a low flame spread and very low smoke-producing cable is that the cable exhibits a maximum flame spread index of 25 and maximum smoke developed index of 50 when tested in accordance with NFPA 255, *Standard Method of Test of Surface Burning Characteristics of Building Materials* with the cable unslit (intact) and cut through to expose the cable core. One method of defining a low potential heat cable is that the cable exhibits a maximum potential heat value of exceeding 8141 kJ/kg (3500 BTU/lb) when tested in accordance with NFPA 259, *Standard Test Method for Potential Heat of Building Materials.*
FPN No. 2: See 8.14.1 of NFPA 13-2002, *Installation of Sprinkler Systems* , for requirements for sprinklers in concealed spaces containing exposed combustibles.
FPN No. 3: Building codes adopted by code jurisdictions may contain restrictions on permissible flame spread index and smoke developed index.
Substantiation: This proposal establishes a listing and marking for cable permitted as an electrical wiring option in concealed spaces where a smoke developed index no greater than 50 is required or large quantities of cable may cause combustible loading. The proposed cable has very-low-smoke-producing characteristics, a low potential heat release value, and low flame spread characteristics. Presently, a number of manufacturers have cables listed to the proposed requirements.

The testing criteria are based on the requirements found in NFPA 13-2003 and the 2003 International Mechanical Code, as revised.

NFPA 13, Section 8.14.1.2.1 follows: "Noncombustible and limited combustible concealed spaces with no combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum." The proposed cable has a very low heat of combustion. While the term "combustible loading" is not defined, the fuel load can be calculated to determine the potential hazard from large quantities of cable.

The 2003 International Mechanical Code, 602.2.1, requires materials in plenums to be noncombustible or have a flame spread index no greater 25 and a smoke index no greater than 50. At the recent ICC meeting in Detroit, exception #5 to 602.2.1 was revised to include "combustible material (electrical wiring) installed in noncombustible raceways or enclosures." The requirements in IMC 602.2.1.1 permits cables meeting NFPA 262 test requirements. Cables meeting NFPA 262 requirements, according to Fire Protection Research Foundation testing using NFPA 255, have a smoke developed index that varies between 450 and 850. The proposed cable meets the requirements of the base paragraph, 602.2.1.

The following (change is underlined) shows the result of action on IMC public comment on M 77 (floor actions in Detroit, September 2005).

602.2.1 Materials exposed within plenums. Except as required by Sections 602.2.1.1 through 602.2.1.5, materials within plenums shall be noncombustible or shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84.

Exceptions:

1. Rigid and flexible ducts and connectors shall conform to Section 603.
2. Duct coverings, linings, tape and connectors shall conform to Sections 603 and 604.
3. This section shall not apply to materials exposed within plenums in one- and two-family dwellings.
4. This section shall not apply to smoke detectors.
5. Combustible materials enclosed in noncombustible raceways or enclosures, approved gypsum board assemblies or enclosed in materials listed and labeled for such application.

602.2.1.1 Wiring. Combustible electrical or electronic wiring methods and materials, optical fiber cable, and optical fiber raceway exposed within a plenum shall have a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread not greater than 5 feet (1524 mm) when tested in accordance with NFPA 262. Only type OFNP (plenum rated nonconductive optical fiber cable) shall be installed in plenum-rated optical fiber raceways. Wiring, cable, and raceways addressed in this section shall be listed and labeled as plenum rated and shall be installed in accordance with ICC *Electrical Code* .

The Fire Protection Research Foundation report demonstrated that NFPA 255, *Standard Method of Test of Surface Burning Characteristics of Building Materials* , provides a suitable test method for establishing the cable characteristics (flame spread index & smoke developed index) specified in the FPN.

Establishing a listing and marking for a Type FPL50 cable provides a wiring option for complying with requirements of other standards and building codes. The NEC has previously established listings and markings for cable to correlate with other codes and standards. Additionally, the listing and marking may or may not have a specific application. Specific examples follow:

1. Type CMG cable was included in the 1993 NEC to correlate with the Canadian Electrical Code. The change was proposed by the Chair of NEC TCC, Harold Ware and Roy Hicks from Canada. Type CMG has a listing and marking in the NEC. Article 800 permits "Type CM or Type CMG" to be installed as a general purpose cable. Note: Type CMG does not have a unique application, and neither cable is considered a minimum requirement.
2. Types MP, MPR, and MPP cable was included in the 1990 NEC. The cables had a listing and marking. The multiple-purpose cables were permitted to substitute for similar cables in Articles 725, 760, & 800. Note: Types MP, MPR, and MPP cables do not have a unique application, just a listing and marking.
3. A change to the 1999 NEC permitted Types NPLF, NPLFR, NPLFP, FPL, FPLR, and FPLP to have a "-CI" suffix. The change included only listing and marking requirements. This change to the NEC correlated with NFPA 72, National Fire Alarm Code, requirements for a circuit integrity cable. Note: Cables with a "-CI" suffix did not have an application, until changes were made to the 2005 NEC.
4. A change to the 2005 NEC permitted Types CM, CMR and CMP to have a "-CI" suffix. As of today, no company has a listed circuit integrity using the permitted markings. Note: Types CM-CI, CMR-CI, and CMP-CI do not have an application, just a listing and marking.

Panel Meeting Action: Reject
Panel Statement: The submitter did not provide adequate technical substantiation to support a need for a cable listed for concealed spaces.

Concealed spaces should be adequately defined. See action on Proposals 16-13, 16-110, and 16-247 where the proposed definition was determined to be unacceptable.

The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"[S]o as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:

OHDE, H.: We agree with panel action and believe that the panel statement should also reflect the latest NFPA 13 Technical Committee actions. Included in the submitter's substantiation was the 2002 Section 8.14 which since has been revised. We would like to add that NFPA 13 just completed their balloting process for the 2006 NFPA 13 Standard. The Technical Committee on Sprinkler Installation submitted a comment on Proposal 13-284.

This comment reworded proposed A.8.14.1.2.1 to read " *Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc…can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1) For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined* ."

In the NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

16-224 Log #3243 NEC-P16 **Final Action: Reject**
(800.179(K) (New))

Submitter: Frank Peri, Communications Design Corporation
Recommendation: Add new 800.179(K), as follows:
(K) Type CMD. Type CMD air duct cable shall be listed as being suitable for use in ducts, plenums, and other space used for environmental air and shall also be listed as having adequate fire-resistant, very low smoke-producing characteristics, and very low potential heat release.
FPN No: One method of defining a low flame spread and very low smoke-producing cable is that the cable exhibits a maximum flame spread index of 25 and maximum smoke developed index of 50 when tested in accordance with NFPA 255, *Standard Method of Test of Surface Burning Characteristics of Building Materials* with the cable unslit (intact) and cut through to expose the cable core. One method of defining a low potential heat cable is that the cable exhibits a maximum potential heat value of exceeding 8141 kJ/kg (3500 BTU/lb) when tested in accordance with NFPA 259, *Standard Test Method for Potential Heat of Building Materials.*

Substantiation: The purpose of this proposal is to correlate with NFPA 5000-2006. NFPA 5000-2006, recently issued by the NFPA Standards Council, incorporates extracted plenum requirements from NFPA 90A-2002. Consequently, the plenum requirements in NFPA 5000-2006 are identical to the ceiling cavity plenum requirements in NFPA 90A-2002. This proposal provides listing requirements for a cable with characteristics that complies with the NFPA 90A-2002, 4.3.10.2.6: requirements for limited combustible materials exposed to the airflow. This proposal provides a listing and marking for a cable that complies with the NFPA 90A-2002, 4.3.10.2.6.1:a requirement for a listed limited combustible cable with a maximum smoke developed index of 50. The proposed cable meets the NFPA Standards Council's directive to not identify cable as "limited combustible," because it is not a building construction material. The cable name and listing requirements meets guidance from the NFPA Standards Council to identify cable characteristics in terms of flame spread index, smoke developed index, and potential heat release.

As compared to a combustible plenum cable that is listed using NFPA 262, air duct cable is a much "safer" cable. Air duct cable provides users with an opportunity to significantly reduce the potential hazard from smoke during a fire emergency. Additionally, the much lower potential heat release of air duct cable provides much lower combustible loading than found in combustible plenum cable listed using NFPA 262.

Air duct cables are available on the market today. Presently, there is air duct cable available to meet the plenum installation requirements of Articles 725, 760, 770, and 800. Unfortunately, the only marking available in the NEC is for a combustible plenum cable. The NEC decides what marking is permitted, and listing organizations correlate. That is, it would be inappropriate for a listing organization to mark cable with a "Type XXX" that is not published in the NEC.

The following is an example of air duct cable information from the UL Web Site:

OWKZ.GuideInfoLimited Combustible Cable

Guide Information for Electrical Equipment for Use in Ordinary Locations

GENERAL

This category covers electrical and optical fiber cable that meets the limited combustible and smoke developed requirements for cable in ceiling cavity and raised floor plenums in accordance with NFPA 90A, "Standard for the Installation of Air Conditioning and Ventilating Systems." This cable also meets the requirements for cable used in ducts, plenums and other spaces used for environmental air in accordance with Articles 725, 760, 770, 800, 820 and 830 of ANSI/NFPA 70, "National Electrical Code".

This cable has a maximum Potential Heat value of 3500 Btu/lb when tested in accordance with NFPA 259, "Standard Test Method for Potential Heat of Building Materials." This cable has a maximum smoke developed index of 50 and a maximum flame spread index of 25 when tested in accordance with UL 723 (NFPA 255), "Test for Surface Burning Characteristics of Building Materials" before and after exposure to elevated temperature and humidity. The cable also meets the requirements for plenum cable in one or more of the following product categories:

· Power-limited Circuit Cable (**QPTZ**) - Types CL2P or CL3P
· Communications Cable (**DUZX**) - Type CMP
· Power-limited Fire Alarm Cable (**HNIR**) - Type FPLP
· Nonpower-limited Fire Alarm Cable (**HNHT**) - Type NPLFP
· Optical Fiber Cable (**QAYK**) - Types OFNP or OFCP
· Community Antenna Television Cable (**DVCS**) - Type CATVP
· Network-powered Broadband Communications Cable (**PWIP**) - Type BLP

PRODUCT MARKINGS

This cable is identified by the marking "Limited Combustible FHC 25/50" on the surface of the jacket or on a marker tape under the jacket. This marking is immediately followed by one of the Type designations shown above. The cable also has the required markings including optional markings as indicated in the product categories referenced above. This cable may also be Verified for transmission performance if authorized in the product categories referenced above, and will bear the appropriate performance verification marking.

ADDITIONAL INFORMATION

For additional information, see Electrical Equipment for Use in Ordinary Locations (**AALZ**).

REQUIREMENTS

The basic requirements used to investigate products in this category are contained in Subject 2424, "Outline of Investigation for Cable Marked 'Limited Combustible.'"

UL MARK

The UL symbol on the product and the Listing Mark of Underwriters Laboratories Inc. on the attached tag, the reel, or the smallest unit container in which the product is packaged is the only method provided by UL to identify products manufactured under its Listing and Follow-Up Service. The Listing Mark for these products includes the UL symbol (as illustrated in the Introduction of this Directory) together with the word "LISTED," a control number, and the product name "Limited Combustible Cable."

Cable which is also Verified to the UL Data Transmission Performance Category Marking Program has the marking "Verified to UL Performance Category Program," or the UL Verification Mark along with the words "Performance Category Program" together with the Listing Mark information on the tag, the reel, or the smallest unit container. Cable which is also Verified to another transmission performance specification has the marking "Verified in Accordance with [Specification name and/or number]" or the UL Verification Mark along with the applicable Specification name and/or number together with the Listing Mark information on the tag, the reel, or the smallest unit container.

Last Updated on 2004-03-24

Panel Meeting Action: Reject

Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-225 Log #3634 NEC-P16 **Final Action: Reject**
(800.179(K) (New))

Submitter: Allen C. Weidman, The Society of the Plastics Industry, Inc.

Recommendation: Add new text as follows:

<u>**(K) Concealed Space Cables.** Cables that meet the requirements for Type CM that are also listed as having a low potential heat value, low flame spread characteristics, and low smoke producing characteristics shall be permitted to be listed and marked as concealed space cables Type CM-CS.</u>

<u>FPN: One method of defining a low flame spread and low smoke-producing cable is that the cable exhibits a maximum flame spread distance of 1.52 m (5 ft), a maximum peak optical density of 0.5 and a maximum average optical density of 0.15 when tested in accordance with NFPA 262-2002, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces with the cable unslit (intact) and cut through to expose the cable core. One method of defining a low potential heat cable is that the cable exhibits a maximum potential heat value of exceeding 8141 kJ/kg (3500 BTU/lb) when tested in accordance with NFPA 259, *Standard Test Method for Potential Heat of Building Materials.*</u>

Substantiation: The purpose of this proposal is to provide listing and marking for a cable that will be suitable for use in concealed spaces where there are large quantities of cables. Users would have the option of using these cables to avoid establishing a fuel load above the threshold where the quantity of cables would be considered a combustible loading. Also, these cables provide a flame spread index and a smoke developed index that correlate with the requirements for exposed materials within concealed spaces in buildings.

Cables tested using NFPA 255 and 259 establish parameters commonly used in NFPA standards and building codes: smoke developed index, smoke developed index, and heat of combustion. This proposal uses the NFPA 262 test in place of NFPA 255. The Fire Protection Research Foundation's *International Limited Combustible Plenum Cable Fire Test Project* (copy attached) has shown that both of these tests are suitable and provided data (page 18 of the report) for setting equivalent criteria in the two tests. A maximum average optical density of 0.17 in NFPA 262 is equivalent to a smoke developed index of 450 in NFPA 255. This proposal sets the maximum optical density requirement at 0.15 to allow for a margin of error and to correlate with the existing requirements for plenum cable.

NFPA 13 has requirements for sprinklers in a concealed space that contains a combustible loading. Combustible loading is a function of the density (number) of cables and their potential heat release determined by NFPA 259.

The following is excerpted from the Automatic Systems Sprinkler Handbook 2002 edition: In the handbook the commentary is printed in blue. Since the proposals are printed in black and white I have changed the handbook commentary to ***bold italics*** . I also underlined the text that refers to computer room raised floors.

As indicated in 8.1.1(1), sprinklers are required throughout the premises. Under certain conditions, however, the omission of sprinklers in certain areas and spaces within a building is permitted. Section 8.14 identifies these spaces and conditions.

8.14.1 Concealed Spaces.

8.14.1.1 Concealed Spaces Requiring Sprinkler Protection. All concealed spaces enclosed wholly or partly by exposed combustible construction shall be protected by sprinklers except in concealed spaces where sprinklers are not required to be installed by 8.14.1.2.1 through 8.14.1.2.15.

Concealed spaces requiring sprinkler protection are covered in 8.14.1.1. Concealed spaces, unless protected, can provide an unabated passage for firespread throughout a building. Paragraph 8.14.1 applies to those portions of a building that have construction or finish materials of a combustible nature, are used for the storage of combustible materials, and can contain combustibles associated with building system features such as computer

wiring or large quantities of nonmetallic piping.

Any of these scenarios could be found in a concealed space. It is important to recognize that concealed spaces are not exclusively limited to areas above ceilings but can also be found in walls and in spaces beneath the floor. For example, a raised floor in a computer room is a . concealed space. If none of the three prescribed conditions exists, the space is defined as a concealed, noncombustible space with respect to combustible objects and requires no additional sprinkler protection.

Some minor quantities of combustible materials, such as communication wiring, can be present in some concealed spaces but should not typically be viewed as requiring sprinklers (see 8.14.1.1). The threshold value at which sprinklers become necessary in the concealed space is not defined. For example, the usual amounts of data or telephone wiring found above a ceiling would not typically constitute a threat. If bundles of unsheathed computer wiring are installed above the ceiling or beneath the floor in a manner where fire propagation in all directions is likely, then the concealed space should be treated the same as a combustible space, thereby requiring appropriate sprinkler protection. If some other protection measure is provided, such as a CO, system, then the concealed space is considered to be protected, and sprinklers are not required.

Users of this article need to be aware of the requirements of NFPA 13 so they can provide the appropriate fire protection where these is a build-up of combustible cables that constitute a combustible loading, or preferably avoid the buildup of combustible cables that would result in a combustible loading. Use of concealed space cables would be an option in a strategy to avoid establishing a combustible loading.

A flame spread index of 25 is a typical requirement for materials permitted in concealed spaces or exposed in buildings.

A smoke developed index of 450 is a typical requirement for materials permitted in concealed spaces or exposed in buildings.

The following requirements are from NFPA 5000-2003 identify heat of combustion, flame spread, and smoke as major concerns:

Chapter 4 General

4.4.7 Limiting Fire Spread.

4.4.7.1 Interior Finishes. The interior surfaces of the building shall not contribute to an unacceptable rate and magnitude of fire spread and generation of heat and smoke.

4.4.7.2 Concealed Spaces. The construction of concealed spaces shall not contribute to an unacceptable rate of the spread of fire, hot gases, and smoke to areas of the building remote from the fire source and shall limit their spread beyond the immediate area of the origin of the fire.

4.4.7.3 Compartmentation. The building shall be compartmented, as appropriate, by walls and floors, including their associated openings with proper closures, to limit the spread of fire, hot gases, and smoke to an acceptable area beyond the immediate area of fire origin.

Chapter 8 Fire-Resistive Materials and Construction

8.1 General.

8.1.1 The chapter addresses fire protection features intended to restrict or resist the spread of fire and smoke beyond the compartment of fire origin.

8.1.2 Where required by other chapters of this Code, every building shall be divided into compartments to limit the spread of fire and restrict or resist the movement of smoke.

8.1.2.1* Fire compartments shall be formed with fire barrier walls that comply with Section 8.4 or horizontal assemblies that comply with Section 8.6, or a combination of both.

8.1.2.2 Smoke compartments shall be formed with smoke barriers that comply with Section 8.11.

8.16 Insulating Materials.

8.16.7 Insulation and Covering on Pipe and Tubing. Insulation and covering on pipe and tubing shall have a flame spread index of not more than 25 and a smoke developed index of not more than 450.

Chapter 10 Interior Finishes

10.3.2* Products required to be tested in accordance with NFPA 255 or ASTM E 84 shall be grouped in the classes described in 10.3.2(A) through 10.3.2(C) in accordance with their flame spread and smoke development, except as indicated in 10.3.3.

(A) Class A Interior Wall and Ceiling Finish. Class A interior wall and ceiling finishes shall be those finishes with a flame spread of 0–25 and smoke development of 0–450 and shall include any material classified at 25 or less on the flame spread test scale and 450 or less on the smoke test scale. Any element thereof, when so tested, shall not continue to propagate fire.

Panel Meeting Action: Reject

Panel Statement: The submitter did not provide adequate technical substantiation to support a need for a concealed space listed cable.

Concealed spaces should be adequately defined. See action on Proposals 16-13, 16-110, and 16-247 where the proposed definition was determined to be unacceptable.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

OHDE, H.: We agree with panel action and believe that the panel statement should reflect the latest NFPA 13 Technical Committee actions. Included in the submitter's substantiation was the 2002 Section 8.14 which since has been revised. We would like to add that NFPA 13 just completed their balloting process for the 2006 NFPA 13 Standard. The Technical Committee on Sprinkler Installation submitted a comment on Proposal 13-284.

This comment reworded proposed A.8.14.1.2.1 to read " *Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc…can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1) For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined* ."

In the committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

16-226 Log #751 NEC-P16 **Final Action: Reject**
(800.182(A))

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.

Recommendation: Delete the phrase as shown:

(A) Plenum Communications Raceways. Plenum communications raceways <u>shall be listed for use in other spaces used for environmental air</u> ~~listed as plenum optical fiber raceways shall be permitted for use in ducts, plenums, and other spaces used for environmental air~~ and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.

FPN: One method of defining that an optical fiber raceway is a low smoke producing raceway and a fire-resistant raceway is that the raceway exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with the plenum test in UL 2024, *Standard for Optical Fiber Cable Raceway* .

Substantiation: This proposal is a technical change. (Task Group No. 800-31)

It arose because the task group noticed that the listing requirements for plenum raceway were not consistent across the CMP-16 Articles.

It makes the listing requirements for plenum communications raceways the same as those for CATV raceways. Initially the listing requirements for plenum communications raceways referenced optical fiber raceways because the issue of NFPA 90A current at the time only had requirements for optical fiber raceways and NFPA 90A had primary responsibility for combustible in plenums. NFPA 90A has been revised and now permits plenum communications raceways; hence this requirement can be revised also. Furthermore listing these raceways for use in "other space used for environmental air" and not for use in ducts or other plenums is consistent with the requirements of NFPA 90A. The term "other space used for environmental air" is equivalent to the spaces in NFPA 90A as ceiling cavity plenums plus raised floor plenums.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.

Panel Meeting Action: Reject

Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

ARTICLE 810 — RADIO AND TELEVISION EQUIPMENT

16-227 Log #1551 NEC-P16 **Final Action: Accept**
(810)

TCC Action: The Technical Correlating Committee understands that the revisions in 810.54, Exception were to be made to the existing Exception text.

The Technical Correlating Committee directs the panel to correct the Exceptions to 810.57 to make them into complete sentences. This action will be considered by the panel as a public comment.

Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Delete the term "effectively" from the terms "effectively grounded" and "effectively bonded" from Articles 810 and revise text as shown for the affected NEC sections.

810.20(A) Exception:

Exception: Where the lead-in conductors are enclosed in a continuous metallic shield that either is ~~permanently and effectively~~ grounded with a conductor in accordance with 810.21 or is protected by an antenna discharge unit.

810.21(F)(3):

(3) If the building or structure served has no grounding means, as described in 810.21(F)(1) or (F)(2), ~~to an effectively grounded metal structure or~~ to any of the individual electrodes described in 250.52

810.54 Exception:

Exception No. 1: Where protected by a continuous metallic shield that is ~~permanently and effectively~~ grounded with a conductor in accordance with 810.58 .

810.55 Except where protected with a continuous metallic shield that is ~~permanently and effectively~~ grounded with a conductor in accordance with 810.58 , lead-in conductors for transmitting stations shall enter buildings by one of the following methods: …

810.57 Exception No. 1:

Exception No. 1: Where protected by a continuous metallic shield that is ~~permanently and effectively~~ grounded with a conductor in accordance with 810.58 .

810.57 Exception No. 2:

Exception No. 2: Where the antenna is ~~permanently and effectively~~ grounded with a conductor in accordance with 810.58 .

810.71(B):

(B) Grounding of Controls. All external metal handles and controls accessible to the operating personnel shall be ~~effectively~~ connected to an equipment grounding conductor if the transmitter is powered by the premises wiring system or grounded with a conductor in accordance with 810.21 .

Substantiation: 810.20(A) Exception: The definition of "effectively grounded" is ambiguous and very subjective without any defined values or parameters for one to judge as either "effective" or "ineffective." Revise to be more specific and prescriptive for the users.

810.21(F)(3): The definition of "effectively grounded" is ambiguous and very subjective without any defined values or parameters for one to judge as either "effective" or "ineffective."

Here the reference to "effectively grounded metal structure" seems superfluous.

810.54 Exception: The definition of "effectively grounded" is ambiguous and very subjective without any defined values or parameters for one to judge as either "effective" or "ineffective."

Reference to 810.58 is proposed to replace appropriate here.

810.55: The definition of "effectively grounded" is ambiguous and very subjective without any defined values or parameters for one to judge as either "effective" or "ineffective."

Revise to be more specific and prescriptive for the users. Reference to 810.58 is proposed to replace appropriate here.

810.57 Exception No. 1: The definition of "effectively grounded" is ambiguous and very subjective without any defined values or parameters for one to judge as either "effective" or "ineffective."

Reference to 810.58 is proposed to replace appropriate here.

810.57 Exception No. 2: The definition of "effectively grounded" is ambiguous and very subjective without any defined values or parameters for one to judge as either "effective" or "ineffective."

Revise to be more specific and prescriptive for the users. Reference to 810.58 is proposed to replace appropriate here.

810.71(B): The definition of "effectively grounded" is ambiguous and very subjective without any defined values or parameters for one to judge as either "effective" or "ineffective."

Revise to be more specific and prescriptive for the users by requiring the connection to an equipment grounding conductor.

This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to delete the term "grounded, effectively" and its definition from Article 100 and other companion proposals throughout the NEC relative to this Task Group's recommendations. The substantiation of this proposal is as follows.

The term "Effectively Grounded" is used 29 times in the NEC. It appears as though in the majority of the locations where it is used, the word "grounded" or phrase "connected to an equipment grounding conductor" could be used. Other proposals are submitted to make those changes.

The 1996 NEC in Section 250.51 used the term "effective grounding path," and those concepts were incorporated in 250.2 (1999 NEC) and then expanded in 250.4(A) and (B) in the 2002 NEC. The performance criteria of grounding and bonding are currently provided in Section 250.4 and include the concepts contained in the vague definition of the term "effectively grounded."

The definition "Effectively Grounded" is very subjective and without any defined values or parameters for one to judge grounding as either "effective" or "ineffective." "Effective" is described in Section 250.4(A) and (B), but it relates to the effective ground-fault current path as a performance criteria. Deleting the term in the NEC and the definition is logical because there are no definitive parameters for Code users to make a determination on what constitutes "effectively grounded." Systems are solidly grounded, grounded through a resistor or impedance, or ungrounded. Equipment (normally noncurrent-carrying metal parts are grounded where connected to an equipment grounding conductor.

This proposal is to change the term "Effectively Bonded" to just "Bonded" in each of the section where it is used. The term "Effectively Bonded" is currently not defined in the NEC.

The term "effectively bonded" is also used a few times in the NEC and is undefined. The same situation exists. There are no defined parameters for Code users to judges what the difference between "Effectively Bonded" and "Bonded" really is. Where the term appears in the NEC, it is revised to just "bonded" and still has the same meaning in each rule.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept

Ballot Results: Affirmative: 15

16-228 Log #373 NEC-P16 **Final Action: Reject**
(810(5))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise text as follows:

"...They shall not be exposed to ~~physical~~ damage...".

Substantiation: Use of the word "physical" is superfluous–the intent is obvious given the context. (I leave it to the CMP whether you want to get more specific naming some source of damage such as "blows or abrasion.")

Submitting proposals removing the adjective "physical" may strike people as about as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every unnecessary instance, as I am attempting to do, we actually cut the NEC down by up to oh, maybe a quarter-page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.

Second, the unneeded use of "physical" not only is poor writing–look at William Zinsser's classic, On Writing Well–but is silly, and reflects a bit poorly on the Code process. When references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."

Panel Meeting Action: Reject
Panel Statement: The grounding conductor is potentially subject to multiple sources of damage: electrical, physical, and environmental. The word "physical" is necessary to specifically identify the type of damage that the section is addressing.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-229 Log #2830 NEC-P16 **Final Action: Reject**
(810.3)

Submitter: John Kacpenski, Western Telecommunications Consulting (WTC)
Recommendation: Add new text as follows:

810.3 Other Articles.

Penetrations of the fire-resistant room boundary shall be in accordance with 300.21. The accessible portion of abandoned network-powered communications cables shall not be permitted to remain.

Substantiation: This addition will harmonize this Article's text with the following: 725.3(B), 760.3(A), 770.3(A), 800.3(C), 820.3(A), and 830.3(A) - Also, being proposed for Article 645.7.
Panel Meeting Action: Reject
Panel Statement: "Network-powered communications cables" don't exist. However, see Article 830 for network-powered broadband communications cables.

The submitter's intent was not clear. The submitter is encouraged to review the proposal and resubmit for the ROC.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-230 Log #2315 NEC-P16 **Final Action: Reject**
(810.15 Exception)

Submitter: Robert Dudley, Amerisat Inc.
Recommendation: Revise text to read:
Exception: Masts and metal structures supporting antennas, not electrically connected to lead-in conductors and mounted to nonconductive material, do not require grounding.
Substantiation: In those instances where the lead-in conductors are not electrically connected to the mast or metal supporting structures and the mast is mounted to a nonconductive surface such as brick, wood, or block, the mast and supports should be exempt from this section's grounding requirement. This isolation inhibits surges from entering the location. This includes all accessible mounting locations, including those locations which are not the highest point on the structure.
Note: Supporting Material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The submitter apparently proposes to add an exception to 810.15. A metallic structure such as an antenna support assembly or mast, when mounted to non-conductive surfaces such as masonry, roofing, wood, or vinyl, should be grounded to reduce the possibility of flash-over and risk of fire in the event of a lightning strike.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-231 Log #852 NEC-P16 **Final Action: Accept**
(810.18(A))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read as follows:
(A) Outside of Buildings Lead-in conductors attached to buildings shall be installed so that they cannot swing closer than 600 mm (2 ft) to the conductors of circuits of 250 volts or less between conductors, or 3.0 m (10 ft) to the conductors of circuits of over 250 volts between conductors, except that in the case of circuits not over 150 volts between conductors, where all conductors involved are supported so as to ensure permanent separation, the clearance shall be permitted to be reduced but shall not be less than 100 mm (4 in.). The clearance between lead-in conductors and any conductor forming a part of a lightning protection ~~rod~~ system shall not be less than 1.8 m (6 ft) ~~unless the bonding referred to in 250.60 is accomplished~~ . Underground conductors shall be separated at least 300 mm (12 in.) from conductors of any light or power circuits or Class 1 circuits.
Exception: Where the electric light or power conductors, Class 1 conductors, or lead-in conductors are installed in raceways or metal cable armor.
FPN No.1: See 250.60 for use of air terminals. For further information, see NFPA 780-2004, Standard for the Installation of Lightning Protection Systems, which contains detailed information on grounding, bonding, and spacing from lightning protection systems.
FPN No. 2: Metal raceways, enclosures, frames, and other non-current-carrying metal parts of electric equipment installed on a building equipped with a lightning protection system may require bonding or spacing from the lightning protection conductors in accordance with NFPA 780-2004, Standard for the Installation of Lightning Protection Systems. Separation from lightning protection conductors is typically 1.8 m (6 ft) through air or 900 mm (3 ft) through dense materials such as concrete, brick, or wood.
Substantiation: The term "lightning protection system" is more accurate than "lighting rod system". 250.60 and 250.106 were revised in recent cycles to remove specific separation distances required between down leads of lighting protection systems and other systems or metal parts which has more to do with installations of those systems. This information should be covered by the requirements in NFPA 780. It appears that this same separation requirement is still left in this section and is no longer needed. The FPNs are identical to those following 250.106 and provide the information and references users need relative to what is required for separation and what Standard applies. Ground terminals of lightning protection systems are required to be bonded to the power system grounding electrodes as specified in 250.106.
810.21(J) requires the electrode for the radio and antenna equipment to be bonded to the power system electrode with bonding jumper not smaller than 6 AWG copper or equivalent.
Panel Meeting Action: Accept

Ballot Results: Affirmative: 15

16-232 Log #3354 NEC-P16 **Final Action: Reject**
(810.21(A))

Submitter: Paul Dobrowsky, Holley, NY
Recommendation: Revise text to read:
810.21 Grounding Conductors — Receiving Stations. Grounding conductors shall comply with 810.21(A) through 810.21(K).
(A) Material. The grounding conductor shall be of copper, aluminum, copper-clad steel, bronze, or similar corrosion-resistant material. Bare aluminum ~~Aluminum~~ or copper-clad aluminum grounding conductors shall not be used where in direct contact with masonry or the earth or where subject to corrosive conditions. Where used outside, aluminum or copper-clad aluminum grounding conductors shall not be ~~installed~~ terminated within 450 mm (18 in.) of the earth.
Substantiation: The language should be changed to be consistent with that of 260.66(A). Aluminum conductors are commonly used outside such as for service drops, service laterals. The issue is with bare conductors and the termination of aluminum conductors.
Panel Meeting Action: Reject
Panel Statement: The proximity of the grounding conductor to the earth is the requirmment of the section. Further, no additional technical justification was provided.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-233 Log #1254 NEC-P16 **Final Action: Reject**
(810.21(A) and (D))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise last sentence of (A): Where used outside, aluminum or copper-clad aluminum not in a rigid type raceway, and connections to a grounding electrode, shall not be installed within 450 mm (18 in.) of the earth.
(D) Insert as second sentence: The grounding conductor shall be permitted to be protected by a rigid type conduit, electrical metallic tubing, or cable armor. Revise last sentence: Where the grounding conductor is run in a metal ~~raceway~~ conduit, electrical metallic tubing, or cable armor , both ends of the raceway or cable armor shall be bonded...(remainder unchanged)
Substantiation: It is unclear whether the intent of this requirement was to apply to open conductors or conductors in a rigid raceway such as conduit or tubing. Metal "raceway" includes flexible metal conduits, which may provide choke effects to high frequency lightning induced currents.
Panel Meeting Action: Reject
Panel Statement: The submitter does not provide adequate technical substantiation.
It is not necessary to provide an all-inclusive list of the types of metal raceways that may be encountered.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-234 Log #374 NEC-P16 **Final Action: Reject**
(810.21(D))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise text as follows:
"...The grounding conductor shall be protected where exposed to ~~physical~~ damage...".
Substantiation: Use of the word "physical" is superfluous–the intent is obvious given the context. (I leave it to the CMP whether you want to get more specific naming some source of damage such as "blows or abrasion.")
Submitting proposals removing the adjective "physical" may strike people as about as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every unnecessary instance, as I am attempting to do, we actually cut the NEC down by up to oh, maybe a quarter-page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the unneeded use of "physical" not only is poor writing–look at William Zinsser's classic, On Writing Well–but is silly, and reflects a bit poorly on the Code process. When references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."
Panel Meeting Action: Reject
Panel Statement: The grounding conductor is potentially subject to multiple sources of damage: electrical, physical, and environmental. The word "physical" is necessary to specifically identify the type of damage that the section is addressing.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-235 Log #857 NEC-P16 **Final Action: Accept**
(810.21(D))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read as follows:
(D) Mechanical Protection. The grounding conductor shall be protected where exposed to physical damage, ~~or the size of the grounding conductors shall be increased proportionately to compensate for the lack of protection~~ .

Where the grounding conductor is run in a metal raceway, both ends of the raceway shall be bonded to the grounding conductor or to the same terminal or electrode to which the grounding conductor is connected.

Substantiation: This requirement in its current form is vague and unenforceable. There are no specific parameters to establish a starting point for making a proportional adjustment in size from the minimum sizes provided in 810.21(H) to compensate for the lack of protection. In its current form, this text is subjective and leads to inconsistencies in enforcement due to the lack of specific parameters. How much of a proportional increase is enough? This section should provide enforcement only with language that can be used to require physical protection where it is judged that the grounding conductor would be subjected to.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-236 Log #1891 NEC-P16 **Final Action: Accept**

(810.21(F))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 5-20. This action will be considered by the Panel as a Public Comment.

Submitter: Jeffrey Boksiner, Telcordia Technologies, Inc. / Rep. Alliance for Telecommunications Industry Solutions

Recommendation: Revise 810.21(F) **Grounding Conductors — Receiving Stations. (Electrode)** as follows:

(F) Electrode. The grounding conductor shall be connected as follows:

(1) In Buildings or Structures with an Intersystem Grounding Termination. If the building or structure served has an intersystem grounding termination the grounding conductor shall be connected to the intersystem grounding termination.

(~~1~~) (2) In Buildings or Structures with Grounding Means. If the building or structure served has no intersystem grounding termination, the grounding conductor shall be connected to the nearest accessible location on the following:

....

..................Retain existing list and text.

....

~~(2)~~ **(3) In Buildings or Structures Without Intersystem Grounding Termination or Grounding Means.** If the building or structure served has no intersystem grounding termination or grounding means, as described in 810.21(F)(1),

a) to any one of the individual electrodes described in 250.52; or

b) ~~(3)~~ If the building or structure served has no grounding means, as described in 810.21(F)(1) or (F)(2), to an effectively grounded metal structure ~~or to any of the individual electrodes described in 250.52.~~

Substantiation: This is one of several correlated proposals (100 Definitions, 250.95, Chapter 8 Articles) to improve the requirements related to intersystem bonding and grounding of communication systems. The intent is to create a dedicated and well-defined location for terminating the grounding conductors required in Chapter 8 Articles and accomplishing the intersystem bonding between communication and power systems. The proposed termination would have sufficient capacity to handle multiple communication systems (telecom, satellite, cable) on premises. The proposed revision makes the intersystem bonding terminal the preferred destination for grounding conductor in Article 810. See the figures I have provided.

Intersystem bonding accomplished by connection of a communication grounding conductor to the power system is an important safety measure to prevent occurrences of voltages between communication system and power system. However, the existing requirements are not adequate. Bonding is becoming difficult to implement due to changes in building construction practices such as increased prevalence of flush construction and use of PVC conduits. Frequently, in new construction, the grounding electrode, the raceway and the grounding electrode conductor are hidden behind walls and not accessible for bonding connection.

Even in older construction with accessible equipment, the requirement for installation of intersystem bonding connection is subject to varying interpretation because there is not a clearly defined dedicated bonding location. The connection to the power system is sometimes haphazard. Installers are sometimes confused over where the connection should be made especially if multiple Communication Systems are present on premises.

In addition this proposal modifies the arrangement of the text in 810.21 to look similar to other Article in Chapter 8.

Note: Supporting Material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-237 Log #1992 NEC-P16 **Final Action: Accept in Principle**

(810.21(F))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 16-236. This action will be considered by the Panel as a Public Comment.

It was also the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 5 for information.

Submitter: Neil F. LaBrake, Jr., Niagara Mohawk, a National Grid Company / Rep. Edison Electric Institute-Electric Light & Power Group

Recommendation: Add these two sentences after the last sentence of 810.21(F):

A device intended to provide a termination point for the grounding conductor (inter-system bonding) shall be prohibited from use when the installation of such device interferes with opening a service or metering equipment enclosure. An inter-system bonding device shall not be installed on an enclosure cover.

Substantiation: Poor grounding practices by installers of CATV, telephone, satellite and other communication systems using termination devices that clamp to enclosure covers have resulted in interruption of grounding continuity. This is a companion proposal to proposals to add this requirement to 800.100(B), 820.100(B), and 830.100(B).

Panel Meeting Action: Accept in Principle

Add the following after the last sentence of 810.21(F):

A device intended to provide a termination point for the grounding conductor shall not interfere with the opening of an equipment enclosure. A bonding device shall be mounted on non-removable parts. A bonding device shall not be mounted on a door or cover even if the door or cover is non-removable.

Panel Statement: The panel accepts the intent of the submitter and has reworded the text for clarity. It is requested that the TCC forward to Panel 5 for take similar action as applicable.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

BRUNSSEN, J.: The submitter's text, as modified by the Panel, should be placed following the existing text of 810.21(F)(e.) rather than at the end of 810.21(F). Section 810.21(F)(e.) specifically addresses connection to the service equipment enclosure and that is the issue that the submitter intended to address.

ARTICLE 820 — COMMUNITY ANTENNA TELEVISON AND RADIO DISTRIBUTION SYSTEMS

16-238 Log #755 NEC-P16 **Final Action: Accept**

(820 V. (title))

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.

Recommendation: Change title:

From V. Cables Within Buildings

To V. Installation Methods Within Buildings

Substantiation: This proposal is editorial. (Task Group No. 820-01)

The sections included under V. include more than cables and the recommended change is more descriptive. This title is consistent with similar recommendations for Articles 770, 800 and 830.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-239 Log #2695 NEC-P16 **Final Action: Reject**

(820.2)

Submitter: Harold C. Ohde, IBEW #134

Recommendation: Delete the following:

~~820.2 Air Duct. A conduit or passageway for conveying air to or from heating, cooling, air conditioning, or ventilating equipment, but not including the plenum. [NFPA 97:1.2.6]~~

Substantiation: This is an editorial proposal to remove the term "air duct" as this term is not used in Article 800. The term "air duct" should not be defined in the article, as per the National Electrical Code Style Manual.

Panel Meeting Action: Reject

Panel Statement: The Panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

JENSEN, R.: We believe that the interpretation of whether being allowed to address this proposal in view of the NFPA Standard Council Long Decision 05-24 (SC #05-7-4) was misunderstood.

We agree with deleting the term "air duct" as it was evidently an oversight that it was not removed during the last code cycle. Air duct was introduced for use with "air duct cable" which was not to be used in the 2005 code. Additionally, the term is not used within Article 800. To further not using this term, in proposal 16-29, the panel revised the proposal to not use "air duct", but instead to harmonize code language by using the term "ventilation or air handling ducts".

OHDE, H.: We do not believe that the NFPA Standards Council Long Decision 05-24 (SC #05-7-4) would prohibit this definition of Air Duct from being deleted. We do believe that expansion of or new definition of Air Duct would be in violation of NFPA Standards Council Long Decision 05-24 (SC #05-7-4). This proposal should have been accepted.

This proposal was to remove the definition of "Air Duct" from 820.2 as this term is not used in Article 820.

16-240 Log #2364 NEC-P16 **Final Action: Reject**
(820.2.Abandoned Coaxial Cable)

Submitter: John H. Schmidt, ABC Television Network

Recommendation: In the definition for Abandoned Coaxial Cable, after the words "and not identified for future use with a tag" add the new text "or in a database."

Substantiation: In modern large systems, cables are often identified with a number at each end, and the function of the cable is listed in a database referencing that number. This database should be adequate to identify cables for future use.

Panel Meeting Action: Reject

Panel Statement: The AHJ is unlikely to have access to the database for every building under his/her jurisdiction. The majority of communications technicians (installation/repair) work at a multiplicity of locations. Database administrative responsibility is not identified in the proposal. Maintaining and referencing a database for every location is cumbersome, unwieldy, and impractical.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-241 Log #2684 NEC-P16 **Final Action: Reject**
(820.2. Abandoned Coaxial Cable)

Submitter: Charles M. Trout, Maron Electric Co. Inc.

Recommendation: Revise 820.2 Abandoned Coaxial Cable to read:

Installed coaxial cable that is not terminated at equipment other than a coaxial connector and not identified for future use with a tag which is of a material impervious to the deleterious effects of temperature and dampness. The tag shall be resistant to the effects of gnawing by rodents. The tag shall contain the following information:

(1) Date tag was installed.

(2) Date of intended use of disconnected cable.

(3) Drawing or file number containing information relating to intended future use of disconnected cable.

The date of intended use of disconnected cable shall not exceed 90 days date of disconnection.

Substantiation: Abandoned cables are a growing problem in the industry. These cables are left for others to deal with when present users discontinue their operation. Understanding this problem, the removal of abandoned cables, is required by articles 640, 645, 725, 760, 770, 800, 820, and 830. Section 820.3(A) requires the removal of abandoned communications cables. Tagging of cables intended for future use without a method of ensuring the intention of future use invites tagging of cables to avoid the responsibility of their proper removal.

Panel Meeting Action: Reject

Panel Statement: While the submitter makes the point that the "tagging" requirements may be used to circumvent abandoned cable removal, the proposed additional requirements are impractical, burdensome, and preclude the pre-wiring of buildings. For example, buildings are often "pre-wired" for CATV. While the current tenant may not require all the coaxial cable pre-wiring, future tenants may have additional needs and require the additional wiring. Allowing only "90 days" is insufficient to support pre-wiring. A tag that is immune to temperature, dampness, and rodents needs to be of special material and would likely require special means to mark the tag. Adding a file number implies the existence of a database. No suggestion is provided as to who would be responsible for populating and maintaining the database.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-242 Log #3013 NEC-P16 **Final Action: Reject**
(820.2. Abandoned Coaxial Cable)

Submitter: Marcelo M. Hirschler, GBH International

Recommendation: Revise text to read as follows:

820.2 Definitions.

Abandoned Coaxial Cable. Installed coaxial cable that is not terminated at equipment ~~other than a coaxial connector~~ and not identified for future use with a tag.

Substantiation: The definitions of abandoned cable in every article should be identical. The relevant articles are: 640, 645, 725, 760, 770, 800, 820 and 830. The definitions at articles 640 and 725 are already correct as follows:

640.2: Abandoned Audio Distribution Cable. Installed audio distribution cable that is not terminated at equipment and not identified for future use with a tag.

725.2: Abandoned Class 2, Class 3, and PLTC Cable. Installed Class 2, Class 3, and PLTC cable that is not terminated at equipment and not identified for future use with a tag.

The additional wording in this definition causes confusion. Proposals are being made to make changes to the definitions in articles 770, 800, 820 and 830, and to add a general definition into article 645 and into article 100.

Panel Meeting Action: Reject

Panel Statement: See panel action on Proposal 16-1.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

OHDE, H.: This proposal should be accepted as submitted. The submitter substantiates that the definitions of abandoned cables in Articles 640, 645, 725, 760, 770, 800, 820, and 830 should be identical. This proposal deletes unnecessary language in the present definitions and provides consistent language throughout the above articles mentioned. The panel statement does not explain the reason for rejecting this proposal other than to see panel action on Proposal 16-1.

16-243 Log #2664 NEC-P16 **Final Action: Reject**
(820.2. Air Duct)

Submitter: Robert W. Jensen, dbi / Rep. BICSI, A Telecommunications Association

Recommendation: Delete the following text:

~~**820.2 Air Duct.** A conduit or passageway for conveying air to or from heating, cooling, air conditioning, or ventilating equipment, but not including the plenum. [NFPA 97:1.2.6]~~

Substantiation: Air duct is not a term used in Article 800. This was an apparent miss in the 2005 editorial review under the Standards Council mandate to remove content related to "air duct cable".

Panel Meeting Action: Reject

Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

JENSEN, R.: We believe that the interpretation of whether being allowed to address this proposal in view of the NFPA Standard Council Long Decision 05-24 (SC #05-7-4) was misunderstood.

We agree with deleting the term "air duct" as it was evidently an oversight that it was not removed during the last code cycle. Air duct was introduced for use with "air duct cable" which was not to be used in the 2005 code. Additionally, the term is not used within Article 800. To further not using this term, in proposal 16-29, the panel revised the proposal to not use "air duct", but instead to harmonize code language by using the term "ventilation or air handling ducts".

16-244 Log #781 NEC-P16 **Final Action: Accept**
(820.2.Cable, coaxial (New))

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Add a definition as follows:

Cable, coaxial. A cylindrical assembly composed of a conductor centered inside a metallic tube or shield, separated by a dielectric material, and usually covered by an insulating jacket.

Substantiation: This proposal is editorial and technical. (Task Group No. 820-27)

The term "cable" is used throughout the Article without being defined. This Proposal corrects this omission and provides a definition parallel with 800.2.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.

The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.

Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-245 Log #41 NEC-P16 **Final Action: Accept in Principle**
(820.2. CATV Raceway)

Submitter: Stanley Kaufman, Cable Safe Inc.
Recommendation: Revise as follows:

<u>**CATV Raceway.** A raceway designed for enclosing and routing listed CATV cables.</u>

<u>FPN: See Article 100 for a definition of raceway.</u>

Substantiation: Optical Fiber Raceway is defined in Article 770. CATV raceway should be defined too.

Panel Meeting Action: Accept in Principle

Add new definition to 820.2 as follows:

<u>CATV Raceway. A raceway for enclosing and routing CATV cables.</u>

<u>FPN: See Article 100 for a definition of raceway.</u>

Panel Statement: Added new definition.

Removed "design", as specification does not belong in a definition.

Removed "listed", as specification does not belong in a definition per NEC Manual of Style.

The change meets the submitter's intent.

Number Eligible to Vote: 15
Ballot Results: Affirmative: 12 Negative: 3
Explanation of Negative:

HUGHES, R.: The Panel action should have been to "reject". The definition for "Optical Fibers Raceway" was created specifically to define Innerduct. Innerduct is used only for Optical Fibers and nothing else. The definition of "raceway" in Article 100 is adequate and there is nt reason to create a specific definition "Communication Raceway".

JENSEN, R.: Propose to remove the FPN from the definition, thereby extending the committee action of "Accept in Principle".

CMP 16 accepted proposal 16-5 to harmonize 770.2, 800.2, 820.2, and 830.2 by including a normative reference to "See Article 100". Adding a FPN to again "See Article 100" is redundant, especially since this FPN will be a few lines down from the identical wording in normative text. Additionally, the 2003NEC Style Manual specifically states to avoid redundant use of references.

OHDE, H.: This definition would require that any raceway that is used for enclosing and routing CATV cables be listed to the requirements shown 820.182. This section states "CATV raceways shall be listed in accordance with 820.182(A) through 820.182(C)." There are metal raceways, for example, that are allowed to enclose communications cables but are not required to be listed plenum raceways or riser raceways. These listings are typically for nonmetallic raceways.

