(B) Electrical Rating The electrical rating shall include the voltage and frequency and shall indicate the current rating of the unit, including the ballast, transformer, or autotransformer.

410.~~36~~ 76 Design and Material

Luminaires (fixtures) shall be constructed of metal, wood, or other material suitable for the application and shall be designed and assembled so as to secure requisite mechanical strength and rigidity. Wiring compartments, including their entrances, shall be designed and constructed to permit conductors to be drawn in and withdrawn without physical damage.

410.~~37~~ 77 Nonmetallic Luminaires (Fixtures)

When luminaire (fixture) wiring compartments are constructed from combustible material, armored or lead-covered conductors with suitable fittings shall be used or the wiring compartment shall be lined with metal.

410.~~38~~ 78 Mechanical Strength

(A) Tubing for Arms. Tubing used for arms and stems where provided with cut threads shall not be less than 1.02 mm (0.040 in.) in thickness and, where provided with rolled (pressed) threads, shall not be less than 0.64 mm (0.025 in.) in thickness. Arms and other parts shall be fastened to prevent turning.

(B) Metal Canopies Metal canopies supporting lampholders, shades, and so forth exceeding 4 kg (8 lb), or incorporating attachment-plug receptacles, shall not be less than 0.51 mm (0.020 in.) in thickness. Other canopies shall not be less than 0.41 mm (0.016 in.) if made of steel and not less than 0.51 mm (0.020 in.) if of other metals.

(C) Canopy Switches. Pull-type canopy switches shall not be inserted in the rims of metal canopies that are less than 0.64 mm (0.025 in.) in thickness, unless the rims are reinforced by the turning of a bead or the equivalent. Pull-type canopy switches, whether mounted in the rims or elsewhere in sheet metal canopies, shall not be located more than 90 mm (3 1/ 2 in.) from the center of the canopy. Double set-screws, double canopy rings, a screw ring, or equal method shall be used where the canopy supports a pull-type switch or pendant receptacle.

The thickness requirements in the preceding paragraph shall apply to measurements made on finished (formed) canopies.

410.~~39~~ 79 Wiring Space

Bodies of luminaires (fixtures), including portable lamps, shall provide ample space for splices and taps and for the installation of devices, if any. Splice compartments shall be of nonabsorbent, noncombustible material.

410.~~42~~ 82 Portable Lamps

(A) General Portable lamps shall be wired with flexible cord recognized by 400.4 and an attachment plug of the polarized or grounding type.

Where used with Edison-base lampholders, the grounded conductor shall be identified and attached to the screw shell and the identified blade of the attachment plug.

(B) Portable Handlamps In addition to the provisions of 410.42(A), portable handlamps shall comply with the following:

(1) Metal shell, paper-lined lampholders shall not be used.

(2) Handlamps shall be equipped with a handle of molded composition or other insulating material.

(3) Handlamps shall be equipped with a substantial guard attached to the lampholder or handle.

(4) Metallic guards shall be grounded by means of an equipment grounding conductor run with circuit conductors within the power-supply cord.

Portable handlamps shall not be required to be grounded where supplied through an isolating transformer with an ungrounded secondary of not over 50 volts.

410.~~44~~ 84 Cord Bushings

A bushing or the equivalent shall be provided where flexible cord enters the base or stem of a portable lamp. The bushing shall be of insulating material unless a jacketed type of cord is used.

410.~~45~~ 85 Tests

All wiring shall be free from short circuits and grounds and shall be tested for these defects prior to being connected to the circuit.

410.~~46~~ 86 Live Parts

Exposed live parts within porcelain luminaires (fixtures) shall be suitably recessed and located so as to make it improbable that wires come in contact with them. There shall be a spacing of at least 13 mm (1/ 2 in.) between live parts and the mounting plane of the luminaire (fixture).

VIII. Installation of Lampholders

410.~~47~~ 90 Screw-Shell Type

Lampholders of the screw-shell type shall be installed for use as lampholders only. Where supplied by a circuit having a grounded conductor, the grounded conductor shall be connected to the screw shell.

410.~~48~~ 93 Double-Pole Switched Lampholders

Where supplied by the ungrounded conductors of a circuit, the switching device of lampholders of the switched type shall simultaneously disconnect both conductors of the circuit.

410.~~49~~ 96Lampholders in Wet or Damp Locations

Lampholders installed in wet or damp locations shall be of the weatherproof type.

IX. Construction of Lampholders

410.~~50~~ 100Insulation

The outer metal shell and the cap shall be lined with insulating material that prevents the shell and cap from becoming a part of the circuit. The lining shall not extend beyond the metal shell more than 3 mm (1/ 8 in.) but shall prevent any current-carrying part of the lamp base from being exposed when a lamp is in the lampholding device.

410.~~52~~ 102Switched Lampholders

Switched lampholders shall be of such construction that the switching mechanism interrupts the electrical connection to the center contact. The switching mechanism shall also be permitted to interrupt the electrical connection to the screw shell if the connection to the center contact is simultaneously interrupted.

X. Lamps and Auxiliary Equipment

410.~~53~~ 103 Bases, Incandescent Lamps

An incandescent lamp for general use on lighting branch circuits shall not be equipped with a medium base if rated over 300 watts, or with a mogul base if rated over 1500 watts. Special bases or other devices shall be used for over 1500 watts.

410.~~54~~ 104 Electric-Discharge Lamp Auxiliary Equipment

(A) Enclosures Auxiliary equipment for electric-discharge lamps shall be enclosed in noncombustible cases and treated as sources of heat.

(B) Switching Where supplied by the ungrounded conductors of a circuit, the switching device of auxiliary equipment shall simultaneously disconnect all conductors.

XI. Special Provisions for Flush and Recessed Luminaires (Fixtures)

Formal Interpretation 81-6

Reference: Article 410, Part XI

410.~~64~~ 110 General

Luminaires (fixtures) installed in recessed cavities in walls or ceilings shall comply with 410.65 through 410.72.

410.~~65~~ 115 Temperature

(A) Combustible Material Luminaires (fixtures) shall be installed so that adjacent combustible material will not be subjected to temperatures in excess of 90°C (194°F).

(B) Fire-Resistant Construction Where a luminaire (fixture) is recessed in fire-resistant material in a building of fire-resistant construction, a temperature higher than 90°C (194°F) but not higher than 150°C (302°F) shall be considered acceptable if the luminaire (fixture) is plainly marked that it is listed for that service.

(B) Recessed Incandescent Luminaires (Fixtures) Incandescent luminaires (fixtures) shall have thermal protection and shall be identified as thermally protected.

Exception No. 1: Thermal protection shall not be required in a recessed luminaire (fixture) identified for use and installed in poured concrete.

Exception No. 2: Thermal protection shall not be required in a recessed luminaire (fixture) whose design, construction, and thermal performance characteristics are equivalent to a thermally protected luminaire (fixture) and are identified as inherently protected.

410.~~66~~ 116 Clearance and Installation

(A) Clearance

(1) Non-Type IC A recessed luminaire (fixture) that is not identified for contact with insulation shall have all recessed parts spaced not less than 13 mm (1/ 2 in.) from combustible materials. The points of support and the trim finishing off the opening in the ceiling or wall surface shall be permitted to be in contact with combustible materials.

(2) Type IC A recessed luminaire (fixture) that is identified for contact with insulation, Type IC, shall be permitted to be in contact with combustible materials at recessed parts, points of support, and portions passing through or finishing off the opening in the building structure.

(B) Installation Thermal insulation shall not be installed above a recessed luminaire (fixture) or with 75 mm (3 in.) of the recessed luminaire's (fixture's) enclosure, wiring compartment, or ballast unless it is identified for contact with insulation, Type IC.

410.~~67~~ 117 Wiring

(A) General Conductors that have insulation suitable for the temperature encountered shall be used.

(B) Circuit Conductors Branch-circuit conductors that have an insulation suitable for the temperature encountered shall be permitted to terminate in the luminaire (fixture).

Tap Conductors Tap conductors of a type suitable for the temperature encountered shall be permitted to run from the luminaire (fixture) terminal connection to an outlet box placed at least 300 mm (1 ft) from the luminaire (fixture). Such tap conductors shall be in suitable raceway or Type AC or MC cable of at least 450 mm (18 in.) but not more than 1.8 m (6 ft) in length.

XII. Construction of Flush and Recessed Luminaires (Fixtures)

410.~~68~~ 118 Temperature

Luminaires (fixtures) shall be constructed such that adjacent combustible material is not subject to temperatures in excess of 90°C (194°F).

410.~~70~~ 120 Lamp Wattage Marking

Incandescent lamp luminaires (fixtures) shall be marked to indicate the maximum allowable wattage of lamps. The markings shall be permanently installed, in letters at least 6 mm (1/ 4 in.) high, and shall be located where visible during relamping.

410.~~71~~ 121 Solder Prohibited

No solder shall be used in the construction of a luminaire (fixture) box.

410.~~72~~ 122Lampholders

Lampholders of the screw-shell type shall be of porcelain or other suitable insulating materials. Where used, cements shall be of the high-heat type.

XIII. Special Provisions for Electric-Discharge Lighting Systems of 1000 Volts or Less

410.~~73~~ 130 General

(A) Open-Circuit Voltage of 1000 Volts or Less Equipment for use with electric-discharge lighting systems and designed for an open-circuit voltage of 1000 volts or less shall be of a type intended for such service.

(B) Considered as Energized The terminals of an electric-discharge lamp shall be considered as energized where any lamp terminal is connected to a circuit of over 300 volts.

(C) Transformers of the Oil-Filled Type Transformers of the oil-filled type shall not be used.

(D) Additional Requirements In addition to complying with the general requirements for luminaires (lighting fixtures), such equipment shall comply with Part XIII of this article.

(E) Thermal Protection — Fluorescent Luminaires (Fixtures)

(1) Integral Thermal Protection The ballast of a fluorescent luminaire (fixture) installed indoors shall have integral thermal protection. Replacement ballasts shall also have thermal protection integral with the ballast.

(2) Simple Reactance Ballasts A simple reactance ballast in a fluorescent luminaire (fixture) with straight tubular lamps shall not be required to be thermally protected.

(3) Exit Fixtures A ballast in a fluorescent exit luminaire (fixture) shall not have thermal protection.

(4) Egress Luminaires (Fixtures) A ballast in a fluorescent luminaire (fixture) that is used for egress lighting and energized only during a failure of the normal supply shall not have thermal protection.

(F) High-Intensity Discharge Luminaires (Fixtures)

(1) Recessed. Recessed high-intensity luminaires (fixtures) designed to be installed in wall or ceiling cavities shall have thermal protection and be identified as thermally protected.

(2) Inherently Protected Thermal protection shall not be required in a recessed high-intensity luminaire (fixture) whose design, construction, and thermal performance characteristics are equivalent to a thermally protected luminaire (fixture) and are identified as inherently protected.

(3) Installed in Poured Concrete Thermal protection shall not be required in a recessed high-intensity discharge luminaire (fixture) identified for use and installed in poured concrete.

(4) Recessed Remote Ballasts A recessed remote ballast for a high-intensity discharge luminaire (fixture) shall have thermal protection that is integral with the ballast and be identified as thermally protected.

(5) Metal Halide Lamp Containment Luminaires (fixtures) that use a metal halide lamp other than a thick-glass parabolic reflector lamp (PAR) shall be provided with a containment barrier that encloses the lamp, or shall be provided with a physical means that only allows the use of a lamp that is Type O.

FPN: See ANSI Standard C78.387, American National Standard for Electric Lamps — Metal Halide Lamps, Methods of Measuring Characteristics.