In addition, Section 90.1(C) of the NEC states " *This Code is not intended as a design specification or an instruction manual for the untrained persons* ." The addition of the FPN referencing Article 100 for the definition of raceway is not needed nor warranted. A trained installer will know the Code content and how the Code book is to be used.

16-246 Log #757 NEC-P16 **Final Action: Accept in Principle**
(820.2.CATV Raceway (New))

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Add the following definition:

<u>**CATV Raceway.** A raceway designed for enclosing and routing listed CATV coaxial cables.</u>

Substantiation: This proposal is technical. (Task Group No. 820-03)

Optical fiber raceway is defined in article 770. This proposal will add a parallel definition in article 820. A similar definition is needed here.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.

The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.

Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 16-245.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:

HUGHES, R.: The Panel action should have been to "reject". The definition for "Optical Fibers Raceway" was created specifically to define Innerduct. Innerduct is used only for Optical Fibers and nothing else. The definition of "raceway" in Article 100 is adequate and there is no reason to create a specific definition "Communication Raceway".

OHDE, H.: See my Explanation of Negative on Proposal 16-245.

16-247 Log #24 NEC-P16 **Final Action: Reject**
(820.2. Concealed Space)

Submitter: Stanley Kaufman, Cable Safe Inc.
Recommendation: Revise as follows:

Concealed Space. That portion(s) of a building behind walls, over suspended ceilings, in pipe chases, attics, and in whose size might normally range from 44.45 mm (1 3/4 in.) stud spaces to 2.44 m (8 ft) interstitial truss spaces and that might contain combustible materials such as building structural members, thermal and/or electrical insulation, and ducting. <u>[NFPA 96:3.3.42.1]</u>

Substantiation: The term concealed space is used in 820.154(A). This definition is an extract from NFPA 96, Standard for Ventilation Control and Fire Protection of Commercial Cooking Operations. It is the only definition of concealed space in the NFPA Glossary.

Panel Meeting Action: Reject
Panel Statement: The definition may involve combustible material in environmental air spaces and, therefore, may fall under the Standards Council Decision 05-24 (SC #05-7-4).

The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:

OHDE, H.: We agree with panel action and believe that the panel statement should also reflect the latest NFPA 13 Technical Committee actions since the submitter is trying to define the term "concealed spaces". We would like to add that NFPA 13 just completed their balloting process for the 2006 NFPA 13 Standard. The Technical Committee on Sprinkler Installation submitted a comment on Proposal 13-284.

This comment reworded proposed A.8.14.1.2.1 to read " *Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc…can be present in concealed* *spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1) For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined* ."

In the NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

16-248 Log #1858 NEC-P16 **Final Action: Accept in Principle**
(820.2.Exposed (to Accidental Contact))

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industry Solutions
Recommendation: Revise the definition of "Exposed" as follows:
" **Exposed** **(to Accidental Contact)** . ~~An exposed cable is one that is~~ A circuit in such a position that, in case of failure of supports ~~and~~ or insulation, contact with another circuit may result."
Substantiation: The proposed revision clarifies the term "Exposed" as used in Article 820 to indicate possible contact with another circuit, as opposed to the definitions of "Exposed" contained in Article 100, i.e., live parts or wiring methods. The style used to differentiate the term is identical to that of Article 100 for consistency. The word "and" is deleted and replaced by the word "or" as either of the conditions, failure of supports or failure of insulation, may result in accidental contact. Replacing of the phrase "An exposed cable is one that is" with the phrase "A circuit" provides a consistent definition throughout Articles 770, 800, 820 and 830. This is a companion proposal to 770.2, 800.2 and 830.2.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 16-249.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-249 Log #1938 NEC-P16 **Final Action: Accept**
(820.2.Exposed (to Accidental Contact))

Submitter: Stanley D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Revise the definition of "Exposed" as follows:
"Exposed (to Accidental Contact). ~~An exposed cable is one that is~~ A circuit in such a position that, in case of failure of supports ~~and~~ or insulation, contact with another circuit may result."
FPN: See Article 100 for two other definitions of Exposed.
Substantiation: This proposal is a clarification. (Task Group No. 820-03A)
It clarifies the term "Exposed" as used in Article 820 to indicate possible contact with another circuit, as opposed to the definitions of "Exposed" contained in Article 100, i.e., live parts or wiring methods. The style used to differentiate the term is identical to that of Article 100 for consistency. The text was also changed to clarify that it is the circuit that is exposed rather than just the cable. The word "and" is deleted and replaced by the word "or" as either of the conditions, failure of supports or failure of insulation, may result in accidental contact. This is a companion proposal to those submitted for 770.2; 800.2; and 830.2 and provides consistency and correlation in the definition of "exposed" across 770; 800; 820 and 830.
This is one of a group of proposals prepared by the CMP 16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related articles such that similar requirements are stated the same way in each article;
3) make the articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand sections.
The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-250 Log #39 NEC-P16 **Final Action: Accept in Principle**
(820.2. Point of Entrance)

Submitter: Stanley Kaufman, Cable Safe Inc.
Recommendation: Revise as follows:
Point of Entrance. The point within a building at which the cable emerges from an external wall, from a concrete floor slab, or from a rigid metal conduit (Type RMC) or an intermediate metal conduit (Type IMC) grounded to an electrode in accordance with 820.100(B).
FPN: See 342.2 for a definition of Intermediate Metal Conduit (Type IMC).
FPN: See 344.2 for a definition of Rigid Metal Conduit (Type RMC).
Substantiation: The addition of a fine print notes pointing installers to the definitions of intermediate metal conduit and rigid metal conduit will help installers who are not Code experts. Use of the type designations will promote consistency throughout the code.
Panel Meeting Action: Accept in Principle
The panel accepts the submitter's proposal with the following revisions:
Number FPNs as follows:
FPN No. 1: See 342.2 for a definition of Intermediate Metal Conduit (Type IMC).
FPN No. 2: See 344.4 for a definition of Rigid Metal Conduit (Type RMC).
Panel Statement: Multiple FPNs are required to be numbered.
See panel action on Proposal 16-251.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
OHDE, H.: This proposal should be rejected. Section 90.1 (C) of the NEC states " *This Code is not intended as a design specification or an instruction manual for the untrained persons* ." The addition of the two FPN's referencing the definitions of IMC raceway in 342.2 and RMC raceway in 344.4 is not needed nor warranted. In the submitter's substantiation he states these Fine Print Notes will help installers who are not Code experts. A trained installer will know the Code content and how the Code book is to be used.
Comment on Affirmative:
JENSEN, R.: The panel action regarding FPN No. 2 for Rigid Metal Conduit should refer to 344.2, not 344.4.

16-251 Log #756 NEC-P16 **Final Action: Accept in Principle**
(820.2. Point of Entrance)

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Add the term "coaxial" to the definition as shown:
Point of Entrance. The point within a building at which the coaxial cable emerges from an external wall, from a concrete floor slab, or from a rigid metal conduit or an intermediate metal conduit grounded to an electrode in accordance with 820.100(B).
Substantiation: This proposal is a clarification, (Task Group No. 820-02)
It is one of a series of proposals to clarify that Article 820 deals with "coaxial" cable. Adding the word "coaxial" adds clarity to the section for the code user.
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.
Panel Meeting Action: Accept in Principle
Change 820.2 Point of Entrance to read as follows:
Point of Entrance. The point within a building at which the coaxial cable emerges from an external wall, from a concrete floor slab, or from a rigid metal conduit (Type RMC) or an intermediate metal conduit (Type IMC) ~~grounded~~ connected by a grounding conductor to an electrode in accordance with 820.100(B).
FPN No 1: See 342.2 for a definition of Intermediate Metal Conduit (Type IMC).
FPN No.2: See 344.4 for a definition of Rigid Metal Conduit (Type RMC).
Panel Statement: The text inserted by the panel, "connected by a grounding conductor," provides for editorial consistency across Articles 770, 800, 820, and 830.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
OHDE, H.: See my Explanation of Negative on Proposal 16-250.

16-252 Log #3662 NEC-P16 **Final Action: Reject**
(820.2 Air Duct)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Recommendation: Delete the following text:
~~**820.2 Air Duct.** A conduit or passageway for conveying air to or from heating, cooling, air conditioning, or ventilating equipment, but not including the plenum.~~
Substantiation: The term "air duct" is not used in article 820 and should not be defined in the article, as per the manual of style of the National Electrical Code.
Panel Meeting Action: Reject
Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

JENSEN, R.: We believe that the interpretation of whether being allowed to address this proposal in view of the NFPA Standard Council Long Decision 05-24 (SC #05-7-4) was misunderstood.

We agree with deleting the term "air duct" as it was evidently an oversight that it was not removed during the last code cycle. Air duct was introduced for use with "air duct cable" which was not to be used in the 2005 code. Additionally, the term is not used within Article 800. To further not using this term, in proposal 16-29, the panel revised the proposal to not use "air duct", but instead to harmonize code language by using the term "ventilation or air handling ducts".

OHDE, H.: See my Explanation of Negative on Proposal 16-239.

16-253 Log #42 NEC-P16 **Final Action: Accept**
(820.2.Abandoned Coaxial Cable, FPN (New))

Submitter: Stanley Kaufman, Cable Safe Inc.

Recommendation: Add a fine print note to the definition of Abandoned Coaxial Cable

Abandoned Coaxial Cable. Installed coaxial cable that is not terminated at equipment other than a coaxial connector and not identified for future use with a tag.

<u>FPN: See Article 100 for a definition of equipment.</u>

Substantiation: The addition of a fine print note alerting installers that equipment is defined in Article 100 will help installers who are not Code experts.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

JENSEN, R.: Propose to "Reject".

CMP 16 accepted proposal 16-5 to harmonize 700.2, 800.2, 820.2, and 830.2 by including a normative reference to "See Article 100". Adding a FPN to again "See Article 100" is redundant, especially since this FPN will be a few lines down from the identical wording in normative text. Additionally, the 2003 NEC Style Manual specifically states to avoid redundant use of references.

OHDE, H.: This proposal should be rejected. Section 90.1 (C) of the NEC states " *This Code is not intended as a design specification or an instruction manual for the untrained persons* ." In the submitter's substantiation he states this FPN will help installers who are not Code experts. The addition of the FPN referencing Article 100 for the definition of equipment is not needed nor warranted. A trained installer will know the Code content and how the Code book is to be used.

16-254 Log #758 NEC-P16 **Final Action: Accept in Part**
(820.3)

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.

Recommendation: Revise 820.3 Other Articles as follows:

820.3 Other Articles. Circuits and equipment shall comply with 820.3(A) through 820.3(G).

~~**(A) Spread of Fire or Products of Combustion.** Section 300.21 shall apply. The accessible portion of abandoned coaxial cables shall be removed.~~

~~**(B) Ducts, Plenums, and Other Air-Handling Spaces.** Section~~ <u>300.22</u> ~~, where installed in ducts, plenums, or other spaces used for environmental air, shall apply.~~

~~*Exception: As permitted in 820.154(A).*~~

<u>**(A) Hazardous (Classified) Locations.** CATV equipment installed in a location that is classified in accordance with 500.5 shall comply with the applicable requirements of Chapter 5.</u>

<u>**(B) Equipment in Other Space Used for Environmental Air** . Section 300.22(C)(2) shall apply.</u>

(C) Installation and Use . Section 110.3 shall apply.

(D) Installations of Conductive and Nonconductive Optical Fiber Cables . Article 770 shall apply.

(E) Communications Circuits. Article 800 shall apply.

(F) Network-Powered Broadband Communications Systems. Article 830 shall apply.

(G) Alternate Wiring Methods. The wiring methods of Article 830 shall be permitted to substitute for the wiring methods of Article 820.

FPN: Use of Article 830 wiring methods will facilitate the upgrading of Article 820 installations to network-powered broadband applications

Substantiation: This proposal is editorial and technical. (Task Group No. 820-04)

To correlate with other proposals from the Task Group, this proposal deletes 820.3(A) and (B).

The substantiation for deletion of (A) is that the requirements are being moved to other, more appropriate sections. The substantiation for deletion of (B) is to remove a conflict.

This proposal creates a Section on hazardous locations for Article 820 and a Section on Equipment used in other spaces for environmental air. These sections are required in Article 820. In addition, this proposal makes 820 text comparable to parallel articles in 800 and 830.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.

Panel Meeting Action: Accept in Part

Revise 820.3 to read as follows:

820.3 Other Articles. Circuits and equipment shall comply with 820.3(A) through 820.3(G).

(A) Hazardous (Classified) Locations. CATV equipment installed in a location that is classified in accordance with 500.5 shall comply with the applicable requirements of Chapter 5.

(B) Ducts, Plenums, and Other Air-Handling Spaces. Section 300.22, where installed in ducts, plenums, or other spaces used for environmental air, shall apply.

Exception: As permitted in 820.154(A).

(C) Installation and Use. Section 110.3 shall apply.

(D) Installations of Conductive and Nonconductive Optical Fiber Cables. Article 770 shall apply.

(E) Communications Circuits. Article 800 shall apply.

(F) Network-Powered Broadband Communications Systems. Article 830 shall apply.

(G) Alternate Wiring Methods. The wiring methods of Article 830 shall be permitted to substitute for the wiring methods of Article 820. FPN: Use of Article 830 wiring methods will facilitate the upgrading of Article 820 installations to network-powered broadband applications

Panel Statement: The panel accepts the submitter's deletion of subsection (A).

The panel rejects the submitter's revision of subsection (B).

The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-255 Log #3103 NEC-P16 **Final Action: Reject**
(820.3)

Submitter: Donald Hall, Corning Cable Systems

Recommendation: Revise text to read as follows:

820.3 Other Articles.

Circuits and equipment shall comply with 820.3(A) through 820.3(G).

(A) Spread of Fire or Products of Combustion. 300.21 shall apply. ~~The accessible portion of a~~ Abandoned network-powered broadband coxial cables shall be removed.

Also, add the following FPN to 820.3(A):

<u>FPN: ANSI/NECA/BICSI 568-2001, Standard for Installing Commercial Building Telecommunications Cabling, and other industry standards provide recommended cable installation practices which facilitate the eventual removal of cables as they become abandoned.</u>

Substantiation: Abandoned cable should be removed to reduce unnecessary accumulation of fuel load and promote electrical safety. It is not reasonable or necessary to install cables in a manner that prevents their eventual removal.

The proposed FPN will provide useful information to architects, system designers, and installers to help minimize the cost and inconvenience of removing abandoned cable.

Panel Meeting Action: Reject
Panel Statement: The proposal would require all abandoned cable to be removed, irrespective of accessibility, presenting a compliance conundrum to installers. Without access, it is impossible to remove cables that are securely fastened without damaging the building or adjacent cables. The submitter's substantiation states: "It is not reasonable or necessary to install cables in a manner that prevents their eventual removal." However, the panel previously imposed additional securing and supporting requirements by referencing 300.11 in 820.24. Gaining access may sometimes require disassembly of part of the building. This is not the intent of the panel. The current requirement to remove only the accessible portion is reasonable. The submitter further proposes to add an FPN following 820.3(A) that is already contained in 820.24. Note that the submitter has referenced "network-powered broadband coaxial cables," which are not covered by 820.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
OHDE, H.: We concur with submitter's substantiation and believe a change of wording will ensure that are abandoned cables are remove and prevent confusion in future. We suggest that the submitter resubmit his recommendation in the 2008 ROC stage in a more appropriate section with Part 1 – General so these requirements will apply throughout the entire Article. The FPN that the submitter submitted is not required as this Standard is very basic and really does not provide enough information that is applicable to the removal of abandoned cables.

16-256 Log #1386 NEC-P16 **Final Action: Reject**
(820.3(A))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 16-257. This action will be considered by the Panel as a Public Comment.
Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Delete text concerning abandoned cables
820.3 Other Articles.
Circuits and equipment shall comply with 820.3(A) through 820.3(G).
(A) Spread of Fire or Products of Combustion. Section 300.21 shall apply. ~~The accessible portion of abandoned coaxial cables shall be removed.~~
Substantiation: The NEC is an installation standard, not a maintenance standard. Because of this, this rule should not be a part of the NEC. Furthermore, this provision does not accomplish its intent, as the code is not a retroactive document. To require abandoned cables to be removed is similar to requiring facilities to update their receptacles to the new GFCI provision every three years. With that said, the only time this rule applies is when an installer creates an abandoned cable. Also, this provision does not fall within the purpose of the NEC 90.1(A). The NEC is concerned with the hazards created from the use of electricity…this rule seems to imply that a cable with a voltage applied to it is safe, but a cable with no voltage applied to it is dangerous.
Panel Meeting Action: Reject
Panel Statement: See panel action on Proposal 16-26.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-257 Log #2809 NEC-P16 **Final Action: Accept in Part**
(820.3(A))

Submitter: Harold C. Ohde, IBEW #134
Recommendation: Revise text to read as follows:
820.3 Other Articles. No change.
(A) Spread of Fire or Products of Combustion. ~~Section~~ 300.21 <u>shall apply</u> . ~~The accessible portion of abandoned coaxial cables shall be removed.~~
Substantiation: The requirements for removal of abandoned coaxial cables would be better suited in appropriate code section within Article 820. I have submitted another proposal that would move the abandoned coaxial cables requirements to 820.24 - Mechanical Execution of Work. The abandoned coaxial cables requirements are out of place in 820.3 - Other Articles. The requirements are not part of another Article as they are part of Article 820 and are lcoated within Article 820.
The deletion of the word "Section" is an editorial change to comply the National Electrical Code Style Manual.
Similar proposals have been submitted for 640.3, 725.3, 760.3, 770.3, 800.3, and 830.3 to revise these sections as well.
Panel Meeting Action: Accept in Part
Panel Statement: The Panel accepts the part that deletes the second sentence of 820.3(A) concerning abandoned cables. The Panel rejects the proposed revisions to the first sentence.
The panel agrees that the requirement to remove abandoned cable does not belong in 820.3 and should be relocated. A direct reference to 300.21 is inappropriate, as it applies to electrical installations and not CATV (coaxial cable) installations. See panel action on Proposal 16-259 that relocates the requirement to remove abandoned cable to 820.25 (new) and restates the spread of fire requirements in CATV (coaxial cable) terms in 820.26 (new).
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
OHDE, H.: This proposal should have been accepted as originally submitted. The panel statement seems to be in conflict as it states the provisions of 300.21 will work well in the new proposed section 820.26 but not in 820.3(A) where it has always been properly located. The panel accepted the same 300.21 requirements whose concern is the spread of fire and products of combustion in hollow spaces, vertical shafts and ventilation and air- handling ducts caused by electrical installations and located them in 820.26.

16-258 Log #3010 NEC-P16 **Final Action: Reject**
(820.3(A))

Submitter: Marcelo M. Hirschler, GBH International
Recommendation: Revise text to read as follows:
820.2 Definitions.
Abandoned Coaxial Cable. Installed coaxial cable that is not terminated at equipment other than a coaxial connector and not identified for future use with a tag.
820.3 Other Articles.
Circuits and equipment shall comply with 820.3(A) through 820.3(G).
(A) Spread of Fire or Products of Combustion. Section 300.21 shall apply. ~~The accessible portion of abandoned~~ <u>Abandoned</u> coaxial cables shall be removed. <u>Removal of abandoned cables shall not damage the building structure or finish and shall not compromise the performance of adjacent wiring systems or components.</u>
Substantiation: This comment recommends a change in wording to ensure that abandoned cables are removed and to prevent confusion in future. There have been multiple proposals that would permit some cables to remain in "inaccessible spaces". This is not conducive to safe electrical practice; this the key change is the elimination of the words "the accessible portion of".
If the intent of the code-making panel was to clarify that removal of cable should not be done if such removal would damage the building, which is obviously not the intent, a second sentence can be added stating that removal of abandoned cables shall not be performed if it would damage the building structure or finish or in any way compromise the functional performance of any other wiring systems or components. This would be accomplished by the optional added sentence.
Consistent wording on removal of abandoned cables is being proposed for sections: 640.3, 725.3, 770.3, 770.154, 800.3, 800.154, 820.3, 820.154 and 830.3.
For information, see the relevant definitions in the NEC.
Accessible (as applied to equipment). Admitting close approach; not guarded by locked doors, elevation, or other effective means.
Accessible (as applied to wiring methods). Capable of being removed or exposed without damaging the building structure or finish or not permanently closed in by the structure or finish of the building.
Accessible, Readily (Readily Accessible). Capable of being reached quickly for operation, renewal, or inspections without requiring those to whom ready access is requisite to climb over or remove obstacles or to resort to portable ladders, and so forth.
Concealed. Rendered inaccessible by the structure or finish of the building. Wires in concealed raceways are considered concealed, even though they may become accessible by withdrawing them.
Isolated (as applied to location). Not readily accessible to persons unless special means for access are used.
Panel Meeting Action: Reject
Panel Statement: See panel action on Proposal 16-28.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
OHDE, H.: We concur with submitter's substantiation and believe a change of wording will ensure that are abandoned cables are remove and prevent confusion in future. We suggest that the submitter resubmit his recommendation in the 2008 ROC stage in a more appropriate section with Part 1 – General so these requirements will apply throughout the entire Article.

16-259 Log #759 NEC-P16 **Final Action: Accept in Principle**
(820.3(A), 820.25 (new) & 820.26 (new))

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal regarding what is meant by "reorder subsections of 820.3." This action will be considered by the Panel as a Public Comment.
Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Make the following changes:
~~**820.3 (A) Spread of Fire or Products of Combustion.** Section 300.21 shall apply. The accessible portion of abandoned coaxial cables shall be removed.~~
<u>**820.25. Abandoned Cables.** The accessible portion of abandoned coaxial cables shall be removed.</u>

820.26 Spread of Fire or Products of Combustion. Installations of coaxial cables and CATV raceways in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations of coaxial cables and CATV raceways through fire-resistantÐrated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating.

FPN: Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made. Building codes also contain restrictions on membrane penetrations on opposite sides of a fire-resistanceÐrated wall assembly. An example is the 600-mm (24-in.) minimum horizontal separation that usually applies between boxes installed on opposite sides of the wall. Assistance in complying with 820.26 can be found in building codes, fire resistance directories, and product listings.

Substantiation: This proposal is editorial. (Task Group No. 820-05)

The title of Section 820.3 is "Other Articles". The requirement for the removal of abandoned cables is not in another article; it is in Article 820. It is out of place in section 820.3. This proposal will move it to a new section of Article 820. Rather than refer section 300.21 requirements for the prevention of the spread of fire, it is better to have the requirements in Article 820 which should be familiar to CATV installers. The text of proposed section 820.26 is based on section 300.21 but modified to apply to CATV cables and raceways.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.

Panel Meeting Action: Accept in Principle

The panel accepts the submitter's proposal.

Reorder subsections of 820.3.

Panel Statement: The panel accepts the submitter's proposal.

Editorial changes are made to reorder subsections of 820.3.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

OHDE, H.: This proposal should be deleted in its entirety. We agree that the requirements for the removal of abandoned cables are out of place in 820.3(A) and needs to be located in another section within Part 1 –General. There are other proposed proposals with the same intent to locate the abandoned cable requirements that seem better suited and make good enforceable code.

The substantiation provided to delete 820.3(A) which contains the requirements of 300.21 is unclear. The submitter stated the proposed 820.26 is based on the requirements of 300.21. There was no substantiation submitted for this change. In addition there is no need for the FPN to be mentioned as the language in 820.3(A) clearly states the requirements of 300.21 apply. 300.21 has the identical FPN that is being proposed.

16-260 Log #2776 NEC-P16 **Final Action: Accept in Principle in Part (820.3(A), 820.25 (new) & 820.26 (new))**

TCC Action: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the panel as a public comment.

Submitter: Allen C. Weidman, The Society of the Plastics Industry, Inc.

Recommendation: Make the following changes:

~~**820.3 (A) Spread of Fire or Products of Combustion.** Section 300.21 shall apply. The accessible portion of abandoned coaxial cables shall be removed.~~

820.25. Abandoned Cables. The accessible portion of abandoned coaxial cables shall be removed.

820.26 Spread of Fire or Products of Combustion. Installations of coaxial cables and CATV raceways in hollow spaces, concealed spaces, vertical shafts and air ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations of coaxial cables and CATV raceways through fire-resistant–rated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating.

FPN No. 1: Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made. Building codes also contain restrictions on membrane penetrations on opposite sides of a fire-resistance–rated wall assembly. An example is the 600-mm (24-in.) minimum horizontal separation that usually applies between boxes installed on opposite sides of the wall. Assistance in complying with 820.26 can be found in building codes, fire resistance directories, and product listings.

FPN No. 2: FPN: See 8.14.1 of NFPA 13-2002, *Installation of Sprinkler Systems* , for requirements for sprinklers in concealed spaces containing exposed combustibles.

Substantiation: The title of Section 820.3 is "Other Articles". The requirement for the removal of abandoned cables is not in another article; it is in Article 820. It is out of place in section 820.3. This proposal will move it to a new section of Article 820. Rather than refer section to 300.21 requirements for the prevention of the spread of fire, it is better to have the requirements in Article 820 which should be familiar to CATV installers. The text of proposed section 820.26 is based on section 300.21 but modified to apply to CATV cables and raceways. For clarity, "ventilation or air-handling ducts" has been simplified by replacing it with "air ducts". Also, "concealed spaces" have been added to the list of areas requiring fire protection vigilance (hollow spaces, vertical shafts, and air ducts) to correlate with NFPA 13, *Installation of Sprinkler Systems*, which has requirements for protecting concealed spaces. A FPN is included to refer users to the NFPA 13 requirements.

Panel Meeting Action: Accept in Principle in Part

Panel Statement: The Panel accepts the submitter's deletion of 820.3(C), the addition of 820.25 (new), and the addition of 820.26 (new), but revises "air ducts" to "ventilation or air handling duct" in keeping with the existing NEC text.

See panel action on Proposal 16-259.

The panel rejects the addition of FPN No. 2 because it introduces undefined terminology. "Concealed spaces" should be adequately defined. See action on Proposals 16-13, 16-110, and 16-247 where the proposed definition was determined to be unacceptable.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

OHDE, H.: This proposal should be deleted in its entirety. We agree that the requirements for the removal of abandoned cables are out of place in 820.3(A) and needs to be located in another section within Part 1 –General. There are other proposed proposals with the same intent to locate the abandoned cable requirements that seem better suited and make good enforceable code.

The substantiation provided to delete 820.3(A) which contains the requirements of 300.21 is unclear. The submitter stated the proposed 820.26 is based on the requirements of 300.21 but modified to apply to CATV cables and raceways. There was no substantiation submitted for this change. In addition there is no need for the FPN No.1 to be mentioned as the language in 820.3(A) clearly states the requirements of 300.21 apply. 300.21 has the identical FPN that is being proposed.

We believe that the panel statement should also reflect the latest NFPA 13 Technical Committee actions. Included in the submitter's substantiation was the 2002 Section 8.14 which since has been revised. We would like to add that NFPA 13 just completed their balloting process for the 2006 NFPA 13 Standard. The Technical Committee on Sprinkler Installation submitted a comment on Proposal 13-284.

This comment reworded proposed A.8.14.1.2.1 to read " *Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc…can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1) For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined* ."

In the NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

Comment on Affirmative:

BRUNSSEN, J.: The Panel Statements refers to "deletion of 820.3(C)"; it should state "deletion of 820.3(A)".

16-261 Log #3314 NEC-P16 **Final Action: Accept in Principle in Part (820.3(A), 820.25 (new) & 820.26 (new))**

TCC Action: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the panel as a public comment.

Submitter: William E. Koffel, Koffel Assoc., Inc. / Rep. Society of the Plastics Industry

Recommendation: Make the following changes:

~~**820.3 (A) Spread of Fire or Products of Combustion.** Section 300.21 shall apply. The accessible portion of abandoned coaxial cables shall be removed.~~

820.25. Abandoned Cables. The accessible portion of abandoned coaxial cables shall be removed.

820.26 Spread of Fire or Products of Combustion. Installations of coaxial cables and CATV raceways in hollow spaces, concealed spaces, vertical shafts and air ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations of coaxial cables and CATV raceways through fire-resistant–rated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating.

FPN No. 1: Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made. Building codes also contain restrictions on membrane penetrations on opposite sides of a fire-resistance–rated wall assembly. An example is the 600-mm (24-in.) minimum horizontal separation that usually applies between boxes installed on opposite sides of the wall. Assistance in complying with 820.26 can be found in building codes, fire resistance directories, and product listings.

FPN No. 2: FPN: See 8.14.1 of NFPA 13, *Installation of Sprinkler Systems* , for requirements for sprinklers in concealed spaces containing exposed combustibles.

Substantiation: The title of Section 820.3 is "Other Articles". The requirement for the removal of abandoned cables is not in another article; it is in Article 820. It is out of place in Section 820.3. This proposal will move it to a new section of Article 820. Rather than refer section to 300.21 requirements for the prevention of the spread of fire, it is better to have the requirements in Article 820 which should be familiar to CATV installers. The text of proposed Section 820.26 is based on Section 300.21 but modified to apply to CATV cables and raceways. For clarity, "ventilation or air-handling ducts" has been simplified by replacing it with "air ducts". Also, "concealed spaces" have been added to the list of areas requiring fire protection vigilance (hollow spaces, vertical shafts, and air ducts) to correlate with NFPA 13, *Installation of Sprinkler Systems,* which has requirements for protecting concealed spaces. A FPN is included to refer users to the NFPA 13 requirements. It should be noted that the section number may need to be revised once the 2006 Edition of NFPA 13 is published.

Panel Meeting Action: Accept in Principle in Part

The panel accepts the submitter's deletion of 820.3(C), the addition of 820.25 (new) and the addition of 820.26 (new), but revises "air ducts" to "ventilation or air handling duct" in keeping with the existing NEC text. The panel accepts FPN No. 1 but rejects the addition of FPN No 2.

Panel Statement: See panel action on Proposal 16-259.

The panel rejects the addition of FPN No. 2 because it introduces undefined terminology. "Concealed spaces" should be adequately defined. See action on Proposals 16-13, 16-110, and 16-247 where the proposed definition was determined to be unacceptable.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

OHDE, H.: See my Explanation of Negative on Proposal 16-260.

Comment on Affirmative:

BRUNSSEN, J.: The Panel Statements refers to "deletion of 820.3(C)"; it should state "deletion of 820.3(A)".

16-262 Log #30 NEC-P16 **Final Action: Reject**

(820.3(B))

Submitter: Stanley Kaufman, Cable Safe Inc.

Recommendation: Delete as follows:

~~**(B) Ducts, Plenums, and Other Air-Handling Spaces.** Section~~ 300.22 ~~, where installed in ducts, plenums, or other spaces used for environmental air, shall apply.~~

~~*Exception: As permitted in 820.154(A).*~~

Substantiation: Section 820.3(B) provides no additional guidance or requirements that are not already in 820.154(A). It's redundant and perhaps confusing to send a CATV installer to section 300.22 to look for requirements that are already in Article 820. Section 800.3 does not have a similar requirement. Elimination of 820.3(B) will improve the parallelism between the articles.

Panel Meeting Action: Reject

Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"[S]o as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Number Eligible to Vote: 15

16-265 Log #760 NEC-P16 **Final Action: Reject**

(820.3(B))

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.

Recommendation: Make the following changes:

~~**(B) Ducts, Plenums, and Other Air-Handling Spaces.** Section~~ 300.22 ~~, where installed in ducts, plenums, or other spaces used for environmental air, shall apply.~~

~~*Exception: As permitted in 820.154(A).*~~

Substantiation: This is an editorial and clarification proposal. (Task Group No. 820-06)

Section 820.3(B) provides no additional guidance or requirements that are not already in 820.154(A). It conflicts with Article 820 because Article 820 requires listed coaxial cables whereas 300.22 permits various electrical power and control cables that are not permitted to be used for CATV circuits in Article 820. Section 800.3 does not have a similar requirement.

Acceptance of this proposal will make Articles 770, 800, 820 and 830 consistent and in compliance with section 3.3.5 of the NEC Style Manual, shown below:

3.3.5 Parallel Construction. Parallel construction means stating similar requirements in similar ways for greater consistency. This helps makes the *NEC* clear for users. Lack of consistency often creates confusion, causing users to ask: *Does this difference in wording represent a different requirement? Or is it simply two different ways of trying to say the same thing?* There are several kinds of parallel construction:

Organization and Numbering . If practicable, the subsections of similar articles should be numbered in the same order (see 2.4.1).

Sections. Different sections, within the same article, that reflect similar or closely related subjects, should have similar structures.

Lists. All items in a list should be parallel (that is, singular or plural, written in the same verb tense, using phrases or sentences but not a mix).

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.

Panel Meeting Action: Reject

Panel Statement: The Panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"[S]o as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-266 Log #74 NEC-P16 **Final Action: Reject**

(820.15)

Submitter: John Chamberlain, Broadband Telecommunications. LLC

Recommendation: Revise as follows:

820.15 Energy Limitations. ~~Coaxial cable shall be permitted to deliver low-energy power to equipment that is directly associated with the radio frequency distribution system if the voltage is not over 60 volts and if the current supply si from a transformer or other device that has energy limiting characteristics.~~ Coaxial drop cable under Article 820 shall not be permitted to deliver energy for the purpose of powering devices. Refer to Article 830 Network-Powered Communications Systems.

Substantiation: Ambiguity appears to exist in the 2005 NEC between Sections 820.15 and Article 830. Section 820.15 states that coaxial cable under Section 820 shall be permitted to deliver low energy power that is directly associated with the radio frequency distribution system. The voltage allowed in 820.15 is up to and including 60 volts if other conditions are met.

Section 830.1 Scope, defines a network-powered broadband communications system as communications systems that provide any combination of voice, audio, video, data, and interactive services through a network interface device. Section 830.15 Power Limitations, for Article 830, defines low powered network powered systems as 0-100 volts.

Ambiguity exists for network-powered communications systems with delivery voltages less than 60 volts. There would be no ambiguity if:

1) Section 820.15 was stricken or,

2) Section 820.15 was reworded to allow up to 60 volts except in the case supply power is delivered to an NIU per Network-Powered Communications Systems Article 830 definition or,

3) Replace 820.15 with a statement allowing no supply voltages under Article 820 and to refer to Article 830 for coaxial drop systems when supply voltages are required.

Panel Meeting Action: Reject

Panel Statement: Article 820 allows the delivery of low-energy power in order to operate amplifiers and other devices necessary to distribute "radio signals typically employed in community antenna television (CATV) systems" (quote from Article 820 scope). These applications are not Article 830 applications and should remain allowable under Article 820.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

(Note: The sequence 16-267 was not used)

16-268 Log #761 NEC-P16 **Final Action: Accept in Principle**
(820.15)

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.

Recommendation: Make the following changes:

820.15 ~~Energy~~ Power Limitations.

Coaxial cable shall be permitted to deliver ~~low~~ - ~~energy~~ power to equipment that is directly associated with the radio frequency distribution system if the voltage is not over 60 volts and if the current ~~supply~~ is supplied by ~~from~~ a transformer or other device that has ~~energy~~ power- limiting characteristics.

Substantiation: This proposal is a clarification. (Task Group No. 820-07)

The proposed wording is more descriptive and is consistent and is parallel to 830.15.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.

Panel Meeting Action: Accept in Principle

Make the following changes to 820.15:

820.15 ~~Energy~~ Power Limitations.

Coaxial cable shall be permitted to deliver power to equipment that is directly associated with the radio frequency distribution system if the voltage is not over 60 volts and if the current ~~supply~~ is supplied by ~~from~~ a transformer or other device that has ~~energy~~ power- limiting characteristics.

Power shall be blocked from premises devices on the network that are not intended to be powered via the coaxial cable.

Panel Statement: The changes meet the submitter's intent. The panel added additional requirements to complete the submitter's intent.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-269 Log #783 NEC-P16 **Final Action: Accept**
(820.21)

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.

Recommendation: Make the changes as shown:

820.21 Access to Electrical Equipment Behind Panels Designed to Allow Access.

Access to electrical equipment shall not be denied by an accumulation of ~~wires and~~ coaxial cables that prevents removal of panels, including suspended ceiling panels.

Substantiation: This proposal is editorial. (Task Group No. 820-290

It creates consistency among parallel articles and references the specific medium used in this article. Article 820 does not use "wires" so that term was removed.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.

Ballot Results: Affirmative: 15

16-271 Log #1387 NEC-P16 **Final Action: Reject**
(820.24)

Submitter: Mike Holt, Mike Holt Enterprises

Recommendation: Delete requirement to comply with 300.4(D)

800.24 Mechanical Execution of Work.

Communications circuits and equipment shall be installed in a neat and workmanlike manner. Cables installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be secured by straps, staples, hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also conform with ~~300.4(D) and~~ 300.11.

Substantiation: There is no reason to protect limited energy circuits from accidental contact with nails or screws. Limited energy circuits are considered to be inherently safe from a fire and electric shock perspective, hence the allowances of lesser wiring methods and allowances for open splicing with out boxes. The protection of these circuits is a design and/or performance issue, not a safety issue. The requirement found in the existing *Code* text does not fit into the purpose of the NEC, as addressed in 90.1(A).

Panel Meeting Action: Reject

Panel Statement: Compliance with 300.4(D) has been a Code requirement for many years, resulting in an exemplary safety record. While the submitter points out that communications circuits are energy-limited circuits and "… considered to be inherently safe from a fire and electric shock perspective", it is inappropriate and poor workmanship to permit the potential energization of nails, screws, or other construction/decorative attachment devices at any level.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-272 Log #1388 NEC-P16 **Final Action: Accept in Principle in Part**
(820.24)

Submitter: Mike Holt, Mike Holt Enterprises

Recommendation: Delete requirement to comply with 300.4(D)

820.24 Mechanical Execution of Work.

Community antenna television and radio distribution systems shall be installed in a neat and workmanlike manner. Cables installed exposed on the surface of ceiling and sidewalls shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be secured by straps, staples, cable ties , hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also conform with 300.4(D) and 300.11.

FPN: Accepted industry practices are described in ANSI/NECA/BICSI 568–2001, Standard for Installing Commercial Building Telecommunications Cabling, and other ANSI-approved installation standards.

Substantiation: This is being proposed in an effort to create uniform language with the chapter three cable wiring method support sections, specifically, 230.30(A), 330.30(A) and 334.30. Similar proposals are also being made to 725.8, 640.6, 760.8, 770.24, 800.24 and 830.24

Panel Meeting Action: Accept in Principle in Part

Change 820.24 to read as follows:

820.24 Mechanical Execution of Work. Community antenna television and radio dist ribution systems shall be installed in a neat and workmanlike manner. Cables installed exposed on the surface of ceiling and sidewalls shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be secured by listed hardware including straps, staples, cable ties , hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also conform with 300.4(D) and 300.11.

FPN: Accepted industry practices are described in ANSI/NECA/BICSI 568–2001, Standard for Installing Commercial Building Telecommunications Cabling, and other ANSI-approved installation standards.

Panel Statement: The panel does not accept deletion of 300.4(D). Compliance with 300.4(D) has been a Code requirement for many years resulting in an exemplary safety record. While the submitter points out that communications circuits are energy-limited circuits and "… considered to be inherently safe from a fire and electric shock perspective", it is inappropriate and poor workmanship to permit the potential energization of nails, screws, or other construction/decorative attachment devices at any level.

The panel basically accepts the submitter's revision to 820.24 but modified for coordination.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 11 Negative: 3 Abstain: 1

Explanation of Negative:

BOYER, J.: NEMA does not believe that all such product used for the securement of communications circuits need be listed. Code Panel 8 has steadily rejected similar proposals relating to the support of conduit and cables. UL 1565 provides requirements for listed cable ties intended for primary support of flexible conduits and cables in accordance with the NEC. Such cable ties must have a minimum loop tensile strength rating of 23 kg (50 lbs) or greater. NEMA proposes that the panel reconsider its action and ACCEPT the proposal in principle and in part with the following action. Accept the proposed addition of "cable ties" in the third sentence, reject the requirement that all such hardware be "listed", and add the following new fourth sentence. " Cable ties that provide primary support for such cables shall have a minimum loop tensile strength of 23 kg (50 lbs.)"

BRUNSSEN, J.: See my explanation of negative vote on Proposal 16-43.

DORNA, G.: See my explanation of negative vote on Proposal 16-45.

Explanation of Abstention:

KAHN, S.: Though I agree with the proposal and the submitter's intent to introduce consistency, the material is used in plenums and other air handling spaces and the proposal should be subjected to the direction given by the Standards Council relative to such proposals and rejected. The directive of the Standards Council, as interpreted, must be applied consistently.

Comment on Affirmative:

OHDE, H.: The panel statement does not reflect the recommendation submitted by the submitter.

16-273 Log #1763 NEC-P16 **Final Action: Reject**
(820.24)

TCC Action: The Technical Correlating Committee notes that neither the panel statement nor the revised statement shown in the affirmative vote are responsive to the submitter's substantiation for the recommendation. The Technical Correlating Committee directs the panel to act on the merits of the recommendation. This action will be considered by the Panel as a Public Comment.

Submitter: Percy E. Pool, Verizon NS

Recommendation: Add the following exception to 820.24:

"Exception: 300.11(C) shall not apply."

Substantiation: 300.11(C) is clearly not applicable to CATV cabling. CATV cables are typically lashed together to form a "cable assembly". This frequently occurs during modifications or additions to an existing installation. CATV cables are physically smaller, lighter and carry less voltage and current than power cables. It is overly restrictive to prohibit lashing of CATV cables together to form a cable assembly. CATV cables secured in this manner have adequate support (see 300.11(A)), are supported independently of the suspended ceiling grid, and are not likely to collapse in the event the suspended ceiling collapses. Such restriction imposes additional installation costs with no improvement in safety.

Panel Meeting Action: Reject

Panel Statement: The requirements of 300.11(C) are applicable to optical fiber cables.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

BRUNSSEN, J.: This proposal should be accepted. If the Panel continues to support the addition of the requirements of 300.11 to 820.24, then at the very least, the requirements of 300.11(C) should be waived. Section 300.11(C) is clearly not applicable to CATV cables. Installation practice is to lash CATV cables together to form a "cable assembly". This frequently occurs during modifications or additions to an existing installation. CATV cables are physically smaller and lighter than power cables and typically contain no electrical power. Application of 300.11(C) is overly restrictive and will preclude lashing of CATV cables together to form a cable assembly. CATV cables secured in this manner have adequate support (see 300.11 (A)), are supported independently of the suspended ceiling grid, and are not likely to collapse in the event the suspended ceiling collapses. Such restriction imposes additional installation costs with no improvement in safety.

JOHNSON, S.: I agree with the submitter's points in his proposal. There is no safety issue that should preclude the long-standing practice of lashing an additional CATV drop cable to an existing bundle that is already installed and supported properly where it is owned by the same entity. These cables are lightweight, and carry much less voltage and current than power cables. No evidence has been shown that this practice has not been used safely and successfully in the past and should not continue to be allowed. I vote against the Panel's action to reject.

Comment on Affirmative:

JENSEN, R.: The panel statement should read:

The requirements of 300.11 are applicable to coaxial cables.

This appears as though it was copied from another panel statement regarding optical fiber.

STENE, S.: The panel statement should be revised to state "The requirements of 300.11(C) are applicable to ~~optical fiber cables~~ community antenna television cables ."

16-274 Log #1881 NEC-P16 **Final Action: Reject**
(820.24)

TCC Action: The Technical Correlating Committee notes that neither the panel statement nor the revised statement shown in the affirmative vote are responsive to the submitter's substantiation for the recommendation. The Technical Correlating Committee directs the panel to act on the merits of the recommendation. This action will be considered by the Panel as a Public Comment.

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industry Solutions

Recommendation: In the final sentence, delete the reference to 300.11 as follows:

"The installation shall also conform with 300.4(D) ~~and 300.11~~ ."

Substantiation: The requirement added by Panel 16 during the 2005 revision cycle is overly restrictive and inappropriate for CATV and radio distribution systems. The Fine Print Note associated with 820.24 presently directs the reader to the appropriate installation practices for CATV and radio distribution systems cabling. Section 300.11 is directed toward power cable assemblies that are heavier, larger and operate at greater voltage and current levels than CATV cables. A CATV cable used for premises wiring is typically one-quarter inch in diameter contains no electrical power. Deletion of the reference to 300.11 will yield consistency throughout the NEC as Panel 3 did not see fit to adopt this reference in Articles 760 and 725.

Panel Meeting Action: Reject

Panel Statement: The requirements of 300.11 are applicable to optical fiber cables.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

BRUNSSEN, J.: This proposal should be accepted. The requirement added by Panel 16 during the 2005 revision cycle is overly restrictive and inappropriate for CATV cables. The Fine Print Note associated with 820.24 directs the reader to the appropriate installation standards. The Panel has enhanced the Fine Print Note during this cycle by the addition of three new references covering the installation of CATV cables (see Proposal 16-277). These references are all that is necessary and sufficient for such cables without imposing the burdensome requirements of 300.11. Section 300.11 is directed toward power cable assemblies that are heavier and larger than communications cables, operate at much greater power levels (CATV cables often contain no power), and present a greater risk of injury if not properly installed.

JOHNSON, S.: I agree with the submitter's points in his proposal. 300.11 deals with cables that are larger and heavier than CATV drop cables. Referencing 300.11 also creates an inconsistency with Sections 760 and 725, which deal with similar sized cables and do not make this reference. I vote against the Panel's action to reject.

Comment on Affirmative:

JENSEN, R.: The panel statement should read:

The requirements of 300.11 are applicable to coaxial cables.

This appears as though it was copied from another panel statement regarding optical fiber.

STENE, S.: The panel statement should be revised to state "The requirements of 300.11 are applicable to ~~optical fiber cables~~ community antenna television cables ."

16-275 Log #3055 NEC-P16 **Final Action: Accept in Principle in Part (820.24)**

Submitter: Harold C. Ohde, IBEW #134
Recommendation: Revise 820.24 as follows:
820.24 Mechanical Execution of Work
(A) **Neat and Workmanlike Manner.** Community television and radio distribution systems, equipment, cables and circuits shall be installed in a neat and workmanlike manner.
(B) **Installation of Coaxial Cables.** Coaxial cables installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the coaxial cables will not be damaged by normal building use. Such cables shall be secured by listed straps, staples, hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also comply with 300.4(D) and 300.11.
FPN: Accepted industry practices are described in ANSI/NECA/BICSI 568-2001, *Standard for Installing Commercial Building Telecommunications Cabling*, and other ANSI- approved installation standards.
(C) **Abandoned Coaxial Cables.** Abandoned coaxial cables shall be removed.
FPN: Accepted industry practices are described in ANSI/NECA/BICSI 568-2001, Standard for installing Commercial Building Telecommunications Cabling, and other ANSI-approved standards which provide cable installation that facilitates the removal of abandoned cables.
Substantiation: This proposal revises this section into a practical working tool which will assist in making 820.24 a clear, usable and enforceable code. Each first level subdivision contains a code rule that requires action and the required action has been presented in clear, usable and enforceable manner.
In the electrical industry, the electrician, contractor and AJH have been taught the importance and significance of the concept of mechanical execution of work. I am an electrical instructor who teaches this important concept to the people involved. This is one of the basis for 90.1(A) which serves as the purpose of this Code. The Code's purpose is to provide a safe installation from the hazards arising from the use of electricity.
The revised text in 820.24(A) will require all community antenna television and radio distribution systems, equipment, cables and circuits to be installed in a neat and workmanlike manner.
820.24(B) is an editorial change with additional language to require the means of securing and supporting to be listed for the purpose.
The addition of 820.24(C) would replace the requirements that were located in 820.3(A), 820.154(A), 820.154(B), and 820.154(D). It makes sense to have the requirements of both the installation of cable and the removal of cable in the same Code section. This would provide the proper guidance to everyone involved. The installer, contractor and the AHJ would gain from this revised section as the rules are centrally located in one Code section. If coaxial cables are installed properly then the removal of coaxial cables should be no problem if it is not needed anymore or abandoned. The proposed FPN will provide useful guidance and information to everyone involved regarding correct installation practices which would facilitate the removal of the cable as well.
Similar proposals have been submitted for 640.6, 725.8, 760.8, 770.24, 800.24, and 830.24.
Panel Meeting Action: Accept in Principle in Part
The panel accepts the incorporation of the term "listed".
The panel accepts in principle the part of the proposal that recommends relocating requirements for abandoned cable.
The panel does not accept the breaking up of 820.24 and the changes to the FPN.
Panel Statement: See panel action on Proposal 16-272, and 16-259.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 10 Negative: 4 Abstain: 1
Explanation of Negative:
BRUNSSEN, J.: See my explanation of negative vote on Proposal 16-43.
DORNA, G.: See my explanation of negative vote on Proposal 16-45.
OHDE, H.: This proposal should have been accepted in part. The FPN located after 820.24(C) is not required as this Standard is very basic and really does not provide enough information that is applicable to the removal of abandoned cables.
PREZIOSO, L.: The proposal adds a Fine Print Note (FPN) identifying an ANSI/NECA/BICSI Standard as the source for identifying accepted industry practices. While FPNs are not enforceable, referencing these standards in a FPN as a means for determining the acceptable industry standard is, at best, misleading. I fully support these standards, but on many projects these standards are not incorporated as requirements into the design or the construction of the system or the building. The owners and tenants often waive compliance with these standards as a means of reducing costs. In this situation, the installation of wires and cables cannot be completed in accordance with the standards, and it is therefore unfair to reference these standards as accepted industry practices. Accordingly, the proposal should be rejected and the FPN should not be added to the NEC.
Explanation of Abstention:
KAHN, S.: Though I agree with the proposal and the submitter's intent to introduce consistency, the material is used in plenums and other air handling spaces and the proposal should be subjected to the direction given by the Standards Council relative to such proposals and rejected. The directive of the Standards Council, as interpreted, must be applied consistently.

16-276 Log #2276 NEC-P16 **Final Action: Reject (820.24, FPN)**

Submitter: H. Brooke Stauffer, National Electrical Contractors Assn. (NECA)
Recommendation: Update the publication date of the referenced standard as follows:
FPN: Accepted industry practices are described in ANSI/NECA/BICSI 568-2006, Standard for Installing Commercial Building Telecommunications Cabling, and other ANSI-approved installation standards.
Substantiation: ANSI/NECA/BISCI 568-2001 is currently being revised, and the 2008 NEC should reference the latest edition.
ANSI/NECA/BICSI 568-2006 will be completed prior to the Public Comment deadline.
Panel Meeting Action: Reject
Panel Statement: The panel cannot act on ANSI/NECA/BICSI 568-2006 as it has not yet been issued.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
BOYER, J.: See NEMA's negative comment on Proposal 16-136.

16-277 Log #2337 NEC-P16 **Final Action: Accept in Principle (820.24, FPN)**

Submitter: James W. Romlein, MV Labs LLC / Rep. TIA
Recommendation: Add an FPN to read:
FPN: Accepted industry practices are described in:
ANSI/TIA/EIA-568-B.1 2004 - Part 1 General Requirements Commercial Building Telecommunications Cabling Standard, ANSI/TIA-569-B 2004 - Commercial Building Standard for Telecommunications Pathways and Spaces, ANSI/TIA-570-B - Residential Telecommunications Infrastructure.
(List Other Documents Here) and other ANSI-approved installation standards.
Substantiation: TIA standards contain the source specifications that drive the performance-related industry practices. These TIA documents have a long history of demonstrated successful guidance to the installation, inspection, and network ownership communities. TIA wiring standards have been recognized by the Federal Communications Commission since before 2000 as the appropriate industry standards to be used for new and revised wiring, and are encouraged to be called out in building codes. (See, "Third Report and Order" in CC Docket No. 88-57 (FCC 99-405) (2000), released January 10, 2000, and 47 CFR section 68.213(c) of the FCC Rules.)
Panel Meeting Action: Accept in Principle
Change FPN to read as follows:
FPN: Accepted industry practices are described in ANSI/NECA/BICSI 568–2001, Standard for Installing Commercial Building Telecommunications Cabling; ANSI/TIA/EIA-568-B.1 2004 - Part 1, General Requirements Commercial Building Telecommunications Cabling Standard; ANSI/TIA-569-B 2004, Commercial Building Standard for Telecommunications Pathways and Spaces; ANSI/TIA-570-B, Residential Telecommunications Infrastructure, and other ANSI-approved installation standards.
Panel Statement: The panel combined the submitter's FPN with the existing text.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
BOYER, J.: See NEMA's negative comment on Proposal 16-136.
PREZIOSO, L.: The proposal adds a Fine Print Note (FPN) identifying an ANSI/NECA/BICSI Standard as the source for identifying accepted industry practices. While FPNs are not enforceable, referencing these standards in a FPN as a means for determining the acceptable industry standard is, at best, misleading. I fully support these standards, but on many projects these standards are not incorporated as requirements into the design or the construction of the system or the building. The owners and tenants often waive compliance with these standards as a means of reducing costs. In this situation, the installation of wires and cables cannot be completed in accordance with the standards, and it is therefore unfair to reference these standards as accepted industry practices. Accordingly, the proposal should be rejected and the FPN should not be added to the NEC.

16-278 Log #3064 NEC-P16 **Final Action: Reject**
(820.24, FPN)

Submitter: Ron Alley, ELECTRICO
Recommendation: Delete the following text:
~~FPN: Accepted industry practices are described in ANSI/NECA/BICSI 568-2001, Standard for Installing Commercial Building Telecommunications Cabling, and other ANSI approved installation standards.~~
Substantiation: Numerous consensus standards from organizations such as Electronics Industry Association (EIA), Telecommunication Industry Association (TIA), Underwriters Laboratories Inc. (UL), NEMA, IEEE and IEC/ISO could be added as a Fine Print Note throughout the Code to assist the reader of the NEC as the existing FPN note does. There are just as many publications such as Telecommunications Cabling Installation, Network Cabling, Telecommunications Cable Splicing, Communications Cabling, Telecommunications Internetworking and too many others to mention, that could be listed in a FPN that would benefit the reader. Also, there are safety regulations, pertaining to telecommunication systems such as OSHA 1910 and OSHA 1926 that could be added as a Fine Print Note to assist readers to make their companies and workers safer. Adding a Fine Print Note for the purpose of informing the reader of all related standard and publications would be cumbersome. The NEC should list all prominent standards and publications in a FPN or it should list none.

The particular standard mentioned in the FPN, (ANSI/NECA/BICSI 568-2001 (Installing Commercial Building Telecommunications Cabling) contains only 46 pages. The Standard mentioned in the FPN is very basic. It lists only a small percentage of the terminations used in the industry. Also, only a limited number of communications cables are shown and their limitations are not discussed. The standard does not contain enough information to be used as stand alone document without the use of other standards and text books that are not mentioned in the FPN. In my opinion, the ANSI standard listed in the FPN should never be used instead of manufacturer’s instructions.

Manufacturer’s instructions are sometimes required to be included as a condition of listing or labeling of telecommunications equipment and are sent with the listed or labeled products or can be requested from the manufacturer prior to installation. Manufacturer’s instructions are updated as needed to keep up with product improvements. The FPN in the 2005 Code most likely will not be as up-to-date as the manufacturer’s instructions.

If the committee decides to keep the FPN, please consider modifying the FPN as follows:

“ANSI/NECA/BICSI 568-2001 Standard for Installing Commercial Building Telecommunications Cabling is one source of many that can be used with manufacturer instructions.”

Panel Meeting Action: Reject
Panel Statement: The references provided in the FPN provide guidance for installation in a neat and workmanship like manner.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
OHDE, H.: This proposal should have been accepted. The submitter substantiates that there are numerous consensus standards from reputable organization that also could be added to assist the reader of the NEC as existing FPN do. The ANSI/NECA/BICSI 568-2001 Standard is also a very basic and non-informative document that does not provide much guidance to the installer.

PREZIOSO, L.: The proposal removes a Fine Print Note (FPN) identifying an ANSI/NECA/BICSI Standard as the source for identifying accepted industry practices. While FPNs are not enforceable, referencing these standards in a FPN as a means for determining the acceptable industry standard is, at best, misleading. I fully support these standards, but on many projects these standards are not incorporated as requirements into the design or the construction of the system or the building. The owners and tenants often waive compliance with these standards as a means of reducing costs. In this situation, the installation of wires and cables cannot be completed in accordance with the standards, and it is therefore unfair to reference these standards as accepted industry practices. Accordingly the proposal should be accepted and the FPN should be removed.

16-279 Log #56 NEC-P16 **Final Action: Accept in Principle**
(820.25 (New), 820.26 (New) & 820.3(A))

Submitter: Stanley Kaufman, Cable Safe Inc.
Recommendation: Revise as follows:
<u>820.25 Abandoned Cables. The accessible portion of abandoned coaxial cables shall be removed.</u>
<u>FPN: See Article 100 for a definition of “accessible.”</u>
<u>820.26 Spread of Fire or Products of Combustion. Installations of coaxial cables and CATV raceways in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations of coaxial cables and CATV raceways through fire-resistant-rated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating.</u>
<u>FPN: See Article 100 for the definition of “approved”.</u>
~~820.3(A) Spread of Fire or Productions of Combustion. Section 300.21 shall apply. the accessible portion of abandoned coaxial cables shall be removed.~~
Substantiation: The title of 820.3 is “Other Articles”. The requirement for the removal of abandoned cables is not in another article; it is in Article 820. It is out of place in 820.3. This proposal will move it to a new section of Article 820. Rather than refer to 300.21 requirements for the prevention of the spread of fire, it is better to have the requirements in Article 820 which should be familiar to CATV installers. The text of proposed 820.26 is based on 300.21, but modified to apply to coaxial cables and CATV raceways. The fine print notes pointing to definitions are intended to assist installers who are not code experts and may not be aware of Article 100. The fine print note in 300.21 was not copied because it does not provide sufficient guidance for a CATV cable installer.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 16-259.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
OHDE, H.: This proposal should be deleted in its entirety. We agree that the requirements for the removal of abandoned cables are out of place in 820.3(A) and needs to be located in another section within Part 1 –General. There are other proposed proposals with the same intent to locate the abandoned cable requirements that seem better suited and make good enforceable code.

The substantiation provided to delete 820.3(A) which contains the requirements of 300.21 is unclear. The submitter stated the proposed 820.26 is based on the requirements of 300.21 but modified to apply to coaxial cables and CATV raceways. There was no substantiation submitted for this change.

In addition, Section 90.1 (C) of the NEC states “ *This Code is not intended as a design specification or an instruction manual for the untrained persons* .” In the submitter’s substantiation he states these FPN’s will help installers who are not Code experts. The addition of the FPN following 820.25 referencing Article 100 for the definition of accessible the FPN following 820.26 referencing Article 100 for the definition of approved is not needed nor warranted. A trained installer will know the Code content and how the Code book is to be used.

16-280 Log #2665 NEC-P16 **Final Action: Accept in Principle in Part**
(820.30)

Submitter: Robert W. Jensen, dbi / Rep. BICSI, A Telecommunications Association
Recommendation: Consolidated from various areas to a new section:
<u>**800.30 Abandoned Cables.** The accessible portion of abandoned coaxial cables shall be removed.</u>
Remove wording in 820.3(A) “The accessible portion of abandoned coaxial cables shall be removed.”
Remove wording in 820.154(A), “Abandoned cables shall not be permitted to remain.”
Remove wording in 820.154(B)(1), “Abandoned cables shall not be permitted to remain.”
Substantiation: The title of Section 820.3 is “Other Articles”. The requirement for the removal of abandoned cables is not in another article; it is in Article 820. It is out of place in section 820.3. This proposal will move it to a new section of Article 820. The deletion of the requirements to remove abandoned cable in 820.154(A) and (B) corrects an error.
Panel Meeting Action: Accept in Principle in Part
The panel accepts the change pertaining to 820.3(A).
The panel accepts in principle the recommendation to move the abandoned cable requirements. See panel action on Proposal 16-259.
The panel rejects the submitter’s action on 820.154(A) and accepts the change to 820.154(B)(1). See panel action on Proposal 16-333.
Panel Statement: See Proposals 16-259 and 16-333.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
OHDE, H.: We agree with the submitter’s intent to locate all abandoned cable requirements to a new section in Part 1- General within the Article. Part 1- General applies to the entire article and therefore would reduce the confusion. We believe that not just the accessible portion of abandoned cables but all abandoned cables be removed to reduce the fuel load.

16-281 Log #764 NEC-P16 **Final Action: Accept**
(820.44)

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Add the term “coaxial” as shown:
II. <u>Coaxial</u> Cables Outside and Entering Buildings
820.44 Overhead <u>Coaxial</u> Cables.
(B) Lead-in Clearance. Lead-in or aerial-drop <u>coaxial</u> cables from a pole or other support, including the point of initial attachment to a building or structure, shall be kept away from electric light, power, Class 1, or nonÐpower-limited fire alarm circuit conductors so as to avoid the possibility of accidental contact.

(C) On Masts. Aerial coaxial cables shall be permitted to be attached to an above-the-roof raceway mast that does not enclose or support conductors of electric light or power circuits.

(D) Above Roofs. C oaxial c ables shall have a vertical clearance of not less than 2.5 m (8 ft) from all points of roofs above which they pass.

(E) Between Buildings. C oaxial c ables extending between buildings and also the supports or attachment fixtures shall be acceptable for the purpose and shall have sufficient strength to withstand the loads to which they may be subjected.

Exception: Where a coaxial cable does not have sufficient strength to be self-supporting, it shall be attached to a supporting messenger cable that, together with the attachment fixtures or supports, shall be acceptable for the purpose and shall have sufficient strength to withstand the loads to which they may be subjected.

(F) On Buildings. Where attached to buildings, coaxial cables shall be securely fastened in such a manner that they will be separated from other conductors in accordance with 820.44(F)(1), (F)(2), and (F)(3).

Substantiation: This proposal is a clarification. (Task Group No. 820-09)

It is part of a series of proposals to clarify that Article 820 deals with "coaxial" cable. Adding the word "coaxial" adds clarity to the section for the code user.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-282 Log #765 NEC-P16 **Final Action: Accept in Principle**
(820.47)

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.

Recommendation: Add the sentence as shown:

820.47. Underground Circuits Entering Building. Underground coaxial cables entering buildings shall comply with 820.47(A) and 820.47(B).

Change the title of (A) as follows:

(A) ~~Underground Systems.~~ With Electric Light and Power Conductors.

Substantiation: This proposal is editorial. (Task Group No. 820-10)

It proposes wording parallel to that in Article 800 and properly describes the requirements of the Section and the title change also parallels that of Article 800 and is more descriptive of the paragraph.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.

Panel Meeting Action: Accept in Principle

Accept the submitter's proposal with the following revisions:

In the title of 820.47, make "Building" plural as in 2005 NEC text.

In proposed new title of 820.47(A), delete the period following "Systems".

Panel Statement: These changes reflect the 2005 NEC existing text and provide a correction to punctuation.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-283 Log #766 NEC-P16 **Final Action: Accept in Principle**
(820.48 (New) & 800.113 Exception No. 2)

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.

Recommendation: Make the following changes:

820.48. Unlisted Cables Entering Buildings. ÊUnlisted outside plant coaxial cables shall be permitted in building spaces other than risers, air ducts, plenums and other spaces used for environmental air, where the length of the cable within the building, measured from its point of entrance, does not exceed 15 m (50 ft) and the cable enters the building from the outside and is terminated at a grounding block.

FPN No. 1: This section limits the length of unlisted outside plant cable to 15 m (50 ft), while 820.93 requires that the outer conductive shield of the coaxial cable be grounded at the building premises as close to the point of cable entrance or attachment as practicable. Therefore the outside plant coaxial cable may not be permitted to extend 15 m (50 ft) into the building if it is practicable to ground the outer conductive shield closer than 15 m (50 ft) to the entrance point.

FPN No, 2: See 820.2 for the definition of point of entrance.

FPN No. 3: See 820.2 for the definition of air duct.

FPN No. 4: See Article 100 for the definition of plenum.

FPN No. 5: See 300.22(C) for information on other space used for environmental air.

820.113, *Exception No. 2: As permitted in 820.48.* ~~*Listing and marking shall not be required where the length of the cable within the building, measured from its point of entrance, does not exceed 15 m (50 ft) and the cable enters the building from the outside and is terminated at a grounding block.*~~

Substantiation: This is an editorial and technical proposal. (Task Group No.820-11)

It is a companion proposal to similar proposals made for articles 770 and 800. Part II of Article 820 covers "Cables Outside and Entering Buildings". Part VI covers "Cables Within Buildings". Exception No. 2 to 820.113 deals with cables entering buildings and logically belongs in Part II.

The proposed new fine print notes 2, 3, 4 & 5 are provided to help the reader by pointing to the definitions of "point of entrance", "air duct" and "plenum" and a description of "other space used for environmental air". New fine print note 1 is provides useful information for simultaneously complying with the 50 foot rule and the requirement for grounding. It is similar to the fine print note No. 2 to Exception No.2 in 800.113.

The technical portion is a requirement prohibiting outside plant cables from running in risers or in the air distribution system; thereby correcting an omission in the current code.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action on Proposal 16-284.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-284 Log #27 NEC-P16 **Final Action: Accept in Principle**
(820.48 (New) & 800.113, Exception No. 2)

Submitter: Stanley Kaufman, Cable Safe Inc.

Recommendation: Revise as follows:

820.48. Unlisted Cables Entering Buildings. Unlisted outside plant coaxial cables shall be permitted in building spaces other than risers, air ducts, concealed spaces, plenums and other spaces used for environmental air, where the length of the cable within the building, measured from its point of entrance, does not exceed 15 m (50 ft) and the cable enters the building from the outside and is terminated at a grounding block.

FPN No. 1: This section limits the length of unlisted outside plant cable to 15 m (50 ft), while 820.93 requires that the outer conductive shield of the coaxial cable be grounded at the building premises as close to the point of cable entrance or attachment as practicable. Therefore the outside plant coaxial cable may not be permitted to extend 15 m (50 ft) into the building if it is practicable to ground the outer conductive shield closer than 15 m (50 ft) to the entrance point.

FPN No, 2: See 820.2 for the definition of point of entrance.

FPN No. 3: See 820.2 for the definition of air duct.

FPN No. 4: See Article 100 for the definition of plenum.

FPN No. 5: See 300.22(C) for information on other space used for environmental air.

820.113, *Exception No. 2: As permitted in 820.48.* ~~*Listing and marking shall not be required where the length of the cable within the building, measured from its point of entrance, does not exceed 15 m (50 ft) and the cable enters the building from the outside and is terminated at a grounding block.*~~

Substantiation: Part II of Article 820 covers "Cables Outside and Entering Buildings". Part VI covers "Cables Within Buildings". Exception No. 2 to 820.113 deals with cables entering buildings and logically belongs in Part II.

In addition to editorially changing the exception to positive language and moving it to Part II, this proposal deals with the issue of the fire hazard of unlisted outside plant cables in buildings. Unlisted outside plant entrance cables are sometimes run in risers, air ducts, concealed spaces and plenums. When the 50-foot exemption for outside plant cable was adopted, it was assumed that the entrance cable would go into an equipment room. It was not envisioned that the unlisted cable, which is not fire resistant, would run up a riser, in an air duct, in concealed spaces, or a plenum. The proposed new fine print notes 2, 3, 4 & 5 are provided to help the reader by pointing to the definitions of "point of entrance", "air duct" and "plenum" and a description of "other space used for environmental air". New fine print note 1 is provides useful information for simultaneously complying with the 50 foot rule and the requirement for grounding. It is similar to the fine print note No. 2 to Exception No.2 in 800.113.

Panel Meeting Action: Accept in Principle

The panel accepts the submitter's proposal with the following revisions:

820.48 to read as follows:

820.48. Unlisted Cables Entering Buildings. Unlisted outside plant coaxial cables shall be permitted to be installed in locations as described in 820.154(D), where the length of the cable within the building, measured from its point of entrance, does not exceed 15 m (50 ft) and the cable enters the building from the outside and is terminated at a grounding block.

Delete FPNs 3, 4, and 5.

Change 820.113 Exception No. 2 to be Exception.

Panel Statement: The panel made changes to the submitter's text to correlate with the language in the remainder of the article.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-285 Log #600 NEC-P16 **Final Action: Reject**
(820.93)

Submitter: John Chamberlain, Broadband Telecommunications. LLC
Recommendation: Revise text to read as follows:
820.93 Grounding of Outer Conductive Shield of a Coaxial Cable.
The outer conductive shield of the coaxial cable shall be grounded at the building premises as close to the point of cable entrance or attachment as practicable. Interruption of the shield with a listed device shall be allowed prior to the cable entrance as an additional measure to protect against surges entering buildings.
Substantiation: The majority of premises in the US have delivered to them multiple "utility" services. Typically these services include Power, Telephone, and Cable TV. Power is delivered with three conductors; 1) Hot-power delivered from a generator, 2) Return-a low resistance return to the generator to complete the electrical circuit in an economic fashion, and 3) Ground-for safety in the case that the return path is compromised and for providing a "common ground" in the premises for safety.
Although the NEC provides for safe distribution of power in the home, when there is an accidental code violation dangerous conditions can develop on the outer conductor of the coaxial cable that supplies typical broadband services such as Cable Television, data services, and FoIP telephony.
In the case of a "neutral crossing" or a "compromised ground" in a premises, the power delivered by the power company attempts to complete the circuit to the power generators by the lowest resistance path. In some cases, this path can be the outer conductor of a coaxial cable that is bonded to ground at both ends of the coaxial cable (bonded at the premises and the pedestal or strand). In this case, the outer conductor of the coaxial cable acts as a bonding conductor to ground at the pedestal. Currents as high as 20 amps have been measured and cable has been know to melt and drop onto homes.
I propose a change to NEC 820 to resolve this potential safety issue. I propose that an automatic resettable fuse be required in the outer conductor electrical path of the supply cable (drop cable) between the. The proposed solution would maintain a bond between the network ground and the premises ground at all times except in the case that more than an allowable current is detected on the outer conductor of the coaxial cable. At that point, the "fuse" would trip and the high current would not be on the cable of concern. An indicator of the condition should be required as part of the proposed solution, thereby alerting personnel to the safety issue present. In addition, when the fuse trips the outer conductor of the supply, or network, side would still be grounded to the network ground, and the outer conductor of the premises cable would still be grounded to the premises ground, the two would just not be bonded together for the duration of the existence of the problem. The resettable fuse would reconnect the two outer conductors automatically in the case that the issue resolved itself.
Panel Meeting Action: Reject
Panel Statement: Any device will introduce an undesirable impedance in the ground path.
Shock issues are not addressed. When in a high impedance state, there could be a dangerous voltage differential between the premises shield and equipment "grounds" and the earth ground resulting in a significant risk of electric shock. Even in the low impedance state, it is possible to have enough of a differential with current flow high enough to pose a risk of shock yet not high enough to trip the device.
Without equipotential bonding, ground potential rise issues can result in circuit damage.
Articles 770 and 800 permit installation of an interruption device; this does not seem to be a suitable insulation device.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-286 Log #767 NEC-P16 **Final Action: Accept in Part**
(820.93)

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Revise 820.93 as follows:
820.93 Grounding of the Outer Conductive Shield of ~~a~~ Coaxial ~~Cable~~ Cables Entering Buildings. The outer conductive shield of ~~the~~ coaxial ~~cable~~ cables entering buildings shall be grounded ~~at the building premises~~ as close to the point of ~~cable~~ entrance or attachment as practicable. For purposes of this section, grounding located at mobile home ……..
Substantiation: This proposal is editorial. (Task Group No. 820-12)
It provides for consistency between 770.93, 800.93, 820.93 and 830.93. This is a companion proposal to 770.93, 800.93 and 830.93.
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.
Panel Meeting Action: Accept in Part
Revise 820.93 as follows:
820.93 Grounding of the Outer Conductive Shield of ~~a~~ Coaxial ~~Cable~~ Cables . The outer conductive shield of ~~the~~ coaxial ~~cable~~ cables shall be grounded ~~at the building premises~~ as close to the point of ~~cable~~ entrance or attachment as practicable. For purposes of this section, grounding located at mobile home ……..
Panel Statement: "Entering Buildings" is inappropriate as the cable may not actually enter the building. This is removed in two places.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-287 Log #1308 NEC-P16 **Final Action: Accept**
(820.93)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 16-286. This action will be considered by the Panel as a Public Comment.
Submitter: Steven C. Johnson, Time Warner Cable / Rep. National Cable Telecommunications Association
Recommendation: Revise as follows:
820.93 Grounding of Outer Conductive Shield of a Coaxial Cable. The outer conductive shield of the coaxial cable shall be grounded at the building premises as close to the point of cable entrance or attachment as practicable.
For purposes of this section, grounding located at mobile home service equipment located ~~in sight from, and not more~~ within 9.0 (30 ft) of the exterior wall of the mobile home it serves, or at a mobile home disconnecting means grounded in accordance with 250.32 and located ~~in sight from, and not more~~ within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, shall be considered to meet the requirements of this section.
Substantiation: Improves clarity. The existing, double-negative wording is difficult to interpret. This editorial change makes the text easier to interpret and clarifies the requirements.
For purposes of grounding or bonding CATV equipment, being able to see the power disconnection point is immaterial. Where as "in sight from" may be critical for disconnecting power in an emergency, maintaining a reasonable length grounding conductor is the key in a CATV application. This proposal does not affect service equipment placement requirements. It only clarifies where the CATV grounding will be done based on where the service equipment is already placed.
Panel Meeting Action: Accept

Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
OHDE, H.: This proposal should be rejected. Section 90.1 (C) of the NEC states " *This Code is not intended as a design specification or an instruction manual for the untrained persons* ." In the submitter's substantiation he states this FPN will help installers who are not Code experts. The addition of the FPN referencing 820.2 for the definition of point of entrance is not needed nor warranted. A trained installer will know the Code content and how the Code book is to be used.

16-289 Log #73 NEC-P16 **Final Action: Accept in Principle in Part**
(820.94 (New))

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal. The first sentence in new (C) references compliance with (B)(1) and there is not a (B)(1). This action will be considered by the Panel as a Public Comment.
Submitter: John Chamberlain, Broadband Telecommunications. LLC
Recommendation: New Article 820 Section for Primary Protection.
820.XX Primary Electrical Protection.
(A) Application. Primary electrical protection shall be provided on all community antenna television and radio distribution systems that are neither grounded nor interrupted and are run partly or entirely in aerial cable not confined within a block. Also, primary protection shall be provided on all aerial or underground community antenna television and radio distribution systems that are neither grounded nor interrupted and are located within the block containing the building served so as to be exposed to lightning or accidental contact with electric light or power conductors operating at over 300 volts to ground.
(1) Fuseless Primary Protectors. Fuseless type primary protectors shall be permitted where power fault currents on all protected conductors in the cable are safely limited to a value no greater than the current-carrying capacity of the primary protector and of the primary protector grounding conductor.
(2) Fused Primary Protectors. Where the requirements listed in 820.XX(A)(1) are not met, fused type primary protectors shall be used. Fused-type primary protectors shall consist of an arrestor connected between each conductor to be protected and ground, a fuse in series with each conductor to be protected, and an appropriate mounting arrangement. Fused primary protector terminals shall be marked to indicate line, instrument, and ground, as applicable.
(B) Location. The location of the primary protector, where required, shall comply with (B)(1)
(1) A listed primary protector shall be applied on each community antenna and radio distribution cable external to the premises. The listed primary protector should be located as close as practicable to the entrance point of the cable on either side or integral to the ground block.
(C) Hazardous (Classified) Locations. The primary protector or the equipment providing the primary protection function shall not be located in any hazardous (classified) location as defined in Article 500 or in the vicinity of easily ignitable material.
Substantiation: A change in technology requires that Article 820 include a provision for "Primary Protection". Due to the advent of VoIP (Voice over Internet Protocol) delivered by Community Antenna Television and Radio Distribution Systems as per Article 820, primary protection should be required in this article. Both Article 800 Communications Circuits, and Article 830 Network-Powered Communications Circuits have requirements for "Primary Protection". Currently, Article 820 does not have this requirement.
The wiring methods for all three articles (800, 820, and 830) are similar, the only differentiation that Article 820 currently seems to have is that voice or telephone services are not delivered. Given, this current differentiation, it is understandable that primary protection only be required for telephone delivery systems because the end user equipment (a telephone headset) places personnel in very close proximity to the equipment and a potential safety hazard exists for high voltage surges such as lightning strikes.
Now that VoIP is being delivered by systems that fall under Article 820, Primary Protection should also be required in this Article. In addition, it is possible for third parties to deliver VoIP over Article 820 systems without the knowledge or approval of the carrier. Therefore, primary protection should be required on Article 820 systems whether the carrier is providing VoIP services or not.
Panel Meeting Action: Accept in Principle in Part
Add the following text to 820.93 as follows:
(C) Location. The location of the primary protector, where required, shall comply with (B)(1).
(1) A listed primary protector shall be applied on each community antenna and radio distribution cable external to the premises. The listed primary protector should be located as close as practicable to the entrance point of the cable on either side or integral to the ground block.
(D) Hazardous (Classified) Locations. Where a primary protector or equipment providing the primary protection function is used, it shall not be located in any hazardous (classified) location as defined in 500.5 or in the vicinity of easily ignitible material.
Exception: As permitted in 501.150, 502.150, and 503.150.
Panel Statement: The panel did not accept the submitter's subsection (A) because 820.93 requires grounding on all Article 820 installations. As this proposal is worded, a primary protector would never be required.
Section 820.93(B) already allows the use of such a device.
Adding the new text addresses the submitter's concern of locating protectors.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-290 Log #159 NEC-P16 **Final Action: Reject**
(820.94 (New))

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal. The first sentence in new (C) references compliance with (B)(1) and there is not a (B)(1). This action will be considered by the Panel as a Public Comment.
Submitter: Jon Spencer, J-Tech
Recommendation: Add the primary protection requirement (NEC 830.9) into Article 820.
Substantiation: Additions to the 1999 NEC publication include Article 830, to govern MSOs (Multiple Service Operators) who provided multiple services using a Network-Powered Broadband Communications Systems. NEC 830 provided guidelines for many aspects of delivering bundled services.
830.90 Primary Electrical Protection required primary protection for all network powered drop cables to protect against lightning, power crossing and other high voltage situations. Section 830.90 is significant because of the increased risk of electrical shock to the end-user due to physical contact between the telephone headset and personal body. (Reference pages 3 & 4 of article from the Maine Today newspaper which I have provided). Clearly, 830.90 is a vital safety aspect when telephone services are provided, however, the article is limited to Network-Powered Broadband Communications Systems: NEC Article 830.
Advances in VoIP technology allow MSOs and 3rd party vendors to offer residential and business telephone service that relies on home power and/or battery backup. By using home power and/or battery backup, the system falls under Article 820 and leaves the individual at an increased risk of electrical shock hazard due to the lack of primary protection requirement.
As the cable industry and 3rd party vendors continue to launch new products, like VoIP, it becomes harder to determine which customers subscribe to telephone service over cable and those who do not. Based on the uncertainty and severity of lightning and factor in the future penetration rates of VoIP technology, it is critical primary protection is added to the 2008 version Article 820. (Radio Distribution Systems)
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide text for the new section.
The submitter indicated a possible problem but did not provide proposed text to solve said problem.
Supporting material relayed accounts of lightning strike damage but did not identify the path taken by the lightning.
The substantiation does not show that present grounding requirements are insufficient or that adding a protector would add safety over present requirements.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

(Note: The sequence 16-291 was not used)

16-292 Log #1311 NEC-P16 **Final Action: Accept**
(820.100)

Submitter: Steven C. Johnson, Time Warner Cable / Rep. National Cable Telecommunications Association
Recommendation: Revise as follows:
820.100 Cable Grounding. ~~Where required by 820.93, t~~ T he shield of the coaxial cable shall be grounded as specified in 820.100(A) through 820.100(D).
Substantiation: Prior to 2002, the NEC listed criteria where grounding was required, such as exposure to lightning, exposure to accidental contact with power conductors, etc. The 2002 code removed these qualifications and just specified that the shield be grounded. Since 820.93 requires grounding without exception, the phrase "Where required by 820.93" is redundant.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-293 Log #3510 NEC-P16 **Final Action: Reject**
(820.100)

Submitter: Paul Dobrowsky, Holley, NY
Recommendation: Revise as Follows:
820.100 Cable Grounding. Where required by 820.93, the shield of the coaxial cable shall be grounded as specified in 820.100(A) through 820.100(D).
(A) Grounding Electrode Conductor.
(1) Insulation. The grounding electrode conductor shall be insulated and shall be listed as suitable for wet locations ~~the purpose~~ .
(2) Material. The grounding electrode conductor shall be copper or other corrosion-resistant conductive material, stranded or solid.
(3) Size. The grounding electrode conductor shall not be smaller than 14 AWG. It shall have a current-carrying capacity approximately equal to that of the outer conductor of the coaxial cable. The grounding electrode conductor shall not be required to exceed 6 AWG.

(4) Length. The grounding electrode conductor shall be as short as practicable. In one- and two-family dwellings, the grounding electrode conductor shall be as short as practicable, not to exceed 6.0 m (20 ft) in length.

FPN: Similar grounding electrode conductor length limitations applied at apartment buildings and commercial buildings will help to reduce voltages that may be developed between the building's power and communications systems during lightning events.

Exception: In one- and two-family dwellings where it is not practicable to achieve an overall maximum grounding electrode conductor length of 6.0 m (20 ft), a separate ~~ground~~ grounding connection as specified in 250.52(A)(5), (A)(6), or (A)(7) shall be used, the grounding electrode conductor shall be grounded ~~to the separate ground~~ in accordance with 250.70, and ~~the separate ground~~ bonded to the power grounding electrode system in accordance with 820.100(D).

(5) Run in Straight Line. The grounding electrode conductor shall be run to the grounding electrode in as straight a line as practicable.

(6) Physical Protection. Where subject to physical damage, the grounding electrode conductor shall be adequately protected. Where the grounding e lectrode conductor is run in a metal raceway, both ends of the raceway shall be bonded to the grounding electrode conductor or the same terminal or electrode to which the grounding electrode conductor is connected.

(B) Electrode. The grounding electrode conductor shall be connected in accordance with 820.100(B)(1) and (B)(2).

(1) In Buildings or Structures with Grounding Means. To the nearest accessible location on the following:

(1) The building or structure grounding electrode system as covered in 250.50

(2) The grounded interior metal water piping system, within 1.52 m (5 ft) from its point of entrance to the building, as covered in 250.52

(3) The power service accessible means external to enclosures as covered in 250.94

(4) The metallic power service raceway

(5) The service equipment enclosure

(6) The service, system, building or structure grounding electrode conductor or the grounding electrode conductor metal enclosure, or

(7) The grounding electrode conductor or the grounding electrode of a building or structure disconnecting means that is grounded to an electrode as covered in 250.32

(2) In Buildings or Structures Without Grounding Means. If the building or structure served has no grounding means, as described in 820.100(B)(1):

(1) To any one of the individual electrodes described in 250.52(A)(1), (A)(2), (A)(3), (A)(4); or,

(2) If the building or structure served has no grounding means, as described in 820.100(B)(1) or (B)(2)(1), to an effectively grounded metal structure or to any one of the individual electrodes described in 250.52(A)(5), (A)(6), and (A)(7).

(C) Electrode Connection. Connections to grounding electrodes shall comply with 250.70.

(D) Bonding of Electrodes. A bonding jumper not smaller than 6 AWG copper or equivalent shall be connected between the community antenna television system's grounding electrode and the power grounding electrode system at the building or structure served where separate electrodes are used.

Exception: At mobile homes as covered in 820.106.

FPN No. 1: See 250.60 for use of air terminals (lightning rods).

FPN No. 2: Bonding together of all separate electrodes limits potential differences between them and between their associated wiring systems.

Substantiation: The concept of listed for the purpose needs to be explained. If being suitable for a wet location is not the intent, then please describe what is.

The term grounding conductor should be replaced with grounding electrode conductor. A proposal was submitted to Article 100 to modify the existing definition of grounding electrode and to delete the term grounding conductor. to clarify this issue. The Term Grounding conductor is sometimes used to describe a connection to the earth and other times to describe any of the different types of conductors that use the term "grounding". Separate grounding electrodes are already required to be bonded together by 250.50.

Describing what listed for the purpose will improve usablity.

Panel Meeting Action: Reject

Panel Statement: The term "grounding electrode conductor" specifically applies to the conductor that connects the grounding electrode(s) to the equipment grounding conductor or to the grounded conductor, or both at the electric service to the building. The conductor connecting the metallic members of the cable sheath and the primary protector grounding terminal to the building grounding means is not a "grounding electrode conductor", but a "grounding conductor" as determined by the TCC Grounding & Bonding Task Group.

The listing of a grounding electrode conductor does not include a special investigation for a wet location.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-294 Log #847 NEC-P16 **Final Action: Reject**
(820.100(A)(1))

Submitter: Michael J. Johnston, Plano, TX

Recommendation: Revise text to read as follows:

820.100 Cable Grounding.

Where required by 820.93, the shield of the coaxial cable shall be grounded as specified in 820.100(A) through 820.100(D).

(A) Grounding Conductor

(1) Insulation. The grounding conductor shall be insulated and shall be listed and marked as a grounding protector wire. ~~as suitable for the purpose.~~

Substantiation: Under the category KDER and the UL White Book, Protector Grounding wires are addressed. The guide card information indicates that this wire is required to be marked with the manufacturer's name, size, and the words "protector grounding wire". In step with the directives to address the term listed or listed as suitable for the purpose, this proposal is an effort to be more specific in the rule to require a conductor specifically listed and marked for this purpose.

Panel Meeting Action: Reject

Panel Statement: There is nothing special about the conductor used to ground the protector. The communications industry has used listed wire to ground the protector universally and safely for many years. There is no need to specifically mark this conductor "as a grounding protector wire". Such marking may lead to confusion and misinterpretation. The submitter has demonstrated no safety issue with the present practice.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-295 Log #851 NEC-P16 **Final Action: Accept**
(820.100(A)(1))

Submitter: Michael J. Johnston, Plano, TX

Recommendation: Revise text to read as follows:

820.100 Cable Grounding.

Where required by 820.93, the shield of the coaxial cable shall be grounded as specified in 820.100(A) through 820.100(D).

(A) Grounding Conductor

(1) Insulation. The grounding conductor shall be insulated and shall be listed. ~~as suitable for the purpose.~~

Substantiation: Listed insulated conductors are currently being used for this purpose and there doesn't appear to be insulated conductors listed specifically for the purpose of accomplishing the grounding required by this section.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-296 Log #905 NEC-P16 **Final Action: Reject**
(820.100(A)(3))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: (A)(3) revise second sentence:

It shall have a current-carrying capacity ~~approximately equal to~~ not less than that of the outer conductor of the coaxial cable

(D) A copper bonding jumper not smaller than 6 AWG ~~copper~~ or equivalent... (remainder unchanged).

Substantiation: Edit. Present wording indicates the grounding conductor is not permitted to have a current-carrying capacity greater than the outer conductor. In (D) copper appears intended, however, literal wording only requires a jumper that is not smaller than 6 AWG copper, for which 6 AWG aluminum suffices.

Panel Meeting Action: Reject

Panel Statement: The present text is clear. The bonding jumper can be "… not smaller than 6 AWG copper or equivalent …". An equivalent conductor is one with at least the same ampacity and corrosion-resistance capability and could be of different material and/or larger in size (AWG). The panel notes that the submitter did not see the necessity to revise "equivalent" in his proposals on similar requirements in 820.100(A)(3) and 830.100(D).

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-297 Log #376 NEC-P16 **Final Action: Reject**
(820.100(A)(6))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education

Recommendation: Revise text as follows:

" ~~Physical~~ Protection. Where subject to ~~physical~~ damage, the grounding conductor shall be adequately protected...".

Substantiation: Use of the word "physical" is superfluous–the intent is obvious given the context. (I leave it to the CMP whether you want to get more specific naming some source of damage such as "blows or abrasion." I also leave it to you whether to update "adequately" to something like "by a means acceptable to the AHJ.")

Submitting proposals removing the adjective "physical" may strike people as about as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every unnecessary instance, as I am attempting to do, we actually cut the NEC down by up to oh, maybe a quarter-page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.

Second, the unneeded use of "physical" not only is poor writing–look at William Zinsser's classic, On Writing Well–but is silly, and reflects a bit poorly on the Code process. When references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."

Panel Meeting Action: Reject

Panel Statement: The grounding conductor is potentially subject to multiple sources of damage: electrical, physical, and environmental. The word "physical" is necessary to specifically identify the type of damage that the section is addressing.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-298 Log #850 NEC-P16 **Final Action: Accept**

(820.100(A)(6))

Submitter: Michael J. Johnston, Plano, TX

Recommendation: Revise text to read as follows:

(6) Physical Protection. <u>The grounding conductor shall be protected where exposed to physical damage.</u> ~~Where subject to physical damage, the grounding conductor shall be adequately protected.~~ Where the grounding conductor is run in a metal raceway, both ends of the raceway shall be bonded to the grounding conductor or the same terminal or electrode to which the grounding conductor is connected.

Substantiation: Adequately is subjective in this requirement and can lead to inconsistencies. The word "adequate" is a word that is identified by the Style Manual as one to avoid in Code rules for that reason.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-299 Log #1888 NEC-P16 **Final Action: Accept**

(820.100(B))

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal with respect to the use of the word "and" in the sentence "The grounding conductor shall be connected in accordance with 820.100(B)(1), (B)(2), and (B)(3)." This action will be considered by the Panel as a Public Comment.

It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 5-20.

Submitter: Jeffrey Boksiner, Telcordia Technologies, Inc. / Rep. Alliance for Telecommunications Industry Solutions

Recommendation: Revise 820.100(B) **Cable and Primary Protector Grounding (Electrode)** as follows:

(B) Electrode. The grounding conductor shall be connected in accordance with 820.100(B)(1), ~~and~~ (B)(2) <u>and (B)(3).</u>

<u>**(1) In Buildings or Structures with an Intersystem Grounding Termination.** If the building or structure served has an intersystem grounding termination the grounding conductor shall be connected to the intersystem grounding termination.</u>

~~**(1)**~~ <u>**(2)**</u> **In Buildings or Structures with Grounding Means.** <u>If the building or structure served has no intersystem grounding termination, the grounding conductor shall be connected</u> to the nearest accessible location on the following:

....

.................Retain existing list and text.

....

~~**(2)**~~ **(3) In Buildings or Structures Without** <u>**Intersystem Grounding Termination or**</u> **Grounding Means.** If the building or structure served has no <u>intersystem grounding termination or</u> grounding means, as described in 820.100(B)(~~1~~ <u>2</u>), the grounding conductor shall be connected to either of the following:.

(1) To any one of the individual electrodes described in 250.52(A)(1), (A)(2), (A)(3), (A)(4); or,

(2) If the building or structure served has no <u>intersystem grounding termination or</u> grounding means, as described in 820.100(B)(~~1~~ <u>2</u>) or (B)(~~2~~ <u>3</u>)(1), to an effectively grounded metal structure or to any one of the individual electrodes described in 250.52(A)(5), (A)(6), and (A)(7).

Substantiation: This is one of several correlated proposals (100 Definitions, 250.95, Chapter 8 Articles) to improve the requirements related to intersystem bonding and grounding of communication systems. The intent is to create a dedicated and well-defined location for terminating the grounding conductors required in Chapter 8 Articles and 770.93. These grounding conductors also provide between communication and power systems (intersystem bonding). The proposed termination would have sufficient capacity to handle multiple communication systems (telecom, satellite, CATV) on premises. The proposed revision makes the intersystem bonding terminal the preferred destination for grounding conductor in Article 820. See the figures I have provided.

Intersystem bonding accomplished by connection of a communication grounding conductor to the power system is an important safety measure to prevent occurrences of voltages between communication system and power system. However, the existing requirements are not adequate. Bonding is becoming difficult to implement due to changes in building construction practices such as increased prevalence of flush construction and use of PVC conduits. Frequently, in new construction, the grounding electrode, the raceway and the grounding electrode conductor are hidden behind walls and not accessible for bonding connection.

Even in older construction with accessible equipment, the requirement for installation of intersystem bonding connection is subject to varying interpretation because there is not a clearly defined dedicated bonding location. The connection to the power system is sometimes haphazard. Installers are sometimes confused over where the connection should be made especially if multiple Communication Systems are present on premises.

Note: Supporting Material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-300 Log #1993 NEC-P16 **Final Action: Accept in Principle**

(820.100(B))

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal based on the placement of the recommended text as indicated in the affirmative comment. This action will be considered by the Panel as a Public Comment.

Submitter: Neil F. LaBrake, Jr., Niagara Mohawk, a National Grid Company / Rep. Edison Electric Institute-Electric Light & Power Group

Recommendation: Add these two sentences after the last sentence of 820.100(B):

<u>A device intended to provide a termination point for the grounding conductor (inter-system bonding) shall be prohibited from use when the installation of such device interferes with opening a service or metering equipment enclosure. An inter-system bonding device shall not be installed on an enclosure cover.</u>

Substantiation: Poor grounding practices by installers of CATV, telephone, satellite and other communication systems using termination devices that clamp to enclosure covers have resulted in interruption of grounding continuity. This is a companion proposal to proposals to add this requirement to 800.100(B), 810.21(F), and 830.100(B).

Panel Meeting Action: Accept in Principle

Add the following after the last sentence of 820.100(B):

A device intended to provide a termination point for the grounding conductor shall not interfere with the opening of an equipment enclosure. A bonding device shall be mounted on non-removable parts. A bonding device shall not be mounted on a door or cover even if the door or cover is non-removable.

Panel Statement: The panel accepts the intent of the submitter and has reworded the text for clarity. It is requested that the Technical Correlating Committee forward to Code-Making Panel 5 for similar action as applicable.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

BRUNSSEN, J.: The submitter's text, as modified by the Panel, should be placed following the existing text of 820.100(B)(5) rather than at the end of 820.100(B). Section 820.100(B)(5) specifically addresses connection to the service equipment enclosure and that is the issue that the submitter intended to address.

16-301 Log #1552 NEC-P16 **Final Action: Accept**

(820.100(B)(2)(2))

Submitter: Technical Correlating Committee on National Electrical Code®,

Recommendation: Delete the term "effectively" from the terms "effectively grounded" and "effectively bonded" from Articles 820 and revise text as shown for the affected NEC sections.

820.100(B)(2)(2):

(2) If the building or structure served has no grounding means, as described in 820.100(B)(1) or (B)(2)(1), ~~to an effectively grounded metal structure or~~ to any one of the individual electrodes described in 250.52(A)(5), (A)(6), and (A)(7).

Substantiation: 820.100(B)(2)(2): Here the reference to "effectively grounded metal structure" seems superfluous.

This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to delete the term "grounded, effectively" and its definition from Article 100 and other companion proposals throughout the NEC relative to this Task Group's recommendations. The substantiation of this proposal is as follows.

The term "Effectively Grounded" is used 29 times in the NEC. It appears as though in the majority of the locations where it is used, the word "grounded" or phrase "connected to an equipment grounding conductor" could be used. Other proposals are submitted to make those changes.

The 1996 NEC in Section 250.51 used the term "effective grounding path," and those concepts were incorporated in 250.2 (1999 NEC) and then expanded in 250.4(A) and (B) in the 2002 NEC. The performance criteria of grounding and bonding are currently provided in Section 250.4 and include the concepts contained in the vague definition of the term "effectively grounded."

The definition "Effectively Grounded" is very subjective and without any defined values or parameters for one to judge grounding as either "effective" or "ineffective." "Effective" is described in Section 250.4(A) and (B), but it relates to the effective ground-fault current path as a performance criteria. Deleting the term in the NEC and the definition is logical because there are no definitive parameters for Code users to make a determination on what constitutes "effectively grounded." Systems are solidly grounded, grounded through a resistor or impedance, or ungrounded. Equipment (normally noncurrent-carrying metal parts are grounded where connected to an equipment grounding conductor.

This proposal is to change the term "Effectively Bonded" to just "Bonded" in each of the section where it is used. The term "Effectively Bonded" is currently not defined in the NEC.

The term "effectively bonded" is also used a few times in the NEC and is undefined. The same situation exists. There are no defined parameters for Code users to judges what the difference between "Effectively Bonded" and "Bonded" really is. Where the term appears in the NEC, it is revised to just "bonded" and still has the same meaning in each rule.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-302 Log #2316 NEC-P16 **Final Action: Reject**
(820.100(B)(1) Exception)

Submitter: Robert Dudley, Amerisat Inc.
Recommendation: Add an Exception to read:

Exception: In dwellings where it is not practicable to ground as specified in 820.100(B)(1) or (B)(2), such as in multiple story buildings and in buildings with exterior ownership restrictions, grounding may be accomplished by connection to grounded equipment as specified in 250.138(A).

Substantiation: When the cable shield is connected to equipment which is grounded in accordance with 250.138(A), it is acceptable as a ground for the cable in those areas where other grounding is not readily available. Grounding conductors should always be as straight and short as possible, and this exception, in many installations, would allow shorter grounding conductor paths. Unplugging the device or disconnecting power to the outlet cuts power to the cable as well as to the equipment it is connected to.