(G) Disconnecting Means In indoor locations, other than dwellings and associated accessory structures, fluorescent luminaires (fixtures) that utilize double-ended lamps and contain ballast(s) that can be serviced in place or ballasted luminaires that are supplied from multiwire branch circuits and contain ballast(s) that can be serviced in place shall have a disconnecting means either internal or external to each luminaire (fixture), to disconnect simultaneously from the source of supply all conductors of the ballast, including the grounded conductor if any. The line side terminals of the disconnecting means shall be guarded. The disconnecting means shall be located so as to be accessible to qualified persons before servicing or maintaining the ballast. This requirement shall become effective January 1, 2008.

Exception No. 1: A disconnecting means shall not be required for luminaires (fixtures) installed in hazardous (classified) location(s).

Exception No. 2: A disconnecting means shall not be required for emergency illumination required in 700.16.

Exception No. 3: For cord-and-plug-connected luminaires, an accessible separable connector or an accessible plug and receptacle shall be permitted to serve as the disconnecting means.

Exception No. 4: A disconnecting means shall not be required in industrial establishments with restricted public access where conditions of maintenance and supervision ensure that only qualified persons service the installation by written procedures.

Exception No. 5: Where more than one luminaire is installed and supplied by other than a multiwire branch circuit, a disconnecting means shall not be required for every luminaire when the design of the installation includes locally accessible disconnects, such that the illuminated space cannot be left in total darkness.

410.~~74~~ 134 Direct-Current Equipment

Luminaires (fixtures) installed on dc circuits shall be equipped with auxiliary equipment and resistors designed for dc operation. The luminaires (fixtures) shall be marked for dc operation.

410.~~75~~ 135 Open-Circuit Voltage Exceeding 300 Volts

Equipment having an open-circuit voltage exceeding 300 volts shall not be installed in dwelling occupancies unless such equipment is designed so that there will be no exposed live parts when lamps are being inserted, are in place, or are being removed.

410.~~76~~ 136 Luminaire (Fixture) Mounting

(A) Exposed Ballasts Luminaires (fixtures) that have exposed ballasts or transformers shall be installed so that such ballasts or transformers will not be in contact with combustible material.

(B) Combustible Low-Density Cellulose Fiberboard Where a surface-mounted luminaire (fixture) containing a ballast is to be installed on combustible low-density cellulose fiberboard, it shall be listed for this condition or shall be spaced not less than 38 mm (1 1/ 2 in.) from the surface of the fiberboard. Where such luminaires (fixtures) are partially or wholly recessed, the provisions of 410.64 through 410.72 shall apply.

FPN: Combustible low-density cellulose fiberboard includes sheets, panels, and tiles that have a density of 320 kg/m 3 (20 lb/ft 3) or less and that are formed of bonded plant fiber material but does not include solid or laminated wood or fiberboard that has a density in excess of 320 kg/m 3 (20 lb/ft 3) or is a material that has been integrally treated with fire-retarding chemicals to the degree that the flame spread in any plane of the material will not exceed 25, determined in accordance with tests for surface burning characteristics of building materials. See ANSI/ASTM E84-1997, Test Method for Surface Burning Characteristics of Building Materials.

410.~~77~~ 137 Equipment Not Integral with Luminaire (Fixture)

(A) Metal Cabinets Auxiliary equipment, including reactors, capacitors, resistors, and similar equipment, where not installed as part of a luminaire (lighting fixture) assembly, shall be enclosed in accessible, permanently installed metal cabinets.

(B) Separate Mounting Separately mounted ballasts that are intended for direct connection to a wiring system shall not be required to be separately enclosed.

(C) Wired Luminaire (Fixture) Sections Wired luminaire (fixture) sections are paired, with a ballast(s) supplying a lamp or lamps in both. For interconnection between paired units, it shall be permissible to use metric designator 12 (trade size 3/ 8) flexible metal conduit in lengths not exceeding 7.5 m (25 ft), in conformance with Article 348. Luminaire (fixture) wire operating at line voltage, supplying only the ballast(s) of one of the paired luminaires (fixtures), shall be permitted in the same raceway as the lamp supply wires of the paired luminaires (fixtures).

410.~~78~~ 138 Autotransformers

An autotransformer that is used to raise the voltage to more than 300 volts, as part of a ballast for supplying lighting units, shall be supplied only by a grounded system.

410.~~79~~ 139 Switches

Snap switches shall comply with 404.14.

XIV. Special Provisions for Electric-Discharge Lighting Systems of More Than 1000 Volts

410.~~80~~ 140 General

(A) Listing Electric-discharge lighting systems with an open-circuit voltage exceeding 1000 volts shall be listed and installed in conformance with that listing.

(B) Dwelling Occupancies Equipment that has an open-circuit voltage exceeding 1000 volts shall not be installed in or on dwelling occupancies.

(C) Live Parts The terminal of an electric-discharge lamp shall be considered as a live part.

(D) Additional Requirements In addition to complying with the general requirements for luminaires (lighting fixtures), such equipment shall comply with Part XIV of this article.

FPN: For signs and outline lighting, see Article 600.

410.~~81~~ 141 Control

(A) Disconnection Luminaires (fixtures) or lamp installation shall be controlled either singly or in groups by an externally operable switch or circuit breaker that opens all ungrounded primary conductors.

(B) Within Sight or Locked Type The switch or circuit breaker shall be located within sight from the luminaires (fixtures) or lamps, or it shall be permitted elsewhere if it is provided with a means for locking in the open position.

410.~~82~~ 142 Lamp Terminals and Lampholders

Parts that must be removed for lamp replacement shall be hinged or held captive. Lamps or lampholders shall be designed so that there are no exposed live parts when lamps are being inserted or removed.

410.~~83~~ 143 Transformers

(A) Type Transformers shall be enclosed, identified for the use, and listed.

(B) Voltage The secondary-circuit voltage shall not exceed 15,000 volts, nominal, under any load condition. The voltage to ground of any output terminals of the secondary circuit shall not exceed 7500 volts, under any load conditions.

(C) Rating Transformers shall have a secondary short-circuit current rating of not more than 150 mA if the open-circuit voltage is over 7500 volts, and not more than 300 mA if the open-circuit voltage rating is 7500 volts or less.

(D) Secondary Connections Secondary circuit outputs shall not be connected in parallel or in series.

410.~~84~~ 144Transformer Locations

(A) Accessible Transformers shall be accessible after installation.

(B) Secondary Conductors Transformers shall be installed as near to the lamps as practicable to keep the secondary conductors as short as possible.

C) Adjacent to Combustible Materials Transformers shall be located so that adjacent combustible materials are not subjected to temperatures in excess of 90°C (194°F).

410.~~85~~ 145 Exposure to Damage

Lamps shall not be located where normally exposed to physical damage.

410.~~86~~ 146 Marking
Each luminaire (fixture) or each secondary circuit of tubing having an open-circuit voltage of over 1000 volts shall have a clearly legible marking in letters not less than 6 mm (1/ 4 in.) high reading ``Caution _____ volts.'' The voltage indicated shall be the rated open-circuit voltage.
410.~~87~~ 147 Switches
Snap switches shall comply with 404.4.

XV. Lighting Track

410.~~100~~ 150 Definition
Lighting Track. A manufactured assembly designed to support and energize luminaires (lighting fixtures) that are capable of being readily repositioned on the track. Its length can be altered by the addition or subtraction of sections of track.
410.~~101~~ 151 Installation
(A) Lighting Track Lighting track shall be permanently installed and permanently connected to a branch circuit. Only lighting track fittings shall be installed on lighting track. Lighting track fittings shall not be equipped with general-purpose receptacles.
(B) Connected Load The connected load on lighting track shall not exceed the rating of the track. Lighting track shall be supplied by a branch circuit having a rating not more than that of the track.
(C) Locations Not Permitted Lighting track shall not be installed in the following locations:
(1) Where likely to be subjected to physical damage
(2) In wet or damp locations
(3) Where subject to corrosive vapors
(4) In storage battery rooms
(5) In hazardous (classified) locations
(6) Where concealed
(7) Where extended through walls or partitions
(8) Less than 1.5 m (5 ft) above the finished floor except where protected from physical damage or track operating at less than 30 volts rms open-circuit voltage
(9) Where prohibited by 410.4(D)
(D) Support Fittings identified for use on lighting track shall be designed specifically for the track on which they are to be installed. They shall be securely fastened to the track, shall maintain polarization and grounding, and shall be designed to be suspended directly from the track.

410.~~103~~ 153 Heavy-Duty Lighting Track
Heavy-duty lighting track is lighting track identified for use exceeding 20 amperes. Each fitting attached to a heavy-duty lighting track shall have individual overcurrent protection.
410.~~104~~ 154 Fastening
Lighting track shall be securely mounted so that each fastening is suitable for supporting the maximum weight of luminaires (fixtures) that can be installed. Unless identified for supports at greater intervals, a single section 1.2 m (4 ft) or shorter in length shall have two supports, and, where installed in a continuous row, each individual section of not more than 1.2 m (4 ft) in length shall have one additional support.
410.~~105~~ 155 Construction Requirements
(A) Construction The housing for the lighting track system shall be of substantial construction to maintain rigidity. The conductors shall be installed within the track housing, permitting insertion of a luminaire (fixture), and designed to prevent tampering and accidental contact with live parts. Components of lighting track systems of different voltages shall not be interchangeable. The track conductors shall be a minimum 12 AWG or equal and shall be copper. The track system ends shall be insulated and capped.
Grounding Lighting track shall be grounded in accordance with Article 250, and the track sections shall be securely coupled to maintain continuity of the circuitry, polarization, and grounding throughout.

XVI. Decorative Lighting and Similar Accessories

410.~~110~~ 160 Listing of Decorative Lighting
Decorative lighting and similar accessories used for holiday lighting and similar purposes, in accordance with 590.3(B), shall be listed.

I**Substantiation:** During the 2005 cycle panel meetings a task group was formed to make editorial changes to Article 410 to comply with the Style Manual & Manual of Style:
a. Reformat 410.2 (Other Articles) to tabular style and rename 410.3 & table 410.3.
b. Move any definitions contained in 410 to 410.2 Definitions
c. Renumber Article 410 to make space for the present 410.3 that will be displaced by the action of 1 above and to allow for future additions by creating larger numerical gaps between requirements.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-42 Log #3167 NEC-P18 **Final Action: Accept**
(410, Entire Document)

Submitter: Wally Harris, Atlantic Inland Inspections
Recommendation: Delete the bracketed references to "fixtures", and "fixture".
Substantiation: This terminology was changed to the term Luminaire, and the definition of "Luminaire" as stated in Article 100. There is no definition of "fixture" or "lighting fixture".
In the 2002 Edition of the NEC Handbook the commentary states as follows; "The term luminaire first appeared in the 1996 NEC in a fine print note following 410-1. In the 2002 Code, the term luminaire is used throughout in place of the term lighting fixture".
This proposed change will go a long way to standardize the Code and make it less confusing.
Panel Meeting Action: Accept
Panel Statement: See panel action and statement on Proposal 18-44.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-45 Log #1753 NEC-P18 **Final Action: Accept**
(410.1, 410.3, 410.39, 410.42, 410.44)