Panel Meeting Action: Reject
Panel Statement: The intent of the grounding requirements of 820.100(B) is to obtain the best ground connection possible at a specific location. The grounding connection options are therefore presented in a descending order of acceptability. One should always strive to achieve the best ground connection possible when installing the cable ground. Electrical safety is of paramount importance and "practicability" is never a consideration.

16-305 Log #1313 NEC-P16 **Final Action: Accept in Principle**
(820.106(A))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 16-4 based on text in the affirmative comments. This action will be considered by the Panel as a Public Comment.

Submitter: Steven C. Johnson, Time Warner Cable / Rep. National Cable Telecommunications Association
Recommendation: Revise as follows:

820.106 Bonding and Grounding at Mobile Homes.

(A) Grounding. <u>Grounding shall comply with (1) and (2).</u>

<u>(1)</u> Where there is no mobile home service equipment located ~~in sight from, and not more~~ <u>within</u> 9.0 m (30 ft) <u>of</u> the exterior wall of the mobile home it serves, <u>the coaxial cable shield ground, or surge arrester ground, shall be in accordance with 820.100(B)(2).</u>

<u>(2) Where</u> ~~or~~ there is no mobile home disconnecting means grounded in accordance with 250.32 and located ~~within sight from, and not more~~ <u>within</u> 9.0 m (30 ft) <u>of</u> the exterior wall of the mobile home it serves, the coaxial cable shield ground, or surge arrester ground, shall be in accordance with 820.100(B)(2).

Substantiation: Improves clarity. The existing, double-negative wording is difficult to interpret. This editorial change makes the text easier to interpret and clarifies the requirements.

For purposes of grounding or bonding CATV equipment, being able to see the power disconnection point is immaterial. Whereas "in sight from" may be critical for disconnecting power in an emergency, maintaining a reasonable length grounding conductor is the key in a CATV application. This proposal does not affect service equipment placement requirements. It only clarifies where the CATV grounding will be done based on where the service equipment is already placed.

Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 16-4.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:

BRUNSSEN, J.: The Panel Action is "Accept in Principle" and the reader is referred to the Panel Action on Proposal 16-4. However, the Panel Meeting Action on Proposal 16-4 with regard to 820.106(A) is incorrect. See my affirmative comment on Proposal 16-4, 820.106(A).

16-306 Log #63 NEC-P16 **Final Action: Accept**
(820.110)

Submitter: Stanley Kaufman, Cable Safe Inc.
Recommendation: Revise as follows:

820.110 Raceways for Coaxial Cables.

Where coaxial cables are installed in a raceway, the raceway shall be either of a type permitted in Chapter 3 and installed in accordance with Chapter 3 or <u>listed plenum CATV raceway, listed riser CATV raceway, or listed general-purpose CATV raceway installed in accordance with 820.154, and</u> ~~a listed nonmetallic raceway complying with 820.182(A), (B), or (C), as~~

~~applicable, and installed in accordance~~ with 362.24 through 362.56, where the requirements applicable to electrical nonmetallic tubing apply.
Exception: Conduit fill restrictions shall not apply.
Substantiation: This is a corollary proposal to one being submitted for Article770. Specifically mentioning each plenum, riser and general-purpose raceway, rather that using the term "nonmetallic raceway" is more user-friendly. The installation requirements are in 820.154 so the reference to 820.182(A) (which is listing requirements) was changed to 820.154 since this section deals with installation.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
OHDE, H.: This proposal should be modified. Change the last part of the first sentence of the new 820.110 as follows: "and installed in accordance with 362.10, 362.12 and 362.24 through 362.56, where the requirements applicable to electrical nonmetallic tubing apply".
The Chapter 3 raceways must be installed in accordance with all of the requirements of Chapter 3. These raceways (general-purpose, riser) should also have to be installed in accordance with 362.10 and 362.12 since they have the same or similar characteristics to ENT.

16-307 Log #771 NEC-P16 **Final Action: Accept**
(Table 820.113)

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Change the title as shown:
Table 820.113 Coaxial Cable Markings
Substantiation: This is an editorial proposal. (Task Group No. 820-16)
It is part of a series of proposals to clarify that Article 820 deals with "coaxial" cable. Adding the word "coaxial" adds clarity to the section for the code user. Note that another proposal from the editorial task group moves this table to section 820.179 (Task Group No.).
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.

(820.113)

Submitter: Allen C. Weidman, The Society of the Plastics Industry, Inc.
Recommendation: Add a sentence at the end of 820.113.
The temperature rating shall be marked on the cable .
Substantiation: It is important for the system designer, installer, local authority, and building owners to know the temperature rating of cables for proper application.
Panel Meeting Action: Reject
Panel Statement: The Code presently permits the temperature rating to be marked on the cable. See UL 444.
The AHJ does not have the authority to require the manufacturer to mark the temperature rating on the cable.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-309 Log #776 NEC-P16 **Final Action: Accept**
(820.113 and 820.179)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 16-284. This action will be considered by the Panel as a Public Comment.
Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Revise 820.179 and 820.113 as shown and transfer Table 820.113 and Table FPN's to 820.179.
820.179 Coaxial Cables.
Cables shall be listed in accordance with 820.179(A) through 820.179(D) and marked in accordance with Table 820.179. The cable voltage rating shall not be marked on the cable.
FPN: Voltage markings on cables could be misinterpreted to suggest that the cables may be suitable for Class 1, electric light, and power applications.
Exception: Voltage markings shall be permitted where the cable has multiple listings and voltage marking is required for one or more of the listings.
820.113 Installation and Marking of Coaxial Cables.
Listed coaxial cables shall be installed as wiring within buildings. ~~Coaxial cables shall be marked in accordance with Table 820.113. The cable voltage rating shall not be marked on the cable.~~
~~FPN: Voltage markings on cables could be misinterpreted to suggest that the cables may be suitable for Class 1, electric light, and power applications.~~
~~*Exception No. 1: Voltage markings shall be permitted where the cable has multiple listings and voltage marking is required for one or more of the listings.*~~
Exception No. 2: Listing and marking shall not be required where the length of the cable within the building, measured from its point of entrance, does not exceed 15 m (50 ft) and the cable enters the building from the outside and is terminated at a grounding block.
Substantiation: The change is editorial. (Task Group No. 820-22)
It moves the cable marking requirements from 820.113 to 820.179. Marking requirements belong with listing requirements.
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.
Panel Meeting Action: Accept

16-312 Log #773 NEC-P16 **Final Action: Accept**
(820.133(A))

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Renumber this section as shown:
820.133 Installation of Cables and Equipment.
Beyond the point of grounding, as defined in 820.93, the cable installation shall comply with 820.133(A) through 820.133(C).
(A) Separation from Other Conductors.
(1) In Raceways and Boxes.
(a ~~1~~) Other Circuits. Coaxial cables shall be permitted in the same raceway or enclosure with jacketed cables of any of the following:
(1) ~~a~~ . Class 2 and Class 3 remote-control, signaling, and power-limited circuits in compliance with Article 725
(2) ~~b~~ . Power-limited fire alarm systems in compliance with Article 760
(3) ~~c~~ . Nonconductive and conductive optical fiber cables in compliance with Article 770
(4) ~~d~~ . Communications circuits in compliance with Article 800
(5) ~~e~~ . Low-power network-powered broadband communications circuits in compliance with Article 830
(b ~~2~~) Electric Light, Power, Class 1, NonÐPower-Limited Fire Alarm, and Medium Power Network-Powered Broadband Communications Circuits. Coaxial cable shall not be placed in any raceway, compartment, outlet box, junction box, or other enclosures with conductors of electric light, power, Class 1, nonÐpower-limited fire alarm, or medium power network-powered broadband communications circuits.
Exception No. 1: Where all of the conductors of electric light, power, Class 1, nonÐpower-limited fire alarm, and medium power network-powered broadband communications circuits are separated from all of the coaxial cables by a permanent barrier or listed divider.
Exception No. 2: Power circuit conductors in outlet boxes, junction boxes, or similar fittings or compartments where such conductors are introduced solely for power supply to the coaxial cable system distribution equipment. The power circuit conductors shall be routed within the enclosure to maintain a minimum 6-mm (0.25-in.) separation from coaxial cables.
Substantiation: This proposal is editorial. (Task Group No. 820-18)
The change in numbering will bring this section into conformance with the numbering guideline of the NEC Style Manual and make the numbering the same as articles 800 and 830.
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.

16-313 Log #2630 NEC-P16 **Final Action: Reject**
(820.133(A) Exception (New))

Submitter: David H. Kendall, Carlon
Recommendation: Add a new exception to 820.133(A) to read as follows:
Exception: Where all of the conductors of electric light, power, Class 1, nonpower-limited fire alarm, and medium power network-powered broadband communications circuits are separated from all of the coaxial cables by a permanent barrier or listed divider.
Substantiation: This is a new exception for 820.133(A) that would allow a coaxial cable to share the same raceway, outlet box or enclosure as long as a barrier was in place. This language is similar to the language found in 800.133(A)(1)(c) Exception No. 1. Coaxial cable can become energized if it comes in contact with electrical conductors. This proposal defines the barrier as a permanent function of the enclosure or that it may be a removal or field installed listed divider. These barriers are used to divide the coaxial cable from the power circuits.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: Exception No.1 presently meets the submitter's intent.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-314 Log #1287 NEC-P16 **Final Action: Accept**
(820.133(A)(1))

Submitter: Gerald Lee Dorna, Belden CDT. Inc.
Recommendation: Revise text to read:
800.133 (A) (1) (1) In Raceways , Cable Trays and Boxes.
(1) Other Circuits. Coaxial cables shall be permitted in the same raceway , cable tray or enclosure with jacketed cables of any of the following:
a. Class 2 and Class 3 remote-control, signaling, and power-limited circuits in compliance with Article 725
b. Power-limited fire alarm systems in compliance with Article 760
c. Nonconductive and conductive optical fiber cables in compliance with Article 770
d. Communications circuits in compliance with Article 800
e. Low-power network-powered broadband communications circuits in compliance with Article 830
Substantiation: Obviously, cables that can be safely installed in the same raceway or enclosure can also be safely installed in the same cable tray. Stating that these cables are allowed "in the same cable tray" will avoid having the user assume that they are not permitted to be installed together in the same cable tray. It clarifies the use in the Code. Article 770, in section 770.133(B), has text similar to that proposed here. This is one of five similar proposals that are being submitted for Articles 725, 760, 800, 820 and 830.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
JONES, R.: The submitter is obviously in error with the assertion "Obviously, cables that can be safely installed in the same raceway or enclosure can also be safely installed in the same cable tray." O NLY cABLES LISTED FOR INSTALLATION IN CABLE TRAYS CAN BE INSTALLED IN CABLE TRAYS.

16-315 Log #3432 NEC-P16 **Final Action: Reject**
(820.133(A)(1)2. Exception No. 1)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Delete the phrase "listed divider" at the end; substitute the words "a securely installed barrier identified for the use."
Substantiation: This wording correlates with the changes made by CMP 9 to an equivalent rule in 404.8(B) in response to an equivalent proposal from the same submitter. The problem is that Article 314 does not require conventional steel outlet boxes to be listed, and therefore not all steel box dividers manufactured for this purpose are listed. In addition, none of these barriers (for outlet boxes) are permanently installed; but they certainly can be securely installed, and they certainly meet the provisions of the Article 100 definition of identified, in that they are recognizable as suitable for this purpose. This wording refers to the identical products and should therefore correlate with Article 314 requirements.
Panel Meeting Action: Reject
Panel Statement: This situation is not the same as 404.8(B). Section 404.8(B) deals with the grouping of snap switches with other snap switches and similar devices such as receptacles. The barriers described in 404.8(B) are used to separate these similar devices containing similar circuits.
Section 800. 133(A)(1)c; Exception No. 1; 820.133(A)(1)2, Exception No. 1; and 830.133(A)(1)d, Exception No. 1 deal with the separation of communications, CATV and broadband circuits from electric light, power and Class 1 circuits.
A permanent barrier as currently permitted is okay as it is a physical part of the metal box or listed plastic box and its suitability can be determined by the AHJ or is covered by the listing. There are concerns associated with a non-permanent barrier or divider that cannot be easily dealt with at the point of installation. For example compatibility with the box (fit and secureness), compatibility with the installed hardware such as power receptacles materials, ease of installation, clarity of proper installation procedures, affect on wiring space inside the box, and the like, need to be investigated and listed.
These articles do not only cover metal boxes. The proposal would allow non-listed barriers in metal and listed non-metallic boxes, voiding the listing of a non-metallic box.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-316 Log #2631 NEC-P16 **Final Action: Reject**
(820.135 (New))

Submitter: David H. Kendall, Carlon
Recommendation: Add a new section to read as follows:
820.135 Communication Device and Equipment Mounting. Communication devices or equipment shall be mounted in listed boxes, brackets or assemblies designed for the purpose, and such boxes or assemblies shall be securely fastened in place. Boxes or brackets can be completely enclosed or backless.
(A) Communication Devices and Equipment Mounted to Boxes or Brackets. Communication devices or equipment shall be mounted to a listed boxes or bracket and installed per 314.20.
(B) Communication Devices and Equipment Mounted on Covers. Communication device and equipment mounted to and supported by a cover shall be held rigidly against the cover which is mounted to the box or bracket.
Substantiation: This proposal adds a new section to Article 820 addressing the mounting of devices or equipment to listed boxes and brackets. Currently, depending on the quality of workmanship, coaxial devices or equipment have not been mounted to boxes or brackets that can support them. After several years device and/or covers that are mounted directly to the dry wall will become a hazard because they have become loose and exposed. Coaxial cable can become energized by coming in incidental contact with electrical conductors.
820.135 was only a suggestion for the location of this new section. (A) addresses devices mounted directly to boxes or devices where as (B) address devices mounted to covers.
Panel Meeting Action: Reject
Panel Statement: The submitter has provided no data supporting an existing hazard. The submitter offers only an individual opinion that, depending on the quality of workmanship, equipment or devices mounted directly to drywall may, over time, loosen and become a hazard. The addition of listed boxes or assemblies will not, in itself, guarantee a hazard-free installation. The same quality of workmanship is necessary to help ensure a hazard-free equipment installation whether or not listed boxes are used.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
OHDE, H.: I concur with submitter's recommendation which addresses the mounting of equipment or devices to listed boxes and brackets. However the submitter has not provided CMP 16 member any technical substantiation or data supporting the existing hazard. The submitter should resubmit the proposal in the 2008 ROC and provide CMP 16 members with such data.

16-317 Log #774 NEC-P16 **Final Action: Accept**
(820.154)

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Make the changes as shown:
820.154 Applications of Listed CATV Cables and CATV Raceways.
CATV cables shall comply with the requirements of 820.154(A) through 820.154(D) or where cable substitutions are made as shown in Table 820.154.
(A) Plenums. C oaxial c ables installed in ducts, plenums, and other spaces used for environmental air shall be Type CATVP. Abandoned cables shall not be permitted to remain. Types CATVP, CATVR, CATV, and CATVX cables installed in compliance with 300.22 shall be permitted. Listed plenum CATV raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only Type CATVP cable shall be permitted to be installed in these raceways.
FPN: See 8.14.1 of NFPA 13-2002, Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.
(B) Riser. C oaxial c ables installed in risers shall comply with any of the requirements of 820.154(B)(1) through (B)(3).
(1) C oaxial c ables in Vertical Runs. C oaxial c ables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type CATVR. Floor penetrations requiring Type CATVR shall contain only cables suitable for riser or plenum use. Abandoned cables shall not be permitted to remain.
Substantiation: This is an editorial proposal. (Task Group No. 820-19)
It is part of a series of proposals to clarify that Article 820 deals with "coaxial" cable. Adding the word "coaxial" adds clarity to the section for the code user.
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-318 Log #782 NEC-P16 **Final Action: Accept**
(820.154)

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Make the changes as shown:
820.154 Applications of Listed CATV Cables and CATV Raceways.
CATV cables shall comply with the requirements of 820.154(A) through 820.154(D) or where cable substitutions are made as shown in Table 820.154.
(A) Plenums. C oaxial c ables installed in ducts, plenums, and other spaces used for environmental air shall be Type CATVP. Abandoned cables shall not be permitted to remain. Types CATVP, CATVR, CATV, and CATVX cables installed in compliance with 300.22 shall be permitted. Listed plenum CATV raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only Type CATVP cable shall be permitted to be installed in these raceways.
FPN: See 8.14.1 of NFPA 13-2002, Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.
(B) Riser. C oaxial c ables installed in risers shall comply with any of the requirements of 820.154(B)(1) through (B)(3).
(1) C oaxial c ables in Vertical Runs. C oaxial c ables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type CATVR. Floor penetrations requiring Type CATVR shall contain only cables suitable for riser or plenum use. Abandoned cables shall not be permitted to remain.
Substantiation: This is an editorial proposal. (Task Group No.820-28)
It is part of a series of proposals to clarify that Article 820 deals with "coaxial" cable. Adding the word "coaxial" adds clarity to the section for the code user.
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.

Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-319 Log #1440 NEC-P16 **Final Action: Accept**
(820.154)

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Make the changes and addition as shown:
820.154 Applications of Listed CATV Cables and CATV Raceways.
CATV cables shall comply with the requirements of 820.154(A) through 820.154(~~D~~ E) or where cable substitutions are made as shown in Table 820.154.
(~~C~~ , D) Cable Trays.
(~~D~~ , C) Other Wiring.
(E) Cable Substitutions. The uses and permitted substitutions for CATV coaxial cables listed in Table 820.154 shall be considered suitable for the purpose and shall be permitted.
Substantiation: This proposal is editorial. (Task Group No. 820-19(A))
The text being proposed adds clarity and creates parallelism between 800, 820, and 830.
This is one of a group of proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonalby possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.
Panel Meeting Action: Accept
Panel Statement: See panel action on CP-1602.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-320 Log #2533 NEC-P16 **Final Action: Reject**
(820.154)

Submitter: Sanford Egesdal, Egesdal Associates PLC
Recommendation: Revise 820.154, as shown.

CATV cables shall comply with the requirements of 820.154(A) through 820.154(D) or where cable substitutions are made as shown in Table 820.154. CATV very-low-smoke cable shall be permitted to be installed meet requirements for very-low-smoke producing characteristics, low potential heat release, and low flame spread characteristics.

Substantiation: NFPA 13-2002 has requirements for installation of sprinklers where a concealed space has combustible loading. Type CATV50 cable has a heat release that is significantly lower than combustible plenum cable listed using NFPA 262-2002, *Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces* .

The 2003 International Mechanical Code (IMC), 602.2.1 requires a smoke developed index less than 25 and a smoke developed index less than 50 for materials in plenums.

The Fine Print Note provides guidance to system designers, installers, and code officials. Over the past few decades, there has been a significant increase in the quantity of combustible cables installed in concealed spaces (hollow spaces and HVAC system spaces).

NFPA 13-2002, Installation of Sprinkler Systems, requires installation of a sprinkler system in concealed spaces where combustible loading is present. Because other NFPA documents reference NFPA 13, it is important for correlation for the NEC to include a pointer to NFPA 13. The following requirements are from NFPA 13-2002:

"8.14.1.5 Localized Protection of Exposed Combustible Construction or Exposed Combustibles. In concealed spaces having exposed combustible construction, or containing exposed combustibles, in localized areas, the combustibles shall be protected as follows:

(1) If the exposed combustibles are in the vertical partitions or walls around all or a portion of the enclosure, a single row of sprinklers spaced not over 12 ft (3.7 m) apart nor more than 6 ft (1.8 m) from the inside of the partition shall be permitted to protect the surface. The first and last sprinklers in such a row shall not be over 5 ft (1.5 m) from the ends of the partitions.

(2) If the exposed combustibles are in the horizontal plane, the area of the combustibles shall be permitted to be protected with sprinklers on a light hazard spacing. Additional sprinklers shall be installed no more than 6 ft (1.8 m) outside the outline of the area and not more than 12 ft (1.8 m) on center along the outline. When the outline returns to a wall or other obstruction, the last sprinkler shall not be more than 6 ft (1.8 m) from the wall or obstruction."

"8.14.1.2.1 Noncombustible and limited combustible concealed spaces with no combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum."

The definition of combustible, from NFPA 5000 is:

"3.3.340.2 Combustible (Material). A material that, in the form in which it is used and under the conditions anticipated, will ignite and burn; a material that does not meet the definition of noncombustible or limited-combustible."

During the 2005 NEC code cycle, the proposed Fine Print Note was added to 800.154(A). Because communications cables are permitted to substitute for Class 2 and Class 3 circuit cables, it is important to have parallel requirements in both NEC Sections. Additionally, the Fine Print Note applies to all concealed spaces.

In July of 2004, an appeal to the NFPA Standards Council requested deletion of the Fine Print Note to 800.154(A), prior to publication of the 2005 NEC. The appeal was denied.

There is a companion proposal for the listing and marking of Type CATV50.

Panel Meeting Action: Reject

Panel Statement: The submitter did not provide adequate technical substantiation to support a need for a cable listed for concealed spaces.

Concealed spaces should be adequately defined. See action on Proposals 16-13, 16-110, and 16-247 where the proposed definition was determined to be unacceptable.

The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"[S]o as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

OHDE, H.: We agree with panel action and believe that the panel statement should also reflect the latest NFPA 13 Technical Committee actions. Included in the submitter's substantiation was the 2002 Section 8.14 which since has been revised. We would like to add that NFPA 13 just completed their balloting process for the 2006 NFPA 13 Standard. The Technical Committee on Sprinkler Installation submitted a comment on Proposal 13-284.

This comment reworded proposed A.8.14.1.2.1 to read " *Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc…can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1) For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined* ."

In the NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

16-321 Log #2662 NEC-P16 **Final Action: Reject**
(820.154)

Submitter: Robert W. Jensen, dbi / Rep. BICSI, A Telecommunications Association
Recommendation: Delete the following text:

~~FPN: See 8.14.1 of NFPA 13 (2002), Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.~~

Substantiation: This FPN is being misinterpret and used in aggressive marketing attempts to require the installation of "limited combustible cable" (one such example is found at http://www.dupont.com/cablingsolutions/products/codes.html). The FPN has had a profound effect in which it is used in misleading the AHJ to require limited combustible cable, conduit, or a sprinkler system to be installed within the concealed space.

As an example, an AHJ Massachusetts would not provide a certificate of occupancy until the communications cabling was either replaced with limited combustible cable, the CMP cable was placed in conduit, or a sprinkler system installed above the suspended ceiling.. Although the installer had met the requirements of the NEC, the FPN misled the AHJ causing project delays and the potential of inordinate cost to the project. A plea to the NFPA aided the communications installer in which clarification was given that the CMP cabling was indeed sufficient to meet code and that NFPA 13 allowed some quantities (which is not defined) of communications cabling within concealed spaces. The installation of the CMP cable was allowed.

To further the removal of this FPN, the Report on Proposals A2006 from NFPA 13 (see attached), the NFPA committee specifically added an annex A.8.14.1.2.1 in 13-284 log #551 stating that, "Some minor quantities of combustible materials, such as communication wiring, can be present in some concealed spaces but should not typically be viewed as requiring sprinklers (see 8.14.1.1). The threshold value at which sprinklers become necessary in the concealed space is not defined. For example, the usual amounts of data or telephone wiring found above a ceiling would not typically constitute a threat. If bundles of unsheathed computer wiring are installed above the ceiling or beneath the floor in a manner where fire propagation in all directions is likely, then the concealed space should be treated the same as a combustible space, thereby requiring appropriate sprinkler protection."

In addition to the above, Panel 3 rejected the last minute introduction of this proposal that was made in the ROC stage. BICSI, which represents 24,000 installers, designers and manufacturers, feels that this last minute interjection of a FPN was not sufficiently vetted to industry and that the TCC should review this matter.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

JENSEN, R.: We believe that the interpretation of whether being allowed to address this proposal in view of the NFPA Standard Council Long Decision 05-24 (SC #05-7-4) was misunderstood.

The proposal to delete this FPN is not involved with NFPA 90A and should be deleted for the reasons given in the submitter's substantiation. To further acceptance of removing this FPN, refer to several comments within the 2006 NFPA 13 ROC and in particular to 13-389a.

OHDE, H.: We do not believe that the NFPA Standards Council Long Decision 05-24 (SC #05-7-4) would prohibit this Fine Print Note from being deleted. We do believe that expansion of or new Fine Print Notes referencing NFPA 13 would be in violation of NFPA Standards Council Long Decision 05-24 (SC #05-7-4). This proposal should have been accepted. This Fine Print Note referencing NFPA 13 offers no value to the user of NFPA 70 and in fact misleads the user and AHJ.

16-322 Log #2813 NEC-P16 **Final Action: Accept in Part**
(820.154)

TCC Action: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the panel as a public comment.
Submitter: Harold C. Ohde, IBEW #134
Recommendation: Delete the wording "Abandoned cables shall not be permitted to remain." in the following areas:

820.154 Applications of Listed CATV Cables and CATV Raceways. No change.

Revise text to read as follows:

(A) Plenum. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CATVP. ~~Abandoned cables shall not be permitted to remain.~~ Types CATVP, CATVR, CATV, and CATVX cables installed in compliance with 300.22 shall be permitted. Listed plenum CATV raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only Type CATVP cable shall be permitted to be installed in raceways.

(B) Riser. Cables installed in risers shall comply with any of the requirements of 820.154(B)(1) through (B)(3).

(1) Cables in Vertical Runs. Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type CATVR. Floor penetrations requiring Type CATVR shall contain only cables suitable for riser or plenum use. ~~Abandoned cables shall not be permitted to remain.~~ Listed riser CATV raceways shall be permitted to be installed in vertical riser runs in a shaft from floor to floor. Only Type CATVR and CATVP cables shall be permitted to be installed in these raceways.

(2) Metal Raceways or Fireproofed Shafts. No change.

(3) One- and Two- Family Dwellings. No change.

(C) Cable Trays. No change.

(D) Other Wiring Within Buildings. Cables installed in building locations other than the locations covered in 820.154(A) and 820.154(B) shall be with any of the requirements in 820.154(D)(1) through (D)(5). ~~Abandoned cables in hollow spaces shall not be permitted to remain.~~

Substantiation: I have submitted a proposal that would move the abandoned coaxial cables requirements to a more appropriate and central section within Article 800. The abandoned coaxial cables requirements belong in 820.24 - Mechanical Execution of Work. 820.24 is located within Part I, General which would apply to the entire Article 820.

Panel Meeting Action: Accept in Part

The panel accepts the submitter's deletion of subsections (B) and (D).

The panel rejects the submitter's revision of subsection (A).

Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

See panel action on Proposals 16-333 and 16-336.

Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:

BRUNSSEN, J.: Under "Panel Meeting Action:", revise the first sentence as follows: "The panel accepts the submitter's deletion of the sentence 'Abandoned cables shall not be permitted to remain.' in subsection (B), and the deletion of the sentence 'Abandoned cables in hollow spaces shall not be permitted to remain.' in subsection (D). It was the two sentences that were deleted, not entire subsections (B) and (D).

DORNA, G.: The panel statement contains an error. The panel accepted the deletion in subsections (B) and (D), not of subsections (B) and (D).

KAHN, S.: The panel statement requires correction as the panel accepted the submitter's deletion "in" subsections (B) and (D), not the deletion "of" subsections (B) and (D).

16-323 Log #3009 NEC-P16 **Final Action: Reject**
(820.154)

Submitter: Marcelo M. Hirschler, GBH International
Recommendation: Revise text to read as follows:

820.2 Definitions.

Abandoned Coaxial Cable. Installed coaxial cable that is not terminated at equipment other than a coaxial connector and not identified for future use with a tag.

820.154 Applications of Listed CATV Cables and CATV Raceways.

CATV cables shall comply with the requirements of 820.154(A) through 820.154(D) or where cable substitutions are made as shown in Table 820.154.

(A) Plenums. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CATVP. ~~The accessible portion of abandoned~~ Abandoned coaxial cables shall be removed. Removal of abandoned cables shall not damage the building structure or finish and shall not compromise the performance of adjacent wiring systems or components. Types CATVP, CATVR, CATV, and CATVX cables installed in compliance with 300.22 shall be permitted. Listed plenum CATV raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only Type CATVP cable shall be permitted to be installed in these raceways.

FPN: See 8.14.1 of NFPA 13-2002, Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.

(B) Riser. Cables installed in risers shall comply with any of the requirements of 820.154(B)(1) through (B)(3).

(1) Cables in Vertical Runs. Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type CATVR. Floor penetrations requiring Type CATVR shall contain only cables suitable for riser or plenum use. ~~The accessible portion of abandoned~~ Abandoned coaxial cables shall be removed. Removal of abandoned cables shall not damage the building structure or finish and shall not compromise the performance of adjacent wiring systems or components. Listed riser CATV raceways shall be permitted to be installed in vertical riser runs in a shaft from floor to floor. Only Type CATVR and CATVP cables shall be permitted to be installed in these raceways.

(D) Other Wiring Within Buildings. Cables installed in building locations other than the locations covered in 820.154(A) and 820.154(B) shall be with any of the requirements in 820.154(D)(1) through (D)(5). ~~The accessible portion of abandoned~~ Abandoned coaxial cables shall be removed from hollow spaces . Removal of abandoned cables shall not damage the building structure or finish.

Substantiation: This comment recommends a change in wording to ensure that abandoned cables are removed and to prevent confusion in future. There have been multiple proposals that would permit some cables to remain in "inaccessible spaces". This is not conducive to safe electrical practice; this the key change is the elimination of the words "the accessible portion of".

If the intent of the code-making panel was to clarify that removal of cable should not be done if such removal would damage the building, which is obviously not the intent, a second sentence can be added stating that removal of abandoned cables shall not be performed if it would damage the building structure or finish or in any way compromise the functional performance of any other wiring systems or components. This would be accomplished by the optional added sentence.

Consistent wording on removal of abandoned cables is being proposed for sections: 640.3, 725.3, 770.3, 770.154, 800.3, 800.154, 820.3, 820.154 and 830.3.

For information, see the relevant definitions in the NEC.

Accessible (as applied to equipment). Admitting close approach; not guarded by locked doors, elevation, or other effective means.

Accessible (as applied to wiring methods). Capable of being removed or exposed without damaging the building structure or finish or not permanently closed in by the structure or finish of the building.

Accessible, Readily (Readily Accessible). Capable of being reached quickly for operation, renewal, or inspections without requiring those to whom ready access is requisite to climb over or remove obstacles or to resort to portable ladders, and so forth.

Concealed. Rendered inaccessible by the structure or finish of the building. Wires in concealed raceways are considered concealed, even though they may become accessible by withdrawing them.

Isolated (as applied to location). Not readily accessible to persons unless special means for access are used.

Panel Meeting Action: Reject
Panel Statement: See panel action on Proposal 16-28.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:

OHDE, H.: We concur with submitter's substantiation and believe a change of wording will ensure that are abandoned cables are remove and prevent confusion in future. We suggest that the submitter resubmit his recommendation in the 2008 ROC stage in a more appropriate section with Part 1 – General so these requirements will apply throughout the entire Article.

16-324 Log #2201 NEC-P16 **Final Action: Reject**
(820.154, 820.179)

Submitter: Frank Peri, Communications Design Corporation
Recommendation: In 820.154 revise and re-letter the existing section (A) to (B) and introduce a new (A) as shown below. Also establish a new cable substitution section (E) as shown below. Re-letter the remaining sections, (B) to (C), (C) to (D) etc.

(A)Air Ducts. Coaxial cables installed in air ducts shall be Type CATVD and shall be associated with the air distribution system and shall be as short as practicable. Types CATVD, CATVP, CATVR, CATV, and CATVX cables installed in raceway that is installed in compliance with 300.22(B) shall also be permitted.

(B~~A~~) Plenum. Cables installed in ~~ducts,~~ plenums~~,~~ and other space~~s~~ used for environmental air shall be Type CATVD or CATVP. Abandoned cables shall not be permitted to remain. Types CATVD, CATVP, CATVR, CATV, and CATVX cables installed in compliance with 300.22 shall be permitted. Listed plenum CATV raceways shall be permitted to be installed in ~~ducts and~~ plenums as described in 300.22(B) and in other space~~s~~ used for environmental air as described in 300.22(C). Only Types CATVD and CATVP cables shall be permitted to be installed in ~~these~~ listed plenum CATV raceways.

_FPN: See 8.14.1 of NFPA 13-2002, *Installation of Sprinkler Systems*, for requirements for sprinklers in concealed spaces containing exposed combustibles.

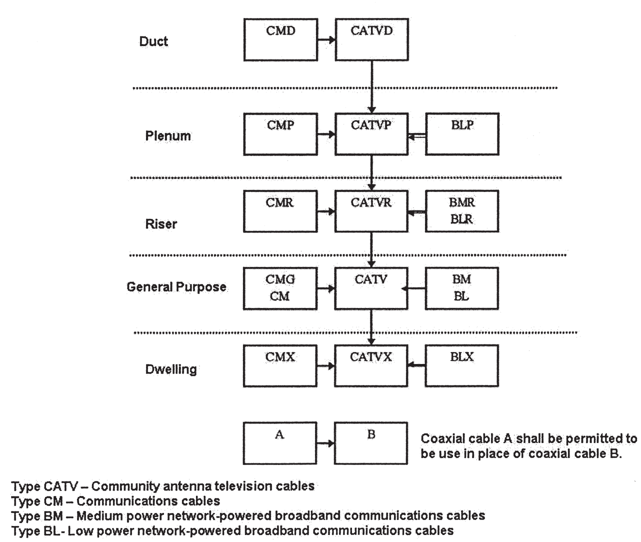
(E) Cable Substitutions. The uses and permitted substitutions for CATV coaxial cables listed in Table 820.154 shall be considered suitable for the purpose and shall be permitted.

.

Table 820.154 Coaxial Cable Uses and Permitted Substitutions

Cable Type	Permitted Substitutions
CATVP	CATVD, CMD, CMP, BLP
CATVR	CATVD, CMD, CATVP, CMP, CMR, BMR, BLP, BLR
CATV	CATVD, CMD, CATVP, CMP, CATVR, CMR, CMG, CM, BMR, BM, BLP, BLR, BL
CATVX	CATVD, CMD, CATVP, CMP, CATVR, CMR, CATV, CMG, CM, BMR, BM, BLP, BLR, BL, BLX

FPN No. 1: See Figure 820.154, Cable Substitution Hierarchy.
FPN No. 2: The substitute cables in Table 820.154 are only coaxial-type cables.



In 820.179 revise and re-letter the existing section (A) to (B) and introduce a new (A) as shown below. Re-letter the remaining sections, (B) to (C), (C) to (D) etc.

(A)Type CATVD. Type CATVD CATV air duct cables shall be listed as suitable for use in air ducts and shall be rated for continuous use at 121°C. Type CATVD communications air duct cables shall also be listed as having a low potential heat value, low flame spread characteristics, and very low smoke-producing characteristics.

FPN: One method of defining a low potential heat cable is establishing an acceptable value of potential heat when tested in accordance with NFPA 259, *Standard Test Method for Potential Heat of Building Materials*, to a maximum potential heat value not exceeding 8141 kJ/kg (3500 BTU/lb). One method of defining low flame spread cable is establishing an acceptable value of flame spread when tested in accordance with NFPA 255, *Standard Method of Test of Surface Burning Characteristics of Building Materials*, to a maximum flame spread index of 25, with the cable unslit (intact) and slit. Similarly, one method of defining very low smoke-producing cable is establishing an acceptable value when tested in accordance with NFPA 255, *Standard Method of Test of Surface Burning Characteristics of Building Materials*, to maximum smoke developed index of 50, with the cable unslit (intact) and slit. These test methods and resultant values correlate with the requirements of NFPA 90A-2002, *Standard for the Installation of Air-Conditioning and Ventilating Systems* for materials installed in ducts and plenums. *For additional testing information see Underwriters Laboratories Subject 2424, Outline of Investigation For Cable Marked Limited Combustible.*

(B~~A~~) Type CATVP. Type CATVP community antenna televison plenum cables shall be listed as being suitable for use in ~~ducts,~~ plenums~~,~~ and other space~~s~~ used for environmental air and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.

FPN: One method of defining a cable that is low smoke-producing cable and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262-2002, *Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces.*

Substantiation: **Summary**
This proposal is submitted to accomplish four things:
1.) Change the code to not allow the dangerous practice of using air ducts as a cable pathway.
2.)Code recognition that there may be instances where a small amount of in-duct cable is necessary for air handling equipment, dampers, security, temperature control, fire protection, etc.
3.)Establish minimum requirements for flame spread, smoke, and potential heat for in-duct (CL2D, CL3D, FPLP, OFND, OFCD, CMD and CATVD) cables used in this special hazard space.
4.)Include air duct "D" cables as permissible substitute for plenum "P" cables for installation in ceiling cavity and raised floor plenums (other space used for environmental air).

This proposal correlates with a TIA that I submitted for NFPA 90A-2002, *Standard for the Installation of Air-Conditioning and Ventilating Systems.* Similar proposals have been submitted for Articles 725, 760, 770, 800 and 820.

The substantiation for the TIA is shown below:

"This TIA is being submitted in accordance with Section 5 of the *2005 NFPA REGULATIONS GOVERNING COMMITTEE PROJECTS.* In particular, it addresses a hazard meeting the criteria of section 5-2(d), which states:

(d) The proposed TIA intends to offer to the public a benefit that would lessen a recognized (known) hazard or ameliorate a continuing dangerous condition or situation.

The purpose of this TIA is to address the dangerous practice of installing combustible communications/data cables in air ducts.

NFPA 90A-2002 does not have explicit requirements for electrical wiring in air ducts. While there is a need for some limited amount of wiring in air ducts where the function of the wiring is associated with the function of the air handling system, use of air duct instead of an electrical raceway for routing wiring unassociated with the air handling system is a dangerous practice. It introduces unlimited quantities of combustible cable into an air handling system and thus unacceptability increases the potential for the spread of fire and smoke through the air distribution system.

This TIA would greatly reduce the amount of wiring in air ducts by only permitting wiring and raceways associated with the air distribution system and also requiring that they be as short as practicable. It would require that the wiring and nonmetallic raceway in the ducts have the appropriate temperature rating for hot air ducts; NFPA 90A permits the supplied air to be at 121° C (250° F). The permitted wiring and nonmetallic raceway would be required to have initial flame spread and smoke requirements identical to those for supplementary materials in an air duct (flame spread index =25, smoke developed index =50). In addition to these initial requirements, there are slitting and ageing requirements to assure that the cables installed in air ducts meet the flame spread, smoke and potential heat requirements equivalent to those for limited combustible materials. Essentially they would be required to be listed to the UL 2424.

Combustible plenum cable is unsuitable and dangerous for this application. Typically, combustible plenum cable has a temperature rating of 60 ° C, which is significantly less that the 121 $^{\circ}$ C air permitted in the air duct. Furthermore, according to Fire Protection Research Foundation tests, these cables can have smoke developed index (SDI) of up to 850. This SDI is an order of magnitude greater than permitted for supplementary materials installed in an air duct.

It is essential that these requirements be adopted now in NFPA 90A."

Section 820.154(A) in the 2005 NEC permits unlimited amounts of Type CATVP cable in air ducts. While there is a need for some limited amount of wiring in air ducts where the function of the wiring is associated with the function of the air handling system, use of an air duct instead of an electrical raceway for routing wiring unassociated with the air handling system is a dangerous practice. It introduces unlimited quantities of combustible cables into an air handling system and thus unacceptability increases the potential for the spread of fire and smoke through the air distribution system.

This proposal would greatly reduce the amount of wiring in air ducts by only permitting wiring associated with the air duct and as short as practicable. It would require that the wiring in the ducts have the appropriate temperature rating for hot air ducts; NFPA 90A-2002, *Standard for the Installation of Air-Conditioning and Ventilating Systems*, permits the supplied air to be at 121° C (250° F). The permitted wiring would be required to have flame spread and smoke requirements identical to those in NFPA 90A-2002 section 4.3.3.1 for supplementary materials in an air duct (flame spread index =25, smoke developed index =50). Essentially they would be required to be listed to the UL 2424, *Outline of Investigation For Cable Marked Limited Combustible* (copy attached) .

"P" type plenum cables are unsuitable and dangerous for this application. Typically, they have a temperature rating of 60° C, which is significantly less that the 121° C air permitted in the air duct. Furthermore, according to Fire Protection Research Foundation tests (copy attached), these cables can have smoke developed index (SDI) of up to 850. This SDI is an order of magnitude greater than permitted for supplementary materials installed in an air duct.

"D" type air duct cables will meet the NFPA 90A listing requirements for use in ceiling cavity and raised floor plenums (other space used for environmental air) and therefore will be able to safely substitute for "P" type plenum cables. "D" type air duct cables have approximately 1/20 the smoke production of "P" type plenum cables.

In order to be consistent with the applications of plenum cable, this proposal will also prohibit the installation of plenum communications raceways in air ducts.

The cable substitution table and figure have been revised to permit air duct cables to substitute for plenum cables since air duct cables are superior cables. "D" type air duct cables also meet the requirements in NFPA 90A for use in ceiling cavity plenums and raised floor plenums (other space used for environmental air).

Some of the applications that require the installation of cables in air ducts are fire alarm (Article 760), temperature sensing and control (Article 725), security (Articles 725 and 820) and communications (Article 800). Optical fiber cables (Article 770) could be used in place of copper conductor cables. Communications cables are permitted to substitute for Class 2 & 3, fire alarm and CATV cables. I am submitting similar proposals for each of these articles.

Note: Supporting Material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

(820.154(A))

Submitter: Donald Hall, Corning Cable Systems

Recommendation: This is a companion proposal to two similiar proposals addressing the same NFPA 13 reference in Articles 770 and 800.

Delete FPN text as follows:

~~FPN: See 8.14.1 of NFPA 13 (2002), Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.~~

Substantiation: The reference to 8.14.1 of NFPA 13 is misleading and should be removed for the following reasons:

(1) The reference is related to sprinkler protection of combustible concealed spaces and their stored content. The use of a concealed space as a pathway for cables and raceway in a manner permitted by the NEC does not constitute a storage condition.

(2) The Technical Committee for NFPA 13 has never provided any useful guidance to indicate what quantity of cable/raceway or other circumstance might trigger requirement for communications cables to be protected by sprinklers. The Technical Committee for NFPA 13 proposed a new annex for addition to the next revision of NFPA 13 (shown below). The proposed annex is non binding, contains vague terminology, and does not add any new clarifying information, because it is identical to the existing language of the NFPA 13 Handbook. For normal circumstances in which cables and raceway are installed in accordance with the NEC and are listed by a Nationally Recognized Test Laboratory "as suitable for use in ducts, plenums, and other spaces used for environmental air and as having adequate fire resistant and low smoke producing characteristics" it is understood that these cables and raceways are safe and do not require additional protection from sprinklers.

(3) The cited portion of NFPA 13 is broadly applicable to all concealed spaces, not just those which handle environmental air. The selective placement of this FPN within three sections of the NEC all pertaining to plenum spaces, creates a perceived encumbrance to the permitted use of plenum cables and plenum cables alone. This perceived encumbrance is being aggressively exploited through the marketing efforts of multiple commercial interests to create a new market for their products.

NFPA 13 ROP indicates the following proposed change:

A.8.14.1.2.1 Some minor quantities of combustible materials, such as communication wiring, can be present in some concealed spaces but should not typically be viewed as requiring sprinklers (see 8.14.1.1). The threshold value at which sprinklers become necessary in the concealed space is not defined. For example, the usual amounts of data or telephone wiring found above a ceiling would not typically constitute a threat. If bundles of unsheathed computer wiring are installed above the ceiling or beneath the floor in a manner where fire propagation in all directions is likely, then the concealed space should be treated the same as a combustible space, thereby requiring appropriate sprinkler protection.

Panel Meeting Action: Reject

Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

(820.154(A))

Submitter: Frank Peri, Communications Design Corporation
Recommendation: Revise 820.154(A), as shown.

(A) Plenums. Cables installed in ducts, plenums, and other spaces used for environmental air shall be <u>Type CATVD or </u>Type CATVP. Abandoned cables shall not be permitted to remain. Types <u>CATVD, </u>CATVP, CATVR, CATV, and CATVX cables installed in compliance with 300.22 shall be permitted. Listed plenum CATV raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only Type <u>s CATVD or</u> CATVP cable shall be permitted to be installed in these raceways.

FPN: See 8.14.1 of NFPA 13-2002, Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.

Substantiation: The purpose of this proposal is to correlate with NFPA 5000-2006. NFPA 5000-2006, recently issued by the NFPA Standards Council, incorporates extracted plenum requirements from NFPA 90A-2002. Consequently, the plenum requirements in NFPA 5000-2006 are identical to the ceiling cavity plenum requirements in NFPA 90A-2002. This proposal provides listing requirements for a cable with characteristics that complies with the NFPA 90A-2002, 4.3.10.2.6: requirements for limited combustible materials exposed to the airflow. This proposal provides a listing and marking for a cable that complies with the NFPA 90A-2002, 4.3.10.2.6.1: a requirement for a listed limited combustible cable with a maximum smoke developed index of 50. The proposed cable meets the NFPA Standards Council's directive to not identify cable as "limited combustible," because it is not a building construction material. The cable name and listing requirements meets guidance from the NFPA Standards Council to identify cable characteristics in terms of flame spread index, smoke developed index, and potential heat release.

As compared to a combustible plenum cable that is listed using NFPA 262, air duct cable is a much "safer" cable. Air duct cable provides users with an opportunity to significantly reduce the potential hazard from smoke during a fire emergency. Additionally, the much lower potential heat release of air duct cable provides much lower combustible loading than found in combustible plenum cable listed using NFPA 262.

Air duct cables are available on the market today. Presently, there is air duct cable available to meet the plenum installation requirements in Articles 725, 760, 770, and 800. Unfortunately, the only marking available in the NEC is for a combustible plenum cable. The NEC decides what marking is permitted, and listing organizations correlate. That is, it would be inappropriate for a listing organization to mark cable with a "Type XXX" that is not published in the NEC.

Panel Meeting Action: Reject

Recommendation: Delete the FPN text that follows 800.154(A).

~~FPN: See 8.14.1 of NFPA 13 (2002). Installation of Sprinkler Systems for requirements for sprinklers in concealed spaces containing exposed combustibles.~~

Substantiation: As chief electrical inspector of Buffalo Grove, I do not see any reason or any technical support as why this FPN referencing 8.14.1 of NFPA 13 (2002), Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles was added to the 2005 NEC. This FPN is very misleading and inappropriate as well. My own personal experience as the AHJ has found that this FPN being a negative effect on the National Electrical Code which is used as an installation documentation to be in conflict with the NFPA 13.

NFPA 13 Technical Committee added new Annex A8.14.1.2.1 in the 2006 ROP #13-284, Log# 551 which should provide guidance to both the installer and AHJ for cabling in concealed spaces.

Panel Meeting Action: Reject

16-332 Log #3000 NEC-P16 **Final Action: Reject**
(820.154(A), FPN)

Submitter: Marcelo M. Hirschler, GBH International
Recommendation: 820.154 Applications of Listed CATV Cables and CATV Raceways.

CATV cables shall comply with the requirements of 820.154(A) through 820.154(D) or where cable substitutions are made as shown in Table 820.154.

(A) Plenums. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CATVP. Abandoned cables shall not be permitted to remain. Types CATVP, CATVR, CATV, and CATVX cables installed in compliance with 300.22 shall be permitted. Listed plenum CATV raceways shall be permitted to be installed in ducts and plenums as described in 300.22(B) and in other spaces used for environmental air as described in 300.22(C). Only Type CATVP cable shall be permitted to be installed in these raceways.

~~FPN: See 8.14.1 of NFPA 13 (2002), Installation of Sprinkler Systems, for requirements for sprinklers in concealed spaces containing exposed combustibles.~~

Substantiation: This is one of three references to NFPA 13 (it is repeated identically in articles 770, 800 and 820) included in the code that is a meaningless reference. Other references to NFPA 13, in Article 362, are properly included in mandatory sections of the code (section 362.10). Whenever a jurisdiction adopts NFPA 13 they need to adopt it for mandatory sections and not for an unenforceable FPN in one section, which is intended to mislead the user. In fact, there have been several documented examples already of misrepresentation in that authorities having jurisdiction have been told that this means that sprinklers are required in plenum areas unless "limited combustible cable" is installed. I have been personally involved in two cases to date, and have heard of many more cases where this is being stated.