TCC Action: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the panel action.
Submitter: David Belt, Underwriters Laboratores Inc.
Recommendation: Add portable luminaires to differentiate from lamp. Replace the term "portable lamp" with the term " portable luminaire ". Revise text as follows:
410.1 Scope. This article covers luminaires (lighting fixtures), portable luminaires , lampholders, pendants, incandescent filament lamps, arc lamps, electric-discharge lamps, decorative lighting products, lighting accessories for temporary seasonal and holiday use, portable flexible lighting products, and the wiring and equipment forming part of such products and lighting installations.
410.3 Live Parts. Luminaires (fixtures), portable luminaires , lampholders, and lamps shall have no live parts normally exposed to contact. Exposed accessible terminals in lampholders and switches shall not be installed in metal luminaire (fixture) canopies or in open bases of portable table or floor ~~lamps~~ luminaires .
410.39 Wiring Space. Bodies of luminaires (fixtures), including portable ~~lamps~~ luminaires , shall provide ample space for splices and taps and for the installation of devices, if any. Splice compartments shall be of nonabsorbent, noncombustible material.
410.42 Portable ~~Lamps~~ Luminaires .
(A) General. Portable ~~lamps~~ luminaires shall be wired with flexible cord recognized by 400.4 and an attachment plug of the polarized or grounding type. Where used with Edison-base lampholders, the grounded conductor shall be identified and attached to the screw shell and the identified blade of the attachment plug.
410.44 Cord Bushing. A bushing or the equivalent shall be provided where flexible cord enters the base or stem of a portable ~~lamp~~ luminaires . The busing shall be of insulating material unless a jacketed type of cord is used.
Substantiation: The terms "portable lamp" and "lamp" is confusing, as it is not always obvious if the requirement applies to a light source or a lighting system.
The term "luminaire" has already been accepted in the Code as the correct terminology for a lighting system and replaces the terms "fixture" or "lighting fixture", which were terms for fixed lighting systems.
The term "portable luminaire" has been accepted by the IEC as the correct term for cord and plug connected lighting products and has also been adopted by UL in their ANSI/UL153 Safety Standard, which was previously titled "Portable Electric Lamps" and is now titled "Portable Electric Luminaires".
Panel Meeting Action: Accept
Panel Statement: Editorially correct luminaires to luminaire in the proposal text of 410.44, Cord Bushing.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-44 Log #2929 NEC-P18 **Final Action: Accept**
(410.1, Entire Document)

TCC Action: The Technical Correlating Committee directs staff to remove all parenthetical reference to fixtures and lighting fixtures throughout the NEC such that the term luminaire is the only term that remains. The Technical Correlating Committee advises that Article Scope statements and Titles are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the panel action. The Technical Correlating Committee further directs that this proposal be sent to Code-Making Panels1 through 20 for information.
Submitter: Frederick L. Carpenter, Lithonia Lighting
Recommendation: Remove the parenthetical references to "lighting fixture(s)" or "fixture(s)" after the word "luminaire" throughout the document.

Substantiation: When the 2002 NEC was published a definition for the term "Luminaire" was added in Article 100. Throughout the document the word "luminaire" was substituted for the term "lighting fixture" and either the words "lighting fixture" or just "fixture" were added in parentheses after the word "luminaire." As an example, Article 410 is titled "Luminaires (Lighting Fixtures), Lampholders, and Lamps". The practice of using the term "luminaire" followed parenthetically by "lighting fixture" or "fixture" was carried over into the 2005 NEC. Now that the term "luminaire" has been used for two complete code cycles, the parenthetical references to "fixture(s)" should no longer be necessary.
Panel Meeting Action: Accept
Panel Statement: The parenthetical use of the term "fixture" in the 2005 NEC was provided to assist in transitioning the replacement term "luminaire." The panel agrees that the transition period be concluded and the parenthetical use of the term be eliminated.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-46 Log #206 NEC-P18 **Final Action: Accept in Principle**
(410.2)

NOTE: The following proposal consists of Comment 18-30 on Proposal 18-52a in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 18-52a was:
Revise 410.2 to read:
"Lighting systems operating at 30 volts or less shall conform to Article 411. Arc lamps used in theaters shall comply with 520.61, and arc lamps used in projection machines shall comply with 540.20. Arc lamps used on constant-current systems shall comply with the general requirements of Article 490."
It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 18-51. See Technical Correlating Committee action on Proposal 18-51. This action will be considered by the Panel as a Public Comment.

Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 18-51. See Technical Correlating Committee action on Proposal 18-51. This action will be considered by the Panel as a Public Comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 18-43.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-47 Log #2127 NEC-P18 **Final Action: Reject**
(410.2)

Submitter: Thomas F. Mueller, Southern Company Services
Recommendation: Add another sentence at the end of the paragraph (or within the existing paragraph) that states the following:
Lighting shall conform to the voltage limitations of 210.6, and for outdoor lighting, 225.7.
Substantiation: Article 410 is the place in the code where one would expect to find all the rules concerning lighting. But, 210.6 and 225.7 also explicitly define approved lighting voltages. As such, these sections should be referenced in this article. This change will improve usability of the code.
Panel Meeting Action: Reject
Panel Statement: The arrangement of the Code specified in Section 90.3 makes this reference unnecessary. Section 4.1 of the 2003 NEC Style Manual instructs not to use a reference if the requirement is already covered by Section 90.3.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-48 Log #3192 NEC-P18 **Final Action: Accept**
(410.2)

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal and correlate with the action taken on Proposal 18-43. This action will be considered by the Panel as a Public Comment.
Submitter: Donald Cook, Shelby County Development Services
Recommendation: Equipment for use in hazardous (classified) locations shall conform to Articles 500 through 517. Lighting systems operating at 30 volts or less shall conform to Article 411. Arc lamps used in theaters shall comply with 520.61 and arc lamps used in projection machines shall comply with 540.20. ~~Arc lamps used on constant-current systems shall comply with the general requirements of Article 490.~~
Substantiation: Delete the marked text. There is nothing in the general requirements of Article 490, Part I, that applies to arc lamps used on constant-current systems.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-49 Log #3193 NEC-P18 **Final Action: Accept**
(410.2)

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal and correlate with the action taken on Proposal 18-43. This action will be considered by the Panel as a Public Comment.
Submitter: Donald Cook, Shelby County Development Services
Recommendation: ~~Equipment for use in hazardous (classified) locations shall conform to Articles 500 through 517.~~ Lighting systems operating at 30 volts or less shall conform to Article 411. ~~Arc lamps used in theaters shall comply with 520.61 and arc lamps used in projection machines shall comply with 540.20.~~ Arc lamps used on constant-current systems shall comply with the general requirements of Article 490.
Substantiation: This proposal deletes the references to applications in Chapter 5 which modify the requirements in Article 410 for luminaires, lampholders and lamps. The text is not needed since NEC 90.3 clearly indicates that requirements in Chapter 5 supplement or modify the general rules found in Chapters 1 through 4.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-50 Log #1433 NEC-P18 **Final Action: Reject**
(410.4(D))

Submitter: Greg Chontow, Hopatcong, NJ
Recommendation: Add new text as follows:
"No parts of wall mounted (luminairers) ,...".
Substantiation: This section previously excluded wall mounted luminaires, yet it can cause an equal life safety issue.
Panel Meeting Action: Reject
Panel Statement: Section 410.4(D) requires luminaires installed within the tub / shower zone to be listed damp or wet location. No evidence that such luminaires have resulted in shock incidents was presented in the substantiation.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-51 Log #1906 NEC-P18 **Final Action: Accept**
(410.4(D))

Submitter: James W. Carpenter, International Association of Electrical Inspectors
Recommendation: In the last sentence of 410.4(D), delete the phrase "in this zone" and replace it with the phrase "within the actual footprint of the bathtub rim or shower threshold" to read as follows:
"(D) Bathtub and Shower Areas. No parts of cord-connected luminaires (fixtures), chain-, cable-, or cord-suspended-luminaires (fixtures), lighting track, pendants, or ceiling-suspended (paddle) fans shall be located within a zone measured 900 mm (3 ft) horizontally and 2.5 m (8 ft) vertically from the top of the bathtub rim or shower stall threshold. This zone is all encompassing and includes the ~~zone~~ space directly over the tub or shower stall.
Luminaires (lighting fixtures) located ~~in this zone~~ within the actual outside dimension of the bathtub or shower to a height of 2.5 m (8 ft) vertically from the top of the bathtub rim or shower threshold shall be listed for damp or listed for wet locations where subject to shower spray."
Substantiation: The word "zone" was changed in the last sentence of the first paragraph to make it consistent with the text used in 404.4 for switches and in the title for 406.8 for receptacles. The more appropriate word seems to be space since zone indicates the three-foot space outside of the footprint or space of the actual tub or shower. The text, as presently worded in the 2005 NEC, would imply that the area within three feet from the edge of the bathtub or shower is a wet or damp location requiring the luminaire to be listed for wet or damp locations. This would also logically carry over to any receptacle, switch, or luminaire that was located on the wall within this three ft distance, thus requiring the same wet or damp location rating for these devices or luminaires. Switches and receptacles would then be required to have a weatherproof cover installed. This three-foot area from the edge of the tub or shower is constructed of drywall with regular texture and paint. Any wetness or dampness in this area would cause rapid deterioration of the paint and drywall.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-52 Log #2138 NEC-P18 **Final Action: Reject**
(410.4(D))

Submitter: Michael Briggs, Kichler Lighting
Recommendation: Removal of the verbiage "Luminaires (lighting fixtures) located in this zone shall be listed for damp locations, or listed for wet locations where subject to shower spray", until a special category and testing requirements are developed in UL 1598.
Substantiation: Rational: The allowance of luminaire installation inside a shower area, based on wet location rating, leaves open the possibility of a serious safety hazard due to unintended use of the luminaire. The wet location category is very broad as defined under UL 1598. It covers many different styles of luminaires. Not all wet location rated luminaires where designed for the potential abuse of a shower area. One case in point would be a typical lantern used in many homes as a porch light.
(1) Typical outdoor luminaires employ a water shield to protect electrical components from water exposure. This shield is normally made of un-tempered glass and may be damaged by thermal change or impact force. According to the new version of the luminaire Standard, UL 1598, the water shield is no longer required to be subjected to thermal shock or impact testing. If this water shield were to break, a typical "A" type lamp would shatter exposing the filament to water exposure. This in conjunction with a totally immersed human body poses an extreme shock hazard.
(2) Showers and baths pose a slip hazard as well. When unbalanced, a person will look for a hand hold for support. It is easy to imagine the weight of a human body being applied to the fixture and mounting means. Smaller luminaires are not constructed to support this type of load. Almost all wet location luminaires are mounted directly to a junction box which is limited to a fifty pound force. No such loading or mounting test is required for this type of luminaire.
Panel Meeting Action: Reject
Panel Statement: The submitter presents a worst-case scenario in which the fixture would have to be rated to support the impact load of a falling person to comply with this section. While such a rating is commendable, the panel finds it impractical. Also, by deleting or removing the verbiage located in damp locations and wet locations, the submitter allows any fixture in this area until the standard is changed. The panel encourages the submitter to pursue the special location rating through the UL STP process.
Surface-mounted wet location luminaires are subjected to the rain and/or sprinkler tests, depending on the mounting specifications.
A recessed luminaire intended to be mounted in a covered ceiling is subject to a sprinkler test.
The UL1598 rain and sprinkler test protocol specifies preheating the luminaire 1 hour before exposing it to a spray of cold tap water. This exposes the water shield to thermal stresses it is expected to experience in use.
The impact test referred to never yielded any test failures and was deleted.
There are no field data indicating an increase in shock incidences with these changes.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13
Comment on Affirmative:
O'BOYLE, M.: There is no substantiation to prohibit all luminaires from this area. From the submitter's substantiation, I believe the focus of this proposal was on wall mounted, not ceiling mounted, luminaires. Many wall mounted luminaires are wet locations rated, but not specifically designed for installation in a bath or shower space. The practicality of a wall mounted luminaire for this application is left to the judgment of the installer and AHJ. A special location rating would help installers and AHJs to identify wall mounted luminaires specifically designed for this application.

18-53 Log #2583 NEC-P18 **Final Action: Reject**
(410.4(D), FPN (New))

Submitter: Jebediah Novak, Cedar Rapids Electrical JATC
Recommendation: Add text to read as follows:
<u>FPN: Examples of luminaires permitted to be located in this zone include but are not limited to recessed fixtures or bath fan/light combinations.</u>
Substantiation: As the current text reads now, the first two sentences imply that no fixtures are to be located in that zone around the tub or shower. Then, the last sentence says that if you do put a fixture there, however, make sure it's listed for that location. By adding the FPN some of this confusion will be alleviated.
Panel Meeting Action: Reject
Panel Statement: The panel disagrees with the substantiation that all luminaires are excluded by current Code wording. This FPN is redundant.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-54 Log #117 NEC-P18 **Final Action: Reject**
(410.4(D) Exception (New))

Submitter: Brian Roenigk, Citi Electric
Recommendation: Add an exception to allow low voltage (12 volts or less) pendant luminaires inside of the (3 ft) horizontal and below the (8 ft) vertical zone. However, limitations should be set for this exception. Possible limitations could be to allow pendants (low voltage) inside (3 ft) horizontally but, no less than (7 ft) vertically from top of tub, or GFCI protected.
Substantiation: I had a customer with a large bay window next to large bath tub. I wanted to hang a single low volt pendant center over the tub and in the window. Of course, I could not. I believe with low voltage lighting this would not be a hazard. Two examples could be any outdoor low volt landscape or low volt swimming pool lighting that could have similar hazard conditions but are acceptable.
Panel Meeting Action: Reject
Panel Statement: This proposal does not conform to Section 4-3.3 in the NFPA Regulations Governing Committee Projects in that it does not contain recommended text. A low voltage pendant style luminaire may present the same type of safety concerns as other luminaires. The listings covering such products do not anticipate this application.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-55 Log #2013 NEC-P18 **Final Action: Reject**
(410.4(E))

Submitter: Robert Hinson, James D. Hinsen Electrical Contracting Co. Inc.
Recommendation: Revise text to read as follows:
"Luminaires (fixtures) subject to physical damage using mercury vapor, metal halide <u>or compact fluorescent lamps,</u> installed in playing and spectator...".
Substantiation: Even with a protective guard, the compact fluorescent lamp can be damaged causing glass to fall on the players and spectators. This type of fixture should also require a protective lens for safety.
Panel Meeting Action: Reject
Panel Statement: The intent of 410.4(E) is not to protect against the potential for falling glass particles. Rather, the article was added to the code to address the potential for the exposure to excessive UV radiation from the arc-tube of a Metal Halide or Mercury Vapor lamp. If the outer envelope of many commonly available Metal Halide and Mercury Vapor lamps were to be broken, the arc-tube can continue to operate and expose the public to excessive radiation. Compact Fluorescent lamps will not operate with a broken outer envelope; therefore, they do not need to be included in this article.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13
Comment on Affirmative:
KEMPEL, K.: The types of fluorescent lamps used for general and task lighting applications do not emit sufficient UV to be a UV risk to humans.

18-55a Log #1653 NEC-P18 **Final Action: Reject**
(410.8(B)(3) (New))

Submitter: John Steinke, Reno, NV
Recommendation: Add (3) LED's, rope lighting, and compact fluorescents, and any other lighting method may be used, in the following applications:
a) Lights with a surface temperature greater than 150F will be treated as incandescent lights;
b) Lights with a surface temperature of 150F or less will be treated as fluorescents; and,
c) specialty lights may be placed closer than 6" only if listed for the application.
FPN: A fixture, and its' spacing, is to be determined by the type of lamp actually installed.
Substantiation: Changes in lighting have resulted in the existing text being inadequate.
For example, the IAEI treats a 'keyless' lampholder as an incandescent, even if a compact fluorescent bulb is used. (Absent the high temperature, a fluorescent can be placed closer in safety.
Likewise, the code, as written, fails to recognize LED's, rope lights, ILLUMINATED CLOTHES RODS, and other items that already exist- yet pose no threat of fire.
Panel Meeting Action: Reject
Panel Statement: This text as submitted is unenforceable since the AHJ would have no means to determine the maximum surface temperature of the luminaire. There are no luminaires specifically listed and identified for use in closets. See Proposal 18-57 for further information on LED luminaires.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-56 Log #145 NEC-P18 **Final Action: Reject**
(410.8(B)(3) (New))

Submitter: Lee Ward, Ardee Lighting Inc.
Recommendation: Add new text to read as follows:
(3) Surface mounted or wall mounted clothes rod luminaire (fixture) independently tested for suitability.
Substantiation: This luminaire or fixture is intended to supply supplemental low voltage or fluorescent lighting to areas of the closet that cannot be reached by conventional fixtures. This system has been independently tested and listed by UL. The fixture is listed with 3W festoon lamps, or T2/T5 fluorescent is enclosed.
Panel Meeting Action: Reject
Panel Statement: The fluorescent illuminated clothes rod is listed as a surface-mounted fluorescent luminaire. This is a luminaire type specified in 410.8 (B)(2), and it can be installed in accordance 410.8(D)(2). There currently are no tests in the luminaire standard, ANSI/UL 1598, that determine the suitability of a luminaire for use in a clothes closet.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-57 Log #586 NEC-P18 **Final Action: Accept in Principle**
(410.8(B)(3))

Submitter: Greg Fretwell, Blue Light Inspection Services
Recommendation: Add 410.8(B)(3)
"Luminaire incorporating LED technology".
Substantiation: White LEDs are coming into the marketplace and these will probably be evaluated by Nationally Recognized Testing Labs as not providing the ignition capability that has prompted most of 410.8.
If we make it legal they will come.
Panel Meeting Action: Accept in Principle
Revise the recommendation to read as follows:
(3) A surface-mounted or recessed LED luminaire with a completely enclosed light source.
Panel Statement: LEDs are a relatively new and developing light source technology. Individual LEDs typically operate at low temperatures but some LEDs can operate at elevated temperatures. As LED technology advances even the operating temperatures of individual LEDs are not certain. Revising the Code as proposed recognizes the advent of LEDs as a general light source while maintaining the risk of fire at or below existing levels.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-58 Log #1075 NEC-P18 **Final Action: Reject**
(410.8(C))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Incandescent luminaires (fixtures) <u>and lampholders</u> with open or partially enclosed lamps, and pendant type luminaires (fixtures) or lampholders shall not be permitted.
Substantiation: A porcelain or plastic lighting fixture in widespread use, with or without an integral switch or receptacle, designed to be mounted on an outlet box is not a "Luminaire" since it has no provision (reflector or lens) for distributing the light, nor for positioning or protecting the lamp. Manufacturers designate these fixtures as lampholders. The lampholders referred to in this section appear to be brass screw-shell type suspended by pendant conductors, which ages ago was common.
Panel Meeting Action: Reject
Panel Statement: The current language in the Code clearly states that lampholders are not permitted in clothes closets. The substantiation is correct. Lampholders were never "fixtures" nor "lighting fixtures" and are not "luminaires."
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-59 Log #418 NEC-P18 **Final Action: Reject**
(410.8(D))

Submitter: Joseph Rossi, Township of Clinton
Recommendation: Add text to read as follows:
In kitchens, pantries, and storage areas:
a. Surface-mounted incandescent luminaries (fixtures) shall have a minimum clearance of 300 mm (12 in.) between the luminaries (fixture) and the nearest point of storage.
b. Surface-mounted fluorescent luminaries (fixtures) shall have a minimum clearance of 150 mm (6 in.) between the luminaries (fixture) and the nearest point of storage.
c. Recessed incandescent luminaries (fixtures) shall have a minimum clearance of 150 mm (6 in.) between the luminaries (fixture) and the nearest point of storage.
d. Recessed fluorescent luminaries (fixtures) shall have a minimum clearance of 150 mm (6 in.) between the luminaries (fixture) and the nearest point of storage.
Substantiation: On one inspection for a final of a new house, I opened a door in the kitchen that was obviously a storage closet. I looked up and saw a surface-mounted incandescent light 4 in. away from the top shelf. I began to write a violation when the electrician asked, "What code is violated." I stated, "410.8". The electrician pointed out to me that 410.8 is for clothes closets and this is a closet for pots and pans. I stated, "Suppose someone puts rags on the top shelf or buys a package of napkins, opens them, and places the remainder on the top shelf with the plastic wrap up against the light." After some discussion, I was forced to agree with him because the code clearly states clothes closets. Nowhere did I find in the NEC anything that prohibits construction of a light in a closet with distance limitation next to storage other than clothes. Therefore, in addition to luminaries location placing fixtures in kitchen pantries should be addressed.
Panel Meeting Action: Reject
Panel Statement: CMP-18 is not aware of any incidents of fire started by luminaires in storage closets. This was not the case with clothes closets. The substantiation provided no incident reports or data that a comparable hazard exists.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-60 Log #1352 NEC-P18 **Final Action: Accept in Principle**
(410.8(D))

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Rewrite the text as follows:
(D) Location. The minimum clearance between luminaires installed in clothes closets and the nearest point of a storage space shall be as follows:
(1) 300 mm (12 in.) for surface-mounted incandescent luminaires installed on the wall above the door or on the ceiling
(2) 150 mm (6 in.) for surface-mounted fluorescent luminaires installed on the wall above the door or on the ceiling
(3) 150 mm (6 in.) for recessed incandescent luminaires installed in the wall or the ceiling
150 mm (6 in.) for recessed fluorescent luminaires installed in the wall or the ceiling.
Substantiation: The proposed wording does not change the existing wording's intent, but expresses it in a more concise, easier to understand style.
Panel Meeting Action: Accept in Principle
Revise the proposed text to read as follows:
(D) Location. The minimum clearance between luminaires installed in clothes closets and the nearest point of a storage space shall be as follows:
(1) 300 mm (12 in.) for surface-mounted incandescent or LED luminaires with a completely enclosed light source installed on the wall above the door or on the ceiling
(2) 150 mm (6 in.) for surface-mounted fluorescent luminaires installed on the wall above the door or on the ceiling
(3) 150 mm (6 in.) for recessed incandescent or LED luminaires with a completely enclosed light source installed in the wall or the ceiling
(4) 150 mm (6 in.) for recessed fluorescent luminaires installed in the wall or the ceiling.

Panel Statement: The panel agrees that the submitter has rewritten 410.8(D) into an easier to read format. The panel disagrees with the removal of "completely enclosed lamp" in 410.8(D)(1) & (3) and has included it. The panel has included (4) to complete the list. This action also includes recommendations from Proposal 18-61.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-61 Log #517 NEC-P18 **Final Action: Accept in Principle**
(410.8(D)(2) and (4))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise text to read:
"...fluorescent <u>or LED</u> luminaires...".
Substantiation: The lesser clearances around fluorescent luminaires compared to incandescent are due to lower temperatures, hence lesser risk of combustion. This is at least as true around light-emitting diodes; fixtures based on them arguably require no clearance at all for such reasons.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on 18-60. The panel agrees that luminaires with LED light sources should be acknowledged in Section 410.8. The panel concludes that luminaires with LED light sources should comply with the current requirements for incandescent luminaires in closets because there are some LEDs that produce temperatures equivelant to incandescent lamps.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

Comment on Affirmative:

KEMPEL, K.: A point of clarification is in order. The Panel Statement implies that individual LEDs are capable of operating at temperatures equivalent to an incandescent lamp. This is a misstatement. It should state that there are LED luminaires with operating temperatures similar to incandescent luminaires. It is the external temperatures of the LED luminaire that are of concern not the operating temperature of the individual LED inside it.