Section 8.14.1 of NFPA 13 (2002) reads as follows:

8.14.1 Concealed Spaces.

8.14.1.1 Concealed Spaces Requiring Sprinkler Protection. All concealed spaces enclosed wholly or partly by exposed combustible construction shall be protected by sprinklers except in concealed spaces where sprinklers are not required to be installed by 8.14.1.2.1 through 8.14.1.2.15.

8.14.1.2 Concealed Spaces Not Requiring Sprinkler Protection.*

8.14.1.2.1 Noncombustible and limited combustible concealed spaces with no combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.

8.14.1.2.2 Noncombustible and limited combustible concealed spaces with limited access and not permitting occupancy or storage of combustibles shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.

8.14.1.2.3 Concealed spaces formed by studs or joists with less than 6 in. (152 mm) between the inside or near edges of the studs or joists shall not require sprinkler protection. (See Figure 8.6.4.1.5.1.)

8.14.1.2.4 Concealed spaces formed by bar joists with less than 6 in. (152 mm) between the roof or floor deck and ceiling shall not require sprinkler protection.

8.14.1.2.5 Concealed spaces formed by ceilings attached directly to or within 6 in. (152 mm) of wood joist construction shall not require sprinkler protection.

8.14.1.2.6 Concealed spaces formed by ceilings attached to composite wood joist construction either directly or onto metal channels not exceeding 1 in. in depth, provided the joist channels are firestopped into volumes each not exceeding 160 ft3 (4.53 m3) using materials equivalent to the web construction*

and at least 3½ in. of batt insulation is installed at the bottom of the joist channels when the ceiling is attached utilizing metal channels, shall not require sprinkler protection.
8.14.1.2.7 Concealed spaces entirely filled with noncombustible insulation shall not require sprinkler protection.
8.14.1.2.8 Concealed spaces within wood joist construction and composite wood joist construction having noncombustible insulation filling the space from the ceiling up to the bottom edge of the joist of the roof or floor deck, provided that in composite wood joist construction the joist channels are firestopped into volumes each not exceeding 160 ft3 (4.53 m3) to the full depth of the joist with material equivalent to the web construction, shall not require sprinkler protection.
8.14.1.2.9 Concealed spaces over isolated small rooms not exceeding 55 ft2 (4.6 m2) in area shall not require sprinkler protection.
8.14.1.2.10 Concealed spaces where rigid materials are used and the exposed surfaces have a flame spread rating of 25 or less and the materials have been demonstrated not to propagate fire in the form in which they are installed shall not require sprinkler protection.
8.14.1.2.11 Concealed spaces in which the exposed materials are constructed entirely of fire-retardant treated wood as defined by NFPA 703, Standard for Fire Retardant Impregnated Wood and Fire Retardant Coatings for Building Materials, shall not require sprinkler protection.
8.14.1.2.12 Noncombustible concealed spaces having exposed combustible insulation where the heat content of the facing and substrate of the insulation material does not exceed 1000 Btu/ft2 (11,356 kJ/m2) shall not require sprinkler protection.
8.14.1.2.13 Concealed spaces below insulation that is laid directly on top of or within the ceiling joists in an otherwise sprinklered attic shall not require sprinkler protection.
8.14.1.2.14 Vertical pipe chases under 10 ft2 (0.93 m2), where provided that in multifloor buildings the chases are fire stopped at each floor using materials equivalent to the floor construction, and where such pipe chases shall contain no sources of ignition, piping shall be noncombustible, and pipe penetrations at each floor shall be properly sealed and shall not require sprinkler protection.
8.14.1.2.15 Exterior columns under 10 ft2 in area formed by studs or wood joist, supporting exterior canopies that are fully protected with a sprinkler system, shall not require sprinkler protection.
8.14.1.3 Concealed Space Design Requirements. Sprinklers in concealed spaces having no access for storage or other use shall be installed in accordance with the requirements for light hazard occupancy.
8.14.1.4 Heat Producing Devices with Composite Wood Joist Construction. Where heat-producing devices such as furnaces or process equipment are located in the joist channels above a ceiling attached directly to the underside of composite wood joist construction that would not otherwise require sprinkler protection of the spaces, the joist channel containing the heat-producing devices shall be sprinklered by installing sprinklers in each joist channel, on each side, adjacent to the heat-producing device.
8.14.1.5 Localized Protection of Exposed Combustible Construction or Exposed Combustibles. In concealed spaces having exposed combustible construction, or containing exposed combustibles, in localized areas, the combustibles shall be protected as follows:
(1) If the exposed combustibles are in the vertical partitions or walls around all or a portion of the enclosure, a single row of sprinklers spaced not over 12 ft (3.7 m) apart nor more than 6 ft (1.8 m) from the inside of the partition shall be permitted to protect the surface. The first and last sprinklers in such a row shall not be over 5 ft (1.5 m) from the ends of the partitions.
(2) If the exposed combustibles are in the horizontal plane, the area of the combustibles shall be permitted to be protected with sprinklers on a light hazard spacing. Additional sprinklers shall be installed no more than 6 ft (1.8 m) outside the outline of the area and not more than 12 ft (3.7 m) on center along the outline. When the outline returns to a wall or other obstruction, the last sprinkler shall not be more than 6 ft (1.8 m) from the wall or obstruction.
8.14.1.6 Sprinklers used in horizontal combustible concealed spaces (with a slope not exceeding 2 in 12) having a combustible upper surface where the assembly or supporting members channel heat and where the depth of the space is less than 36 in. from deck to deck or with double wood joist construction with a maximum of 36 in. between the top of the bottom joist and the bottom of the upper joist shall be listed for such use.*
Moreover, the NFPA13 ROP indicates the following change:
8.14.1.1 Concealed Spaces Requiring Sprinkler Protection. All concealed spaces enclosed wholly or partly by exposed combustible construction shall be protected by sprinklers except in concealed spaces where sprinklers are not required to be installed by 8.14.1.2.1 through 8.14.1.2.15 and 8.14.6.
8.14.1.2.1 Concealed spaces of noncombustible and limited combustible construction with minimal combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum. (For additional information on combustible loading See 8.14.1.2.1)*
8.14.1.2.2 Conceal d spaces of noncombustible and limited combustible construction with limited access and not permitting occupancy or storage of combustibles shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum.
A.8.14.1.2.1 Some minor quantities of combustible materials, such as communication wiring, can be present in some concealed spaces but should not typically be viewed as requiring sprinklers (see 8.14.1.1). The threshold value at which sprinklers become necessary in the concealed space is not defined. For example, the usual amounts of data or telephone wiring found above a ceiling would not typically constitute a threat. If bundles of unsheathed computer wiring are installed above the ceiling or beneath the floor in a manner where fire propagation in all directions is likely, then the concealed space should be treated the same as a combustible space, thereby requiring appropriate sprinkler protection.
This FPN is being misinterpreted by authorities having jurisdiction to indicate that these concealed spaces require sprinkler protection. Moreover, I have come across at least two cases (one in Massachusetts and one in California), where the authority having jurisdiction was informed by a vendor that the only cabling alternative to using sprinklers was the installation of "limited combustible cable". In fact, in one case I have worked on, the concealed space was an 8 inch high underfloor space of totally non combustible construction, which had no ducts or other parts of an air distribution system, and yet the code official had been led to the belief that cables could only be used if the space was sprinklered or the cable was "limited combustible cable".
Examples of misinformation exist and some are attached for committee members' use.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:
"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."
This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
JENSEN, R.: We believe that the interpretation of whether being allowed to address this proposal in view of the NFPA Standard Council Long Decision 05-24 (SC #05-7-4) was misunderstood.
The proposal to delete this FPN is not involved with NFPA 90A and should be deleted for the reasons given in the submitter's substantiation. To further acceptance of removing this FPN, refer to several comments within the 2006 NFPA 13 ROC and in particular to 13-389a.
OHDE, H.: See my Explanation of Negative on Proposal 16-321.

16-333 Log #19 NEC-P16 **Final Action: Accept**
(820.154(B)(1))

Submitter: Stanley Kaufman, Cable Safe Inc.
Recommendation: Revise as follows:
(1) Cables in Vertical Runs. Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type CATVR. Floor penetrations requiring Type CATVR shall contain only cables suitable for riser or plenum use. ~~Abandoned cables shall not be permitted to remain~~ . Listed riser CATV raceways <u>and listed plenum CATV raceways</u> shall be permitted to be installed in vertical riser runs in a shaft from floor to floor. Only Type CATVR and CATVP cables shall be permitted to be installed in these raceways.
Substantiation: Plenum raceways should be permitted to substitute for riser and general purpose raceways just as plenum cable is permitted to substitute for riser and general purpose cables.
Section 820.3(A) requires that "The accessible portion of abandoned coaxial cables shall be removed." The requirement in to remove all abandoned cables in 820.154(B) is an error from the 1999 NEC that the panel tried to correct in the last code cycle.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-334 Log #20 NEC-P16 **Final Action: Accept**
(820.154(D))

Submitter: Stanley Kaufman, Cable Safe Inc.
Recommendation: Revise as follows:
(D) Other Wiring Within Buildings. Cables installed in building locations other than the locations covered in 820.154(A) and 820.154(B) shall be with any of the requirements in 820.154(D)(1) through (D)(5). ~~Abandoned cables in hollow spaces shall not be permitted to remain~~ .

Substantiation: Section 820.3(A) requires that "The accessible portion of abandoned coaxial cables shall be removed." The requirement in to remove all abandoned cables in 820.154(D) is an error from the 1999 NEC that the panel tried to correct in the last code cycle.
Panel Meeting Action: Accept
Panel Statement: See panel action on Proposal 16-336.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-335 Log #1875 NEC-P16 **Final Action: Accept**
(820.154(D))

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industry Solutions
Recommendation: Delete the last sentence of 820.154(D) as follows:
" ~~Abandoned cables in hollow spaces shall not be permitted to remain~~ ."
Substantiation: The proposed deletion provides consistency with 770.154(C), 800.154(E) and 830.154(D). Removal of abandoned cable is now covered in 820.3(A).
Panel Meeting Action: Accept

Ballot Results: Affirmative: 15

16-336 Log #21 NEC-P16 **Final Action: Accept in Principle**
(820.154(D)(1))

Submitter: Stanley Kaufman, Cable Safe Inc.
Recommendation: Revise as follows:
(1) General. Type CATV shall be permitted. Listed CATV general-purpose raceways , listed riser CATV raceways and listed plenum CATV raceways shall be permitted. Only Types CATV, CATVX, CATVR, or CATVP cables shall be permitted to be installed in ~~general-purpose communications~~ these CATV raceways.
Substantiation: Plenum and riser raceways should be permitted to substitute for general purpose raceways just as plenum and riser cables are permitted to substitute for general purpose cables.
Panel Meeting Action: Accept in Principle
Revise as follows:
(1) General. Type CATV shall be permitted. Listed CATV general-purpose raceways , listed riser CATV raceways and listed plenum CATV raceways shall be permitted. Only Types CATV, CATVX, CATVR, or CATVP cables shall be permitted to be installed in ~~general-purpose communications~~ these CATV raceways.
Panel Statement: The change clarifies the submitter's intent.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
OHDE, H.: This proposal should be rejected as this new code language could be confusing to code-users. The revised language allows all of the cables listed to be used in riser and plenum optical fiber raceways. As long as it is clear that these riser and plenum raceways are not being used in riser and plenum applications, the use of those cables in those raceways in not a problem. However, why would anyone want to use the more expensive raceways in "other wiring within buildings" locations? This language is also in conflict with 820.154(A) which states "Only Type CATVP cables shall be permitted to be installed in these raceways" and with 820.154 (B)(1) which requires either plenum or riser cables to be installed in riser communications raceways.

16-337 Log #2534 NEC-P16 **Final Action: Reject**
(820.154(E) (New))

Submitter: Sanford Egesdal, Egesdal Associates PLC
Recommendation: Add new 820.154(E).
(E) CATV Cable Substitutions. The uses and permitted substitutions for CATV cables listed in Table 820.154 shall be considered suitable for the purpose and shall be permitted. CATV50 very-low-smoke cable shall be permitted to substitute for all CATV cables in Table 820.154 to meet requirements for very-low-smoke producing characteristics, low potential heat release, and low flame spread characteristics.
FPN: See 8.14.1 of NFPA 13-2002, *Installation of Sprinkler Systems* , for requirements for sprinklers in concealed spaces containing exposed combustibles.
Substantiation: This proposal correlates with the proposal to add Type CATV50 to 820.154.
There is a companion proposal for the listing and marking of Type CATV50.
Panel Meeting Action: Reject
Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
OHDE, H.: We agree with panel action and believe that the panel statement should also reflect the latest NFPA 13 Technical Committee actions. Included in the submitter's substantiation was the 2002 Section 8.14 which since has been revised. We would like to add that NFPA 13 just completed their balloting process for the 2006 NFPA 13 Standard. The Technical Committee on Sprinkler Installation submitted a comment on Proposal 13-284.
This comment reworded proposed A.8.14.1.2.1 to read " *Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc…can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1) For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined* ."
In the NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

16-338 Log #3246 NEC-P16 **Final Action: Reject**
(820.154(E))

Submitter: Frank Peri, Communications Design Corporation
Recommendation: Add new 820.154(E), as shown.
(E) CATV Cable Substitutions. The uses and permitted substitutions for CATV cables listed in Table 820.154 shall be considered suitable for the purpose and shall be permitted. Type CATVD air duct cable shall be permitted to substitute for all CATV cables in Table 820.154 and Figure 820.154.
Substantiation: This proposal correlates the substitution table and figure with the listing and application requirements for air duct cable.
Panel Meeting Action: Reject
Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-344 Log #2535 NEC-P16 **Final Action: Reject**
(820.179(E))

Submitter: Sanford Egesdal, Egesdal Associates PLC
Recommendation: Insert new 820.179(E).
(E) Type CATV50. Type CATV50 cables shall be listed as suitable for installation in concealed spaces having restrictive requirements for smoke generation, combustible loading, and flame spread and shall be listed as having very-low-smoke producing characteristics, a low potential heat release value, and low flame spread characteristics.
FPN No. 1: One method of defining a low flame spread and very low smoke-producing cable is that the cable exhibits a maximum flame spread index of 25 and maximum smoke developed index of 50 when tested in accordance with NFPA 255, *Standard Method of Test of Surface Burning Characteristics of Building Materials* with the cable unslit (intact) and cut through to expose the cable core. One method of defining a low potential heat cable is that the cable exhibits a maximum potential heat value of exceeding 8141 kJ/kg (3500 BTU/lb) when tested in accordance with NFPA 259, *Standard Test Method for Potential Heat of Building Materials.*
FPN No. 2: See 8.14.1 of NFPA 13-2002, *Installation of Sprinkler Systems* , for requirements for sprinklers in concealed spaces containing exposed combustibles.
FPN No. 3: Building codes adopted by code jurisdictions may contain restrictions on permissible flame spread index and smoke developed index.
Substantiation: This proposal establishes a listing and marking for cable permitted as an electrical wiring option in concealed spaces where a smoke developed index no greater than 50 is required or large quantities of cable may cause combustible loading. The proposed cable has very-low-smoke-producing characteristics, a low potential heat release value, and low flame spread characteristics. Presently, a number of manufacturers have cables listed to the proposed requirements.
The testing criteria are based on the requirements found in NFPA 13-2003 and the 2003 International Mechanical Code, as revised.
NFPA 13, Section 8.14.1.2.1 follows: "Noncombustible and limited combustible concealed spaces with no combustible loading having no access shall not require sprinkler protection. The space shall be considered a concealed space even with small openings such as those used as return air for a plenum." The proposed cable has a very low heat of combustion. While the term "combustible loading" is not defined, the fuel load can be calculated to determine the potential hazard from large quantities of cable.
The 2003 International Mechanical Code, 602.2.1, requires materials in plenums to be noncombustible or have a flame spread index no greater 25 and a smoke index no greater than 50. At the recent ICC meeting in Detroit,

exception #5 to 602.2.1 was revised to include "combustible material (electrical wiring) installed in noncombustible raceways or enclosures." The requirements in IMC 602.2.1.1 permits cables meeting NFPA 262 test requirements. Cables meeting NFPA 262 requirements, according to Fire Protection Research Foundation testing using NFPA 255, have a smoke developed index that varies between 450 and 850. The proposed cable meets the requirements of the base paragraph, 602.2.1.

The following (change is underlined) shows the result of action on IMC public comment on M 77 (floor actions in Detroit, September 2005).

602.2.1 Materials exposed within plenums. Except as required by Sections 602.2.1.1 through 602.2.1.5, materials within plenums shall be noncombustible or shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84.

Exceptions:

1. Rigid and flexible ducts and connectors shall conform to Section 603.
2. Duct coverings, linings, tape and connectors shall conform to Sections 603 and 604.
3. This section shall not apply to materials exposed within plenums in one- and two-family dwellings.
4. This section shall not apply to smoke detectors.
5. Combustible materials <u>enclosed in noncombustible raceways or enclosures,</u> approved gypsum board assemblies or enclosed in materials listed and labeled for such application.

602.2.1.1 Wiring. Combustible electrical or electronic wiring methods and materials, optical fiber cable, and optical fiber raceway exposed within a plenum shall have a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread not greater than 5 feet (1524 mm) when tested in accordance with NFPA 262. Only type OFNP (plenum rated nonconductive optical fiber cable) shall be installed in plenum-rated optical fiber raceways. Wiring, cable, and raceways addressed in this section shall be listed and labeled as plenum rated and shall be installed in accordance with ICC *Electrical Code* .

The Fire Protection Research Foundation report demonstrated that NFPA 255, <u>*Standard Method of Test of Surface Burning Characteristics of Building Materials*</u> , provides a suitable test method for establishing the cable characteristics (flame spread index & smoke developed index) specified in the FPN.

Establishing a listing and marking for a Type FPL50 cable provides a wiring option for complying with requirements of other standards and building codes. The NEC has previously established listings and markings for cable to correlate with other codes and standards. Additionally, the listing and marking may or may not have a specific application. Specific examples follow:

1. Type CMG cable was included in the 1993 NEC to correlate with the Canadian Electrical Code. The change was proposed by the Chair of NEC TCC, Harold Ware and Roy Hicks from Canada. Type CMG has a listing and marking in the NEC. Article 800 permits "Type CM or Type CMG" to be installed as a general purpose cable. Note: Type CMG does not have a unique application, and neither cable is considered a minimum requirement.
2. Types MP, MPR, and MPP cable was included in the 1990 NEC. The cables had a listing and marking. The multiple-purpose cables were permitted to substitute for similar cables in Articles 725, 760, & 800. Note: Types MP, MPR, and MPP cables do not have a unique application, just a listing and marking.
3. A change to the 1999 NEC permitted Types NPLF, NPLFR, NPLFP, FPL, FPLR, and FPLP to have a "-CI" suffix. The change included only listing and marking requirements. This change to the NEC correlated with NFPA 72, National Fire Alarm Code, requirements for a circuit integrity cable. Note: Cables with a "-CI" suffix did not have an application, until changes were made to the 2005 NEC.
4. A change to the 2005 NEC permitted Types CM, CMR and CMP to have a "-CI" suffix. As of today, no company has a listed circuit integrity using the permitted markings. Note: Types CM-CI, CMR-CI, and CMP-CI do not have an application, just a listing and marking.

Panel Meeting Action: Reject

Panel Statement: The submitter did not provide adequate technical substantiation to support a need for a cable listed for concealed spaces.

Concealed spaces should be adequately defined. See Action on Proposals 16-13, 16-110 and 16-247 where the proposed definition was determined to be unacceptable.

The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"[S]o as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

OHDE, H.: We agree with panel action and believe that the panel statement should also reflect the latest NFPA 13 Technical Committee actions. Included in the submitter's substantiation was the 2002 Section 8.14 which since has been revised. We would like to add that NFPA 13 just completed their balloting process for the 2006 NFPA 13 Standard. The Technical Committee on Sprinkler Installation submitted a comment on Proposal 13-284.

This comment reworded proposed A.8.14.1.2.1 to read " *Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc…can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1) For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined* ."

In the NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

16-345 Log #3230 NEC-P16 **Final Action: Reject**
(820.179(E))

Submitter: Frank Peri, Communications Design Corporation

Recommendation: Add new 820.179(E), as shown.

<u>(K) Type CATVD. Type CATVD air duct cable shall be listed as being suitable for use in ducts, plenums, and other spaces used for environmental air and shall also be listed as having adequate fire-resistant, very low smoke-producing characteristics, and very low potential heat release.</u>

<u>FPN No: One method of defining a low flame spread and very low smoke-producing cable is that the cable exhibits a maximum flame spread index of 25 and maximum smoke developed index of 50 when tested in accordance with NFPA 255, *Standard Method of Test of Surface Burning Characteristics of Building Materials* with the cable unslit (intact) and cut through to expose the cable core. One method of defining a low potential heat cable is that the cable exhibits a maximum potential heat value of exceeding 8141 kJ/kg (3500 BTU/lb) when tested in accordance with NFPA 259, *Standard Test Method for Potential Heat of Building Materials.*</u>

Substantiation: The purpose of this proposal is to correlate with NFPA 5000-2006. NFPA 5000-2006, recently issued by the NFPA Standards Council, incorporates extracted plenum requirements from NFPA 90A-2002. Consequently, the plenum requirements in NFPA 5000-2006 are identical to the ceiling cavity plenum requirements in NFPA 90A-2002. This proposal provides listing requirements for a cable with characteristics that complies with the NFPA 90A-2002, 4.3.10.2.6: requirements for limited combustible materials exposed to the airflow. This proposal provides a listing and marking for a cable that complies with the NFPA 90A-2002, 4.3.10.2.6.1: a requirement for a listed limited combustible cable with a maximum smoke developed index of 50. The proposed cable meets the NFPA Standards Council's directive to not identify cable as "limited combustible," because it is not a building construction material. The cable name and listing requirements meets guidance from the NFPA Standards Council to identify cable characteristics in terms of flame spread index, smoke developed index, and potential heat release.

As compared to a combustible plenum cable that is listed using NFPA 262, air duct cable is a much "safer" cable. Air duct cable provides users with an opportunity to significantly reduce the potential hazard from smoke during a fire emergency. Additionally, the much lower potential heat release of air duct cable provides much lower combustible loading than found in combustible plenum cable listed using NFPA 262.

Air duct cables are available on the market today. Presently, there is air duct cable available to meet the plenum installation requirements of Articles 725, 760, 770, and 800. Unfortunately, the only marking available in the NEC is for a combustible plenum cable. The NEC decides what marking is permitted, and listing organizations correlate. That is, it would be inappropriate for a listing organization to mark cable with a "Type XXX" that is not published in the NEC.

The following is an example of air duct cable information from the UL Web Site:

OWKZ.GuideInfoLimited Combustible Cable

<u>Guide Information for Electrical Equipment for Use in Ordinary Locations</u>

GENERAL

This category covers electrical and optical fiber cable that meets the limited combustible and smoke developed requirements for cable in ceiling cavity and raised floor plenums in accordance with NFPA 90A, "Standard for the Installation of Air Conditioning and Ventilating Systems." This cable also meets the requirements for cable used in ducts, plenums and other spaces used for environmental air in accordance with Articles 725, 760, 770, 800, 820 and 830 of ANSI/NFPA 70, "National Electrical Code".

This cable has a maximum Potential Heat value of 3500 Btu/lb when tested in accordance with NFPA 259, "Standard Test Method for Potential Heat of Building Materials." This cable has a maximum smoke developed index of 50 and a maximum flame spread index of 25 when tested in accordance with UL 723 (NFPA 255), "Test for Surface Burning Characteristics of Building Materials" before and after exposure to elevated temperature and humidity. The cable also meets the requirements for plenum cable in one or more of the following product categories:

- Power-limited Circuit Cable (**QPTZ**) - Types CL2P or CL3P
- Communications Cable (**DUZX**) - Type CMP
- Power-limited Fire Alarm Cable (**HNIR**) - Type FPLP
- Nonpower-limited Fire Alarm Cable (**HNHT**) - Type NPLFP
- Optical Fiber Cable (**QAYK**) - Types OFNP or OFCP
- Community Antenna Television Cable (**DVCS**) - Type CATVP
- Network-powered Broadband Communications Cable (**PWIP**) - Type BLP

PRODUCT MARKINGS

This cable is identified by the marking "Limited Combustible FHC 25/50" on the surface of the jacket or on a marker tape under the jacket. This marking is immediately followed by one of the Type designations shown above. The cable also has the required markings including optional markings as indicated in the product categories referenced above. This cable may also be Verified for transmission performance if authorized in the product categories referenced above, and will bear the appropriate performance verification marking.

ADDITIONAL INFORMATION

For additional information, see Electrical Equipment for Use in Ordinary Locations (**AALZ**).

REQUIREMENTS

The basic requirements used to investigate products in this category are contained in Subject 2424, "Outline of Investigation for Cable Marked 'Limited Combustible.'"

UL MARK

The UL symbol on the product and the Listing Mark of Underwriters Laboratories Inc. on the attached tag, the reel, or the smallest unit container in which the product is packaged is the only method provided by UL to identify products manufactured under its Listing and Follow-Up Service. The Listing Mark for these products includes the UL symbol (as illustrated in the Introduction of this Directory) together with the word "LISTED," a control number, and the product name "Limited Combustible Cable."

Cable which is also Verified to the UL Data Transmission Performance Category Marking Program has the marking "Verified to UL Performance Category Program," or the UL Verification Mark along with the words "Performance Category Program" together with the Listing Mark information on the tag, the reel, or the smallest unit container. Cable which is also Verified to another transmission performance specification has the marking "Verified in Accordance with [Specification name and/or number]" or the UL Verification Mark along with the applicable Specification name and/or number together with the Listing Mark information on the tag, the reel, or the smallest unit container.

Last Updated on 2004-03-24

Panel Meeting Action: Reject

Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-346 Log #3635 NEC-P16 **Final Action: Reject**
(820.179(E) (New))

Submitter: Allen C. Weidman, The Society of the Plastics Industry, Inc.

Recommendation: Add new text as follows:

(E) Concealed Space Cables. Coaxial cables that meet the requirements for Type CATV that are also listed as having a low potential heat value, low flame spread characteristics, and low smoke producing characteristics shall be permitted to be listed and marked as concealed space cables Type CATV-CS.

FPN: One method of defining a low flame spread and low smoke-producing cable is that the cable exhibits a maximum flame spread distance of 1.52 m (5 ft), a maximum peak optical density of 0.5 and a maximum average optical density of 0.15 when tested in accordance with NFPA 262-2002, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces with the cable unslit (intact) and cut through to expose the cable core. One method of defining a low potential heat cable is that the cable exhibits a maximum potential heat value of exceeding 8141 kJ/kg (3500 BTU/lb) when tested in accordance with NFPA 259, *Standard Test Method for Potential Heat of Building Materials.*

Substantiation: The purpose of this proposal is to provide listing and marking for a cable that will be suitable for use in concealed spaces where there are large quantities of cables. Users would have the option of using these cables to avoid establishing a fuel load above the threshold where the quantity of cables would be considered a combustible loading. Also, these cables provide a flame spread index and a smoke developed index that correlate with the requirements for exposed materials within concealed spaces in buildings.

Cables tested using NFPA 255 and 259 establish parameters commonly used in NFPA standards and building codes: smoke developed index, smoke developed index, and heat of combustion. This proposal uses the NFPA 262 test in place of NFPA 255. The Fire Protection Research Foundation's *International Limited Combustible Plenum Cable Fire Test Project* (copy attached) has shown that both of these tests are suitable and provided data (page 18 of the report) for setting equivalent criteria in the two tests. A maximum average optical density of 0.17 in NFPA 262 is equivalent to a smoke developed index of 450 in NFPA 255. This proposal sets the maximum optical density requirement at 0.15 to allow for a margin of error and to correlate with the existing requirements for plenum cable.

NFPA 13 has requirements for sprinklers in a concealed space that contains a combustible loading. Combustible loading is a function of the density (number) of cables and their potential heat release determined by NFPA 259.

The following is excerpted from the Automatic Systems Sprinkler Handbook 2002 edition: In the handbook the commentary is printed in blue. Since the proposals are printed in black and white I have changed the handbook commentary to ***bold italics***. I also underlined the text that refers to computer room raised floors.

As indicated in 8.1.1(1), sprinklers are required throughout the premises. Under certain conditions, however, the omission of sprinklers in certain areas and spaces within a building is permitted. Section 8.14 identifies these spaces and conditions.

8.14.1 Concealed Spaces.

8.14.1.1 Concealed Spaces Requiring Sprinkler Protection. All concealed spaces enclosed wholly or partly by exposed combustible construction shall be protected by sprinklers except in concealed spaces where sprinklers are not required to be installed by 8.14.1.2.1 through 8.14.1.2.15.

Concealed spaces requiring sprinkler protection are covered in 8.14.1.1. Concealed spaces, unless protected, can provide an unabated passage for firespread throughout a building. Paragraph 8.14.1 applies to those portions of a building that have construction or finish materials of a combustible nature, are used for the storage of combustible materials, and can contain combustibles associated with building system features such as computer wiring or large quantities of nonmetallic piping.

Any of these scenarios could be found in a concealed space. It is important to recognize that concealed spaces are not exclusively limited to areas above ceilings but can also be found in walls and in spaces beneath the floor. For example, a raised floor in a computer room is a . concealed space. If none of the three prescribed conditions exists, the space is defined as a concealed, noncombustible space with respect to combustible objects and requires no additional sprinkler protection.

Some minor quantities of combustible materials, such as communication wiring, can be present in some concealed spaces but should not typically be viewed as requiring sprinklers (see 8.14.1.1). The threshold value at which sprinklers become necessary in the concealed space is not defined. For example, the usual amounts of data or telephone wiring found above a ceiling would not typically constitute a threat. If bundles of unsheathed computer wiring are installed above the ceiling or beneath the floor in a manner where fire propagation in all directions is likely, then the concealed space should be treated the same as a combustible space, thereby requiring appropriate sprinkler protection. If some other protection measure is provided, such as a CO, system, then the concealed space is considered to be protected, and sprinklers are not required.

Users of this article need to be aware of the requirements of NFPA 13 so they can provide the appropriate fire protection where these is a build-up of combustible cables that constitute a combustible loading, or preferably avoid the buildup of combustible cables that would result in a combustible loading. Use of concealed space cables would be an option in a strategy to avoid establishing a combustible loading.

A flame spread index of 25 is a typical requirement for materials permitted in concealed spaces or exposed in buildings.

A smoke developed index of 450 is a typical requirement for materials permitted in concealed spaces or exposed in buildings.

The following requirements are from NFPA 5000-2003 identify heat of combustion, flame spread, and smoke as major concerns:

Chapter 4 General

4.4.7 Limiting Fire Spread.

4.4.7.1 Interior Finishes. The interior surfaces of the building shall not contribute to an unacceptable rate and magnitude of fire spread and generation of heat and smoke.

4.4.7.2 Concealed Spaces. The construction of concealed spaces shall not contribute to an unacceptable rate of the spread of fire, hot gases, and smoke to areas of the building remote from the fire source and shall limit their spread beyond the immediate area of the origin of the fire.

4.4.7.3 Compartmentation. The building shall be compartmented, as appropriate, by walls and floors, including their associated openings with proper closures, to limit the spread of fire, hot gases, and smoke to an acceptable area beyond the immediate area of fire origin.

Chapter 8 Fire-Resistive Materials and Construction

8.1 General.

8.1.1 The chapter addresses fire protection features intended to restrict or resist the spread of fire and smoke beyond the compartment of fire origin.

8.1.2 Where required by other chapters of this Code, every building shall be divided into compartments to limit the spread of fire and restrict or resist the movement of smoke.

8.1.2.1* Fire compartments shall be formed with fire barrier walls that comply with Section 8.4 or horizontal assemblies that comply with Section 8.6, or a combination of both.

8.1.2.2 Smoke compartments shall be formed with smoke barriers that comply with Section 8.11.

8.16 Insulating Materials.

8.16.7 Insulation and Covering on Pipe and Tubing. Insulation and covering on pipe and tubing shall have a flame spread index of not more than 25 and a smoke developed index of not more than 450.

Chapter 10 Interior Finishes

10.3.2* Products required to be tested in accordance with NFPA 255 or ASTM E 84 shall be grouped in the classes described in 10.3.2(A) through 10.3.2(C) in accordance with their flame spread and smoke development, except as indicated in 10.3.3.

(A) Class A Interior Wall and Ceiling Finish. Class A interior wall and ceiling finishes shall be those finishes with a flame spread of 0–25 and smoke development of 0–450 and shall include any material classified at 25 or less on the flame spread test scale and 450 or less on the smoke test scale. Any element thereof, when so tested, shall not continue to propagate fire.

Panel Meeting Action: Reject

Panel Statement: The submitter did not provide adequate technical substantiation to support a need for a concealed space listed cable.

Concealed spaces should be adequately defined. See action on Proposals 16-13, 16-110, and 16-247 where the proposed definition was determined to be unacceptable.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

OHDE, H.: We agree with panel action and believe that the panel statement should reflect the latest NFPA 13 Technical Committee actions. Included in the submitter's substantiation was the 2002 Section 8.14 which since has been revised. We would like to add that NFPA 13 just completed their balloting process for the 2006 NFPA 13 Standard. The Technical Committee on Sprinkler Installation submitted a comment on Proposal 13-284.

This comment reworded proposed A.8.14.1.2.1 to read " *Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc…can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1) For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined* ."

In the committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

ARTICLE 830 — NETWORK-POWERED BROADBAND COMMUNICATIONS SYSTEMS

16-347 Log #2365 NEC-P16 **Final Action: Reject**
(830.2.Abandoned Network Powered Broadband Communications Cable)

Submitter: John H. Schmidt, ABC Television Network

Recommendation: In the definition for Abandoned Network Powered Broadband Communications Cable, after the words "and not identified for future use with a tag" add the new text "or in a database."

Substantiation: In modern large systems, cables are often identified with a number at each end, and the function of the cable is listed in a database referencing that number. This database should be adequate to identify cables for future use.

Panel Meeting Action: Reject

Panel Statement: The AHJ is unlikely to have access to the database for every building under his/her jurisdiction. The majority of communications technicians (installation/repair) work at a multiplicity of locations. Database administrative responsibility is not identified in the proposal. Maintaining and referencing a database for every location is cumbersome, unwieldy, and impractical.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-348 Log #2676 NEC-P16 **Final Action: Reject**
(830.2.Abandoned Network-Powered Broadband Communications Cable)

Submitter: Charles M. Trout, Maron Electric Co. Inc.

Recommendation: Revise 830.2 to read as follows:

830.2 Abandoned Network-Powered Broadband Communications Cable to read:

Installed network-powered communications cable that is not terminated at equipment other than a connector and not identified for future use with a tag which is of a material impervious to the deleterious effects of temperature and dampness. The tag shall be resistant to the effects of gnawing by rodents. The tag shall contain the following information:

(1) Date tag was installed.

(2) Date of intended use of disconnected cable.

(3) Drawing or file number containing information relating to intended future use of disconnected cable.

The date of intended use of disconnected cable shall not exceed 90 days from date of disconnection.

Substantiation: Abandoned cables are a growing problem in the industry. These cables are left for others to deal with when present users discontinue their operation. Understanding this problem, the removal of abandoned cables, is required by Articles 640, 645, 725, 760, 770, 800, 820 and 830. 830.3(A) requires the removal of abandoned network powered communications cables. Tagging of cables intended for future use without a method of ensuring the intention of future use invites tagging of cables to avoid the responsibility of their proper removal.

Panel Meeting Action: Reject

Panel Statement: While the submitter makes the point that the "tagging" requirements may be used to circumvent abandoned cable removal, the proposed additional requirements are impractical, burdensome, and preclude the pre-wiring of buildings. For example, buildings are often "pre-wired" for network-powered broadband. While the current tenant may not require the pre-wiring, future tenants may have additional needs and require the network-powered broadband wiring. Allowing only "90 days" is insufficient to support pre-wiring. A tag that is immune to temperature, dampness, and rodents needs to be of special material and would likely require special means to mark the tag. Adding a file number implies the existence of a database. No suggestion is provided as to who is responsible for populating and maintaining the database.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-349 Log #3014 NEC-P16 **Final Action: Reject**
(830.2. Abandoned Network-Powered Broadband Communications Cable)

Submitter: Marcelo M. Hirschler, GBH International

Recommendation: Revise text to read as follows:

830.2 Definitions.

Abandoned Network-Powered Broadband Communications Cable. Installed network-powered broadband communications cable that is not terminated at equipment ~~other than a connector~~ and not identified for future use with a tag.

Substantiation: The definitions of abandoned cable in every article should be identical. The relevant articles are: 640, 645, 725, 760, 770, 800, 820 and 830. The definitions at articles 640 and 725 are already correct as follows:

640.2: Abandoned Audio Distribution Cable. Installed audio distribution cable that is not terminated at equipment and not identified for future use with a tag.

725.2: Abandoned Class 2, Class 3, and PLTC Cable. Installed Class 2, Class 3, and PLTC cable that is not terminated at equipment and not identified for future use with a tag.

The additional wording in this definition causes confusion. Proposals are being made to make changes to the definitions in articles 770, 800, 820 and 830, and to add a general definition into article 645 and into article 100.

Panel Meeting Action: Reject

Panel Statement: The AHJ is unlikely to have access to the database for every building under his/her jurisdiction. The majority of communications technicians (installation/repair) work at a multiplicity of locations. Database administrative responsibility is not identified in the proposal. Maintaining and referencing a database for every location is cumbersome, unwieldy, and impractical.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

OHDE, H.: This proposal should be accepted as submitted. The submitter substantiates that the definitions of abandoned cables in Articles 640, 645, 725, 760, 770, 800, 820, and 830 should be identical. This proposal deletes unnecessary language in the present definitions and provides consistent language throughout the above articles mentioned. The panel statement is incorrect.

16-350 Log #53 NEC-P16 **Final Action: Reject**
(830.2.Air Duct)

Submitter: Stanley Kaufman, Cable Safe Inc.
Recommendation: Add a definition to read as follows:
Air Duct. A conduit or passageway for conveying air to or from heating, cooling, air conditioning, or ventilating equipment, but not including the plenum. [NFPA 97:1.2.6]
Substantiation: The definition of air duct is in the definitions section of Articles 800 and 820. Add it to this article for editorial consistency.
Panel Meeting Action: Reject
Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:
"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."
This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
JENSEN, R.: We agree with rejecting this as it was evidently an oversight to be removed during the last code cycle. Air duct was introduced for use with "air duct cable" which was not to be used in the 2005 code. Additionally, the term is not used within Article 770 even though the substantiation says it is. To further not using this term, in proposal 16-29, the panel revised the proposal to not use "air duct", but instead to harmonize code language by using the term "ventilation or air handling ducts".

16-351 Log #3032 NEC-P16 **Final Action: Reject**
(830.2.Air Duct)

Submitter: Marcelo M. Hirschler, GBH International / Rep. American Fire Safety Council
Recommendation: Delete the following text:
~~**800.2 Air Duct.** A conduit or passageway for conveying air to or from heating, cooling, air conditioning, or ventilating equipment, but not including the plenum.~~
Substantiation: The term "air duct" is not used in article 800 and should not be defined in the article, as per the manual of style of the National Electrical Code.
Panel Meeting Action: Reject
Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:
"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."
This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
JENSEN, R.: We believe that the interpretation of whether being allowed to address this proposal in view of the NFPA Standard Council Long Decision 05-24 (SC #05-7-4) was misunderstood.
We agree with deleting the term "air duct" as it was evidently an oversight that it was not removed during the last code cycle. Air duct was introduced for use with "air duct cable" which was not to be used in the 2005 code. Additionally, the term is not used within Article 800. To further not using this term, in proposal 16-29, the panel revised the proposal to not use "air duct", but instead to harmonize code language by using the term "ventilation or air handling ducts".
Comment on Affirmative:
OHDE, H.: This proposal should be rejected because there is no definition in 830.2 for "Air Duct". The panel rejected the proposal based on the NFPA 90A Standards Council Decision 05-24 (SC#05-7-4).

16-352 Log #2666 NEC-P16 **Final Action: Reject**
(830.2.Block)

Submitter: Robert W. Jensen, dbi / Rep. BICSI, A Telecommunications Association
Recommendation: Delete the following text:
~~**Block.** A square or portion of a city, town, or village enclosed by streets, including the alleys so enclosed but not any street.~~
Substantiation: This is a companion proposal to BICSI 830.90. If this proposal is accepted, this definition will no longer be needed because the concept of "block" will be removed.
Panel Meeting Action: Reject
Panel Statement: This is a companion proposal to 16-383, which was rejected.
See panel action on Proposal 16-383.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-353 Log #786 NEC-P16 **Final Action: Accept in Principle**
(830.2.Exposed)

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Revise the definition of "Exposed" as follows:
Exposed <u>(</u> to Accidental Contact <u>)</u> ~~with Electrical Light or Power Conductors~~ . A circuit in such a position that, in case of failure of supports or insulation, contact with another circuit may result.
<u>FPN: See Article 100 for two other definitions of *Exposed* .</u>
Substantiation: This is a clarification. (Task Group No. 830-03)
It clarifies the term "Exposed" as used in Article 800 to indicate possible contact with another circuit, as opposed to the definitions of "Exposed" contained in Article 100, i.e., live parts or wiring methods. The style used to differentiate the term is identical to that of Article 100 for consistency. The word "and" is deleted and replaced by the word "or" as either of the conditions, failure of supports or failure of insulation, may result in accidental contact. This is a companion proposal to 770.2, 800.2 and 820.2. The addition of the fine print note introduces to Articles 770, 800 and 820.
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 16-354.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-354 Log #1941 NEC-P16 **Final Action: Accept**
(830.2.Exposed (to Accidental Contact))

Submitter: Stanley D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Revise the definition of "Exposed" as follows:
Exposed <u>(</u> to Accidental Contact <u>)</u> ~~with Electrical Light or Power Conductors~~ . A circuit in such a position that, in case of failure of supports or insulation, contact with another circuit may result.
<u>FPN: See Article 100 for two other definitions of Exposed.</u>
Substantiation: This is a clarification. (Task Group 830-03A)
It clarifies the term "Exposed" as used in Article 830 to indicate possible contact with another circuit, as opposed to the definitions of "Exposed" contained in Article 100, i.e., live parts or wiring methods. The style used to differentiate the term is identical to that of Article 100 for consistency. This is a companion proposal to 770.2, 800.2 and 820.2. The changes to the definition and the addition of the fine print note provides consistency and correlation in the definition of "exposed" across Articles 770, 800, 820 and 830.
This is one of a group of proposals prepared by the CMP 16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related articles such that similar requirements are stated the same way in each article;
3) make the articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand sections.
The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-355 Log #1876 NEC-P16 **Final Action: Accept in Principle**
(830.2.Exposed to (Accidental Contact))

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industry Solutions
Recommendation: Revise the definition of "Exposed" as follows:
" **Exposed (to Accidental Contact)** ~~**with Electrical Light or Power Conductors**~~ **.** A circuit in such a position that, in case of failure of supports or insulation, contact with another circuit may result."
Substantiation: The proposed revision establishes a consistent definition throughout Articles 770, 800, 820 and 830. The present definition contains an inconsistency between the defined term, i.e., "Exposed to Accidental Contact with Electrical Light or Power Conductors" and the actual wording of the definition, i.e., "contact with another circuit". The proposed revised definition reflects the intended meaning of the term and is consistent with the identical definition in Articles 770, 800 and 820. This is a companion proposal to 770.2, 800.2 and 820.2.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 16-354.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-356 Log #64 NEC-P16 **Final Action: Accept in Principle**
(830.2. Exposed to Accidental Contact with Electrical Light or Power Conductors)

Submitter: Stanley Kaufman, Cable Safe Inc.
Recommendation: Revise as follows:
Exposed to Accidental Contact with Electrical Light or Power Conductors. A circuit in such a position that, in case of failure of supports or insulation, contact with another circuit may result.
Substantiation: "Electrical Light or Power Conductors" has been changed to "Electric Light or Power Conductors" for editorial consistency with the usage in the Code.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 16-354.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-357 Log #37 NEC-P16 **Final Action: Accept in Principle**
(830.2. Point of Entrance)

Submitter: Stanley Kaufman, Cable Safe Inc.
Recommendation: Revise as follows:
Point of Entrance. The point within a building at which the cable emerges from an external wall, from a concrete floor slab, or from a rigid metal conduit (Type RMC) or an intermediate metal conduit (Type IMC) grounded to an electrode in accordance with 830.100(B).
FPN: See 342.2 for a definition of Intermediate Metal Conduit (Type IMC).
FPN: See 344.2 for a definition of Rigid Metal Conduit (Type RMC).
Substantiation: The addition of a fine print notes pointing installers to the definitions of intermediate metal conduit and rigid metal conduit will help installers who are not Code experts. Use of the type designations will promote consistency throughout the code.
Panel Meeting Action: Accept in Principle
Change 830.2 to read as follows:
Point of Entrance. The point within a building at which the cable emerges from an external wall, from a concrete floor slab, or from a rigid metal conduit (Type RMC) or an intermediate metal conduit (Type IMC) ~~grounded~~ connected by a grounding conductor to an electrode in accordance with 830.100(B).
FPN No. 1 : See 342.2 for a definition of Intermediate Metal Conduit (Type IMC).
FPN No. 2 : See 344.2 for a definition of Rigid Metal Conduit (Type RMC).
Panel Statement: The text inserted by the panel, "connected by a grounding conductor," provides for editorial consistency across Articles 770, 800, 820, and 830. Multiple FPNs are required to be numbered.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
OHDE, H.: This proposal should be rejected. Section 90.1 (C) of the NEC states "This Code is not intended as a design specification or an instruction manual for the untrained persons." The addition of the two FPN's referencing the definitions of IMC raceway in 342.2 and RMC raceway in 344.4 is not needed nor warranted. In the submitter's substantiation he states these Fine Print Notes will help installers who are not Code experts. A trained installer will know the Code content and how the Code book is to be used.
Comment on Affirmative:
JENSEN, R.: The panel action regarding FPN No. 2 for Rigid Metal Conduit should refer to 344.2, not 344.4.

16-358 Log #785 NEC-P16 **Final Action: Accept**
(830.2.Premises Wiring)

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Remove the following text:
Premises Wiring. The circuits located on the user side of the network interface unit.

Substantiation: This proposal is technical. (Task Group No. 830-02)
Premises wiring may, in fact, be on the input side of an NIU. This definition is confusing, misleading, and unnecessary.
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-359 Log #38 NEC-P16 **Final Action: Accept**
(830.2, FPN)

Submitter: Stanley Kaufman, Cable Safe Inc.
Recommendation: Add a fine print note to the definition of Abandoned Network-Powered Broadband Communications Cable
Abandoned Network-Powered Broadband Communications Cable. Installed network-powered broadband communications cable that is not terminated at equipment other than a connector and not identified for future use with a tag.
FPN: See Article 100 for a definition of equipment.
Substantiation: The addition of a fine print note alerting installers that equipment is defined in Article 100 will help installers who are not Code experts.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:
JENSEN, R.: Propose to "Reject".
CMP 16 accepted proposal 16-5 to harmonize 770.2, 800.2, 820.2, and 830-2 by including a normative reference to "See Article 100". Adding a FPN to again "See Article 100" is redundant, especially since this FPN will be a few lines down from the identical wording in normative text. Additionally, the 2003 NEC Style Manual specifically states to avoid redundant use of references.
OHDE, H.: This proposal should be rejected. Section 90.1 (C) of the NEC states "This Code is not intended as a design specification or an instruction manual for the untrained persons." In the submitter's substantiation he states this FPN will help installers who are not Code experts. The addition of the FPN referencing Article 100 for the definition of equipment is not needed nor warranted. A trained installer will know the Code content and how the Code book is to be used.

16-360 Log #3102 NEC-P16 **Final Action: Reject**
(830.3)

Submitter: Donald Hall, Corning Cable Systems
Recommendation: Revise text to read as follows:
830.3 Other Articles.
Circuits and equipment shall comply with 830.3(A) through 830.3(E).
(A) Spread of Fire or Products of Combustion. 300.21 shall apply. ~~The accessible portion of a~~ Abandoned network-powered broadband communications cables shall be removed.
Also, add the following FPN to 830.3(A):
FPN: ANSI/NECA/BICSI 568-2001, Standard for Installing Commercial Building Telecommunications Cabling, and other industry standards provide recommended cable installation practices which facilitate the eventual removal of cables as they become abandoned.
Substantiation: Abandoned cable should be removed to reduce unnecessary accumulation of fuel load and promote electrical safety. It is not reasonable or necessary to install cables in a manner that prevents their eventual removal.
The proposed FPN will provide useful information to architects, system designers, and installers to help minimize the cost and inconvenience of removing abandoned cable.