18-62 Log #1401 NEC-P18 **Final Action: Reject**
(410.8(D)(5))

Submitter: George Stolz, II, Pierce, CO
Recommendation: Add new text to read:

<u>(D)(5) Lighting outlets blanked for future use installed in the wall or the ceiling, provided there is a minimum clearance of 450 mm (18 in.) between the lighting outlet and the nearest point of a storage space.</u>

Substantiation: Mistakes during layout result in light fixtures encroaching storage space. In many cases, the size of the luminaire to be installed is unknown to the electrician at rough-in, and to the inspector as well. Frequently, when the mistake is discovered at trim, these lighting outlets are blanked to pass inspection (as this section deals only with luminaires, with no restrictions on lighting outlets.) Adding this section will help to reduce illegal installations and ease the burden on electricians and inspectors under unending negative pressure from contractors.

It is highly likely that a homeowner will essentially be handed a fixture that they have purchased with their new home, but cannot be installed by a reputable electrician to code. The homeowner will most likely install the violating fixture in the absence of the AHJ and electrician. The blanked installation has a high potential for becoming the fire hazard that it was attempting to evade.

The header of 410.8 should be revised to “luminaires/lighting outlets in clothes closets” to reflect this change.

Panel Meeting Action: Reject

Panel Statement: This is an installation issue. Section 90.1(C) states that the Code is not a design or instruction manual.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

18-63 Log #1652 NEC-P18 **Final Action: Reject**
(410.8(D)(5) (New))

Submitter: John Steinke, Reno, NV
Recommendation: Add (5):

Specialty products, such as illuminated clothes rods, may be installed anywhere in the closet, as long as they are approved for the purpose, and installed in accordance with the manufacturers’ directiona and intent.

Substantiation: There are now illuminated rods made for closets. These rods cannot help but place the light closer to the clothing than 6 in.

There have also been additional developements in lighting, such as LEDs, that are not currently recognised by this section, yet may provide safe lighting.

Panel Meeting Action: Reject

Panel Statement: There currently are no tests in the luminaire standard, ANSI/UL 1598, that determine the suitability of a luminaire for use in a clothes closet.

Any luminaire installed in a clothes closet must comply with the installation criteria in 410.8(D).

Also see the panel statement on Proposal 18-56.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

18-64 Log #3260 NEC-P18 **Final Action: Reject**
(410.10)

Submitter: Mathew Scott, Brighton, MI
Recommendation: Revise text to read as follows:

Canopies and outlet boxes ~~taken~~ added together shall provide adequate space so that luminaire conductors and their connecting devices can be properly installed.

Substantiation: The canopie should be part of the volume required for conductors. Example: This would be necessary when a four inch round metal box that is one half inch deep is used which only has a 5.3 cubic inch capacity.

Panel Meeting Action: Reject

Panel Statement: The word “taken” indicates that the volume of the canopy is to be added to the volume of the outlet box. Therefore no change is needed.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

18-65 Log #1670 NEC-P18 **Final Action: Accept in Principle**
(410.10(B))

Submitter: Aleah Thompson, Lightolier / Rep. IESNA Museum & Art Gallery Lighting Committee
Recommendation: Revise text to read as follows:

410.101(B)

The connected load on lighting track shall not exceed the rating of the track. Lighting track shall be supplied by a branch circuit having a rating not more than that of the track. <u>The load calculation in 220.43(A) and (B) is not intended to limit the number of feet of track on a single branch circuit nor is it intended to limit the number of fixtures on an individual track.</u>

Substantiation: This is a companion proposal to one made to 220.43(B).

During the 1996 NEC code writing cycle, Code Making Panel 18 found it appropriate to add a FPN to clarify that the track lighting load value of 150VA for every 2 ft was intended solely for purposes of load calculation.

During the 1999 code cycle, the track lighting load value was moved from 410-102 to 220.43(B) in an effort to further clarify that the electrical load per length value applied during load calculation and did not limit the length of track that can be run or the number of fixtures allowed. At that time, the FPN specifically stating this was removed.

Unfortunately, the relocation of the track lighting load value in 220.43(B) has not prevented continued misinterpretation of the code. Many code users, including Authorities Having Jurisdiction as well as lighting professionals, continue to misinterpret the language in 220.43(B) as limiting the length of track that can be run or the number of fixtures allowed.

The addition of the proposed language to 410.101(B) and 220.43(B) would prevent any further misinterpretation, thereby, greatly improving the usability of the code.

Note: Supporting Material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle

Add the following FPN to 410.101(B) to read as follows:

The load calculation in 220.43(B) is not intended to limit the number of feet of track on a single branch circuit nor is it intended to limit the number of fixtures on an individual track.

Panel Statement: The wording as proposed is explanatory and therefore is not appropriate for mandatory text. CMP 18 therefore added the new text as FPN. Section 220.43(B) addresses feeder and service load calculations (and not branch circuit calculations) while Section 410.101(B) addresses connected load, which are two different subjects.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

18-65a Log #2921 NEC-P18 **Final Action: Reject**
(410.14(B))

Submitter: Marcus Sampson, Lysistrata Electric
Recommendation: Revise as follows:

(B) Access to Boxes. Electric-discharge luminaires (fixtures) surface mounted over concealed, outlet, pull, or junction boxes and designed not to be supported solely by the outlet box shall be provided with suitable openings in the back of the luminaire (fixture) to provide access to the wiring in the box. <u>This opening shall be provided with an approved bushing or shall have smooth, well-rounded edges which cannot damage the conductors.</u>

Substantiation: Openings in surface mounted luminaires installed over concealed outlet, pull, or junction boxes are often made in the field with a knock-out puller or tin snips. These openings are rough at best and often dangerously sharp.

Panel Meeting Action: Reject

Panel Statement: The outlet box access opening must be provided as part of the listed luminaire. Field modification is not intended or permitted by Section 110.3(B).

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

18-66 Log #1116 NEC-P18 **Final Action: Reject**
(410.14(B))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Delete the word “concealed”.
Substantiation: Edit. The definition of concealed in Article 100 is “inaccessible”. 314.29 requires boxes to be accessible.

Panel Meeting Action: Reject

Panel Statement: The intent of the section is to apply to concealed boxes where the box is inaccessible except by removing the luminaire. Section 314.29 refers to the wiring being accessible in the box, not the box itself.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

18-67 Log #1133 NEC-P18 **Final Action: Reject**
(410.15(B))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Change "raintight" to "weatherproof."
Substantiation: Edit. The FPN to the definition of waterproof in Article 100 indicates "watertight" can be weatherproof where wetness, snow, ice, dust, or temperature extremes are not a factor. Most light poles are installed where these conditions are a factor.
Panel Meeting Action: Reject
Panel Statement: There is no technical substantiation to increase the level of protection for a wet location handhole cover.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-68 Log #479 NEC-P18 **Final Action: Reject**
(410.15(B)(1))

Submitter: Don A. Hursey, Durham County Inspections Department
Recommendation: Revise text to read:
A pole shall have handhole not less than 50 mm × 100 mm (2 in. × 4 in.) with a raintight cover to provide access to the supply terminations and wiring method within the pole or pole base.
Substantiation: Many times the raceway(s) are not accessible from the handhole. They are stubbed up short and not reachable from the handhole, therefore, making them inaccessible without removing the pole.
Panel Meeting Action: Reject
Panel Statement: Section 410.15(B)(1) applies when the pole is used as a raceway. The handhole is to allow access to the supply terminations. It does not require that accessibility to the conduit be provided.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-69 Log #1942 NEC-P18 **Final Action: Accept**
(410.15(B)(1))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Revise 410.15(B)(1) as follows:
410.15 Supports.
(B) Metal or Nonmetallic Poles Supporting Luminaires (Lighting Fixtures)
(1) A pole shall have a handhole not less than 50 mm x 100 mm (2 in. x 4 in.) with a ~~raintight~~ cover suitable for use in wet locations to provide access to the supply terminations within the pole or pole base.
Substantiation: The word "raintight" is not appropriate in this section. This application calls for the same degree of protection afford by a box or enclosure in any typical wet location. The word "raintight" in this paragraph provides no useful distinction from "wet location".
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-70 Log #836 NEC-P18 **Final Action: Accept in Principle**
(410.16(B))

Submitter: Stephen W. Drayton, Eastern Idaho Electrical JATC / Rep. IBEW Local 915, IAEI Southcoast Division
Recommendation: Renumber 410.16(B) and relocate as 410.14(C) in its present wording.
Substantiation: We contend that this statement is not properly located in Part IV - Luminaire (Fixture) Supports, and would be more logically located in Part III - Provisions at Luminaire (Fixture) Outlet Boxes, Canopies, and Pans. This change would make finding this information easier.
Panel Meeting Action: Accept in Principle
Relocate existing Code text from Section 410.16(B) to a new section within Article 410, Part I.
Panel Statement: The panel agrees with the submitter that relocating 410.16(B) will improve usability. The panel disagrees with the submitter's proposed relocation to a new Section 410.14(C) because this would restrict the requirement to electric discharge luminaires only and no substantiation to so limit the requirement has been provided. This is a general requirement and more appropriately belongs within Part I. In moving 410.16(B) the panel intends no substantative change in the requirement.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-71 Log #3466 NEC-P18 **Final Action: Reject**
(410.16(C))

Submitter: Richard F. Van Wert, Middle Department Inspection Agency / Rep. Benjamin Franklin Chapter IAEI
Recommendation: Revise text to read:
410.16(C) Suspended Ceilings. Framing members...shall also be permitted. A lay-in luminaire shall not be required to be attached to the ceiling framing member if the luminaire is independently supported by dedicated support wires attached to the building structures.
Substantiation: It is necessary to include this new information to help the installer meet one set of rules and not two. The NEC should recognize that not all the lay-in luminaires are only supported by the ceiling grid itself.
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide technical substantiation to support the recommendation as is required by 4-3.3(d) of the NFPA Regulations Governing Committee Projects. See www.nfpa.org.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-72 Log #1040 NEC-P18 **Final Action: Reject**
(410.17)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Delete, or revise as follows:
Luminaires (fixtures) and lighting equipment to ~~shall~~ be grounded shall be grounded as required ~~in Article 250 and~~ Part V of this article and in accordance with applicable provisions of this Code.
Substantiation: Edit. To comply with the Style Manual. 400.2 uses the phrase "applicable provisions". This is already covered by 90.3. Grounding requirements should also apply where grounding is done by choice and not required. 90.2(A)(3) covers installations required or not: 250.1(1) covers permitted grounding.
Panel Meeting Action: Reject
Panel Statement: The current language clearly and succinctly expresses the general requirement for grounding luminaires. The proposed wording does not improve upon it.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-73 Log #280 NEC-P18 **Final Action: Reject**
(410.22)

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
"410.22 Luminaire (Fixture) Wiring — General. Wiring on or within fixtures shall be neatly arranged and shall not be exposed to ~~physical damage~~ crushing or abrasion...".
Substantiation: Use of the word "physical" is superfluous– the purpose is obvious. In some instances, one could argue for the use of "mechanical" to differentiate that from e.g., "thermal" damage, but context makes the intended sense quite clear, rendering anything like this completely unnecessary.
The proposed rewording is an attempt at precision. If you don't care to reword I would then argue that in that case the term "physical" should be eliminated. Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on. Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.)
Panel Meeting Action: Reject
Panel Statement: The adjective "physical" is clearly understood and its deletion does not improve the readability of the Code. The use of "physical damage" is in accordance with the NEC Style Manual.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-74 Log #1660 NEC-P18 **Final Action: Reject**
(410.29)

Submitter: Thomas Al-Yasha, Thomas Electric
Recommendation: Individual showcases, other than fixed, shall be permitted to be connected by flexible cord to permanently installed GFCI receptacles,and groups of not more than six such showcases shall be permitted to be coupled together by a flexible cord and separable locking-type connectors with one of the group connected by flexible cord to a permanently installed GFCI protected receptacle.
The installation shall comply with 410.29(A) through (E).
Substantiation: The current method of branch circuit protection does not ensure the safety of customers, especially under damp or wet locations, those that would exist after rain or snow.
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide technical substantiation to support the recommendation as is required by 4-3.3(d) of the NFPA Regulations Governing Committee Projects. See www.nfpa.org.

Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-78 Log #3176 NEC-P18 **Final Action: Accept**
(410.30(C)(1)(2)(c))

Submitter: Michael S. O’Boyle, Lightolier Division of Genlyte Thomas Group
Recommendation: Revise text to read:
c. Is terminated in a grounding-type attachment plug cap or busway plug, or is a part of a listed assembly incorporating a manufactured wiring system connector in accordance with 604.6(C), or has a luminaire (fixture) assembly with a strain relief and canopy ~~.~~ , or has a luminaire (fixture) assembly with strain relief and canopy having a maximum 152 mm (6 in.) long section of raceway for attachment to an outlet box above a suspended ceiling .
Substantiation: Suspension systems used to support electric-discharge luminaires are sometimes attached to grid members of suspended ceilings. Such installations are very popular in office environments where end-to-end mounted fluorescent systems are installed to provide indirect lighting of the space. To allow the canopy assembly to be positioned symmetrically in line with the suspension hardware, the canopy needs to be mounted directly below a grid member. This is a problem because the ceiling grid member blocks placement of an outlet box flush with the ceiling surface. Running flexible cord unprotected through a hole in a suspended ceiling is clearly precluded by 400.8. A short length of raceway attached between a luminaire canopy and outlet box would allow placement of the box on top of the ceiling grid. The raceway would protect the cord above the ceiling line. Repositioning a ceiling panel would allow access to the outlet box. 400.8 allows flexible cord to be run in a raceway when specifically permitted elsewhere in the Code.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-79 Log #937 NEC-P18 **Final Action: Accept in Part**
(410.33)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise:
FEEDER AND BRANCH CIRCUIT CONDUCTORS . Feeder and branch circuit conductors with 75 mm (3 in.) of a ballast shall have an insulation temperature rating not lower than 90°C (194°F) unless ~~supplying a~~ the ballast or luminaire (fixture) is listed and marked as suitable for a ~~different~~ lower insulation temperature rating or does not require a higher insulation temperature rating.
Substantiation: Edit. 410.31 permits luminaires (fixtures) to be used as a raceway, not limited to branch circuit conductors. Present wording seems to infer the ballast is an integral part of the fixture. And literally permits a remote ballast to have lower than 90°C rated supply conductors if the separate and remote fixture is listed and marked for a lower temperature rating. If product standards that address insulation temperature ratings are, totally sufficient this section is superfluous.
Panel Meeting Action: Accept in Part
Revise to read as follows:
FEEDER and BRANCH CIRCUIT CONDUCTORS . Feeder and branch circuit conductors within 75 mm (3 in.) of a ballast shall have an insulation temperature rating not lower than 90°C (194°F) unless supplying a luminaire (fixture) listed and marked as suitable for a different insulation temperature.
Panel Statement: The panel accepts the addition of “feeder and” being added to the title and the beginning of the first sentence. The panel accepted the substantiation that luminaires permitted to be used as a raceway could contain feeders. The panel does not accept the additional changes proposed because the language does not add clarity or additional safety.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-79a Log #CP1802 NEC-P18 **Final Action: Accept**
(410.35)

Submitter: Code-Making Panel 18,
Recommendation: Revise the text of 410.35(A) to read as follows:
(A)Marking. All luminaires shall be marked with the maximum lamp wattage or electrical rating, manufacturer's name, trademark, or other suitable means of identification. A luminaire requiring supply wire rated higher than 60°C (140°F) shall be marked with the minimum supply wire temperature rating on the luminaire and shipping carton or equivalent.
Substantiation: The current wording of Section 410.35(A) includes a minimum letter height for the supply wire marking required on all luminaires requiring supply wire with an insulation temperature rating greater than 60°C. Clause 6.15.1.5 and Table 20.1.1, Item 1.1, in the safety Standard for Luminaires, ANSI/UL 1598 address the same issues. However, the minimum letter height for the supply wire marking differs between the two documents. Letter height is one factor to be considered when judging the legibility of a marking. The producers, installers, consumers and AHJ's involved in the ANSI approved consensus process used to develop ANSI/UL 1598 reached consensus agreement that specifying the letter font is equally important They also determined that markings in a specific font but smaller letters are equally readable and effective. For this reason, the trinational luminaire standard, ANSI/UL 1598, since its publication in 2000 specifies both minimum letter height and font for all required markings.
Compliance with marking letter height requirements are most effectively dealt with by the luminaire producer and safety certifier during the design and production of a luminaire, before it arrives at the installation site. They have the proper measuring tools and the resources required to resolve any compliance issues at hand.
Sections 90.7 and 110.3 (A)(1) of the 2005NEC authorize an AHJ to accept properly listed equipment without examining it in order to, "…avoid the necessity for repetition of examinations by different examiners, frequently with inadequate facilities for such work, and the confusion that would result from conflicting reports on the suitability of devices and materials examined for a given purpose." The Code recognizes the difficulties and problems associated with evaluating electrical equipment in the field. Removing the letter height specification in Section 410.35(A) supports these Code Sections and this basic NEC philosophy.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
CARPENTER, F.: The substantiation for eliminating the minimum letter height of this marking because the visibility requirements are already addressed in the listing standard is only valid if all luminaires are required to be listed. Currently, the Code does not require listing of all luminaires. If Proposal 18-40a becomes accepted throughout the code revision process, then this proposal (18-79a) would be acceptable. However, since NEMA is voting against Proposal 18-40a, we must also vote against this proposal because it doesn't address unlisted luminaires.

18-80 Log #2295 NEC-P18 **Final Action: Reject**
(410.35(A))

Submitter: Andre R. Cartal, Princeton Borough Building Dept.
Recommendation: Delete second sentence.
Substantiation: See statement for 410.36
All this second sentence does is to provide liability cover for the luminaire manufacturer. The average homeowner does not read or understand this information.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Proposal 18-82. Additionally, the panel does not agree with the claims that the second sentence provides liability coverage for the luminaire manufacturer and that the markings aren't understood.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

(410.36)

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
410.36 "... Wiring compartments, including their entrances, shall be such that conductors may be drawn in and withdrawn without ~~physical~~ damage."
Substantiation: Use of the word "physical" is superfluous – the purpose is obvious.
Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every unnecessary instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."
Panel Meeting Action: Reject
Panel Statement: The adjective "physical" is clearly understood and its deletion does not improve the readability of the Code. The use of "physical damage" is in accordance with the NEC Style Manual.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-82 Log #2294 NEC-P18 **Final Action: Reject**
(410.36)

Submitter: Andre R. Cartal, Princeton Borough Building Dept.
Recommendation: Add: Luminaires shall be designed and assembled so as to limit the temperature at the branch-circuit conductors to not more than 60 degrees C (140 degrees F).
Substantiation: When I started as an Inspector with the Fire Underwriters in 1948 one of the field concerns I was warned about was the surface mounted enclosed incandescent drum-type fixture that were considered a fire hazard. We saw fixtures that got so hot that the glass shattered. We would only accept these fixtures if a spacer was installed to provide an air gap between the fixture and the ceiling. Soon fixtures were appearing with built-in spacers and then an additional pad of insulating material came with the fixture. The fixtures came with lamp stops which limited the wattage of the bulb as bulbs size varied with wattage. The stops proved ineffective as the bulb size became more uniform. The result is that these fixtures have been destroying branch circuit conductor insulation for half a century and the industry response has been to provide a warning label per 410.35(A) THESE FIXTURES ARE NOT INSTALLED IN THE EXPENSIVE HOMES THAT I SEE, THEY ARE BOUGHT AND INSTALLED IN POOR PEOPLE'S HOMES AND MAYBE BY PEOPLE THAT DON'T HAVE A GOOD UNDERSTANDING OF ENGLISH. WE CAN DO BETTER.
Panel Meeting Action: Reject
Panel Statement: Substantial changes have been made to the safety standards for luminaires over the past 60 years. The submitter has provided no data to substantiate his claim that the current practice has been destroying branch circuit insulation. Additionally, the supply wiring used in new construction is rated greater than 60 degrees C; therefore, limiting luminaires to 60 degrees C in all applications cannot be justified.
Luminaire labeling requirements have recently been revised to simplify and better convey the important wattage limitation information. These lamp wattage markings now employ an internationally agreed upon nomenclature that does not require an understanding of English.

18-84 Log #936 NEC-P18 **Final Action: Reject**
(410.46)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Delete present wording and substitute:
Conductor terminals for lampholders of a nonmetallic fixture designed for surface mounting on an outlet box shall be recessed and not less than 13 mm (1/2 in.) from the mounting plane of the fixture.
Substantiation: The designation "porcelain" infers this section is intended to apply to the ubiquitous lampholder part of a base, intended for surface mounting on an outlet box, which may be metal, which may have an integral switch or receptacle. These are not "luminaries" per definition since they have no provisions for positioning or protecting the lamp. They are also made of plastic, which is not addressed. They are designated "lampholders" by the manufacturers. 410.12 appears to recognize this type of lighting fixture. The title of this article includes lamphodlers, which includes this type sign

receptacles, and flood light type lampholders, none of which meet the definition of luminaire. Live parts (connection terminals) have to be located where wires can contact them. This section is a design specification and such requirements should be covered by other agencies (90.1(C)).
Panel Meeting Action: Reject
Panel Statement: Article 410, Part VII applies to luminaires not to lampholders which are covered in the Article 410, Part VIII. There are porcelain luminaires manufactured. This section does not apply to the ubiquitous lampholder.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-85 Log #1750 NEC-P18 **Final Action: Reject**
(410.47)

Submitter: David Belt, Underwriters Laboratores Inc.
Recommendation: Revise text to read as follows:
410.47 Screw-Shell Type. Lampholders of the screw-shell type shall be installed for use as lampholders only. Where supplied by a circuit having a grounded conductor, the grounded conductor shall be connected to the screw shell. Listed 125V lampholder-to-receptacle outlet adapters shall be permitted for temporary, non-continuous use.
Substantiation: These lampholder-to-outlet adapters have had a long history of use without any evidence of field problems, yet their installation conflicts with 410.47 "lampholders of the screw-shell type shall be installed for use as lampholders only". The adapters are used to supply temporary power during maintenance operations, supplying power to tools, droplights, and the like. They are rated 125, 660W.
Their use dates back before the 410.47 requirements were added to the NEC in 1937. Prior to this date lampholder-to-outlet adapters were installed as a substitute for general use receptacles. The rationale for the 410.47 requirements from the 1937 NEC Handbook alludes to this:
"Where an outlet is intended for the connection of portable lighting equipment or appliances, it must not be fitted with a screw-shell type receptacle, as these devices are unsuitable for such use and when so used are hazardous."
Later NEC Handbooks clarifies the original rationale; per the 2005 NEC Handbook.
"Many years ago it was common practice to install screw-shell lampholders with screw shell adapters in baseboards and walls to connect cord-connecting appliances and lighting equipment. This now prohibited practice permitted exposing live parts to be contacted by persons when the adapters were removed. See 406.2(B) for permitted uses of receptacles."
As these adapters would currently be installed in a ceiling or wall mounted lampholder, high and out of the reach of small children, the risk of shock during insertion and removal is no greater than that of a lamp. While lampholder-to-outlet adapters should not be used as a substitute for general use receptacles, they do have a legitimate use as a temporary power tap for maintenance where other sources of power are not convenient or available.
Panel Meeting Action: Reject
Panel Statement: Providing temporary power via a lampholder is to provide it without an equipment grounding conductor. This is the obvious safety hazard that this proposal would permit.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13
Comment on Affirmative:
KEMPEL, K.: The panel action and substantiation does not adequately address the use with non-grounded products or double-insulated products. It also does not clarify the panel's position on the use of these devices.