Panel Meeting Action: Reject
Panel Statement: The proposal would require all abandoned cable to be removed, irrespective of accessibility, presenting a compliance conundrum to installers. Without access, it is impossible to remove cables that are securely fastened without damaging the building or adjacent cables. The submitter's substantiation states: "It is not reasonable or necessary to install cables in a manner that prevents their eventual removal." However, the panel previously imposed additional securing and supporting requirements by referencing 300.11 in 830.24. Gaining access may sometimes require disassembly of part of the building. This is not the intent of the panel. The current requirement to remove only the accessible portion is reasonable. The submitter further proposes to add an FPN following 830.3(A) that is already contained in 830.24.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
OHDE, H.: We concur with submitter's substantiation and believe a change of wording will ensure that are abandoned cables are remove and prevent confusion in future. We suggest that the submitter resubmit his recommendation in the 2008 ROC stage in a more appropriate section with Part 1 – General so these requirements will apply throughout the entire Article. The FPN that the submitter submitted is not required as this Standard is very basic and really does not provide enough information that is applicable to the removal of abandoned cables.

16-361 Log #787 NEC-P16 **Final Action: Accept in Principle**
(830.3(A))

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Make the following changes:
~~**830.3(A) Spread of Fire or Products of Combustion.** Section 300.21 shall apply. The accessible portion of abandoned network-powered broadband communications cables shall be removed.~~
830.25. Abandoned Cables. The accessible portion of abandoned network-powered broadband cables shall be removed.
830.26 Spread of Fire or Products of Combustion. Installations of network-powered broadband cables in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations of network-powered broadband cables through fire-resistantĐrated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating.Ê
FPN: Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made. Building codes also contain restrictions on membrane penetrations on opposite sides of a fire-resistanceĐrated wall assembly. An example is the 600-mm (24-in.) minimum horizontal separation that usually applies between boxes installed on opposite sides of the wall. Assistance in complying with 830.26 can be found in building codes, fire resistance directories, and product listings.
Substantiation: This proposal is editorial. (Task Group No. 830-04)
The title of Section 830.3 is "Other Articles". The requirement for the removal of abandoned cables is not in another article; it is in Article 830. It is out of place in section 830.3. This proposal will move it to a new section of Article 830. Rather than refer section 300.21 requirements for the prevention of the spread of fire, it is better to have the requirements in Article 830 which should be familiar to communications installers. The text of proposed section 830.26 is based on section 300.21 but modified to apply to network-powered broadband cables.
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) mprove the language in the difficult to understand Sections.
The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.
Panel Meeting Action: Accept in Principle
The panel accepts the submitter's proposal.
In addition, the alpha reference (B) to 770.3 is deleted only so there are not two separate subsections.
Panel Statement: The panel accepts the submitter's proposal, where editorial changes are made to reorder subsections of 830.3.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
OHDE, H.: This proposal should be deleted in its entirety. We agree that the requirements for the removal of abandoned cables are out of place in 830.3(A) and needs to be located in another section within Part 1 –General. There are other proposed proposals with the same intent to locate the abandoned cable requirements that seem better suited and make good enforceable code.
The substantiation provided to delete 830.3(A) which contains the requirements of 300.21 is unclear. The submitter stated the proposed 830.26 is based on the requirements of 300.21. There was no substantiation submitted for this change. In addition there is no need for the FPN to be mentioned as the language in 830.3(A) clearly states the requirements of 300.21 apply. 300.21 has the identical FPN that is being proposed.

16-362 Log #1389 NEC-P16 **Final Action: Reject**
(830.3(A))

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Delete text concerning abandoned cables
830.3 Other Articles.
Circuits and equipment shall comply with 830.3(A) through 830.3(E).
(A) Spread of Fire or Products of Combustion. Section 300.21 shall apply. ~~The accessible portion of abandoned network-powered broadband communications cables shall be removed.~~
Substantiation: The NEC is an installation standard, not a maintenance standard. Because of this, this rule should not be a part of the NEC. Furthermore, this provision does not accomplish its intent, as the code is not a retroactive document. To require abandoned cables to be removed is similar to requiring facilities to update their receptacles to the new GFCI provision every three years. With that said, the only time this rule applies is when an installer creates an abandoned cable. Also, this provision does not fall within the purpose of the NEC 90.1(A). The NEC is concerned with the hazards created from the use of electricity…this rule seems to imply that a cable with a voltage applied to it is safe, but a cable with no voltage applied to it is dangerous.
Panel Meeting Action: Reject
Panel Statement: See panel action on Proposal 16-26.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-363 Log #2810 NEC-P16 **Final Action: Accept in Part**
(830.3(A))

Submitter: Harold C. Ohde, IBEW #134
Recommendation: Revise text to read as follows:
830.3 Other Articles. No change.
(A) Spread of Fire or Products of Combustion. ~~Section~~ 300.21 shall apply . ~~The accessible portion of abandoned network powered broadband communications cables shall be removed.~~
Substantiation: The requirements for removal of abandoned network-powered broadband communications cables would be better suited in appropriate code section within Article 830. I have submitted another proposal that would move the abandoned network-powered broadband communications cables requirements to 830.24 - Mechanical Execution of Work. The abandoned network-powerered broadband communications cables requirements are out of place in 830.3 - Other Articles. The requirements are not part of another Article as they are part of Article 830 and are located within Article 830.
The deletion of the word "Section" is an editorial change to comply the National Electrical Code Style Manual.
Similar proposals have been submitted for 640.3, 725.3, 760.3, 770.3, 800.3 and 820.3 to revise these sections as well.
Panel Meeting Action: Accept in Part
The panel accepts the part that deletes the second sentence of 830.3(A) concerning abandoned cables.
The panel rejects the proposed revisions to the first sentence.
Panel Statement: The panel agrees that the requirement to remove abandoned cable does not belong in 830.3 and should be relocated. A direct reference to 300.21 is inappropriate, as it applies to electrical installations and not network-powered broadband communications installations. See panel action on Proposal 16-361 that relocates the requirement to remove abandoned cable to 830.25 (new) and restates the spread of fire requirements in network-powered broadband terms in 830.26 (new).
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
OHDE, H.: This proposal should have been accepted as originally submitted. The panel statement seems to be in conflict as it states the provisions of 300.21 will work well in the new proposed section 830.26 but not in 830.3(A) where it has always been properly located. The panel accepted the same 300.21 requirements whose concern is the spread of fire and products of combustion in hollow spaces, vertical shafts and ventilation and air- handling ducts caused by electrical installations and located them in 830.26.

16-364 Log #3011 NEC-P16 **Final Action: Reject**
(830.3(A))

Submitter: Marcelo M. Hirschler, GBH International
Recommendation: Revise text to read as follows:
830.2 Definitions.
Abandoned Network-Powered Broadband Communications Cable. Installed network-powered broadband communications cable that is not terminated at equipment other than a connector and not identified for future use with a tag.
830.3 Other Articles.
Circuits and equipment shall comply with 830.3(A) through 830.3(E).
(A) Spread of Fire or Products of Combustion. Section 300.21 shall apply. ~~The accessible portion of abandoned~~ Abandoned network-powered broadband communications cables shall be removed. Removal of abandoned cables shall not damage the building structure or finish and shall not compromise the performance of adjacent wiring systems or components.
Substantiation: This comment recommends a change in wording to ensure that abandoned cables are removed and to prevent confusion in future. There have been multiple proposals that would permit some cables to remain in "inaccessible spaces". This is not conducive to safe electrical practice; this the key change is the elimination of the words "the accessible portion of".
If the intent of the code-making panel was to clarify that removal of cable should not be done if such removal would damage the building, which is obviously not the intent, a second sentence can be added stating that removal of abandoned cables shall not be performed if it would damage the building structure or finish or in any way compromise the functional performance of any other wiring systems or components. This would be accomplished by the optional added sentence.
Consistent wording on removal of abandoned cables is being proposed for sections: 640.3, 725.3, 770.3, 770.154, 800.3, 800.154, 820.3, 820.154 and 830.3.
For information, see the relevant definitions in the NEC.
Accessible (as applied to equipment). Admitting close approach; not guarded by locked doors, elevation, or other effective means.
Accessible (as applied to wiring methods). Capable of being removed or exposed without damaging the building structure or finish or not permanently closed in by the structure or finish of the building.
Accessible, Readily (Readily Accessible). Capable of being reached quickly for operation, renewal, or inspections without requiring those to whom ready access is requisite to climb over or remove obstacles or to resort to portable ladders, and so forth.
Concealed. Rendered inaccessible by the structure or finish of the building. Wires in concealed raceways are considered concealed, even though they may become accessible by withdrawing them.
Isolated (as applied to location). Not readily accessible to persons unless special means for access are used.
Panel Meeting Action: Reject
Panel Statement: See panel action on Proposal 16-28.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
OHDE, H.: We concur with submitter's substantiation and believe a change of wording will ensure that are abandoned cables are remove and prevent confusion in future. We suggest that the submitter resubmit his recommendation in the 2008 ROC stage in a more appropriate section with Part 1 – General so these requirements will apply throughout the entire Article.

16-365 Log #3315 NEC-P16 **Final Action: Accept in Principle in Part**
(830.3(A), 830.25 (new) & 830.26 (new))

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal relative to the panel action text to accept the deletion of 830.3(A), not 830.3(C). This action will be considered by the Panel as a Public Comment.
Submitter: William E. Koffel, Koffel Assoc., Inc. / Rep. Society of the Plastics Industry
Recommendation: Make the following changes:
~~**830.3(A) Spread of Fire or Products of Combustion.** Section 300.21 shall apply. The accessible portion of abandoned network-powered broadband communications cables shall be removed.~~
830.25. Abandoned Cables. The accessible portion of abandoned network-powered broadband cables shall be removed.
830.26 Spread of Fire or Products of Combustion. Installations of network-powered broadband cables in hollow spaces, concealed spaces, vertical shafts and air ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations of network-powered broadband cables through fire-resistant–rated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating.
FPN No. 1: Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made. Building codes also contain restrictions on membrane penetrations on opposite sides of a fire-resistance–rated wall assembly. An example is the 600-mm (24-in.) minimum horizontal separation that usually applies between boxes installed on opposite sides of the wall. Assistance in complying with 830.26 can be found in building codes, fire resistance directories, and product listings.
FPN No. 2: FPN: See 8.14.1 of NFPA 13, *Installation of Sprinkler Systems* , for requirements for sprinklers in concealed spaces containing exposed combustibles.
Substantiation: The title of Section 830.3 is "Other Articles". The requirement for the removal of abandoned cables is not in another article; it is in Article 830. It is out of place in section 830.3. This proposal will move it to a new section of Article 830. Rather than refer to Section 300.21 requirements for the prevention of the spread of fire, it is better to have the requirements in Article 830 which should be familiar to communications installers. The text of proposed section 830.26 is based on Section 300.21 but modified to apply to network-powered broadband cables. For clarity, "ventilation or air-handling ducts" has been simplified by replacing it with "air ducts". Also, "concealed spaces" have been added to the list of areas requiring fire protection vigilance (hollow spaces, vertical shafts, and air ducts) to correlate with NFPA 13, *Installation of Sprinkler Systems,* which has requirements for protecting concealed spaces. A FPN is included to refer users to the NFPA 13 requirements.
It should be noted that the section reference may need to be updated when the 2006 edition of NFPA 13.
Panel Meeting Action: Accept in Principle in Part
The panel accepts the submitter's deletion of 830.3(C), the addition of 830.25 (new), and the addition of 830.26 (new), but revises "air ducts" to "ventilation or air handling duct" in keeping with the existing NEC text. The panel accepts FPN No. 1, but rejects the addition of FPN No.2.
Panel Statement: See panel action on Proposal 16-361.
The Panel rejects the addition of FPN No. 2 because it introduces undefined terminology. "Concealed spaces" should be adequately defined. See action on Proposals 16-13, 16-110, and 16-247 where the proposed definition was determined to be unacceptable.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
OHDE, H.: This proposal should be deleted in its entirety. We agree that the requirements for the removal of abandoned cables are out of place in 830.3(A) and needs to be located in another section within Part 1 –General. There are other proposed proposals with the same intent to locate the abandoned cable requirements that seem better suited and make good enforceable code.
The substantiation provided to delete 830.3(A) which contains the requirements of 300.21 is unclear. The submitter stated the proposed 830.26 is based on the requirements of 300.21 but modified to apply to network-powered broadband cables. There was no substantiation submitted for this change. In addition there is no need for the FPN No.1 to be mentioned as the language in 830.3(A) clearly states the requirements of 300.21 apply. 300.21 has the identical FPN that is being proposed.
We believe that the panel statement should also reflect the latest NFPA 13 Technical Committee actions. Included in the submitter's substantiation was the 2002 Section 8.14 which since has been revised. We would like to add that NFPA 13 just completed their balloting process for the 2006 NFPA 13 Standard. The Technical Committee on Sprinkler Installation submitted a comment on Proposal 13-284.
This comment reworded proposed A.8.14.1.2.1 to read " *Minor quantities of combustible materials such as but not limited to: cabling, nonmetallic plumbing piping, non-structural wood, etc…can be present in concealed spaces constructed of limited or noncombustible materials but should not be viewed as requiring sprinklers (see 8.14.1.1) For example, it is not the intent of this section to require sprinklers, which would not otherwise be required, in the interstitial space of a typical office building solely due to the presence of the usual amount of cabling within the space. The threshold value at which sprinklers become necessary in the concealed space is not defined* ."
In the NFPA 13 committee's substantiation, they wanted to clarify that the normal amount of cabling would not require sprinklers due to the construction of the space. They also expanded the list of combustibles to provide examples of potential combustible loading.

16-366 Log #788 NEC-P16 **Final Action: Reject**
(830.3(B))

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Delete the following:
~~**(B) Ducts, Plenums, and Other Air-Handling Spaces.** Section 300.22 shall apply where installed in ducts, plenums, or other spaces used for environmental air.~~
~~*Exception: As permitted in 830.154(B)*~~
Substantiation: This proposal is editorial and technical. (Task Group No. 830-05)
Section 830.3(B) provides no additional guidance or requirements that are not already in 830.154(A). It conflicts with Article 830 because Article 830 requires listed network-powered broadbad cables whereas 300.22 permits various electrical power and control cables that are not permitted to be used

for network-powered broadband circuits in Article 830. Section 800.3 does not have a similar requirement.

Acceptance of this proposal will make Articles 770, 800, 820 and 830 consistent and in compliance with section 3.3.5 of the NEC Style Manual, shown below:

3.3.5 Parallel Construction. Parallel construction means stating similar requirements in similar ways for greater consistency. This helps makes the *NEC* clear for users. Lack of consistency often creates confusion, causing users to ask: *Does this difference in wording represent a different requirement? Or is it simply two different ways of trying to say the same thing?* There are several kinds of parallel construction:

Organization and Numbering . If practicable, the subsections of similar articles should be numbered in the same order (see 2.4.1).

Sections. Different sections, within the same article, that reflect similar or closely related subjects, should have similar structures.

Lists. All items in a list should be parallel (that is, singular or plural, written in the same verb tense, using phrases or sentences but not a mix).

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.

Panel Meeting Action: Reject

Panel Statement: The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-367 Log #789 NEC-P16 **Final Action: Accept in Part**
(830.3(E))

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal and give further consideration to the comments expressed in the voting. This action will be considered by the Panel as a Public Comment.

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.

Recommendation: Make the changes as shown:

~~**(A) Spread of Fire or Products of Combustion.** Section 300.21 shall apply. The accessible portion of abandoned network-powered broadband communications cables shall be removed.~~

~~**(B) Ducts, Plenums, and Other Air-Handling Spaces.** Section 300.22 shall apply where installed in ducts, plenums, or other spaces used for environmental air.~~

~~*Exception: As permitted in 830.154(B).*~~

(B ~~C~~) Equipment in Other Space Used for Environmental Air. Section 300.22(C) shall apply.

(C ~~D~~) Output Circuits. As appropriate for the services provided, the output circuits derived from the network interface unit shall comply with the requirements of the following:

(1) Installations of communications circuits — Article 800Ê

(2) Installations of community antenna television and radio distribution circuits — Article 820

Exception: 830.90(B)(3) shall apply where protection is provided in the output of the NIU.

(3) Installations of optical fiber cables —Article 770

(4) Installations of Class 2 and Class 3 circuits — Article 725

(5) Installations of power-limited fire alarm circuits — Article 760

(A ~~E~~) Hazardous (Classified) Locations. Network-powered broadband communications circuits and equipment installed in a location that is classified in accordance with ~~Article~~ 500 .5 shall comply with the applicable requirements of Chapter 5.

Substantiation: This proposal is editorial. (Task Group No. 830-06)

It re-letters 830.3(E) to (A) so the hazardous locations requirements will be in the same place in all CMP-16 Articles. The definitions of hazardous locations are in 500.5. This proposal correlates with other task group proposals that deleted (A) & (B), thereby requiring the re-lettering of this section.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.

Panel Meeting Action: Accept in Part

Change 830.3(E) to read as follows:

(A) Hazardous (Classified) Locations. Network-powered broadband communications circuits and equipment installed in a location that is classified in accordance with 500.5 shall comply with the applicable requirements of Chapter 5.

(B) Ducts, Plenums, and Other Air-Handling Spaces. Section 300.22 shall apply where installed in ducts, plenums, or other spaces used for environmental air.

Exception: As permitted in 830.154(B).

(C) Equipment in Other Space Used for Environmental Air. Section 300.22(C) shall apply.

(D) Output Circuits. As appropriate for the services provided, the output circuits derived from the network interface unit shall comply with the requirements of the following:

(1) Installations of communications circuits — Article 800

(2) Installations of community antenna television and radio distribution circuits — Article 820

Exception: 830.90(B)(3) shall apply where protection is provided in the output of the NIU.

(3) Installations of optical fiber cables —Article 770

(4) Installations of Class 2 and Class 3 circuits — Article 725

(5) Installations of power-limited fire alarm circuits — Article 760

Delete 830.3(E).

Panel Statement: The panel accepts the submitter's deletion of subsection (A).

The panel rejects the submitter's revision of subsection (B).

The panel is acting on this and other proposals related to wire and cable in plenum and other air handling spaces based on NFPA Standards Council Decision 05-24 (SC #05-7-4) dated 29 July 2005 that states, in pertinent part, as follows:

"So as not to inject the problems identified in the 2002 edition of NFPA 90A into the NEC®, and in order to give the Technical Committee on Air Conditioning the opportunity to fully address all technical issues related to plenum cables by processing the issues through the entire upcoming NFPA 90A revision cycle, the Council directs the NEC Project to maintain the status quo in the NEC until the Technical Committee on Air Conditioning has, through the processing of NFPA 90A, addressed the issues and released the next edition of NFPA 90A."

This action does not constitute agreement or disagreement with any of the substantiations submitted for the affected proposal.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

OHDE, H.: The submitter did not substantiate for the deletion of 830.3(A). The panel statement and action is also unclear as they deleted the previous 830.3(A) with no explanation.

16-368 Log #1878 NEC-P16 **Final Action: Accept in Principle**
(830.15)

Submitter: Jeffrey Boksiner, Telcordia Technologies, Inc.

Recommendation: Revise 830.15 **Power Limitations** as follows.

Network-powered broadband communications systems shall be classified as having low or medium power sources as defined in Table 830.15 or as having a listed Remote Feeding Telecommunication – Voltage (RFT-V) power source .

FPN: One way to determine applicable requirements for listing of information technology equipment intended to supply and receive operating power via a telecommunication network using RFT-V circuits, is to refer to UL 60950-21-03, *Standard for Safety for Information Technology Equipment – Safety – Part 21: Remote Power Feeding* .

Substantiation: CSA/UL6950-21 (first edition, 2003), Standard for Safety for Information Technology Equipment – Safety – Part 21: Remote Power Feeding, is the ANSI standard that applies to communications systems intended to supply and receive power over the communications network. This is a first proposal of a set of several proposals intended to harmonize the requirements of UL6950-21 and the NEC Article 830.

The RTF-V circuit specified in the CSA/UL document permits voltages up to 200V dc between each conductor and ground with monitoring and control devices that limit the current to ground to 10 mA. The RFT-V is power-limited to 100 W rated power (150 VAmax). Rationale and background for the provisions of CSA/UL 60950-21 can be found in the Annex A to the standard.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action on Proposal 16-369.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-369 Log #2797 NEC-P16 **Final Action: Accept**
(830.15)

Submitter: Randolph J. Ivans, Underwriters Laboratories Inc. / Rep. Telecommunications Industry Association (TIA) Subcommittee TR41.7; Environmental and safety Considerations
Recommendation: Revise as follows:
830.15 Power Limitations. Network-powered broadband cmmunications systems shall be classified as having low or medium power sources as ~~defined~~ specified in ~~Table~~ ~~830.15~~ 830.15(1) or 830.15(2).
(1) Sources shall be classified as defined in Table 830.15.
(2) DC power sources exceeding 150 volts to ground, but no more than 200 volts to ground, with the current to ground limited to 10 mA dc, that meet the current and power limitation for medium power sources in Table 830.15 shall be classified as medium power sources.
FPN: One way to determine compliance with 830.15(2) is listed information technology equpment intended to supply power via a telecommunication network that complies with the requirements for RFT-V circuits as defined in UL 60950-21, Standard for Safety for Information Technology Equipment - Safety - Part 21: Remote Power Feeding.
Substantiation: CSA/UL 60950-21 (first edition, 2003), Standard for Safety for Information Technology Equipment - Safety - Part 21: Remote Power Feeding, is the ANSI standard that applies to communications systems intended to supply and receive power over the communications network. This proposal is intended to harmonize the requirements of UL 6950-21 and the NEC Article 830.
An RFT circuit or “Remote Feeding Telecommunication” circuit is a secondary circuit intended to supply or receive d.c. power via a telecommunication network. An RFT-V circuit is an RFT circuit that is so designed and protected that under normal operating conditions and single fault conditions, the voltages are limited.
The RFT-V circuit specified in the CSA/UL document permits voltages up to 200V dc between each conductor and ground with monitoring and control devices that limit the current to ground to 10 mA. The RFT-V is power-limited to 100 W rated power (150 V Amax). Rationale and background for the provisions of CSA/UL 60950-21 can be found in the Annex A to the standard.
By adding these circuit characteristics to the medium power source, this proposal is also intended to allow the use of Type BMU, Type BM, or Type BMR cables for these circuits. These cables are presently allowed for medium power network-powered broadband communications circuits in 830.40(A). The RFT-V circuits have more stringent power limitations than the medium-power circuit. As insulation for the individual conductors of Type BMU, Type BM, and Type BMR Cables is required to be rated for 300 volts minimum for each conductor, so these cables are suitable for the RFT-V circuits.
This proposal was prepared by the TR41.7, Environmental and Safety Considerations, subcommittee appointed by the Telecommunications Industry Association (TIA) TR41 Committee, User Premises Telecommunications Requirements and consisting of Randolph Ivans as chairman and subcommittee members. A list of participating companies and subcommittee members can be found in the document identified as TR41.7-Voting Attendance quorum V1.3xls located on the TIA TR4.17 public ftp site at: http://ftp.tiaonline.org/tr-41/tr41.7/Public/
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
DORNA, G.: Listing requirements are in Part VI of this article. The information in the new FPN belongs in part VI.
KAHN, S.: The panel action should have been “accept in principle” with the new FPN placed in Part VI of this article where all listing requirements are included.

16-370 Log #2800 NEC-P16 **Final Action: Accept in Principle**
(830.15)

Submitter: Randolph J. Ivans, Underwriters Laboratories Inc.
Recommendation: Revise as follows:
830.15 Power Limitations. Network-powered broadband communications systems shall be as specified in (1) or (2) below .
(1) Classified as having low or medium power sources as defined in Table 830.15.
(2) Listed information technology (communications) equipment remote feeding telecommunications circuit, RFT-V.
FPN: One method of determining applicable requirements for listing of information technology (communications) equipment and remote feeding telecommunications circuits, RFT-V is to refer to UL 60950-1, Information Technology Equipment - Safety - Part 1: General Requirements and UL 60950-21, Information Technology Equipment - Safety - Part 21: Remote Power Feeding. Typically such circuits are used to supply d.c. operating power via a telecommunication network.
No change to Table 830.15.
Substantiation: The voltage limitations in 830.15 do not include some common communication industry practices for powering broadband communications equipment not under the exclusive control of the communications utility.
UL 60950-21, Standard for safety for Information Technology Equipment - Safety - Part 21: Remote Power Feeding, is the ANSI standard that applies to communications systems intended to supply and receive power over the communications network.
An RFT circuit or “Remote Feeding Telecommunication” circuit is a secondary circuit intended to supply or receive d.c. power via a telecommunication network. An RFT-V circuit is an RFT circuit that is so designed and so protected that under normal operating conditions and single fault conditions, the voltages are limited.
An RFT-V circuit as described in UL 609590-21 is so designed and protected that under normal operating conditions the voltages are limited between each conductor and ground to 140V dc, or up to 200 V dc provided that a monitoring and control device is used that limits the current to earth to 10 mA. Power is limited to a maximum rating of 100VA under normal operation and 150VAmax under fault conditions, which are lower than the limits for medium power circuits. In addition, the output current is limited to a value that would not cause damage to the communications wiring system, typically 1.3 A or less. These limits reflect common industry practices for remote feed applications that are now being employed to power broadband equipment not under the exclusive control of the communications utility.
This is a first proposal of a set of three proposals intended to harmonize the requirements of UL60950-21 and the NEC Article 830.
Panel Meeting Action: Accept in Principle

Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-371 Log #762 NEC-P16 **Final Action: Accept**
(830.21)

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Make the changes as shown:
830.21 Access to Electrical Equipment Behind Panels Designed to Allow Access.
Access to electrical equipment shall not be denied by an accumulation of ~~wires and~~ network-powered broadband communications cables that prevents removal of panels, including suspended ceiling panels.

Substantiation: This is an editorial proposal. (Task Group No. 830-07)
It creates consistency among parallel articles and references the specific medium used in this article. Article 830 does not use “wires” so that term was removed.
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-372 Log #1390 NEC-P16 **Final Action: Accept in Principle**
(830.24)

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Add “Cable Ties” to the list of supporting methods
830.24 Mechanical Execution of Work.
Network-powered broadband communications circuits and equipment shall be installed in a neat and workmanlike manner. Cables installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be secured by straps, staples, cable ties , hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also conform with 300.4(D) and 300.11.
FPN: Accepted industry practices are described in ANSI/NECA/BICSI 568–2001, Standard for Installing Commercial Building Telecommunications Cabling, and other ANSI-approved installation standards.
Substantiation: This is being proposed in an effort to create uniform language with the chapter three cable wiring method support sections, specifically, 230.30(A), 330.30(A) and 334.30. Similar proposals are also being made to 725.8, 640.6, 760.8, 770.24 and 800.24.

Panel Meeting Action: Accept in Principle

Change 830.24 to read as follows:

830.24 Mechanical Execution of Work. Network-powered broadband communications circuits and equipment shall be installed in a neat and workmanlike manner. Cables installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be secured by listed hardware including straps, staples, cable ties , hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also conform with 300.4(D) and 300.11.

Panel Statement: The panel basically accepts the submitter's revision to 830.24 but modified for coordination.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 11 Negative: 3 Abstain: 1

Explanation of Negative:

BOYER, J.: NEMA does not believe that all such product used for the securement of communications circuits need be listed. Code Panel 8 has steadily rejected similar proposals relating to the support of conduit and cables. UL 1565 provides requirements for listed cable ties intended for primary support of flexible conduits and cables in accordance with the NEC. Such cable ties must have a minimum loop tensile strength rating of 23 kg (50 lbs) or greater. NEMA proposes that the panel reconsider its action and ACCEPT the proposal in principle and in part with the following action. Accept the proposed addition of "cable ties" in the third sentence, reject the requirement that all such hardware be "listed", and add the following new fourth sentence. " Cable ties that provide primary support for such cables shall have a minimum loop tensile strength of 23 kg (50 lbs.)"

BRUNSSEN, J.: See my explanation of negative vote on Proposal 16-43.

DORNA, G.: See my explanation of negative vote on Proposal 16-45.

Explanation of Abstention:

KAHN, S.: Though I agree with the proposal and the submitter's intent to introduce consistency, the material is used in plenums and other air handling spaces and the proposal should be subjected to the direction given by the Standards Council relative to such proposals and rejected. The directive of the Standards Council, as interpreted, must be applied consistently.

16-373 Log #1877 NEC-P16 **Final Action: Reject**
(830.24)

TCC Action: The Technical Correlating Committee notes that neither the panel statement nor the revised statement shown in the affirmative vote are responsive to the submitter's substantiation for the recommendation. The Technical Correlating Committee directs the panel to act on the merits of the recommendation. This action will be considered by the Panel as a Public Comment.

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industry Solutions

Recommendation: In the final sentence, delete the reference to 300.11 as follows:

"The installation shall also conform with 300.4(D) ~~and 300.11~~ ."

Substantiation: The requirement added by Panel 16 during the 2005 revision cycle is overly restrictive and inappropriate for Network-Powered Broadband Communications Systems conductors. The Fine Print Note associated with 830.24 presently directs the reader to the appropriate installation practices for Network-Powered Broadband Communications Systems conductors. Section 300.11 is directed toward power cable assemblies that are heavier, larger and operate at greater electrical power levels than Network-Powered Broadband Communications Systems conductors. Deletion of the reference to 300.11 will yield consistency throughout the NEC as Panel 3 did not see fit to adopt this reference in Articles 760 and 725.

Panel Meeting Action: Reject

Panel Statement: The requirements of 300.11 are applicable to optical fiber cables.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

BRUNSSEN, J.: This proposal should be accepted. The requirement added by Panel 16 during the 2005 revision cycle is overly restrictive and inappropriate for network-powered broadband communications cables. The Fine Print Note associated with 830.24 directs the reader to the appropriate installation standards. The Panel has enhanced the Fine Print Note during this cycle by the addition of three new references covering the installation of network-powered broadband communications cables (see Proposal 16-376). These references are all that is necessary and sufficient for such cables without imposing the burdensome requirements of 300.11. Section 300.11 is directed toward power cable assemblies that are heavier and larger than network-powered broadband communications cables, operate at much greater power levels and present a greater risk of injury if not properly installed.

JOHNSON, S.: I agree with the submitter's points in his proposal. 300.11 deals with cables that are larger and heavier than network-powered broadband communications cables. Referencing 300.11 also creates an inconsistency with Sections 760 and 725, which deal with similar sized cables and do not make this reference. I vote against the Panel's action to reject.

Comment on Affirmative:

JENSEN, R.: The panel statement should read:

The requirements of 300.11 are applicable to network-powered broadband communications cables.

This appears as though it was copied from another panel statement regarding optical fiber.

STENE, S.: The panel statement should be revised to state "The requirements of 300.11 are applicable to ~~optical fiber cables~~ network-powered broadband cables ."

16-374 Log #3056 NEC-P16 **Final Action: Accept in Principle in Part**
(830.24)

Submitter: Harold C. Ohde, IBEW #134

Recommendation: Revise 830.24 as follows:

830.24 Mechanical Execution of Work

(A) Neat and Workmanlike Manner. Network-powered broadband communications equipment, circuits and cables shall be installed in a neat and workmanlike manner.

(B) Installation of Network-Powered Broadband Communications Cables . Network-powered broadband communications cables installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the network-powered broadband communications cables will not be damaged by normal building use. Such cables shall be secured by listed straps, staples, hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also comply with 300.4(D) and 300.11.

FPN: Accepted industry practices are described in ANSI/NECA/BICSI 568-2001, *Standard for Installing Commercial Building Telecommunications Cabling,* and other ANSI- approved installation standards.

(C) Abandoned Network-Powered Broadband Communications Cables. Abandoned network-powered broadband communications cables shall be removed.

FPN: Accepted industry practices are described in ANSI/NECA/BICSI 568-2001, *Standard for Installing Commercial Building Telecommunications Cabling,* and other ANSI- approved standards which provide cable installation that facilitates the removal of abandoned cables.

Substantiation: This proposal revises this section into a practical working tool which will assist in making 830.24 a clear, usable and enforceable code. Each first level subdivision contains a code rule that requires action and the required action has been presented in clear, usable and enforceable manner.

In the electrical industry, the electrician, contractor and AHJ have been taught the importance and significance of the concept of mechanical execution of work. I am an electrical instructor who teaches this important concept to the people involved. This is one of the basis for 90.1(A) which serves as the purpose of this Code. The Code's purpose is to provide a safe installation from hazards arising from the use of electricity.

The revised text in 830.24(A) will require all network-powered broadband communications equipment cables and circuits to be installed in a neat and workmanlike manner.

830.24(B) is an editorial change with additional language to require the means of securing and supporting to be listed for the purpose.

The addition of 830.24(C) would replace the requirements that are located in 830.3(A). It makes sense to have the requirements of both the installation of cable and the removal of cable in the same Code section. This would provide the proper guidance to everyone involved. The installer, contractor and the AHJ would gain from this revised section as the rules are centrally located in one Code section. If network-powered broadband communications cables are installed properly then the removal of network-powered broadband communications cables should be no problem if it is not needed anymore or abandoned. The proposed FPN will provide useful guidance and information to everyone involved regarding correct installation practices which would facilitate the removal of the cable as well.

Similar proposals have been submitted for 640.6, 725.8, 760.8, 770.24, 800.24, and 820.24.

Panel Meeting Action: Accept in Principle in Part

The panel accepts the incorporation of the term "listed". See panel action on Proposal 16-372.

The panel accepts in principle the part of the proposal that recommends relocating requirements for abandoned cable. See panel action on Proposal 16-361 for the correct text.

The panel does not accept the breaking up of 830.24 and the changes to the FPN.

Panel Statement: See panel action on Proposal 16-372.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 10 Negative: 4 Abstain: 1

Explanation of Negative:

BRUNSSEN, J.: See my explanation of negative vote on Proposal 16-43.

DORNA, G.: See my explanation of negative vote on Proposal 16-45.

OHDE, H.: This proposal should have been accepted in part. The FPN located after 830.24(C) is not required as this Standard is very basic and really does not provide enough information that is applicable to the removal of abandoned cables.

PREZIOSO, L.: The proposal adds a Fine Print Note (FPN) identifying an ANSI/NECA/BICSI Standard as the source for identifying accepted industry practices. While FPNs are not enforceable, referencing these standards in a FPN as a means for determining the acceptable industry standard is, at best, misleading. I fully support these standards, but on many projects these standards are not incorporated as requirements into the design or the construction of the system or the building. The owners and tenants often waive compliance with these standards as a means of reducing costs. In this situation, the installation of wires and cables cannot be completed in accordance with the standards, and it is therefore unfair to reference these standards as accepted industry practices. Accordingly, the proposal should be rejected and the FPN should not be added to the NEC.

Explanation of Abstention:

KAHN, S.: Though I agree with the proposal and the submitter's intent to introduce consistency, the material is used in plenums and other air handling spaces and the proposal should be subjected to the direction given by the Standards Council relative to such proposals and rejected. The directive of the Standards Council, as interpreted, must be applied consistently.

16-375 Log #2277 NEC-P16 **Final Action: Reject**
(830.24, FPN)

Submitter: H. Brooke Stauffer, National Electrical Contractors Assn. (NECA)
Recommendation: Update the publication date of the referenced standard as follows:

FPN: Accepted industry practices are described in ANSI/NECA/BICSI 568-2006, Standard for Installing Commercial Building Telecommunications Cabling, and other ANSI-approved installation standards.

Substantiation: ANSI/NECA/BISCI 568-2001 is currently being revised, and the 2008 NEC should reference the latest edition.

ANSI/NECA/BICSI 568-2006 will be completed prior to the Public Comment deadline.

Panel Meeting Action: Reject
Panel Statement: The panel cannot act on ANSI/NECA/BICSI 568-2006, as it has not yet been issued.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-376 Log #2335 NEC-P16 **Final Action: Accept in Principle**
(830.24, FPN)

Submitter: James W. Romlein, MV Labs LLC / Rep. TIA
Recommendation: Add an FPN to read:

FPN: Accepted industry practices are described in:

ANSI/TIA/EIA-568-B.1 2004 - Part 1 General Requirements Commercial Building Telecommunications Cabling Standard, ANSI/TIA-569-B 2004 - Commercial Building Standard for Telecommunications Pathways and Spaces, ANSI/TIA-570-B - Residential Telecommunications Infrastructure.

(List Other Documents Here) and other ANSI-approved installation standards.

Substantiation: TIA standards contain the source specifications that drive the performance-related industry practices. These TIA documents have a long history of demonstrated successful guidance to the installation, inspection, and network ownership communities. TIA wiring standards have been recognized by the Federal Communications Commission since before 2000 as the appropriate industry standards to be used for new and revised wiring, and are encouraged to be called out in building codes. (See, "Third Report and Order" in CC Docket No. 88-57 (FCC 99-405) (2000), released January 10, 2000, and 47 CFR section 68.213(c) of the FCC Rules.)

Panel Meeting Action: Accept in Principle

Change FPN to read as follows:

FPN: Accepted industry practices are described in ANSI/NECA/BICSI 568–2001, Standard for Installing Commercial Building Telecommunications Cabling; ANSI/TIA/EIA-568-B.1 2004 - Part 1 General Requirements Commercial Building Telecommunications Cabling Standard; ANSI/TIA-569-B 2004 - Commercial Building Standard for Telecommunications Pathways and Spaces; ANSI/TIA-570-B - Residential Telecommunications Infrastructure, and other ANSI-approved installation standards.

Panel Statement: The panel combined the submitter's FPN with the existing text.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:

PREZIOSO, L.: The proposal adds a Fine Print Note (FPN) identifying an ANSI/NECA/BICSI Standard as the source for identifying accepted industry practices. While FPNs are not enforceable, referencing these standards in a FPN as a means for determining the acceptable industry standard is, at best, misleading. I fully support these standards, but on many projects these standards are not incorporated as requirements into the design or the construction of the system or the building. The owners and tenants often waive compliance with these standards as a means of reducing costs. In this situation, the installation of wires and cables cannot be completed in accordance with the standards, and it is therefore unfair to reference these standards as accepted industry practices. Accordingly, the proposal should be rejected and the FPN should not be added to the NEC.

16-377 Log #1764 NEC-P16 **Final Action: Reject**
(830.24 Exception)

TCC Action: The Technical Correlating Committee notes that neither the panel statement nor the revised statement shown in the affirmative vote are responsive to the submitter's substantiation for the recommendation. The Technical Correlating Committee directs the panel to act on the merits of the recommendation. This action will be considered by the Panel as a Public Comment.

Submitter: Percy E. Pool, Verizon NS
Recommendation: Add the following exception to 830.24:

"Exception: 300.11(C) shall not apply."

Substantiation: 300.11(C) is clearly not applicable to network-powered broadband communications cabling. Network-powered broadband communications cables are typically lashed together to form a "cable assembly". This frequently occurs during modifications or additions to an existing installation. Network-powered broadband communications cables are physically smaller, lighter and carry less voltage and current than power cables. It is overly restrictive to prohibit lashing of network-powered broadband communications cables together to form a cable assembly. Network-powered broadband communications cables secured in this manner have adequate support (see 300.11(A)), are supported independently of the suspended ceiling grid, and are not likely to collapse in the event the suspended ceiling collapses. Such restriction imposes additional installation costs with no improvement in safety.

Panel Meeting Action: Reject
Panel Statement: The requirements of 300.11(C) are applicable to optical fiber cables.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 13 Negative: 2
Explanation of Negative:

BRUNSSEN, J.: This proposal should be accepted. If the Panel continues to support the addition of the requirements of 300.11 to 830.24, then at the very least, the requirements of 300.11(C) should be waived. Section 300.11(C) is clearly not applicable to network-powered broadband communications cables. Installation practice is to lash network-powered broadband communications cables together to form a "cable assembly". This frequently occurs during modifications or additions to an existing installation. Network-powered broadband communications cables are physically smaller and lighter than power cables and contain limited power. Application of 300.11(C) is overly restrictive and will preclude lashing of network-powered broadband communications cables together to form a cable assembly. Network-powered broadband communications cables secured in this manner have adequate support (see 300.11 (A)), are supported independently of the suspended ceiling grid, and are not likely to collapse in the event the suspended ceiling collapses. Such restriction imposes additional installation costs with no improvement in safety.

JOHNSON, S.: I agree with the submitter's points in his proposal. There is no safety issue that should preclude the long-standing practice of lashing an additional network-powered broadband communications cable to an existing bundle that is already installed and supported properly where it is owned by the same entity. These cables are lightweight, and carry much less voltage and current than power cables. No evidence has been shown that this practice has not been used safely and successfully in the past and should not continue to be allowed. I vote against the Panel's action to reject.

Comment on Affirmative:

JENSEN, R.: The panel statement should read:

The requirements of 300.11 are applicable to network-powered broadband communications cables.

This appears as though it was copied from another panel statement regarding optical fiber.

STENE, S.: The panel statement should be revised to state "The requirements of 300.11(C) are applicable to ~~optical fiber cables~~ network-powered broadband cables ."

16-378 Log #57 NEC-P16 **Final Action: Accept in Principle**
(830.25 (New), 830.26 (New) & 830.3(A))

Submitter: Stanley Kaufman, Cable Safe Inc.
Recommendation: **830.25. Abandoned Cables.** The accessible portion of abandoned network-powered broadband cables shall be removed.

FPN: See Article 100 for a definition of "accessible"

830.26 Spread of Fire or Products of Combustion. Installations of network-powered broadband cables in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations of network-powered broadband cables through fire-resistant-rated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating.

FPN: See Article 100 for the definition of "approved".

~~**830.3(A) Spread of Fire or Products of Combustion.** Section 300.21 shall apply. The accessible portion of abandoned network-powered broadband communications cables shall be removed.~~

Substantiation: The title of Section 830.3 is "Other Articles". The requirement for the removal of abandoned cables is not in another article; it is in Article 830. It is out of place in section 830.3. This proposal will move it to a new section of Article 830. Rather than refer section 300.21 requirements for the prevention of the spread of fire, it is better to have the requirements in Article 830 which should be familiar to communications installers. The text of proposed section 830.26 is based on section 300.21 but modified to apply to network-powered broadband cables. The fine print notes pointing to definitions are intended to assist installers who are not code experts and may not be aware of Article 100. The fine print note in 300.21 was not copied because does not provide sufficient guidance for a communications cable installer.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 16-361.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
OHDE, H.: This proposal should be deleted in its entirety. We agree that the requirements for the removal of abandoned cables are out of place in 820.3(A) and needs to be located in another section within Part 1 –General. There are other proposed proposals with the same intent to locate the abandoned cable requirements that seem better suited and make good enforceable code.
The substantiation provided to delete 820.3(A) which contains the requirements of 300.21 is unclear. The submitter stated the proposed 820.26 is based on the requirements of 300.21 but modified to apply to network-powered broadband cables. There was no substantiation submitted for this change.
In addition, Section 90.1(C) of the NEC states " *This Code is not intended as a design specification or an instruction manual for the untrained persons* ." In the submitter's substantiation he states these FPN's will help installers who are not Code experts. The addition of the FPN following 820.25 referencing Article 100 for the definition of accessible the FPN following 820.26 referencing Article 100 for the definition of approved is not needed nor warranted. A trained installer will know the Code content and how the Code book is to be used.

16-379 Log #2667 NEC-P16 **Final Action: Accept in Principle**
(830.30)

Submitter: Robert W. Jensen, dbi / Rep. BICSI, A Telecommunications Association
Recommendation: Move to a new section:
<u>**830.30 Abandoned Cables.** The accessible portion of abandoned network-powered broadband communications cables shall be removed.</u>
Remove wording in 830.3(A) "The accessible portion of abandoned network-powered broadband communications cables shall be removed."
Substantiation: The title of Section 830.3 is "Other Articles". The requirement for the removal of abandoned cables is not in another article; it is in Article 830. It is out of place in section 830.3. This proposal will move it to a new section of Article 830.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 16-361.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
OHDE, H.: We agree with the submitter's intent to locate all abandoned cable requirements to a new section in Part 1- General within the Article. Part 1- General applies to the entire article and therefore would reduce the confusion. We believe that not just the accessible portion of abandoned cables but all abandoned cables be removed to reduce the fuel load.

16-380 Log #2815 NEC-P16 **Final Action: Accept in Principle**
(830.40)

TCC Action: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the panel as a public comment.
Submitter: Randolph J. Ivans, Underwriters Laboratories Inc.
Recommendation: Revise as follows:
830.40 Entrance Cables. Network-powered broadband communications cable located outside and entering buildings shall comply with 830.4(A) <u>, and</u> 830.40(B) <u>and</u> 830.40(C).
Add new paragraph (C) after (B) as follows:
<u>(C) RFT-V Circuits. RFT-V network-powered broadband communications circuits located outside and entering buildings shall be installed using Type BMU, Type BM, or Type BMR network-powered broadband communications medium power cables.</u>
Substantiation: This is part of a set of three proposals intended to harmonize the requirements of UL60950-21 and the NEC Article 830. This proposal is a companion proposal to allow RFT-V circuits in 830.15. The voltage limitations in 830.15 do not include some common communication industry practices for powering broadband communications equipment not under the exclusive control of the communications utility.
This proposal is intended to allow the use of Type BMU, Type BM, or Type BMR cables for RFT-V circuits as described in the proposal to allow RFT-V circuits in 830.15. These cables are presently allowed for medium power network-powered broadband communications circuits in 830.40(A). As insulation for the individual conductors of Type BMU, Type BM, and Type BMR Cables are required to be rated for 300 volts minimum, these cables are suitable for the RFT-V circuits.
UL60950-21, Standard for Safety for Information Technology Equipment - Safety - Part 21: Remote Power Feeding, is the ANSI standard that applies to communications systems intended to supply and receive power over the communications network.
An RFT circuit or "Remote Feeding Telecommunication" circuit is a secondary circuit intended to supply or receive d.c. power via a telecommunication network. An RFT-V circuit is an RFT circuit that is so designed and protected that under normal operating conditions and single fault conditions, the voltages are limited.
The RFT-V circuits have more stringent power limitations than the medium-power circuit. An RFT-V circuit as described in UL60950-21 is so designed and protected that under normal operating conditions the voltages are limited between each conductor and ground to 140V dc, or up to 200V dc provided that a monitoring and control device is used that limits the current to earth to 10 mA. Power is limited to a maximum rating of 100VA under normal operation and 150VAmax under fault conditions, which are lower than the limits for medium power circuits. In addition, the output current is limited to a value that would not cause damage to the communications wiring system, typically 1.3 A or less. These limits reflect common industry practices for remote feed applications that are now being employed to power broadband equipment not under the exclusive control of the communications utility.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 16-369.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
BRUNSSEN, J.: The Panel Action should be "Reject". The Panel accepted Proposal 16-369 that classifies RFT-V circuits as medium-power circuits. Therefore, it is not necessary to provide additional cable requirements for RFT-V circuits; they are already medium-power circuits and use the same cable types as other medium-power network-powered broadband communications circuits. Therefore, NFPA staff should not add any additional text to 830.40 based on this proposal.

16-381 Log #1879 NEC-P16 **Final Action: Accept in Principle**
(830.40(C) (New))

TCC Action: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the panel as a public comment.
Submitter: Jeffrey Boksiner, Telcordia Technologies, Inc.
Recommendation: Add new (C) after the Exception in 830.40 **Entrance Cables** as follows.
<u>(C) RFT-V Circuits. RFT-V network-powered broadband communications circuits located outside and entering buildings shall be installed using Type BMU, Type BM, or Type BMR network-powered broadband communications medium power cables</u> .
Substantiation: CSA/UL6950-21 (first edition, 2003), Standard for Safety for Information Technology Equipment – Safety – Part 21: Remote Power Feeding, is the ANSI standard that applies to communications systems intended to supply and receive power over the communications network. This is part of a set of several proposals intended to harmonize the requirements of UL6950-21 and the NEC Article 830.
The RTF-V circuit specified in the CSA/UL document permits voltages up to 200V dc between each conductor and ground with monitoring and control devices that limit the current to ground to 10 mA. The RFT-V is power-limited to 100 W rated power (150 VAmax). Rationale and background for the provisions of CSA/UL 60950-21 can be found in the Annex A to the standard.
This proposal is intended to allow the use of Type BMU, Type BM, or Type BMR cables for RFT-V circuits. These cables are presently allowed for medium power network-powered broadband communications circuits in 830.40(A). The RFT-V circuits have more stringent power limitations than the medium-power circuit. As insulation for the individual conductors of Type BMU, Type BM, and Type BMR Cables is required to be rated for 300 volts minimum, these cables are suitable for the RFT-V circuits. This proposal is a companion proposal to allow RFT-V circuits in 830-15.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 16-369.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
BRUNSSEN, J.: The Panel Action should be "Reject". The Panel accepted Proposal 16-369 that classifies RFT-V circuits as medium-power circuits. Therefore, it is not necessary to provide additional cable requirements for RFT-V circuits; they are already medium-power circuits and use the same cable types as other medium-power network-powered broadband communications circuits. Therefore, NFPA staff should not add any additional text to 830.40 based on this proposal.