18-86 Log #3218 NEC-P18 **Final Action: Reject**
(410.66(B))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Add text to read as follows:
"Ceiling penetrations by recessed lights shall be treated as outlet boxes for the purpose of applying 314.20 and 314.21."
Substantiation: Penetrations for these installations appear to compromise a fire barrier similarly. If the purpose of the Section 314 requirements is solely to contain sources of ignition within outlet boxes, this proposal is inappropriate. However, if they also have the purpose of maintaining the fire rating of a ceiling or wall, on the grounds that a cover plate is not sufficient to restore the barrier between the room and the inside of the wall or ceiling, then they should apply as well to rough-in kits, as there is no reason to presume that trim kits serve any better than cover plates to restore the barrier between the room and the inside of the ceiling.
Panel Meeting Action: Reject
Panel Statement: The purpose of the requirements of Article 314 is to contain sources of ignition within outlet boxes. Fire ratings are based on building construction assemblies that comply with the test criteria of ANSI/UL263 (ASTM E119 and NFPA 251). Published classifications of tested building constructions incorporate a detailed description of the assembly that complied with the test criteria. These descriptions may include generic types of luminaires that are allowed to be part of the fire rated construction. The luminaire standard contains mechanical requirements that allow any listed luminaire of the specified generic type to be used in the fire rated construction in accordance with the provisions included in the description. There are also luminaires and luminaire assemblies that have been subjected to testing and are classified for broad ranges of fire rated designs.

Ballot Results: Affirmative: 13

18-88 Log #2320 NEC-P18 **Final Action: Reject**
(410.73(A))

Submitter: Jimmie Evanisko, National Cathode Corporation
Recommendation: Revise text to read:
(A) Open-circuit Voltage of 1000 Volts or Less. Equipment for use with high mA cathode electric discharge lighting systems and designed for an open-circuit voltage of 1000 volts or less shall be of a type intended for such service.
Substantiation: Over the past few years and the recent IEC proposal #60958-2-27 34/D 843/CD, the lighting consultants, architects, engineers and myself have seen an unbelievable amount of miniature fluorescent used in displays, computers, LCD backlights and neon power sources with very low mA current markings being marketed as cold cathode components which contradicts UL, CSA, NEC, 410.73 through 410.87 and does not fall into the scope of electric signs or outline lighting in Article 100 Definitions.
To substantiate please review the IESNA 8th edition pages 203, 205, 206, and 307, IESNA 9th edition pages 6-21, 6-26, 6-27, 6-29, 6-30, 6-41, and 6-42 which both describe in depth the definition of cold cathode as the IESNA has described in all of their previous editions since 1948.
Note: Supporting Material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: Accepting this proposal would limit the entire Section of 410.73 to high mA cathode electric discharge lighting systems and eliminate coverage of any other electric discharge lighting systems of 1000 volts or less. The panel does not accept restricting electric discharge lighting of 1000 volts or less to a single product.
In addition, Part XIII of Article 410 is not intended to address the installation of electric discharge lighting in appliances. The rules in Part XIII provide guidance for safe installations of electric discharge lighting that qualifies based on the maximum limits specified. No safety reason is given for excluding electric discharge lighting systems that operate below the specified maximums.
The IEC proposal referenced in the substantiation is subject to change. Also, it does not contain a definition for high mA cathode / HMC.
How products are marketed is not valid substantiation to change a safety standard.

Substantiation: Edit. This provision should also apply to fixtures installed in concrete or tile block construction.

Panel Meeting Action: Reject
Panel Statement: The substantiation failed to provide any reason why non-thermally protected luminaires should be permitted in masonry or tile units.
The submitter did not provide technical substantiation to support the recommendation as is required by 4-3.3(d) of the NFPA Regulations Governing Committee Projects. See www.nfpa.org.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-90a Log #CP1801 NEC-P18 **Final Action: Accept**
(410.73(F)(5), FPN)

Submitter: Code-Making Panel 18,
Recommendation: Revise FPN to read as follows:
FPN: See ANSI Standard ~~C78.387~~ C78.389 , *American National Standard for Electric Lamps — ~~Metal Halide Lamps~~* , *High intensity Discharge* , Methods of Measuring Characteristics.
Substantiation: ANSI Standard C78.387 no longer exists. Standard C78.387 has been combined with standards C78.386 and C78.388 into new ANSI standard C78.389; therefore, the reference needs to be updated.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-90b Log #CP1803 NEC-P18 **Final Action: Accept**
(410.73(G))

Submitter: Code-Making Panel 18,
Recommendation: Modify Section 410.73(G) to read as follows:
(G) Disconnecting Means. In indoor locations, other than dwellings and assorted accessory structures, fluorescent luminaires that utilize double ended lamps and contain ballast that can be serviced in place, shall have a disconnecting means either internal or external to each luminaire. When connected to multiwire branch circuits, the disconnect shall simultaneously break all the supply conductors of the ballast, including the grounded conductor. The line side terminals of the disconnecting means shall be guarded. The disconnecting means shall be located so as to be accessible to qualified persons before servicing or maintaining the ballast. Where the disconnecting means is external to the luminaire it shall be a single device, located in sight of the luminaire.
Existing five exceptions to remain as written in the 2005 NEC
Substantiation: The Panel has reviewed Proposals 18-91 through 18-96 and combined the acceptable concepts to create the text. These concepts include removal of the effective date, disconnecting the grounded conductor only on multiwire-branch circuits, location of external disconnect and clarification that the rule applies only to double-ended fluorescent luminaires.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13
Comment on Affirmative:
BER, M.: The final wording of this proposal was mistakenly changed to read: "(G) Disconnecting Means. In indoor locations, other than dwellings and *assorted* accessory structures...". When it should read: "(G) Disconnecting Means. In indoor locations, other than dwellings and *associated* accessory structures...". It was never the intent of the panel to change this word from that used in the 2005 NEC.
CARPENTER, F.: NEMA supports this proposal, but does not agree with the use of the word "assorted" in the first sentence. We believe that this was an inadvertent change by the panel, and recommend reverting to the word "associated" that was used in the 2005 NEC. Additionally, in the first sentence the words "double ended" should be changed to "double-ended", and the word "ballast" should be changed to "ballast(s)" to remain consistent with the previous code language and to clarify that a luminaire may contain more than one ballast.
COSTELLO, P.: The word "assorted" is a misprint in the panel proposal and should read with the current word "associated" accessory structure. Upon closer review of this section, CMP 18 needs to be reminded that 410.73(G) had the support of the electrical section and passed overwhelmingly on the floor of the 2005 NFPA Convention. While this committee proposal addresses some needed clarification, it is a mistake to remove multiwire branch circuits supplying luminaires that are not double ended. The same hazards exist on all multiwire branch circuits whether the luminaries are serviced in place or taken down for service. On multiwire branch circuits, there is a possibility that an open neutral condition could be introduced while servicing the luminaries, this causes a dangerous over voltage condition to the remaining circuit as well as a hazard to the qualified person servicing the luminary. This rule needs to apply to all luminaries on multiwire branch circuits.
KEMPEL, K.: My records indicate the word "assorted" in the first sentence is incorrect in panel proposal 18-90b; it should be "associated".
LARSON, S.: During deliberations to modify 410.73(G), the panel incorrectly inserted the word "assorted" in the first sentence. The word should have been "associated".
O'BOYLE, M.: Word "associated" in first sentence is not correct, it should be "associated".
OWENS, T.: There is a typographical error in the wording of CMP 18's recommendation. The word "assorted" should be "associated" in the first sentence. The first part of the sentence should read "In indoor locations, other than dwellings and associated accessary structures...".
SMITH, M.: Vote to accept this proposal with comment below:
An error was made in the text. My records indicate the word "assorted" is incorrect in the panel proposal and that it must be changed to "associated"...
(G) Disconnecting Means. In indoor locations, other than dwellings and ~~assorted~~ associated accessory structures, fluorescent luminaires that utilize double ended lamps and contain ballast that can be serviced in place, shall have a disconnecting means either internal or external to each luminaire.
WALL, C.: My records indicate the word "assorted" in the first line of panel proposal 18-90b is incorrect and that it needs to be changed to "associated". This line should read: "(G) Disconnecting Means. In indoor locations, other than dwellings and associated accessory structures...".
WRIGHT, R.: I agree with accepting the proposal and replacing the word ~~assorted~~ with associated .

18-91 Log #489 NEC-P18 **Final Action: Accept in Principle in Part**
(410.73(G))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read:
(G) Disconnecting Means. In indoor locations, other than dwellings and associated accessory structures, fluorescent luminaires (fixtures) that utilize double-ended lamps and contain ballast(s) that can be serviced in place or ballasted luminaires that are supplied from multiwire branch circuits and contain ballast(s) that can be serviced in place shall have a disconnecting means either internal or external to each luminaire (fixture), to disconnect simultaneously from the source of supply all conductors of the ballast, including the grounded conductor if any. The line side terminals of ~~the~~ a disconnecting means internal to the luminaires (light fixtures) shall be guarded. The disconnecting means shall be located so as to be accessible to qualified persons before servicing or maintaining the ballast. Where the disconnecting means is external to the luminaire (light fixture) it shall be located immediately adjacent to and readily accessible from the luminaire (light fixture). ~~This requirement shall become effective January 1, 2008.~~
Substantiation: The new requirement accepted in the 2005 NEC falls short of providing specific direction about the location of the service disconnect when it is external to the luminaire (light fixture). Since it is important that this disconnect be located so ready operation can be accomplished without coming off a ladder to shut a circuit off, this proposed text will provide installers and enforcement with additional needed clarity that addresses the location of the external disconnect to effectively and consistently be able to apply it in the field. Disconnecting means located external to the luminaire (fixture) should not be required to have their terminals guarded because they are outside of the luminaire (light fixture) to be serviced.
Panel Meeting Action: Accept in Principle in Part
Panel Statement: The panel agreed in principle with the concept of the removal of the effective date and the need to clarify the location of an external disconnect.
The panel rejected the concept that an external disconnect did not require guarding and that the location of the external disconnect be immediately adjacent to and readily accessible from the luminaire.
See panel action and statement on Proposal 18-90b (Log # CP1803).
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-92 Log #2924 NEC-P18 **Final Action: Accept in Part**
(410.73(G))

Submitter: Frederick L. Carpenter, Lithonia Lighting
Recommendation: Revise 410.73(G) as shown below:
(G) Disconnecting Means. In indoor locations, other than dwellings and associated accessory structures, fluorescent luminaires (fixtures) that utilize double ended lamps and contain ballast(s) that can be serviced in place ~~or ballasted luminaires that are supplied from multiwire branch circuits and contain ballast(s) that can be serviced in place~~ and installed on branch circuits with voltages exceeding 150 volts-to-ground shall have a disconnecting means either internal or external to each luminaire (fixture), to disconnect simultaneously from the source of supply all conductors of the ballast, including the grounded conductor if any. The line side terminals of the disconnecting means shall be guarded. The disconnecting means shall be located so as to be accessible to qualified persons before servicing or maintaining the ballast. ~~This requirement shall become effective January 1, 2008.~~
Substantiation: When 410.73(G) was added during the previous code cycle, no data was presented to show that 120 volt single phase circuits were a problem. Since then, field data regarding incidents has been presented to the Canadian Electrical Code Part 1 Committee which has led them to adopt a change only for systems over 150 volts-to-ground. Additionally, the need to disconnect the grounded conductor on a 120v single phase system cannot be substantiated. The last sentence, establishing an effective date, is no longer needed.