16-382 Log #790 NEC-P16 **Final Action: Accept in Principle**
(830.47)

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Add the sentence as shown:
830.47. Underground Circuits Entering Building. Underground network-powered broadband communications cables entering buildings shall comply with 830.47(A) through 830.47(D).
Change the title of (A) as follows:
(A) ~~Underground Systems.~~ With Electric Light and Power Conductors.
Substantiation: This proposal is editorial and technical. (Task Group No. 830-08)
It proposes wording parallel to that in Article 800 and properly describes the requirements of the Section and the title change also parallels that of Article 800 and is more descriptive of the paragraph.
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.
Panel Meeting Action: Accept in Principle
Accept the submitter's proposal with the following revisions:
In the title of 830.47, make "Building" plural as in 2005 NEC text.
In proposed new title of 830.47(A), delete the period following "Systems".
Panel Statement: These changes reflect the 2005 NEC existing text and provide a correction to punctuation.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-383 Log #2668 NEC-P16 **Final Action: Reject**
(830.90(A))

Submitter: Robert W. Jensen, dbi / Rep. BICSI, A Telecommunications Association
Recommendation: Add new text to read:
(A) Application. Primary electrical protection shall be provided on all aerial network-powered broadband communications conductors. Primary electrical protection shall be provided on all underground network-powered broadband communications conductors that are neither grounded nor interrupted and are exposed to lightning or accidental contact with electric light or power conductors operating at over 300 volts to ground.
Substantiation: This proposal simplifies and clarifies the requirement for protection of network powered broadband circuits.
Panel Meeting Action: Reject
Panel Statement: The submitter proposes to "add new text to read" when in actuality it appears that he intends to replace the existing text of 830.90(A). The submitter has not simplified, but has eliminated requirements! The proposed revision would require primary protection to be applied at all installations, irrespective of exposure considerations, i.e., contained within a block. There continues to exist today many urban communities and neighborhoods where dwellings are served from underground communications plant that is contained within a block, circuits are unexposed to possible contact with power, and lightning exposure is minimal. Primary protection is unnecessary and will not result in improved safety.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-384 Log #791 NEC-P16 **Final Action: Accept**
(830.90(C))

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Make the change as shown:
(C) Hazardous (Classified) Locations. The primary protector or equipment providing the primary protection function shall not be located in any hazardous (classified) location as defined in ~~Article 500~~ 500.5 or in the vicinity of easily ignitable material.
Exception: As permitted in 501.150, 502.150 , and 503.150.
Substantiation: This is an editorial proposal. (Task Group No. 830-09)
The definitions of hazardous locations are in 500.5
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.

Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-385 Log #906 NEC-P16 **Final Action: Accept in Principle**
(830.90(C))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Change "Article 500" to "500.5".
Substantiation: Edit. To conform to Style Manual requirements.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 16-384.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-386 Log #793 NEC-P16 **Final Action: Reject**
(830.93)

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Revise the title of 830.93 as follows:
830.93 Grounding or Interruption of Metallic Members of Network-Powered Broadband Communications Cables Entering Buildings . The shields of network-powered broadband communications cables …….
Substantiation: This is an editorial proposal. (Task Group No.)
It will provide consistency between 770.93, 800.93, 820.93 and 830.93. This is a companion proposal to 770.93, 800.93 and 820.93.
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.
Panel Meeting Action: Reject
Panel Statement: Changing the title of the section is inappropriate, as the cable may not actually enter the building.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-387 Log #1309 NEC-P16 **Final Action: Accept in Principle**
(830.93)

Submitter: Steven C. Johnson, Time Warner Cable / Rep. National Cable Telecommunications Association
Recommendation: Revise as follows:
830.93 Grounding of Outer Conductive Shield of a Coaxial Cable. For purposes of this section, grounding or interruption of network-powered broadband communications cable metallic members installed at mobile home service equipment located ~~in sight from, and not more~~ within 9.0 m (30 ft) ~~from~~ of the exterior wall of the mobile home it serves, or at a mobile home disconnecting means grounded in accordance with 250.32 and located ~~in sight from, and not more~~ within 9.0 m (30 ft) ~~from~~ of the exterior wall of the mobile home it serves shall be considered to meet the requirements of this section.
Substantiation: Improves clarity. The existing, double-negative wording is difficult to interpret. This editorial change makes the text easier to interpret and clarifies the requirements.
For purposes of grounding or bonding network-powered broadband communications cables, being able to see the power disconnection point is immaterial. Whereas "in sight from" may be critical for disconnecting power in an emergency, maintaining a reasonable length grounding conductor is the key in a network-powered broadband communications application. This proposal does not affect service equipment placement requirements. It only clarifies where the network-powered broadband communications grounding will be done based on where the service equipment is already placed.
Panel Meeting Action: Accept in Principle
The panel accepts the submitter's proposal with the following revisions:
Change the title to read as follows:
Grounding or Interruption of Metallic Members of Network-Powered Broadband Communications Cables.
Panel Statement: The panel has corrected the title.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-388 Log #792 NEC-P16 **Final Action: Accept**
(830.93, FPN (New))

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Add a Fine Print Note Number 1 (FPN No 1) to 830.93 as follows:
FPN No. 1: See 830.2 for the definition of *point of entrance* .
Renumber the existing FPN as "FPN No. 2".
Substantiation: This proposal is editorial. (Task Group No. 830-10)
Its addition will provide consistency between 770.93, 800.93, 820.93 and 830.93. This is a companion proposal to 770.93 and 820.93.
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
OHDE, H.: This proposal should be rejected. Section 90.1(C) of the NEC states " *This Code is not intended as a design specification or an instruction manual for the untrained persons* ." In the submitter's substantiation he states this FPN will help installers who are not Code experts. The addition of the FPN referencing 830.2 for the definition of point of entrance is not needed nor warranted. A trained installer will know the Code content and how the Code book is to be used.

16-389 Log #3511 NEC-P16 **Final Action: Reject**
(830.100)

Submitter: Paul Dobrowsky, Holley, NY
Recommendation: Revise as Follows:
830.100 Cable, Network Interface Unit, and Primary Protector Grounding. Network interface units containing protectors, NIUs with metallic enclosures, primary protectors, and the metallic members of the network-powered broadband communications cable that are intended to be grounded shall be grounded as specified in 830.100(A) through 830.100(D).
(A) Grounding Electrode Conductor.
(1) Insulation. The grounding electrode conductor shall be insulated and shall be listed as suitable for wet locations ~~the purpose~~ .
(2) Material. The grounding electrode conductor shall be copper or other corrosion-resistant conductive material, stranded or solid.
(3) Size. The grounding electrode conductor shall not be smaller than 14 AWG and shall have a current-carrying capacity approximately equal to that of the grounded metallic member(s) and protected conductor(s) of the network-powered broadband communications cable. The grounding electrode conductor shall not be required to exceed 6 AWG.
(4) Length. The grounding electrode conductor shall be as short as practicable. In one-family and multifamily dwellings, the grounding electrode conductor shall be as short as permissible, not to exceed 6.0 m (20 ft) in length.
FPN: Similar grounding electrode conductor length limitations applied at apartment buildings and commercial buildings will help to reduce voltages that may be developed between the building's power and communications systems during lightning events.
Exception: In one- and two-family dwellings where it is not practicable to achieve an overall maximum grounding electrode conductor length of 6.0 m (20 ft), a separate communications ground rod meeting the minimum dimensional criteria of 830.100(B)(2)(2) shall be driven, and the grounding electrode conductor shall be connected to the communications ground rod in accordance with 830.100(C). The communications ground rod shall be bonded to the power grounding electrode system in accordance with 830.100(D).
(5) Run in Straight Line. The grounding electrode conductor shall be run to the grounding electrode in as straight a line as practicable.
(6) Physical Protection. Where subject to physical damage, the grounding electrode conductor shall be adequately protected. Where the grounding electrode conductor is run in a metal raceway, both ends of the raceway shall be bonded to the grounding electrode conductor or the same terminal or electrode to which the grounding electrode conductor is connected.
(B) Electrode. The grounding electrode conductor shall be connected as follows.
(1) In Buildings or Structures with Grounding Means. To the nearest accessible location on the following:
(1) The building or structure grounding electrode system as covered in 250.50
(2) The grounded interior metal water piping system, within 1.5 m (5 ft) from its point of entrance to the building, as covered in 250.52
(3) The power service accessible means external to enclosures as covered in 250.94
(4) The metallic power service raceway
(5) The service equipment enclosure
(6) The service, system, building or structure grounding electrode conductor or the grounding electrode metal enclosure, or
(7) The grounding electrode conductor or the grounding electrode of a building or structure disconnecting means that is grounded to an electrode as covered in 250.32
For purposes of this section, the mobile home service equipment or the mobile home disconnecting means, as described in 830.93, shall be considered accessible.
(2) In Buildings or Structures Without Grounding Means. If the building or structure served has no grounding means, as described in (B)(1), the grounding conductor shall be connected to either of the following:
(1) To any one of the individual electrodes described in 250.52(A)(1), (A)(2), (A)(3), or (A)(4)
(2) If the building or structure served has no grounding means, as described in 830.100(B)(1) or (B)(2)(1), to an effectively grounded metal structure or to a ground rod or pipe not less than 1.5 m (5 ft) in length and 12.7 mm (½ in.) in diameter, driven, where practicable, into permanently damp earth and separated from lightning conductors as covered in 800.53 and at least 1.8 m (6 ft) from electrodes of other systems. Steam or hot water pipes or lightning-rod conductors shall not be employed as electrodes for protectors, NIUs with integral protection, grounded metallic members, NIUs with metallic enclosures, and other equipment.
(C) Electrode Connection. Connections to grounding electrodes shall comply with 250.70.
(D) Bonding of Electrodes. A bonding jumper not smaller than 6 AWG copper or equivalent shall be connected between the network-powered broadband communications system grounding electrode and the power grounding electrode system at the building or structure served where separate electrodes are used.
Exception: At mobile homes as covered in 830.106.
FPN No. 1: See 250.60 for use of lightning rods.
FPN No. 2: Bonding together of all separate electrodes limits potential differences between them and between their associated wiring systems.
Substantiation: The concept of listed for the purpose needs to be explained. If being suitable for a wet location is not the intent, then please describe what is.
The term grounding conductor should be replaced with grounding electrode conductor. A proposal was submitted to Article 100 to modify the existing definition of grounding electrode and to delete the term grounding conductor. to clarify this issue. The Term Grounding conductor is sometimes used to describe a connection to the earth and other times to describe any of the different types of conductors that use the term "grounding". Separate grounding electrodes are already required to be bonded together by 250.50.
Describing what listed for the purpose will improve usablity.
Panel Meeting Action: Reject
Panel Statement: The term "grounding electrode conductor" specifically applies to the conductor that connects the grounding electrode(s) to the equipment grounding conductor or to the grounded conductor, or both, at the electric service to the building. The conductor connecting the metallic members of the cable sheath and the primary protector grounding terminal to the building grounding means is not a "grounding electrode conductor", but a "grounding conductor" as determined by the TCC Grounding & Bonding Task Group.
The listing of a grounding electrode conductor does not include a special investigation for a wet location.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-390 Log #849 NEC-P16 **Final Action: Accept**
(830.100(A))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read as follows:
830.100 Cable, Network Interface Unit, and Primary Protector Grounding.
Network interface units containing protectors, NIUs with metallic enclosures, primary protectors, and the metallic members of the network-powered broadband communications cable that are intended to be grounded shall be grounded as specified in 830.100(A) through 830.100(D).
(A) Grounding Conductor
(1) Insulation. The grounding conductor shall be insulated and shall be listed. ~~as suitable for the purpose.~~
Substantiation: Listed insulated conductors are currently being used for this purpose and there doesn't appear to be insulated conductors listed specifically for the purpose of accomplishing the grounding required by this section.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-391 Log #845 NEC-P16 **Final Action: Reject**
(830.100(A)(1))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read as follows:
830.100 Cable, Network Interface Unit, and Primary Protector Grounding.
Network interface units containing protectors, NIUs with metallic enclosures, primary protectors, and the metallic members of the network-powered broadband communications cable that are intended to be grounded shall be grounded as specified in 830.100(A) through 830.100(D).
(A) Grounding Conductor
(1) Insulation. The grounding conductor shall be insulated and shall be listed and marked as a grounding protector wire. ~~as suitable for the purpose.~~
Substantiation: Under the category KDER and the UL White Book, Protector Grounding wires are addressed. The guide card information indicates that this wire is required to be marked with the manufacturer's name, size, and the words "protector grounding wire". In step with the directives to address the term listed or listed as suitable for the purpose, this proposal is an effort to be more specific in the rule to require a conductor specifically listed and marked for this purpose.
Panel Meeting Action: Reject
Panel Statement: There is nothing special about the conductor used to ground the protector. The communications industry has used listed wire to ground the protector universally and safely for many years. There is no need to specifically mark this conductor "as a grounding protector wire". Such marking may lead to confusion and misinterpretation. The submitter has demonstrated no safety issue with the present practice.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-392 Log #377 NEC-P16 **Final Action: Reject**
(830.100(A)(6))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise text as follows:
" ~~Physical~~ Protection. Where subject to ~~physical~~ damage, the grounding conductor shall be adequately protected...".
Substantiation: Use of the word "physical" is superfluous–the intent is obvious given the context. (I leave it to the CMP whether you want to get more specific naming some source of damage such as "blows or abrasion." I also leave it to you whether to update "adequately" to something like "by a means acceptable to the AHJ.")
Submitting proposals removing the adjective "physical" may strike people as about as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every unnecessary instance, as I am attempting to do, we actually cut the NEC down by up to oh, maybe a quarter-page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the unneeded use of "physical" not only is poor writing–look at William Zinsser's classic, On Writing Well–but is silly, and reflects a bit poorly on the Code process. When references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."
Panel Meeting Action: Reject
Panel Statement: The grounding conductor is potentially subject to multiple sources of damage: electrical, physical, and environmental. The word "physical" is necessary to specifically identify the type of damage that the section is addressing.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-393 Log #860 NEC-P16 **Final Action: Accept**
(830.100(A)(6))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read as follows:
(6) Physical Protection. The grounding conductor shall be protected where exposed to physical damage. ~~Where subject to physical damage, the grounding conductor shall be adequately protected.~~ Where the grounding conductor is run in a metal raceway, both ends of the raceway shall be bonded to the grounding conductor or the same terminal or electrode to which the grounding conductor is connected.
Substantiation: Adequately is subjective in this requirement and can lead to inconsistencies. The word "adequate" is a word that is identified by the Style Manual as one to avoid in Code rules for that reason.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-394 Log #794 NEC-P16 **Final Action: Accept in Principle**
(830.100(B))

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal. The Panel Action text addresses the change in 830.110(B), rather than the correct section of 830.100(B). This action will be considered by the Panel as a Public Comment.
Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Make the following changes:
(B) Electrode. The grounding conductor shall be connected in accordance with 830.100(B)(1) and (B)(2).
Substantiation: This is an editorial proposal. (Task Group No.)
P rovides consistency with the Style Manual requirements and provide parallel structure with 820.100(B).
This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:
1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.
The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.
Panel Meeting Action: Accept in Principle
Chan ge 830.110(B) to read as follows:
(B) Electrode. The grounding conductor shall be connected in accordance with 830.100(B)(1) and (B)(2).

Ballot Results: Affirmative: 15

16-395 Log #1887 NEC-P16 **Final Action: Accept**
(830.100(B))

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal with respect to the use of the word "and" in the sentence "The grounding conductor shall be connected in accordance with 830.100(B)(1), (B)(2), and (B)(3)."
It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 5-20.
This action will be considered by the Panel as a Public Comment.
Submitter: Jeffrey Boksiner, Telcordia Technologies, Inc. / Rep. Alliance for Telecommunications Industry Solutions
Recommendation: Revise 830.100(B) **Cable and Primary Protector Grounding (Electrode)** as follows:
(B) Electrode. The grounding conductor shall be connected ~~as follows~~ in accordance with 830.100(B)(1), (B)(2) and (B)(3).
(1) In Buildings or Structures with an Intersystem Grounding Termination. If the building or structure served has an intersystem grounding termination the grounding conductor shall be connected to the intersystem grounding termination.
~~(1)~~ (2) In Buildings or Structures with Grounding Means. If the building or structure served has no intersystem grounding termination, the grounding conductor shall be connected to the nearest accessible location on the following:
....
.................Retain existing list and text.
....
~~(2)~~ (3) In Buildings or Structures Without Intersystem Grounding Termination or Grounding Means. If the building or structure served has no intersystem grounding termination or grounding means ~~,~~ as described in 830.100(B)(~~1~~ 2), the grounding conductor shall be connected to either of the following:.
. (1) To any one of the individual electrodes described in 250.52(A)(1), (A)(2), (A)(3), or (A)(4)
(2) If the building or structure served has no intersystem grounding termination or grounding means, as described in 830.100(B)(~~1~~ 2) or (B)(~~2~~ 3)(1), to an effectively grounded metal structure or to a ground rod or pipe not less than 1.5 m (5 ft) in length and 12.7 mm (in.) in diameter, driven, where practicable, into permanently damp earth and separated from lightning conductors as covered in 800.53 and at least 1.8 m (6 ft) from electrodes of other systems. Steam or hot water pipes or lightning-rod conductors shall not be employed as electrodes for protectors, NIUs with integral protection, grounded metallic members, NIUs with metallic enclosures, and other equipment.
Substantiation: This is one of several correlated proposals (100 Definitions, 250.95, Chapter 8 Articles) to improve the requirements related to intersystem bonding and grounding of communication systems. The intent is to create a dedicated and well-defined location for terminating the grounding conductors

required in Chapter 8 Articles and 770.93. These grounding conductors also provide between communication and power systems (intersystem bonding). The proposed termination would have sufficient capacity to handle multiple communication systems (telecom, satellite, CATV) on premises. The proposed revision makes the intersystem bonding terminal the preferred destination for grounding conductor in Article 830. See the figures I have provided.

Intersystem bonding accomplished by connection of a communication grounding conductor to the power system is an important safety measure to prevent occurrences of voltages between communication system and power system. However, the existing requirements are not adequate. Bonding is becoming difficult to implement due to changes in building construction practices such as increased prevalence of flush construction and use of PVC conduits. Frequently, in new construction, the grounding electrode, the raceway and the grounding electrode conductor are hidden behind walls and not accessible for bonding connection.

Even in older construction with accessible equipment, the requirement for installation of intersystem bonding connection is subject to varying interpretation because there is not a clearly defined dedicated bonding location. The connection to the power system is sometimes haphazard. Installers are sometimes confused over where the connection should be made especially if multiple Communication Systems are present on premises.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

16-396 Log #1994 NEC-P16 **Final Action: Accept in Principle**

(830.100(B))

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal based on the affirmative comment. This action will be considered by the Panel as a Public Comment.

Submitter: Neil F. LaBrake, Jr., Niagara Mohawk, a National Grid Company / Rep. Edison Electric Institute-Electric Light & Power Group

Recommendation: Add these two sentences after the last sentence of 830.100(B):

<u>A device intended to provide a termination point for the grounding conductor (inter-system bonding) shall be prohibited from use when the installation of such device interferes with opening a service or metering equipment enclosure. An inter-system bonding device shall not be installed on an enclosure cover.</u>

Substantiation: Poor grounding practices by installers of CATV, telephone, satellite and other communication systems using termination devices that clamp to enclosure covers have resulted in interruption of grounding continuity. This is a companion proposal to proposals to add this requirement to 800.100(B), 810.21(F), and 820.100(B).

Panel Meeting Action: Accept in Principle

Add the following after the last sentence of 830.100(B):

A device intended to provide a termination point for the grounding conductor shall not interfere with the opening of an equipment enclosure. A bonding device shall be mounted on non-removable parts. A bonding device shall not be mounted on a door or cover even if the door or cover is non-removable.

Panel Statement: The panel accepts the intent of the submitter and has reworded the text for clarity. It is requested that the TCC forward to Panel 5 for take similar action as applicable.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

BRUNSSEN, J.: The submitter's text, as modified by the Panel, should be placed following the existing text of 830.100(B)(5) rather than at the end of 830.100(B). Section 830.100(B)(5) specifically addresses connection to the service equipment enclosure and that is the issue that the submitter intended to address.

16-397 Log #1553 NEC-P16 **Final Action: Accept**

(830.100(B)(2)(2))

Submitter: Technical Correlating Committee on National Electrical Code®,

Recommendation: Delete the term "effectively" from the terms "effectively grounded" and "effectively bonded" from Articles 830 and revise text as shown for the affected NEC sections.

830.100(B)(2)(2):

(2) If the building or structure served has no grounding means, as described in 830.100(B)(1) or (B)(2)(1), ~~to an effectively grounded metal structure o~~ r <u>to any one of the individual electrodes described in 250.52 (A)(6), and (A)(7) or</u> to a ground rod or pipe not less than 1.5 m (5 ft) in length and 12.7 mm (1/2 in.) in diameter, driven, where practicable, into permanently damp earth and separated from lightning conductors as covered in 800.53 and at least 1.8 m (6 ft) from electrodes of other systems. Steam or hot water pipes or lightning-rod conductors shall not be employed as electrodes for protectors, NIUs with integral protection, grounded metallic members, NIUs with metallic enclosures, and other equipment.

Substantiation: 830.100(B)(2)(2): Here the reference to "effectively grounded metal structure" seems superfluous.

The definition of "effectively grounded" is ambiguous and very subjective without any defined values or parameters for one to judge as either "effective" or "ineffective."

This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to delete the term "grounded, effectively" and its definition from Article 100 and other companion proposals throughout the NEC relative to this Task Group's recommendations. The substantiation of this proposal is as follows.

The term "Effectively Grounded" is used 29 times in the NEC. It appears as though in the majority of the locations where it is used, the word "grounded" or phrase "connected to an equipment grounding conductor" could be used. Other proposals are submitted to make those changes.

The 1996 NEC in Section 250.51 used the term "effective grounding path," and those concepts were incorporated in 250.2 (1999 NEC) and then expanded in 250.4(A) and (B) in the 2002 NEC. The performance criteria of grounding and bonding are currently provided in Section 250.4 and include the concepts contained in the vague definition of the term "effectively grounded."

The definition "Effectively Grounded" is very subjective and without any defined values or parameters for one to judge grounding as either "effective" or "ineffective." "Effective" is described in Section 250.4(A) and (B), but it relates to the effective ground-fault current path as a performance criteria. Deleting the term in the NEC and the definition is logical because there are no definitive parameters for Code users to make a determination on what constitutes "effectively grounded." Systems are solidly grounded, grounded through a resistor or impedance, or ungrounded. Equipment (normally noncurrent-carrying metal parts are grounded where connected to an equipment grounding conductor.

This proposal is to change the term "Effectively Bonded" to just "Bonded" in each of the section where it is used. The term "Effectively Bonded" is currently not defined in the NEC.

The term "effectively bonded" is also used a few times in the NEC and is undefined. The same situation exists. There are no defined parameters for Code users to judges what the difference between "Effectively Bonded" and "Bonded" really is. Where the term appears in the NEC, it is revised to just "bonded" and still has the same meaning in each rule.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal by determining whether an "and" should be used or an "or" should be used in the accepted text as follows: "shall comply with 830.106(A)(1) and (A)(2)" or "shall comply with 830.106(A)(1) or (A)(2)". The Technical Correlating Committee also directs that consideration be given to the comments expressed in the voting. This action will be considered by the Panel as a Public Comment.
Submitter: Steven C. Johnson, Time Warner Cable / Rep. National Cable Telecommunications Association
Recommendation: Revise as follows:
(A) Grounding. Grounding shall comply with (1) and (2).
(1) Where there is no mobile home service equipment located ~~in sight from, and not more~~ within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, the network-powered broadband communications cable network interface unit, and primary protector ground shall be installed in accordance with 830.100(B)(2).
(2) Where ~~or~~ there is no mobile home disconnecting means grounded in accordance with 250.32 and located ~~within sight from, and not more~~ within 9.0 m (30 ft) of the exterior wall of the mobile home it serves, the network-powered broadband communications cable, network interface unit, and primary protector ground shall be installed in accordance with 830.100(B)(2).
Substantiation: Improves clarity. The existing, double-negative wording is difficult to interpret. This editorial change makes the text easier to interpret and clarifies the requirements.
For purposes of grounding or bonding network-powered broadband communications cables, being able to see the power disconnection point is immaterial. Whereas "in sight from" may be critical for disconnecting power in an emergency, maintaining a reasonable length grounding conductor is the key in a network-powered broadband communications application. This proposal does not affect service equipment placement requirements. It only clarifies where the network-powered broadband communications grounding will be done based on where the service equipment is already placed.
Panel Meeting Action: Accept in Principle
Revise the submitter's text as follows:
(A) Grounding. Grounding shall comply with 830.106(A)(1) and (A)(2).
(1) Where there is no mobile home service equipment located in sight from, and not more than within 9 m (30 ft) from, the exterior wall of the mobile home it serves, the network-powered broadband communications cable, network interface unit, and primary protector ground shall be installed connected to a grounding conductor in accordance with 830.100(B)(2).
(2) Where there is no mobile home disconnecting means grounded in accordance with 250.32 and located within sight from, and not more than 9 m (30 ft) from, the exterior wall of the mobile home it serves, the network-powered broadband communications cable, network interface unit, and primary protector ground shall be installed connected to a grounding conductor in accordance with 830.100(B)(2).
Panel Statement: The changes made by the panel provide conformity to Section 4.2.1 of the NEC Style Manual in referencing sections of the NEC, incorporate revisions made to similar section 820.106(A) by the TCC Grounding and Bonding Task Group (see panel action on Proposal 16-4, 820.106(A)), and provide editorial consistency across Articles 800, 820, and 830.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
BRUNSSEN, J.: There are a number of typographical errors in the revised text as provided by the Panel. Revise the Panel's revised text under "Panel Meeting Action" as follows:
" **(A) Grounding.** Grounding shall comply with 830.106(A)(1) and (A)(2).
(1) Where there is no mobile home service equipment located ~~in sight from, and not more than~~ within 9.0 m (30 ft) from ~~,~~ the exterior wall of the mobile home it serves, the network-powered broadband communications cable, network interface unit, and primary protector ground shall be ~~installed~~ connected to a grounding conductor in accordance with 830.100(B)(2).
(2) Where there is no mobile home disconnecting means grounded in accordance with 250.32 and located within ~~sight from, and not more than~~ 9.0 m (30 ft) from ~~,~~ the exterior wall of the mobile home it serves, the network-powered broadband communications cable, network interface unit, and primary protector ground shall be ~~installed~~ connected to a grounding conductor in accordance with 830.100(B)(2)."

16-402 Log #58 NEC-P16 **Final Action: Accept**
(830.110 (New))

Submitter: Stanley Kaufman, Cable Safe Inc.
Recommendation: Add a new section 830.110 in Part V.
830.110 Raceways For Low And Medium Power Network-Powered Broadband Communications Cables. Where low and medium power network-powered broadband communications cables are installed in a raceway, the raceway shall be of a type permitted in Chapter 3 and installed in accordance with Chapter 3.
Exception: Conduit fill restrictions shall not apply to low power network-powered broadband communications cables.
Substantiation: This is a corollary proposal to proposals being submitted for Articles770, 800 and 820. Articles 800 and 820 have a section 110. Adding this section provides parallelism between the articles.
Panel Meeting Action: Accept
Number Eligible to Vote: 15

(830.133(A) Exception (New))

Submitter: David H. Kendall, Carlon
Recommendation: Add a new exception to 830.133(A) to read as follows:
<u>Exception: Where all of the conductors of electric light, power, Class 1, nonpower-limited fire alarm, and medium power network-powered broadband communications circuits are separated from all of the Network-Powered Broadband Communication cables by a permanent barrier or listed divider.</u>
Substantiation: This is a new exception for 830.133(A) that would allow a Network-Powered Broadband Communication cable to share the same raceway, outlet box, or enclosure as long as a barrier was in place. This language is similar to the language found in 800.133(A)(1)(c) Exception No. 1. Network-Powered Broadband Communication cable can become energized if it comes in contact with electrical conductors. This proposal defines the barrier as a permanent function of the enclosure or that it may be a removable field installed listed divider. These barriers are used to divide the coaxial cable from the power circuits.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject
Panel Statement: Exception No.1 presently meets the submitter's intent.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-407 Log #1286 NEC-P16 **Final Action: Accept**
(830.133(A)(1))

Submitter: Gerald Lee Dorna, Belden CDT. Inc.
Recommendation: Revise text to read:
(1) In Raceways <u>, Cable Trays</u> and Enclosures.
(a) Low and Medium Power Network-Powered Broadband Communications Circuit Cables. Low and medium power network-powered broadband communications cables shall be permitted in the same raceway <u>, cable tray</u> or enclosure.
(b) Low-Power Network-Powered Broadband Communications Circuit Cables. Low-power network-powered broadband communications cables shall be permitted in the same raceway <u>, cable tray</u> or enclosure with jacketed cables of any of the following circuits:
(1) Class 2 and Class 3 remote-control, signaling, and power-limited circuits in compliance with Article 725
(2) Power-limited fire alarm systems in compliance with Article 760
(3) Communications circuits in compliance with Article 800
(4) Nonconductive and conductive optical fiber cables in compliance with Article 770
(5) Community antenna television and radio distribution systems in compliance with Article 820
(c) Medium Power Network-Powered Broadband Communications Circuit Cables. Medium power network-powered broadband communications cables shall not be permitted in the same raceway <u>, cable tray</u> or enclosure with conductors of any of the following circuits:
(1) Class 2 and Class 3 remote-control, signaling, and power-limited circuits in compliance with Article 725
(2) Power-limited fire alarm systems in compliance with Article 760
(3) Communications circuits in compliance with Article 800
(4) Conductive optical fiber cables in compliance with Article 770
(5) Community antenna television and radio distribution systems in compliance with Article 820
(d) Electric Light, Power, Class 1, Non–Powered Broadband Communications Circuit Cables. Network-powered broadband communications cable shall not be placed in any raceway, <u>cable tray,</u> compartment, outlet box, junction box, or similar fittings with conductors of electric light, power, Class 1, or non–power-limited fire alarm circuit cables.
Exception No. 1: Where all of the conductors of electric light, power, Class 1, non–power-limited fire alarm circuits are separated from all of the network-powered broadband communications cables by a permanent barrier or listed divider.
Exception No. 2: Power circuit conductors in outlet boxes, junction boxes, or similar fittings or compartments where such conductors are introduced solely for power supply to the network-powered broadband communications system distribution equipment. The power circuit conductors shall be routed within the enclosure to maintain a minimum 6-mm (0.25-in.) separation from network-powered broadband communications cables.
Substantiation: Obviously, cables that can be safely installed in the same raceway or enclosure can also be safely installed in the same cable tray. Stating that these cables are allowed "in the same cable tray" will avoid having the user assume that they are not permitted to be installed together in the same cable tray. It clarifies the use in the Code. Article 770, in section 770.133(B), has text similar to that proposed here. This is one of five similar proposals that are being submitted for Articles 725, 760, 800, 820 and 830.

Conversely thinking, I therefore also added "cable tray" to 830.133(A)(1)(d).

Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
JONES, R.: The submitter is obviously in error with the assertion "Obviously, cables that can be safely installed in the same raceway or enclosure can also be safely installed in the same cable tray." O NLY cABLES LISTED FOR INSTALLATION IN CABLE TRAYS CAN BE INSTALLED IN CABLE TRAYS.

16-408 Log #3434 NEC-P16 **Final Action: Reject**
(830.133(A)(1)d. Exception No. 1)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Delete the phrase "listed divider" at the end; substitute the words "a securely installed barrier identified for the use."
Substantiation: This wording correlates with the changes made by CMP 9 to an equivalent rule in 404.8(B) in response to an equivalent proposal from the same submitter. The problem is that Article 314 does not require conventional steel outlet boxes to be listed, and therefore not all steel box dividers manufactured for this purpose are listed. In addition, none of these barriers (for outlet boxes) are permanently installed; but they certainly can be securely installed, and they certainly meet the provisions of the Article 100 definition of identified, in that they are recognizable as suitable for this purpose. This wording refers to the identical products and should therefore correlate with Article 314 requirements.
Panel Meeting Action: Reject
Panel Statement: This situation is not the same as 404.8(B). Section 404.8(B) deals with the grouping of snap switches with other snap switches and similar devices such as receptacles. The barriers described in 404.8(B) are used to separate these similar devices containing similar circuits.

800. 133(A)(1)c. Exception No. 1;820. 133(A)(1)2. Exception No. 1; and 830.133(A)(1)d. Exception No. 1 deal with the separation of communications, CATV and broadband circuits from electric light, power and Class 1 circuits.

A permanent barrier as currently permitted is okay, as it is a physical part of the metal box or listed plastic box and its suitability can be determined by the AHJ or is covered by the listing. There are concerns associated with a non-permanent barrier or divider that cannot be easily dealt with at the point of installation. For example, compatibility with the box (fit and secureness), compatibility with the installed hardware such as power receptacle materials, ease of installation, clarity of proper installation procedures, affect on wiring space inside the box, and the like, need to be investigated and listed.

These articles do not only cover metal boxes. The proposal would allow non-listed barriers in metal and listed non-metallic boxes, voiding the listing of a non-metallic box.

Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-409 Log #2633 NEC-P16 **Final Action: Reject**
(830.135 (New))

Submitter: David H. Kendall, Carlon
Recommendation: Add a new section to read as follows:
<u>830.135 Network-Powered Broadband Communication Device and Equipment Mounting. Network-Powered Broadband Communication devices or equipment shall be mounted in listed boxes, brackets or assemblies designed for the purpose, and such boxes or assemblies shall be securely fastened in place. Boxes or brackets can be completely enclosed or backless.</u>
<u>(A) Network-Powered Broadband Communication Devices and Equipment Mounted to Boxes or Brackets. Communication devices or equipment shall be mounted to a listed boxes or bracket and installed per 314.20.</u>
<u>(B) Network-Powered Broadband Communication Devices and Equipment Mounted on Covers. Communication device and equipment mounted to and supported by a cover shall be held rigidly against the cover which is mounted to the box or bracket.</u>
Substantiation: This proposal adds a new section to Article 830 addressing the mounting of devices or equipment to listed boxes and brackets. Currently, depending on the quality of workmanship, coaxial devices or equipment have not been mounted to boxes or brackets that can support them. After several years device and/or covers that are mounted directly to the dry wall will become a hazard because they have become loose and exposed. Coaxial cable can become energized by coming in incidental contact with electrical conductors.

830.135 was only a suggestion for the location of this new section. (A) addresses devices mounted directly to boxes or devices where as (B) address devices mounted to covers.
Panel Meeting Action: Reject
Panel Statement: The submitter has provided no data supporting an existing hazard. The submitter offers only an individual opinion that, depending on the quality of workmanship, equipment or devices mounted directly to drywall may, over time, loosen and become a hazard. The addition of listed boxes or assemblies will not, in itself, guarantee a hazard-free installation. The same quality of workmanship is necessary to help ensure a hazard-free equipment installation whether or not listed boxes are used.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
OHDE, H.: We concur with submitter's recommendation which addresses the mounting of equipment or devices to listed boxes and brackets. However the submitter has not provided CMP 16 member any technical substantiation or data supporting the existing hazard. The submitter should resubmit the proposal in the 2008 ROC and provide CMP 16 members with such data.

16-410 Log #1883 NEC-P16 **Final Action: Accept in Principle**
(830.151)

TCC Action: The Technical Correlating Committee understands that no change in the NEC occurs as a result of the panel action on this proposal.
Submitter: Jeffrey Boksiner, Telcordia Technologies, Inc.
Recommendation: Modify 830.151 **Medium Power Network-Powered Broadband Communications System Wiring Methods** as follows.
830.151 **Medium Power Network-Powered Broadband Communications System <u>and RFT-V Network-Powered Broadband Communications System</u> Wiring Methods** .
Medium power network-powered broadband communications systems shall be installed within buildings using listed Type BM or Type BMR, network-powered broadband communications medium power cables. <u>RFT-V network-powered broadband communications systems shall be installed within buildings using listed Type BM or Type BMR, network-powered broadband communications medium power cables.</u>
No change in the remainder of this section.
Substantiation: CSA/UL6950-21 (first edition, 2003), Standard for Safety for Information Technology Equipment – Safety – Part 21: Remote Power Feeding, is the ANSI standard that applies to systems intended to supply and receive power over the communications network. This is part of a set of several proposals intended to harmonize the requirements of UL6950-21 and the NEC Article 830.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 16-369.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
BRUNSSEN, J.: The Panel Action should be "Reject". The Panel accepted Proposal 16-369 that classifies RFT-V circuits as medium-power circuits. Therefore, it is not necessary to provide additional cable requirements for RFT-V circuits; they are already medium-power circuits and use the same cable types as other medium-power network-powered broadband communications circuits. Therefore, NFPA staff should not add any additional text to 830.151 based on this proposal.

16-411 Log #2814 NEC-P16 **Final Action: Accept in Principle**
(830.151)

TCC Action: The Technical Correlating Committee understands that no change in the NEC occurs as a result of the panel action on this proposal.
Submitter: Randolph J. Ivans, Underwriters Laboratories Inc.
Recommendation: Revise as follows:
830.151 Medium Power <u>and RFT-V</u> Network-Powered Broadband Communications System Wiring Methods. Medium power <u>and RFT-V</u> network-powered broadband communications systems shall be installed within buildings using listed Type BM or Type BMR, network-powered broadband communications medium power cables.
No change in the remainder of this section.
Substantiation: This is part of a set of three proposals intended to harmonize the requirements of UL60950-21 and the NEC Article 830. This proposal is a companion proposal to allow RFT-V circuits in 830.15. The voltage limitations in 830.15 do not include some common communication industry practices for powering broadband communications equipment not under the exclusive control of the communications utility.
This proposal is intended to allow the use of Type BMU, Type BM, or Type BMR cables for RFT-V circuits as described in the proposal to allow RFT-V circuits in 830.15. These cables are presently allowed for medium power network-powered broadband communications circuits in 830.40(A). As insulation for the individual conductors of Type BMU, Type BM, and Type BMR Cables are required to be rated for 300 volts minimum, these cables are suitable for the RFT-V circuits.
UL60950-21, Standard for Safety for Information Technology Equipment - Safety - Part 21: Remote Power Feeding, is the ANSI standard that applies to communications systems intended to supply and receive power over the communications network.
An RFT circuit or "Remote Feeding Telecommunication" circuit is a secondary circuit intended to supply or receive d.c. power via a telecommunication network. An RFT-V circuit is an RFT circuit that is so designed and protected that under normal operating conditions and single fault conditions, the voltages are limited.
The RFT-V circuits have more stringent power limitations than the medium-power circuit. An RFT-V circuit as described in UL60950-21 is so designed and protected that under normal operating conditions the voltages are limited between each conductor and ground to 140V dc, or up to 200V dc provided that a monitoring and control device is used that limits the current to earth to 10 mA. Power is limited to a maximum rating of 100VA under normal operation and 150VAmax under fault conditions, which are lower than the limits for medium power circuits. In addition, the output current is limited to a value that would not cause damage to the communications wiring system, typically 1.3 A or less. These limits reflect common industry practices for remote feed applications that are now being employed to power broadband equipment not under the exclusive control of the communications utility.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 16-369.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
BRUNSSEN, J.: The Panel Action should be "Reject". The Panel accepted Proposal 16-369 that classifies RFT-V circuits as medium-power circuits. Therefore, it is not necessary to provide additional cable requirements for RFT-V circuits; they are already medium-power circuits and use the same cable types as other medium-power network-powered broadband communications circuits. Therefore, NFPA staff should not add any additional text to 830.151 based on this proposal.

16-411a Log #CP1602 NEC-P16 **Final Action: Accept**
(830.154)

Submitter: Code-Making Panel 16,
Recommendation: Revise 830.154
830.154 <u>Applications of</u> Low-Power Network-Powered Broadband Communications System ~~Wiring Methods~~ . <u>Cables</u>
Substantiation: This proposal is editorial. Acceptance of this proposal will make the title of 830.154 consistent with the titles of 770.154, 800.154 and 820.154 and comply with the style manual requirement for parallel text.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-412 Log #798 NEC-P16 **Final Action: Accept**
(830.154)

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal. The accepted action changes the title of old "(B) Ducts, Plenums and Other Air Handling Spaces." to "(A) Plenums." However, all three applications are still within the subsection. This action will be considered by the Panel as a Public Comment.
Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Delete subsection (A), renumber remaining existing sections (B), (C) and (D) as (A), B) and (C), relocate Section 830.133 (C) to 830.154 (D) as follows:
830.154 Low-Power Network-Powered Broadband Communications System Wiring Methods.
Low-power network-powered broadband communications systems shall comply with any of the requirements of 830.154(A) through 830.154(D).
~~**(A) In Buildings.** Low-power network-powered broadband communications systems shall be installed within buildings using listed Type BLX, Type BL, Type BLR, or Type BLP network-powered broadband communications low-power cables.~~
~~**(B)**~~ **<u>(A)</u>** ~~**Ducts,**~~ **Plenums,** ~~**and Other Air-Handling Spaces.**~~ Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type BLP. Type BLX cable installed in compliance with 300.22 shall be permitted.
~~**(C)**~~ **<u>(B)</u> Riser.** Cables installed in risers shall comply with any of the requirements in 830.154(C)(1), (C)(2), or (C)(3).
(1) Cables in Vertical Runs. Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type BLP, BLR, or BMR. Floor penetrations requiring Type BMR or BLR shall contain only cables suitable for riser or plenum use.
(2) Metal Raceways or Fireproof Shafts. Type BLX cables shall be permitted to be encased in a metal raceway or located in a fireproof shaft having firestops at each floor.

(3) One- and Two-Family Dwellings. Type BLX or BL cables less than 10 mm (0.375 in.) in diameter shall be permitted in one- and two-family dwellings.

~~**(D)**~~ **(C) Other Wiring Within Buildings.** Cables installed in locations other than those covered in 830.154(A), (B), and (C) shall comply with the requirements of 830.154~~(D)~~(C)(1) through ~~(D)~~ (C)(5).

(1) General. Type BLP, BL, or BM shall be permitted.

(2) In Raceways. Type BLX shall be permitted to be installed in a raceway.

(3) Type BLU Cable. Type BLU cable entering the building from outside shall be permitted to be run in rigid metal conduit or intermediate metal conduit. Such conduits shall be grounded to an electrode in accordance with 830.100(B)

(4) One- and Two-Family Dwellings. Type BLX or BL cables less than 10 mm (0.375 in.) in diameter shall be permitted to be installed in one- and two-family dwellings.

(5) Type BLX Cable. Type BLX cable entering the building from outside and terminated at a grounding block or a primary protection location shall be permitted to be installed, provided that the length of cable within the building does not exceed 15 m (50 ft).

FPN: This provision limits the length of Type BLX cable to 15 m (50 ft), while 830.90(B) requires that the primary protector, or NIU with integral protection, be located as close as practicable to the point at which the cable enters the building. Therefore, in installations requiring a primary protector, or NIU with integral protection, Type BLX cable may not be permitted to extend 15 m (50 ft) into the building if it is practicable to place the primary protector closer than 15 m (50 ft) to the entrance point.

(D) Cable Substitutions. The substitutions for network-powered broadband cables listed in Table 830.154 shall be permitted. All cables in Table 830.154, other than network-powered broadband cables, shall be coaxial cables

Table 830.154 Cable Substitution

Cable Type	Permitted Cable Substitutions
BM	BMR
BLP	CMP, CL3P
BLR	CMP, CL3P, CMR, CL3R, BLP, BMR
BL	CMP, CMR, CM, CMG, CL3P, CL3R, CL3, BMR, BM, BLP, BLR
BLX	CMP, CMR, CM, CMG, CMX, CL3P, CL3R, CL3, CL3X, BMR, BM, BLP, BRP, BL

Substantiation: This is an editorial proposal. (Task Group No. 830-19)

Existing Section 830.154(A) may be editorially deleted as it adds no new information to Article 830 that is not covered elsewhere in the article. Renumbering the remaining subsections aligns Section 830.154 with similar requirements in 770.154, 800.154 and 820.154. Adding 830.154 (D) places the information regarding cable substitutions in its rightful place in the Article. This is a companion proposal to similar proposals concerning Sections 800.154, 820.154 and 830.154, and to the proposal to relocate Section 830.133(C) to Section 830.154(D).

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;
2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;
3) make the Articles as self-sufficient as is reasonably possible; and,
4) improve the language in the difficult to understand Sections.

The Task Group members are Donna Ballast, Jim Brunssen, Sandy Egesdal, Roland Gubisch, Stan Kahn, Stan Kaufman and Steve Johnson.

Panel Meeting Action: Accept
Number Eligible to Vote: 15

(830.157)

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise text as follows:

Protection Against ~~Physical~~ Damage. Section 300.4 shall apply.

Substantiation: Use of the word "physical" is superfluous–the intent is obvious given the context. (I leave it to the CMP whether you want to get more specific naming some source of damage such as "blows or abrasion.")

Submitting proposals removing the adjective "physical" may strike people as about as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every unnecessary instance, as I am attempting to do, we actually cut the NEC down by up to oh, maybe a quarter-page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.

Second, the unneeded use of "physical" not only is poor writing–look at William Zinsser's classic, On Writing Well–but is silly, and reflects a bit poorly on the Code process. When references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."

Panel Meeting Action: Reject
Panel Statement: The grounding conductor is potentially subject to multiple sources of damage: electrical, physical, and environmental. The word "physical" is necessary to specifically identify the type of damage that the section is addressing.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

16-415 Log #800 NEC-P16 **Final Action: Accept**
(830.179)

Submitter: S.D. Kahn, Tri-City Electric Co., Inc.
Recommendation: Change the titles as shown:

830.179 Network-Powered Broadband Communications Equipment and Cables.

Network-powered broadband communications equipment and cables shall be listed as suitable for the purpose.

Exception No. 1: This listing requirement shall not apply to community antenna television and radio distribution system coaxial cables that were installed prior to January 1, 2000, in accordance with Article 820 and are used for low-power network-powered broadband communications circuits.

Exception No. 2: Substitute cables for network-powered broadband communications cables shall be permitted as shown in Table 830.133.

(**A) Listing and Marking.** Listing and marking of network-powered broadband communications cables shall comply with 830.179(A)(1) or (A)(2).

(1) Type s BMU, ~~Type~~ BM, and ~~Type~~ BMR Cables. Network-powered broadband communications medium power underground cable, Type BMU; network-powered broadband communications medium power cable, Type BM; and network-powered broadband communications medium power riser cable, Type BMR, shall be factory-assembled cables consisting of a jacketed coaxial cable, a jacketed combination of coaxial cable and multiple individual conductors, or a jacketed combination of an optical fiber cable and multiple individual conductors. The insulation for the individual conductors shall be rated for 300 volts minimum. Cables intended for outdoor use shall be listed as suitable for the application. Cables shall be marked in accordance with 310.11. Type BMU cables shall be jacketed and listed as being suitable for outdoor underground use. Type BM cables shall be listed as being suitable for general-purpose use, with the exception of risers and plenums, and shall also be listed as being resistant to the spread of fire. Type BMR cables shall be listed as being suitable for use in a vertical run in a shaft or from floor to floor and shall also be listed as having fire-resistant characteristics capable of preventing the carrying of fire from floor to floor.

FPN No. 1: One method of defining *resistant to spread of fire* is that the cables do not spread fire to the top of the tray in the vertical tray flame test in ANSI/UL 1581-1991, *Reference Standard for Electrical Wires, Cables and Flexible Cords* . Another method of defining *resistant to the spread of fire* is for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing

the CSA vertical flame test for cables in cable trays, as described in CSA C22.2 No. 0.3-M-1985, *Test Methods for Electrical Wires and Cables.*
FPN No. 2: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the cables pass the requirements of ANSI/UL 1666-2002, *Standard Test for Flame Propagation Height of Electrical and Optical-Fiber Cable Installed Vertically in Shafts.*

(2) Type s BLU, ~~Type~~ BLX, ~~Type~~ BL, BLR and ~~Type~~ BLP Cables. Network-powered broadband communications low-power underground cable, Type BLU; limited use network-powered broadband communications low-power cable, Type BLX; network-powered broadband communications low-power cable, Type BL; network-powered broadband communications low-power riser cable, Type BLR; and network-powered broadband communications low-power plenum cable, Type BLP, shall be factory-assembled cables consisting of a jacketed coaxial cable, a jacketed combination of coaxial cable and multiple individual conductors, or a jacketed combination of an optical fiber cable and multiple individual conductors. The insulation for the individual conductors shall be rated for 300 volts minimum. Cables intended for outdoor use shall be listed as suitable for the application. Cables shall be marked in accordance with 310.11. Type BLU cables shall be jacketed and listed as being suitable for outdoor underground use. Type BLX limited-use cables shall be listed as being suitable for use outside, for use in dwellings, and for use in raceways and shall also be listed as being resistant to flame spread. Type BL cables shall be listed as being suitable for general-purpose use, with the exception of risers and plenums, and shall also be listed as being resistant to the spread of fire. Type BLR cables shall be listed as being suitable for use in a vertical run in a shaft or from floor to floor and shall also be listed as having fire-resistant characteristics capable of preventing the carrying of fire from floor to floor. Type BLP cables shall be listed as being suitable for use in ducts, plenums, and other spaces used for environmental air and shall also be listed as having adequate fire-resistant and low smoke-producing characteristics.

FPN No. 1: One method of determining that cable is resistant to flame spread is by testing the cable to VW-1 (vertical-wire) flame test in ANSI/UL 1581-1991, *Reference Standard for Electrical Wires, Cables and Flexible Cords* .

FPN No. 2: One method of defining *resistant to spread of fire* is that the cables do not spread fire to the top of the tray in the vertical tray flame test in ANSI/UL 1584-1991, *Reference Standard for Electrical Wires, Cables and Flexible Cords* .

FPN No. 3: One method of defining fire-resistant characteristics capable of preventing the carrying of fire from floor to floor is that the cables pass the requirements of ANSI/UL 1666-1997, *Standard Test for Flame Propagation Height of Electrical and Optical-Fiber Cable Installed Vertically in Shafts.*

FPN No. 4: One method of defining a cable that is low smoke-producing cable and fire-resistant cable is that the cable exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with NFPA 262 -1999, *Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air Handling Spaces* .

Substantiation: This is an editorial proposal. (Task Group No. 830-18)

It will make the titles of this section consistent with Article 770.

The text also references network-powered broadband communications low-power riser cable, Type BLR. Type BLR should therefore be included in the title too.

This is one of a group of Proposals prepared by the CMP-16 Special Editorial Task Group. The goals of the task group were to:

1) place requirements in the appropriate sections;

2) improve the parallelism between related Articles such that similar requirements are stated the same way in each Article;

3) make the Articles as self-sufficient as is reasonably possible; and,

4) improve the language in the difficult to understand Sections.

CHAPTER 9 TABLES

8-199 Log #1473 NEC-P08 **Final Action: Reject**
(Chapter 9, Table 1)

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Rename the term "fixture wires" to "luminaire wires" in Note 1 to Table 1.
Substantiation: With the changing of the term "fixture" to "luminaire" it only makes sense that the term "fixture wires" be changed to "luminaire wires".

For the purposes of correlation, this proposal is also being submitted to the following Articles/Sections/Tables/Annexes: 200.6; 210.19; 210.20; 210.24; 240.4; 240.5; 300.17; 310.1; 314.16; Article 402; 517.74; 660.9; Table 1; Table 5; Annex C.

Panel Meeting Action: Reject
Panel Statement: The guide information in the UL White Book doesn't limit the use of fixture wire to luminaires. The product is listed, which means it can be used in the field. It is not limited to OEM internal luminaire wiring. Fixture wires are suitable for use for other than luminaires.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-200 Log #1840 NEC-P08 **Final Action: Accept**
(Chapter 9 Table 1)

Submitter: Mark T. Rochon, Mark J. Rochon Master Electrician
Recommendation: Revise as follows:
A multiconductor cable or <u>flexible cords</u> of two or more conductors shall be treated as a single conductor for calculating percentage conduit fill area.
Substantiation: This change would allow Table 1 to be used of Chapter 9 Tables.
Panel Meeting Action: Accept
Apply the proposed action to (9) in Notes to the Tables for Chapter 9 Table 1.
Panel Statement: The panel recognizes the submitter's proposal is actually for (9) in Notes to the Tables for Chapter 9 Table 1.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
DABE, J.: The submitter has not supplied any technical substantiation supporting this proposal. Also Note (2) Table 1 applies only to complete conduit or tubing systems. 400.8(1) states that flexible cord is not to be used as a substitute for permanent wiring methods.

8-201 Log #436 NEC-P08 **Final Action: Reject**
(Chapter 9, Tables 1 & 4)

Submitter: Ben Stuckey, Piper Electric Co., Inc.
Recommendation: In Chapter 9, Tables 1 and 4 of the 2005 NEC the following revision is recommended:
Where 2 conductors are listed, the percentage of conduit fill should be in proportion to 1 conductor and over 2 conductors, not less. Therefore, the percentage of conduit fill for 2 conductors would be revised to 46 percent of conduit fill.
Substantiation: Why would more than 2 conductors be permitted to occupy more conduit space than only 2 conductors? Shouldn't this be a lesser percentage in order to dissipate heat more effectively? The percentage of conduit fill should be in proportion to the amount of conductors in the conduit. Therefore, the percentage of conduit fill for 2 conductors would be revised to 46% which would relate directly to the percentage of conduit fill for 1 conductor and over 2 conductors.
Panel Meeting Action: Reject
Panel Statement: Heat dissipation is only one concern when installing conductors. In a raceway, ease of installation and removal of conductors, and jamming, are also required to be taken into account.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-202 Log #2550a NEC-P08 **Final Action: Reject**
(Chapter 9, Tables 1 through 4)

Submitter: Richard F. Van Wert, Middle Department Inspection Agency / Rep. Benjamin Franklin Chapter IAEI
Recommendation: A square plate which is 2 ft 2 = 2 ft x 2 ft = 4 sq ft
A square plate which is 2 sq ft = 1.41 ft x 1.41 ft = 2 sq ft
This is a big difference between the two.
Substantiation: The NEC had to change the way 250 KCM used to be referred to as 250 MCM because of a history of using wrong terminology. It is now time to correct a long standing confusing way of referring to square feet and feet squared. They are two different values. The NEC is trying to say "square feet" in sections like 250.52(A)(6) and have it written as "feet squared". Table 220.12 has the term "square feet" written correctly. I find this confusion most often with my foreign students who are learning reading, writing, and math as adults and recent immigrants to the USA. They are the ones who point out the discrepancy. Every Table in Chapter 9 has the same misuse of the terms.
Panel Meeting Action: Reject
Panel Statement: The submitter has not identified where the changes are to take place. Additionally, the panel suggests the specific changes be detailed and substantiated.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-203 Log #379 NEC-P08 **Final Action: Reject**
(Chapter 9, Table 1, Note 2)

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Table 1 applies only to complete conduit or tubing systems and is not intended to apply to sections of conduit or tubing used to protect exposed wiring from ~~physical~~ damage.
Substantiation: Use of the word "physical" is superfluous–the intent is obvious given the context. (I leave it to the CMP whether you want to get more specific naming some source of damage such as "blows or abrasion.")
Submitting proposals removing the adjective "physical" may strike people as about as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every unnecessary instance, as I am attempting to do, we actually cut the NEC down by up to oh, maybe a quarter-page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the unneeded use of "physical" not only is poor writing–look at William Zinsser's classic, On Writing Well–but is silly, and reflects a bit poorly on the Code process. When references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-4 (Log 336).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-204 Log #500 NEC-P08 **Final Action: Reject**
(Chapter 9, Table 2)

Submitter: Donald Shaner, Greenlee Textron Inc.
Recommendation: Change the radius of bends for one shot and full shoe benders for 2 inch trade size conduit from 9 1/2 inches to 9 inches.
Substantiation: Steel conduit springs back to a radius slightly larger than the radius of the bending shoe. Measuring the conduit is very difficult, so most inspectors use the published radius of the shoe to judge compliance with the code.
Greenlee has placed on the market more than 10,000 electric conduit benders with a 2 in. rigid shoe bend radius of 9 inches without any problems. Please refer to the Greenlee catalog pages that I have provided.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The table value of 9 1/2 inches is correct. For field bends after any springback or not, the centerline of the raceway shall not be less than indicated in Table 2 Chapter 9. Additionally, there is no technical substantiation for the proposed change.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-204a Log #1937 NEC-P08 **Final Action: Accept**
(Chapter 9, Table 4)

Submitter: William Wagner, Certification Solutions
Recommendation: Revise Table headings as follows:
Article 352 — Rigid PVC Conduit (<u>PVC</u>) (~~RNC~~), Schedule 80
Articles 352 and 353 — Rigid PVC Conduit (<u>PVC</u>)(~~RNC~~), Schedule 40, and HDPE Conduit (<u>HDPE</u>)
Article 352 — Type A, Rigid PVC Conduit (<u>PVC</u>) (~~RNC~~)
Article 352 — Type EB, PVC Conduit (<u>PVC</u>)(~~RNC~~)
Substantiation: This is a companion proposal for the new definition of Rigid Nonmetallic Conduit in Article 100 and the revised Article 352 for Type PVC Conduit. It clarifies that rigid polyvinyl chloride conduit is designated as Type PVC, rather than the broader Type RNC which includes PVC, HDPE and RTRC. It additionally indicates that high density polyethylene conduit is designated as Type HDPE.
Panel Meeting Action: Accept
Panel Statement: The committee disagreed with the submitter's substantiation that HDPE is RNC, as is shown in the rejection of Proposal 8-2.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

6-94 Log #2550 NEC-P06 **Final Action: Reject**
(Chapter 9, Tables 5 through 9)

Submitter: Richard F. Van Wert, Middle Department Inspection Agency / Rep. Benjamin Franklin Chapter IAEI
Recommendation: A square plate which is 2 ft 2 = 2 ft x 2 ft = 4 sq ft
A square plate which is 2 sq ft = 1.41 ft x 1.41 ft = 2 sq ft
This is a big difference between the two.
Substantiation: The NEC had to change the way 250 KCM used to be referred to as 250 MCM because of a history of using wrong terminology. It is now time to correct a long standing confusing way of referring to square feet and feet squared. They are two different values. The NEC is trying to say "square feet" in sections like 250.52(A)(6) and have it written as "feet

squared". Table 220.12 has the term "square feet" written correctly. I find this confusion most often with my foreign students who are learning reading, writing, and math as adults and recent immigrants to the USA. They are the ones who point out the discrepancy. Every Table in Chapter 9 has the same misuse of the terms.

Panel Meeting Action: Reject

Panel Statement: The ft.² designates area and is the correct designation in accordance with the NEC Style Manual (page 31), and changes to the Manual of Style should be submitted to the TCC. The submitter has not complied with the requirements of 4-3.3(c) of the NFPA Regulations Governing Committee Projects that proposals must provide the specific "wording to be added, revised (and how revised), or deleted."

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-95 Log #131 NEC-P06 **Final Action: Reject**

(Chapter 9 Table 5)

Submitter: Mark Good, Good Electric Corp.

Recommendation: Delete discrepency.

Type RHH*, RHWI, THHN, THWN, THW, THW-2, TFN, TFFN, THWN, THWN-2, RF, XFF

~~THHW, THW, AF~~ RHH*, RHW* 10

~~XF, XFF~~ RHW-2*

Substantiation: The above discrepency is obvious because the #10 wire THW in the column to the left has different diameter and area.

Panel Meeting Action: Reject

Panel Statement: The panel is not sure what the submitter is requesting, unless the submitter is referring to the 2002 Code, in which case the issue was corrected in the 2005 Code (Proposal 6-106).

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-96 Log #563 NEC-P06 **Final Action: Reject**

(Chapter 9, Table 5)

Submitter: R. K. Varma, State of PA, DCED

Recommendation: Add a Table for Cable as shown below:

Substantiation: Currently, there exists no data for cables in terms of their overall areas. Bare conductor areas do not answer "conduit fills" requirements correctly. Forty percent fill, 60 percent fill is mostly not correct and even NEC/NFPA feels these calculations do not truly represent intent of NEC.

Panel Meeting Action: Reject

Panel Statement: The addition of the proposed table is not needed. The panel assumes that the submitter is referencing multiconductor cables, which are dealt with in Table 1, Notes 5 and 9. This table is not under the purview of Panel 6. In addition, Types TWW, THWW, TWW-2 do not exist.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-97 Log #1742 NEC-P06 **Final Action: Reject**

(Chapter 9, Table 5A (New) FPN)

Submitter: David Sroka, Turner Falls, MA

Recommendation: Table 5A - Add new FPN text as follows:

"FPN: Most aluminum building wire in types THW, THHW, THWN/THHN, and XHHW conductors is compact stranded. Table 5A provides appropriate dimensions for these types of wire."

Substantiation: This is currently a comment in the NEC Handbook. It would be more useful as a FPN below the table.

Panel Meeting Action: Reject

Panel Statement: The proposed fine print note is already included in the title of the table.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-98 Log #1741 NEC-P06 **Final Action: Accept in Principle**

(Chapter 9, Table 5B (New))

Submitter: David Sroka, Turner Falls, MA

Recommendation: Table 5B Compact Copper Building Wire Nominal Dimensions* and Areas - please copy "Bare Conductor" columns only from Table 5A - *Dimensions Are From Industry Sources.

Substantiation: This information is currently not included, to show that bare compact stranded dimensions are the same for copper and aluminum.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle

Add the words "Copper and " to the title of the existing Table 5A before "Aluminum".

Panel Statement: The panel resolved the submitter's issue without adding another table.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-99 Log #1838 NEC-P06 **Final Action: Reject**

(Chapter 9, Table 8)

Submitter: Mark T. Rochon, Mark J. Rochon Master Electrician

Recommendation: Add text as follows:

6 AWG 1 Stranding

4 AWG 1 Stranding

Substantiation: 6 AWG and 4 AWG is available in solid and used every day.

Panel Meeting Action: Reject

Panel Statement: The panel agrees with the concept and requests the submitter provide the technical substantiation and the dimensions.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

6-100 Log #1474 NEC-P06 **Final Action: Reject**
(Chapter 9, Table 5)

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Rename the term "fixture wires" to "luminaire wires" in Table 5.
Substantiation: With the changing of the term "fixture" to "luminaire" it only makes sense that the term "fixture wires" be changed to "luminaire wires".

For the purposes of correlation, this proposal is also being submitted to the following Articles/Sections/Tables/Annexes: 200.6; 210.19; 210.20; 210.24; 240.4; 240.5; 300.17; 310.1; 314.16; Article 402; 517.74; 660.9; Table 1; Table 5; Annex C.
Panel Meeting Action: Reject
Panel Statement: The use of fixture wire is not limited to luminaires or lighting fixtures; they are also used within equipment. The action on this proposal should also be forwarded for information to CMP 2, 3, 5, 8, 9, 10, 12, and 15.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 9 Negative: 2
Explanation of Negative:

CLINE, S.: If "fixture" was the word which gave rise to "fixture wires" in the past, then it seems that the term should now be "luminaire wires." It is possible that a different word more inclusive of current applications for these conductors could be better than "luminaire," but "luminaire" is the defined word the Code now uses in place of "fixture." A new word could be done as a Comment should someone have one to suggest. I believe in struggling for uniformity and simplicity in the Code as much as is practically possible.

KENT, G.: See my Explanation of Negative Vote on Proposal 6-5.

6-101 Log #1661 NEC-P06 **Final Action: Reject**
(Chapter 9, Table 9)

Submitter: Stephen Nelson, Leo A. Daly
Recommendation: The reactance values for wire sizes 6, 8 and 10 appear to be out of order in both the PVC and Steel conduit columns. I believe the values for 10 AWG should be for 6 AWG, the values for 6 AWG should be for 8 AWG and the values for 8 AWG should be for 10 AWG.
Substantiation: Larger wire sizes have lower reactance values.
Panel Meeting Action: Reject
Panel Statement: This table is correct as written, and the panel recommends that the submitter provide calculations to support his proposal. Reactances are based on the spacing between conductors.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

6-102 Log #2249 NEC-P06 **Final Action: Reject**
(Chapter 9, Table 9)

Submitter: Noel Williams, Herriman, UT
Recommendation: Delete Table 9 from Chapter 9 and relocate it to a new annex or add to Annex B.
Substantiation: This table is not referenced anywhere in the NEC and as such has no application in NEC requirements. The table is useful, however, so it should be retained, but not in the main areas of the code. Since the table contains no requirement and is not referenced as a requirement, it is equivalent to a Fine Print Note.
Panel Meeting Action: Reject
Panel Statement: The information contained in Table 9 is used to perform various mathematical calculations required throughout the Code.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

3-273a Log #3073 NEC-P03 **Final Action: Reject**
(Chapter 9 Table 11 (A))

Submitter: Michael Bandel, Juno Lighting Group
Recommendation: Add "(see Note 5)" indication to the "Not Inherently Limited Power Source (Overcurrent protection required), Class 3" columns in the "Over 100 through 150" location; also, add new Note 5 text. Please refer to Table 11(A) and Note 5 (table shown on following page)
Substantiation: Problem: Table 11(A) is insufficient in describing the limitations associated with a Class 3 AC power source in the "Over 100 through 150" Source voltage range; it currently designates Power limitation VAmax as "N.A., leaving little doubt that through the other table parameters and Note 1 that the only practical limitation here that would be calcuable is 150VA. This 150VA seems insufficient given the 250VA allowable power limitations of the other source voltage ranges for the "Not Inherently Limited Power Source."

The proposal will set up a 250VA max Power limitation to substitute for the "N.A.," as well as the other power and current parameters subject to a new Note 5. The substantiation for this is as follows:

Substantiation for Proposal: The boundary between the "Over 30 through 100" and "Over 100 through 150" ranges is not seamless. It implies that at 101 V max your discontinuously changes from a clear 250VA to the implied 150VA associated with "N.A." This transition discontinuity is not present in any of the other ranges except if you consider Note 3, and although Note 3 allows for a higher power limitation, it restricts the transition point to 15V as opposed to the 20V limit of the tabular range.

The power limitation itself implies that under the conditions of Note 1, any Article 725 wiring can indeed be circulating 250VA under, "after 1 minute and regardless of load and overcurrent protection bypassed, if used". This is because a short circuit fault could occur anywhere in a Class 3 wiring system; however, most ostensibly it's anticipated that it would occur at the Class 3 loads. If 250VA can circulate in a Class 3 wiring system, there should logically be no issues with allowing this amount in the nameplate rating with stipulations.

Note 6 anticipates the stipulations required in order to keep within the framework originally envisioned by Table 11(A), yet creates an aenue to the only real way to guarantee compliance with the suggested changes. It states that for the ranges of voltage, current and power suggested, the only sensible way to process the power is with a linear or switchmode type electronic power supply. As such, said power supply must include multiple safety circuits to be called safe from the fire initiation. Input fusing is a typical norm in electronic power equpment. It limits the power that can be absorbed from the Class 1 input and transferred externaly via the output. Active thermal shutdown similarly limits power transfer from input to output by sensing temperature at a strategic hot spot so that ouput can be terminated upon excessive power processing. Lastly, output overload shutdown protection monitors and shuts off the output for abnormal loading situations. The "Not Inherently Limited Power Source (Overcurrent Protetion Required)" section of Table 11(A) requires some overcurrent protection device. If an electronic power supply has an overload shutdown characteristic, it offers another basic safety mechanism to rely upon. Combining this with the aforementioned protections of fusing and thermal sensing offers additional levels of protection, any of which could compensate for the other. Additionally, other protections can be envisoned that could each be tested separately at UL to answer questions of their unique contributions to safety from a fire initiation standpoint on a power supply design.

The practical effects of Note 5 will also allow curents greater than the 1.0 specified under the Table 11(A) in effect now. The new range calculable is from 1.67 to 2.5 amperes, (250/V max). This is more restrictive than the current Table 11(A) in the "Over 30 through 100" source voltage range where the "Current limitations" vary from 33.4 to 10 amperes, (1000/V max), and the Maximum overcurrent protection" range is from 1.0 to 3.34 amperes, (100/V max). Again, the Note 5 restriction of the source to be an electronic power supply allows for much more precision in limiting power from a source, as well as qualifying as safe from fire initiation.

In conclusion, the main point to consider is the "Power limitations VA max (volt-amperes) (see Note 1)" levels for a "Not Inherently limited Power Source". Under what must be considered a fault condition 250VA can circulate indefiitely through an Article 725, Class 3 wiring system. It could be asked if the nameplate can be changed on the source voltage range requested, why can't it be changed in the other ranges? The answer is simple. It can be. However, at the lower voltages of those ranges the I 2 x R calculated power losses become greater and less likely to be of practical use. It's really only the higher voltages that allow lower current and a reasonable wiring methodolgy to be employed. The real question is if these changes will maintain safety from a fire initiaiton standpoint. The answer here is yes, if kept within the confines of Note 5, and can obtain a UL listing.
Panel Meeting Action: Reject
Panel Statement: The recommendation is assuming a power limitation in the last column of Table 11(A) of the maximum voltage of the source as 150 volts. With a 1-ampere current limitation, the power limitation would be 150 VA. The Table has this shown as N.A. and the submitter is assuming that Note 3 permits a higher power limitation but this only applies where the voltage is 15 volts or less and not as indicated in the over 100 though 150 volt column. The VA max in Note 1 indicates that the peak VA during a short circuit with the overcurrent protective device bypassed would be a peak of not more than 250 VA but this certainly does not provide permission to have this 250 VA peak during normal operation since a Class 3 system is not designed to operate in a short circuit situation for long periods of time. The 250 VA is a peak value since the power source nameplate cannot be greater than 100 VA. Class 3 systems can operate at a level that could be considered to be a shock hazard but not a fire initiation hazard when insulated at the proper voltage levels for conductors and equipment. Notes 5 and 6 do not seem to be provided with the proposal, however, the substantiation seems to indicate a linear switch-mode electronic power supply with an active thermal shutdown that would limit power transfer from input to output. It also alludes to an output overload shutdown protection monitor. The Table values in 11(A) and (B) have been long standing values that were originally tested and formulated in the late 1950s but have been used for many years to provide limitations for Class 2 and 3 circuits. As voltage is increased, the current level must be decreased to ensure the I 2 t will not exceed the energy limitation for fire initiation. This cannot just be a bolted fault condition since increasing the energy level by increasing the allowable VA will also result in a higher arcing fault level. Any proposed changes must be proven with substantial technical data to establish the proper protection for these circuits. A power supply that does not conform to the Table values must have a Fact Finding study that will address the principle issues of both fire initiation limitation and shock protection that exists in the present tables. This has not been provided in this proposal.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

[Proposal 3-273a (Log #3073)]

Table 11(A) Class 2 and Class 3 Current Power Source Limitations

		Inherently Limited Power Source (Overcurrent Protection Not Required)				**Not Inherently Limited Power Source (Overcurrent Protection Required)**			
Power Source		**Class 2**			**Class 3**	**Class 2**		**Class 3**	
Source voltage V_{max} (volts (see Note 1)		0 through 20*	Over 20 and through 30*	Over 30 and through 150	Over 30 and through 100	0 through 20*	Over 20 and through 30*	Over 30 and through 100	Over 100 and through 150 (see note 5)
Power Limitations VA_{max} (volt-amperes) (see Note 1)		—	—	—	—	250 (see Note 3)	250	250	N.A
Current limitations I_{max} (volts) (see Note 1)		8.0	8.0	0.005	$150/V_{max}$	$1000/V_{max}$	$1000/V_{max}$	$1000/V_{max}$	1
Maximum overcurrent protection (amperes)		—	—	—	—	5.0	$100/V_{max}$	$100/V_{max}$	1
Power source maximum nameplate rating	VA (volt-amperes)	$5.0 X V_{max}$	100	$0.005 X V_{max}$	100	$5.0 X V_{max}$	100	100	100
	Current (amperes)	5.0	$100/V_{max}$	0.005	$100/V_{max}$	5.0	$100/V_{max}$	$100/V_{max}$	$100/V_{max}$

New Note 5 for Table 11(A):

5. For the Class 3 Over 100 and through 150V range, if the power source is an electronic linear or switchmode type power supply with input fusing, active thermal shutdown, and output overload shutdown protection, power limitations and power source maximum nameplate rating can be increased to equal the power limitations VA_{max} limit of 250VA. The current limitations, maximum overcurrent protection, and maximum nameplate rating for current can be calculated as $250/V_{max}$.

3-273b Log #2859 NEC-P03 **Final Action: Reject**
(Chapter 9, Tables 11(A) and 11(B), Footontes)

Submitter: Ole Nilssen, Innovention Center
Recommendation: Table 11(A) and 11(B), Note 1 revised:

I max Maximum output current under any non-capacitive load, including short circuit, and with overcurrent protection bypassed if used. Where a transformer limits the out current Imax limits apply after 1 minute of operation. Where a current-limiting impedance, listed for the purpose or as part of a listed product, is used in combination with a non-power-limited device - such as a transformer or a stored energy device, e.g., storage battery, to limit the output current - I max limits apply after 5 seconds.

VA max Maximum volt-ampere output after 1 minute of operation regardless of load and overcurrent protection bypassed if used. Overcurrent protection need not be bypassed if investigation for listing evaluated the suitability of the overcurrent protection in the event of abnormal operation.

Add to cell in tables "Power source maximum nameplate rating" (See Note 5):

Note 5. The method of marking is customary for simple transformers. Alternatively, the equipment output shall be marked, "class 2" or "class 3" as appropriate.

Substantiation: Present electrical parameter limits for Class 2 and 3 were originally written around a step-down, two winding, isolating transformer operated from a 60 Hz. source of supply. Electrical parameter limits for Class 2 were originally developed and included in the 1933 edition of the NEC, while limits for Class 3 were added with the 1975 edition. The limits do not consider new technology such as electronic circuits operating at higher frequencies or having active circuitry that can limit circuit energy in the advent of abnormal operation or interference with the Class 2 or 3 circuits. In the notes to Table 11, I max definition, last sentence describes a case where a non-power-limited device is used in combination. The mention of a transformer or battery should be noted as an example, not limited to just those two. Also, that same sentence describes when current limiting impedance (within the Class 2 or 3 circuit) can be relied upon, i.e., when listed with that purpose. This was not repeated in the VA max definition, but for consistency, should have been.

The method of marking as "power source maximum nameplate rating", although acceptable for transformers should not be limited to that alone for electronic equipment. Using the input rating in determining the acceptability of a Class 2 or 3 rating does not acknowledge that there could be electrical equipment with several functions, only one of which happens to be that it is the source of a Class 2 or 3 circuit.

Panel Meeting Action: Reject
Panel Statement: There was no technical substantiation to make the change in Note 5 of Tables 11(A) and (B). The reason a transformer is used in Note 1 was to provide information due to transformer core saturation on transformer startup. Once the transformer core saturation occurs, the transformer current stabilizes within the first minute of operation. This table applies to all different types of Class 2 and 3 power sources that can vary as widely as batteries and transformers to electronic power supplies. The information provided in the Table applies to all of these power sources. Maintaining the maximum ampere levels, peak power, and maximum voltages are critical in ensuring that shock and fire hazards do not occur.

Any proposed changes must be proven with substantial technical data to establish the proper protection for these circuits. A power supply that does not conform to the Table values must have a Fact Finding study that will address the principle issues of both fire initiation limitation and shock protection that exists in the present tables. This has not been provided in this proposal. As voltage is increased, the current level must be decreased to ensure the I 2 t will not exceed the energy limitation for fire initiation. This cannot just be a bolted fault condition since increasing the energy level by increasing the allowable VA will also result in a higher arcing fault level.

Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-274 Log #2550b NEC-P03 **Final Action: Reject**
(Chapter 9, Tables 11(A) & (B) & Tables 12(A) & (B))

Submitter: Richard F. Van Wert, Middle Department Inspection Agency / Rep. Benjamin Franklin Chapter IAEI
Recommendation: A square plate which is 2 ft 2 = 2 ft x 2 ft = 4 sq ft

A square plate which is 2 sq ft = 1.41 ft x 1.41 ft = 2 sq ft

This is a big difference between the two.

Substantiation: The NEC had to change the way 250 KCM used to be referred to as 250 MCM because of a history of using wrong terminology. It is now time to correct a long standing confusing way of referring to square feet and feet squared. They are two different values. The NEC is trying to say "square feet" in sections like 250.52(A)(6) and have it written as "feet squared". Table 220.12 has the term "square feet" written correctly. I find this confusion most often with my foreign students who are learning reading, writing, and math as adults and recent immigrants to the USA. They are the ones who point out the discrepancy. Every Table in Chapter 9 has the same misuse of the terms.

Panel Meeting Action: Reject
Panel Statement: Neither Tables 11(A) and 11(B) or Tables 12(A) and 12(B) have square foot measurements, so this proposal does not apply to these tables.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-275 Log #3047 NEC-P03 **Final Action: Reject**
(Chapter 9 Tables 11(A) and 11(B))

Submitter: Dale Fiene, International Product Development, Inc.
Recommendation: Add the following:

"(see Note 5)" in the boxes of Tables 11(A) and 11(B) containing the words "Power source maximum nameplate rating"

Add a note 5 to "Notes for Tables 11(A) and 11(B)" as follows:

5. Multiple loads shall be permitted to be connected to a single listed Power Source. No single load shall draw more than the power and current shown in Tables 11(A) or 11(B). The Nameplate rating shall reflect the total power and current drawn by the maximum number of loads that the Power Source is listed to supply. Only loads listed for connection to the Power Source may be connected.

Substantiation: The wording of the current standard is limiting with respect to newer technologies that can provide much more capability and provide higher levels of safety in much smaller packages than the typical step-down transformers that the limits were originally written around. Active current limiting can provide much safer control in packages that can provide higher levels of power without compromising safety.

Panel Meeting Action: Reject
Panel Statement: A maximum power source nameplate rating was established in Tables 11(A) and 11(B) to ensure that a transformer or a power supply internal failure will not permit more than the rated output of the power source. The maximum current for a small voltage application (0 through 30 volts) is 8 amps. Imax is located in the Notes below the table and is the maximum output current under any non-capacitive load, including short circuits, with any overcurrent protection bypassed, if installed in the circuit. If a transformer is used, the current limitation must not exceed that value after one minute of operation. This permits stabilizing of the current during start-up of the transformer and any internal transformer saturation of the core. The notes at the bottom of the Tables have additional current limitations. There was no technical substantiation provided to make changes to these levels or to accept a new note relaxing these long-established rules.

Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

1-167 Log #3468 NEC-P01 **Final Action: Reject**
(Chapter 9, Table 13)

Submitter: Richard F. Van Wert, Middle Department Inspection Agency / Rep. Benjamin Franklin Chapter IAEI
Recommendation: Revise table to read:

Chapter 9 Table 13
3 m 10 ft
7.5 m 25 ft
15 m 50 ft
30 m 100 ft
etc. etc.

Substantiation: Soon enough the metric system of measurement will be the only measurement system used. A complete and comprehensive conversion chart is needed now.

Panel Meeting Action: Reject
Panel Statement: The Code uses two measurement systems, SI and inch-pound. Since dual dimensions are used throughout the text and in other tables, there is no need to add a conversion table in Chapter 9.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ANNEX A

1-168 Log #2450 NEC-P01 **Final Action: Accept in Principle**
(Annex A)

Submitter: Eliana Beattie, ISA
Recommendation: Annex A

Change ISA S12.23.01 to ANSI/ISA-60079-18 (12.23.01)-2005.
Change ISA 12.0.01 to ANSI/ISA-60079-0 (12.00.01)-2005.
Change ISA S12.16.01 to ANSI/ISA-60079-7 (12.16.01)-2002.
Change ISA S12.22.01 to ANSI/ISA-60079-1 (12.22.01)-2005.
Change ISA S12.25.01 to ANSI/ISA-60079-5 (12.25.01)-1998.
Change ISA S12.26.01 to ANSI/ISA-60079-6 (12.26.01)-1998.
Change ISA S12.12 to ANSI/ISA-12.12.01-2000.

Substantiation: Change format to match actual ISA standards numbering.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel accepts the change of ISA S12.12 to ISA-12.12.01-2000. The panel concludes that the action on 1-169 addresses the submitter's intent on the other documents.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-169 Log #2794 NEC-P01 **Final Action: Accept**
(Annex A)

Submitter: Sonya M. Bird, Underwriters Laboratories Inc.
Recommendation: This proposal is made to:
(1) Update the following standard titles and designations:
(a) Conduit, Tubing, and Cable Fittings, UL 514B - Update title and re-position in the Annex based on the new tittle.
(b) Electric Sign Components, UL 879 - Update title and re-position in the Annex based on the new title.
(c) Electrical Intermediate Metal Conduit - Steel, UL 1242 - Update title and re-position in the Annex based on the new title.
(d) Electrical Rigid Metal Conduit - Steel, UL 6 - Update title and re-position in the Annex based ont he new title.
(e) Gas-Tube-Sign Cable, UL 814 - Update title.
(f) Optical Fiber and Communication Cable Raceway, UL 2024 - Update title.
(g) Schedule 40 and 80 Rigid PVC Conduit and fittings, UL 651 - Update title.
(2) Remove the generic reference to the UL 60079 series of standards addressing Electrical Apparatus for Explosive Gas Atmospheres, and replace it with reference to the 8 specific parts of the standards. Each of these parts is co-published with ISA, and the references are to both the UL and the ISA designations.
(3) Replace the reference to UL 486A (wire connectors and soldering lugs for use with copper conductors) and UL 486B (wire connectors for use with aluminum conductors), and replace them with a combined reference to the single UL standard addressing all wire connectors, UL 486A (wire connectors and soldering lugs for use with copper conductors) and the single UL standard addressing all wire connectors, UL 486A-486B, wire Connectors.
(4) Replace the former reference to UL 62, previously addressing both flexible cord and fixture wire, with references to the 2 unique standards, UL 62, Flexible Cords, and UL 66, Fixture Wire.
(5) Add reference to UL 60947-1, Low-Voltage Switchgear and Controlgear, Part 1: General Requirements, and the existing UL 508, Industrial Control Equipment Standard. These two IEC-based UL standards incorporate the international requirements with relevant national differences based on UL 508.
(6) Add reference to UL 60950-21, Safety of Information Technology Equipment, Part 21: Remote Power Feeding, for specific requirements associated with the general requirements already referenced in UL 60950-1.
(7) Add reference to the following UL standards in order to reflect the product listing requirements of the NEC, and to reflect those standards that are suitable for evaluating products and identifying these for a particular purpose within the NEC (listing for these product safety standards is one mechanism for meeting the requirement that a product be identified for a particular purpose):
(a) UL 514D, Cover Plates for Flush-Mounted Wiring Devices
(b) UL 1459, Telephone Equipment
(c) UL 1573, Stage and Studio Lighting
(d) UL 1642, Lithium Batteries
(e) UL 1666, Flame Propagation Height of Electrical and Optical-Fiber Cables Installed Vertically in Shafts
(f) UL 1989, Standby Batteries
(g) UL 1993, Self-Ballasted Lamps and Lamp Adapters
(h) UL 2075, Gas and Vapor Detectors and Sensors
(i) UL 2108, Low Voltage Luminaires
(j) UL 2196, Fire Resistive Cables
(k) UL 2239, Hardware for the Support of Conduit, Tubing and Cable.
(8) Add reference to UL 1640, Portable Power Distribution Units, to correlate with a proposed addition of a FPN and corresponding reference to UL 1640.
Substantiation: Annex A, Product Safety Standards, is proposed to be updated in order for the annex to reflect the most recent product standard designations and names for those UL standards that are currently referenced. Additionally, changes to the Annex are needed in order to reflect the product listing requirements of the NEC, and to reflect those standards that are suitable for evaluating products and identifying them for a particular purpose within the NEC. Listing to these specific product safety standards is one mechanism for meeting the requirement that a product be identified for a particular purpose.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-170 Log #3605 NEC-P01 **Final Action: Reject**
(Annex A)

Submitter: Robert Alexander, Laguna Hills, CA
Recommendation: Add the following after the first paragraph:
Inclusion in this list should not imply that the referenced products are always required to be listed nor that generic references to certain classes of equipment apply to all equipment of that class.
Substantiation: For example, as of the date and time of this Proposal (November 4, 2005/ 2:45pm EST) General Purpose Electric Motors are not listed. Note the reference to Electric Motors is somewhat misleading. The UL Standard for General Purpose Electric Motors is UL1004B, rather than UL1004. As of this moment no products are listed under that Standard nor does the NEC require it.
Panel Meeting Action: Reject
Panel Statement: The first sentence of the annex states: "Annex A is not a part of the requirements of this NFPA document, but is included for informational purposes only." Requirements for equipment listing, where applicable, appear within the individual articles for different types of equipment. In addition, "should not imply" is not acceptable Code language as defined in Section 3.1 of the NEC Style Manual.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-171 Log #3653 NEC-P01 **Final Action: Reject**
(Annex A through G)

Submitter: Kevin McCall, Local Union #98 IBEW
Recommendation: This Annex provides particular informational requirements of this NFPA document and may be used for informational purposes and may be specially adopted by the local jurisdiction adopting the National Electrical Code.
Substantiation: The Annexes provide information and Article section references which are considered requirements of the NFPA document. There should be clarity expressed why required article sections are considered informational purposes.
Panel Meeting Action: Reject
Panel Statement: CMP-1 concludes that Annexes A and G are clear in their intended purpose and that they comply with the NEC Style Manual, Section 3.3.4, for word clarity. The submitter's proposed language adds no clarity and is in violation of Section 3.1.1 of the Manual by use of the word "may." The submitter has not provided the specific locations for the recommended changes or proposed text as required by 4.3.3(b) and (c) of the NFPA Regulations Governing Committee Projects. The concerns of the submitter appear to be addressed in the first paragraphs of Annex A. Annexes B through F are not under the jurisdiction of CMP-1.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ANNEX C

8-205 Log #1475 NEC-P08 **Final Action: Reject**
(Annex C)

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Rename the term "fixture wires" to "luminaire wires" in Annex C.
Substantiation: With the changing of the term "fixture" to "luminaire" it only makes sense that the term "fixture wires" be changed to "luminaire wires".
For the purposes of correlation, this proposal is also being submitted to the following Articles/Sections/Tables/Annexes: 200.6; 210.19; 210.20; 210.24; 240.4; 240.5; 300.17; 310.1; 314.16; Article 402; 517.74; 660.9; Table 1; Table 5; Annex C.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 8-199.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-206 Log #827 NEC-P08 **Final Action: Reject**
(Table C.8)

Submitter: Dale Smuck, Martin Riley Architects/Engineers
Recommendation: Table 8 - Type THHN/THWN/THWN-2 35 (1 1/4) number of conductors should read 3 not ~~4~~ .
Substantiation: Using Table 5 for size 1 THHN/THWN/THWN-2 and Table 4 Article 344 RMC - over 2 wire 40 percent 4 number 1's exceed the conduit fill for 35 mm (1 1/4) conduit size.
Panel Meeting Action: Reject
Panel Statement: When using the Notes to Tables in Chapter 9, Note 7 of Table 1 applies. When calculated, the result is 3.9, which is rounded to 4.
Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

2-361 Log #154 NEC-P02 **Final Action: Accept**
(Annex D)

TCC Action: The Technical Correlating Committee understands that the Panel Action was to revise the text in Example D4(a) in Annex D, and that similar revisions should be made following "20 ranges" in the same Example, for consistency.
Submitter: Joseph Penachio, Joe Penachio Electrician
Recommendation: Revise as follows:
Range Load: 10 ranges (not over (~~less than~~ 12 kVA) (see Col. C, 25,000 VA Table 220.55)
Substantiation: Less than 12 kVA indicates that a 12 kVA range is not in column C. Column C states ranges "Not over 12 kW rating" indicating that a 12 kVA range is included in Column C.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

2-362 Log #135 NEC-P02 **Final Action: Reject**
(Annex D)

Submitter: Paul Hamann, Lake Forest, IL
Recommendation: Calculate the actual connected lighting load. (8500 VA) Determine the appropriate minimum lighting load from Table 220.3(A). (3VA x 3000 square foot building = 9000 VA).
Select the larger value and multiply by 1.25 for the continuous general lighting load. (9000 VA x 1.25 = 11250 VA)
Substantiation: If the connected lighting load was 8999 VA, then the minimum lighting load from Table 220.3(A) would be used. (9000 VA)
If the connected lighting load was 9001 VA then 125% of the actual connected lighting load would be used. (9001 x 1.25 = 11251 VA)
The problem is that the 1.25 factor is only used when the actual connected lighting load is used.
The example above illustrates that, when 2 VA is added, the lighting load increased by 2251 VA. (11251 - 9000 = 2251)
Panel Meeting Action: Reject
Panel Statement: The proposal does not comply with 4.3.3(c) of the NFPA Regulations Governing Committee Projects in that it does not specifically indicate what text is to be deleted and what text is to be added.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

3-275a Log #CP303 NEC-P03 **Final Action: Accept**
(Annex A)

Submitter: Code-Making Panel 3,
Recommendation: Add the following to Annex A:
Circuit Integrity (CI) cable------ Subject 1724, Outline of Investigation for Fire Tests for Electrical Circuit Protective Systems
Circuit Integrity (CI) cable ----- UL 2196, Tests of Fire Resistive Cables
Substantiation: Adding UL 2196 and Subject 1724, Outline of Investigation, to the annex will provide the user of the Code with two different documents with which to determine product safety for circuit integrity cable.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

2-363 Log #3169 NEC-P02 **Final Action: Accept**
(Annex D, Example D3)

Submitter: Wally Harris, Atlantic Inland Inspections
Recommendation: Add text reference as indicated by underlined type to "Continuous Loads" section of calculation as follows;
Show Window Lighting Load
30 ft at 200 VA per ft [see 220.14(G)]
Substantiation: This proposal will be yet another change that would make it easier for Code users to arrive at the proper reference for calculation requirements.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

11-114 Log #3655 NEC-P11 **Final Action: Reject**
(Annex D Example D 8)

Submitter: Kevin McCall, Local Union #98 IBEW
Recommendation: Conductor Ampacity
Determine the minimum required conductor ampacity for three induction type motors on a 480 VCH, 3 phase feeder. The full-load current value used to determine the minimum required conductor ampacity is obtained from (Table 430.250) for the squirrel-cage motor and the primary of the wound-rotor motors
For the 25 horsepower motor,
34A (As of Table 430.250)
For the 30 horsepower motor
40A (as of Table 430.252)
40A x 1.25 = 50A (As of 430.24 and Table 430.250)
Total Several Motor Load Ampacity = 124 amperes.
Substantiation: To provide clarity and adequate example with proper reference to Articles, Sections and Tables of NFPA 70.
Panel Meeting Action: Reject
Panel Statement: The panel is uncertain as to the intent of the proposal, and the submitter's direction for change is not clear and has incorrect references.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-115 Log #3654 NEC-P11 **Final Action: Reject**
(Annex D, Example D8)

Submitter: Kevin McCall, Local Union #98 IBEW
Recommendation: Conductor Ampacity
The full-load current value vied to determine the minimum required conductor is obtained from 430.750 [see 430.6(A)] for the squirrel-cage motor and the secondary of the wound motors. To obtain the minimum required conductor ampacity, the full-load current is multiplied by 1.75 [see 430.22 and 430.23]
For the 25 horsepower motor,
34A x 1.25 = 42.5A (As of Table 430.250 and 430.22)
For the 30 horsepower motor
65A x 1.25 = 81.25A (As of 430.23)
[Add: secondary of the (words not readable) maker [Delete: 40A x 1.25 = 50A]
Substantiation: To provide clarity and adequate example with proper reference to Articles, Sections and Tables of NFPA 70.
Panel Meeting Action: Reject
Panel Statement: The panel is uncertain as to the intent of the proposal, and the submitter's direction for change is not clear and has incorrect references.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

ANNEX G

1-172 Log #535 NEC-P01 **Final Action: Reject**
(Annex G 80.13(15))

Submitter: William Torres, Ludvik Electric
Recommendation: Revise text to read:
80.13(15) ~~The authority having jurisdiction shall be permitted to waive specific requirements in this code or permit alternative methods where is assured that equivalent objectives can be achieved by establishing and maintaining effective safety.~~ Technical documentation shall be submitted to the authority having jurisdiction to demonstrate equivalency and that the system, method, or device is approved for the intended purpose.
Substantiation: This section of the National Electrical Code 2002 edition seems to be contradicting to the standards of code. As electricians, we are required to perform our duties under the requirements of the National electrical Code. When these requirements are altered according to different interpretations of code by different authorities, it is inconsistent. The authority having jurisdiction being Federal, State or local should all be under the same requirements with no exceptions for alterations.
Panel Meeting Action: Reject
Panel Statement: It is not the purpose of the NEC to suppress emerging technology. See Section 90.4, in which the authority having jurisdiction has the authority to waive specific requirements or permit alternative methods. A number of states and municipalities have adopted laws which waive specific requirements, permit alternative methods, or impose additional requirements. Annex G is for informational purposes and is not a part of the requirements of the NEC unless specifically adopted by the local jurisdiction adopting the NEC.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-173 Log #1659 NEC-P01 **Final Action: Reject**
(Annex G 80.90(D))

Submitter: Joe Tedesco, Boston, MA
Recommendation: Existing Electrical Systems:
(1) The Home Inspector shall observe:
(a) The exterior of the exposed service entrance conductors.
(b) Readily accessible Service equipment, grounding equipment, main over current device, main and distribution panels.
(c) Amperage and voltage ratings of the service.
(d) The exterior of the readily accessible exposed branch circuit conductors, their over current devices, and the compatibility of their ampacities and voltages.
(e) The operation of a representative number of permanently installed lighting fixtures, switches and receptacles located inside the house, garage, and on its exterior walls.
(f) The polarity and grounding of all three-prong receptacles within six feet of interior plumbing fixtures and all readily accessible nondedicated receptacles in the garage and on the exterior of inspected structures.
(g) The operation of Ground Fault Circuit Interrupters.
(2) The Inspector shall report on the following:
(a) The size and the voltage of the main service disconnect (30, 60, 100, 125, 150 and or 200 amp, other service, 120, 120/240, 120/208-volt system).
(b) Service entry conductor materials (copper and or aluminum, if aluminum are the tips coated with a corrosion inhibitor and is the over load device rated for the use of aluminum wire).
(c) Service type as being overhead or underground.
(d) The number of branch circuits in the panels.
(e) The type of branch circuit conductor materials (copper and or aluminum, if aluminum are the tips coated with a corrosion inhibitor and is the over load device rated for the use of aluminum wire).
(f) The compatibility of the overload protective devices and the size of the protected conductor.
(g) The type of branch circuit wiring (BX, conduit, Romex, knob and tube, wire mold, other).
(h) If there is ground fault protection provided.
(i) If the system is grounded.
(3) The Inspector is not required to:
(a) Collect engineering data on the compatibility of the disconnects and individual circuit breakers with the panel and or determine the short circuit interrupting current capacity. (Engineering services).
(b) Determine and or report on the adequacy of the in place systems to provide sufficient power to the dwelling, or reflect on the sufficiency of the electric distribution system in the dwelling (Engineering services).
(c) Insert any tool, probe, or testing device inside the panels.
(d) Test or operate any over current device except Ground Fault Circuit Interrupters.
(e) Dismantle any electrical device or control other than to remove the covers of the main and sub-distribution panels, if readily accessible and not painted in place.
(f) Observe and or report on:
The quality of the conductor insulation. (Electrical Services).
Test for Electro-Magnetic fields. (Electrical Services).
Low voltage systems, door bells.
Smoke detectors (Seller’s responsibility).
Telephone, security alarms, cable TV, intercoms, or other ancillary wiring that is not a part of the primary electrical distribution system.
Substantiation: This information should be available for the public to review and to make the Home Inspection Community follow rules that will lead to electrical safety.
Panel Meeting Action: Reject
Panel Statement: The Electrical Inspection Code for Existing Dwellings, NFPA 73 is available to the home inspection community. The suggested subject matter is not within the stated purpose of Annex G, Article 80. The proposal does not contain substantiation as required by 4.3.3(d) of the Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