Panel Meeting Action: Accept in Part
The panel accepts the deletion of the effective date, and rejects the concept of excluding luminaires operating at less than 150 volts.
Panel Statement: The submitter offers no technical substantiation for proposed exclusion of luminaires operating at less that 150 volts.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
CARPENTER, F.: NEMA supports the action taken by the panel on Proposal 18-90b to clarify the intent of section 410.73(G); however, we disagree with the conclusion that no technical substantiation was presented with this proposal to support the exclusion of luinaires operating at less than 150 volts. The introduction of this section of the code in the 2005 NEC was based on anecdotal reports of shock incidents and did not include any data that supported the adoption of the requirement for all supply voltages. The only incident data of which we are aware is the data that has been collected in recent years by the Electrical Safety Authority in Ontario, Canada. This data supports the exclusion of luminaires installed on circuits operating at less than 150 volts-to-ground.
Comment on Affirmative:
O'BOYLE, M.: As a function of magnitude, voltages below 150V present a lower level of risk than those exceeding 150V. The Canadian Electric Code action level of 150V is based on empirical data recorded in Canada. I agree that such data needs to be reviewed, and a technical substantiation be presented, before this change may be accepted.

18-93 Log #3177 NEC-P18 **Final Action: Accept**
(410.73(G))

Submitter: Michael S. O'Boyle, Lightolier Division of Genlyte Thomas Group
Recommendation: Revise text to read:
(G) Disconnecting Means. In indoor locations, other than dwellings and associated structures, fluorescent luminaires (fixtures) that utilize double-ended lamps and contain ballast(s) that can be serviced in place or ballasted luminaires that are supplied from multiwire branch circuits and contain ballast(s) that can be serviced in place shall have a disconnecting means either internal or external to each luminaire (fixture) . ~~, to disconnect simultaneously from the source of supply all conductors of the ballast, including the grounded conductor if any.~~ When connected to multiwire branch circuits, the disconnect shall simultaneously break all supply conductors of the ballast, including the grounded conductor. The line side terminals of the disconnecting means shall be guarded. The disconnecting means shall be located so as to be accessible to qualified persons before servicing or maintaining the ballast. This requirement shall become effective January 1, 2008.
Substantiation: Since the grounded conductor of a 2-wire branch circuit does not pose a risk of electric shock, there is no reason to require it to be simultaneously disconnected.
Panel Meeting Action: Accept
Panel Statement: See panel action and statement on Proposal 18-90b (Log #CP1803).
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-94 Log #3178 NEC-P18 **Final Action: Reject**
(410.73(G))

Submitter: Michael S. O'Boyle, Lightolier Division of Genlyte Thomas Group
Recommendation: Revise text to read:
(G) Disconnecting Means. In indoor locations, other than dwellings and associated structures, fluorescent luminaires (fixtures) that utilize double-ended lamps and contain ballast(s) that can be serviced in place ~~or ballasted luminaires that are supplied from multiwire branch circuits and contain ballast(s) that can be serviced in place~~ and have input over 150V to ground shall have a disconnecting means either internal or external to each luminaire (fixture), to disconnect simultaneously from the source of supply all conductors of the ballast, including the grounded conductor if any. The line side terminals of the disconnecting means shall be guarded. The disconnecting means shall be located so as to be accessible to qualified persons before servicing or maintaining the ballast. This requirement shall become effective January 1, 2008.
Substantiation: The Canadian Electric Code is expected to adopt a similar requirement that establishes a 150V action level for disconnect protection based on empirical field data. No empirical data has been presented showing that 120V single phase circuits have been an issue.
Panel Meeting Action: Reject
Panel Statement: The panel rejects the concept of excluding luminaires operating at less than 150 volts since there was no technical substantiation submitted for the change.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
CARPENTER, F.: See my Explanation of Negative Vote on Proposal 18-92.
Comment on Affirmative:
O'BOYLE, M.: As a function of magnitude, voltages below 150V present a lower level of risk than those exceeding 150V. The Canadian Electric Code action level of 150V is based on empirical data recorded in Canada. I agree that such data needs to be reviewed, and a technical substantiation be presented, before this change may be accepted.

18-95 Log #1740 NEC-P18 **Final Action: Reject**
(410.73(G) Exception No. 4)

Submitter: Jeffrey Roche, Kenall Manufacturing Co.
Recommendation: Revise text to read as follows:
410.73(G) Exception No. 4: A disconnecting means shall not be required ~~in industrial establishments with restricted public access~~ where the AHJ can verify that the conditions of maintenance and supervision ensure that only qualified persons service the installation by written procedures.
Substantiation: New Section 410.73(G) states in the first sentence that this section applies to indoor locations that are NOT dwellings or associated structures. The requirement can be met by either a luminaire construction that contains an internal disconnecting means or by a wiring method that allows a 2 pole switch to disconnect power to the luminaire. Dwellings are defined in Article 100, so by excluding dwellings, all other buildings are included. Exception No. 4 is directed only to "industrial establishments" but Article 100 does not have a definition for "industrial establishments." There are 2 ways to meet the requirement, and because this is an installation/maintenance requirement and not a luminaire construction requirement, luminaire manufacturers will not be required to incorporate a disconnect means into luninaires. Compliance will be determined by the AHJ and rather than having the AHJ define an "industrial establishment", and limiting the exception to "industrial establishments", I suggest removing that terminology. As reworded, the AHJ has the authority to use the exception in any non-dwelling application that has qualified maintenance personnel with written maintenance procedures.
Panel Meeting Action: Reject
Panel Statement: The panel rejects the submitter's opinion that the term "industrial establishments" is an undefined or unrecognized term. This term is used extensively (33 other times) throughout the NEC.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-96 Log #2928 NEC-P18 **Final Action: Accept in Principle**
(410.73(G) Exception No. 5)

Submitter: Frederick L. Carpenter, Lithonia Lighting
Recommendation: Add the sentence: "The locally accessible disconnects do not need to disconnect the grounded conductor." to the end of Exception No. 5 to 410.73(G). The exception would read as follows:
Where more than one luminaire is installed and supplied by other than a multiwire branch circuit, a disconnecting means shall not be required for every luminaire when the design of the installation includes locally accessible disconnects, such that the illuminated space cannot be left in total darkness. The locally accessible disconnects do not need to disconnect the grounded conductor."
Substantiation: The current wording is unclear. The exception could be incorrectly interpreted as implying that the locally accessible disconnects do not have to be on every luminaire, but do need to disconnect the grounded conductor. The intent should be clarified by incorporating this additional sentence.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 18-90b (Log #CP 1803).
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-97 Log #1737 NEC-P18 **Final Action: Reject**
(410.73(H))

Submitter: Michael Thornburg, Thornburg Electric
Recommendation: Install inline fuse protection for all ballast units from the factory.
Substantiation: Even though most florescent ballast have overload protection, they may be on the same circuit as other fixtures, making it hard to trace when one fails.
As Chief Engineer with the Owosso Township Fire Department for 31 years, I have been on many alarms where the building has been evacuated due to the smell of a burnt ballast, even though the bulbs were still lit.
I have had several municipal street light projects where power was ran several hundred feet and fused at 60 amps for a 2 amp ballast. We always wire in fuses at the base of the pole to prevent ballast from burning before it would/could trip an over current device.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide proposed text in the recommendation as is required by 4-3.3(c) of the NFPA Regulations Governing Committee Projects. See www.nfpa.org.

The submitter described incidents that do not appear to present hazards. Product safety standards require ballasts to have suitable enclosures to contain the arcing that might accompany ballast failure.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-98 Log #2319 NEC-P18 **Final Action: Reject**
(410, Part XIV)

Submitter: Jimmie Evanisko, National Cathode Corporation
Recommendation: Revise text to read:
XIV. Special provisions for <u>high mA cathode</u> electric-discharge lighting systems of more than 1000 volts.
Substantiation: Over the past few years and the recent IEC proposal #60958-2-27 34/D 843/CD, the lighting consultants, architects, engineers and myself have seen an unbelievable amount of miniature fluorescent used in displays, computers, LCD backlights and neon power sources with very low mA current markings being marketed as cold cathode components which contradicts UL, CSA, NEC, 410.73 through 410.87 and does not fall into the scope of electric signs or outline lighting in Article 100 Definitions.
To substantiate please review the IESNA 8th edition pages 203, 205, 206, and 307, IESNA 9th edition pages 6-21, 6-26, 6-27, 6-29, 6-30, 6-41, and 6-42 which both describe in depth the definition of cold cathode as the IESNA has described in all of their previous editions since 1948.
Note: Supporting Material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: Accepting this proposal would limit Part XIV of Article 410 to high mA cathode electric discharge lighting systems and eliminate coverage of any other electric discharge lighting systems over 1000 volts. The panel does not accept restricting electric discharge lighting over 1000 volts to a single product.
In addition, Part XIV of Article 410 is not intended to address the installation of electric discharge lighting in appliances. The rules in Part XIV provide guidance for safe installations of electric discharge lighting that qualifies based on the limits specified. No safety reason is given for excluding electric discharge lighting systems that operate within the limitations.
The IEC proposal referenced in the substantiation is subject to change. Also, it does not contain a definition for high mA cathode / HMC.
How products are marketed is not valid substantiation to change a safety standard.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-99 Log #2321 NEC-P18 **Final Action: Reject**
(410.80(A))

Submitter: Jimmie Evanisko, National Cathode Corporation
Recommendation: Revise text to read:
(A) Listing. <u>High mA cathode</u> electric-discharge lighting systems with an open-circuit voltage exceeding 1000 volts shall be listed and installed in conformance with that listing.
Substantiation: Over the past few years and the recent IEC proposal #60958-2-27 34/D 843/CD, the lighting consultants, architects, engineers and myself have seen an unbelievable amount of miniature fluorescent used in displays, computers, lCD backlights and neon power sources with very low mA current markings being marketed as cold cathode components which contradicts UL, CSA, NEC, Article 410, 73 through 410.87 and does not fall into the scope of electric signs or outline lighting in Article 100 Definitions.
To substantiate please review the IESNA 8th edition pages 203, 205, 206, and 307, IESNA 9th edition pages 6-21, 6-26, 6-27, 6-29, 6-30, 6-41, and 6-42 which both describe in depth the definition of cold cathode as the IESNA has described in all of their previous editions since 1948.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: Accepting this proposal would limit Section 410.80 to high mA cathode electric discharge lighting systems and eliminate the listing requirement of any other electric discharge lighting systems over 1000 volts. The panel does not accept restricting the listing requirement of electric discharge lighting over 1000 volts to a single product.
In addition, Part XIV of Article 410 is not intended to address the installation of electric discharge lighting in appliances. The rules in Part XIV provide guidance for safe installations of electric discharge lighting that qualifies based on the limits specified. No safety reason is given for excluding electric discharge lighting systems that operate within the limitations.
The IEC proposal referenced in the substantiation is subject to change. Also, it does not contain a definition for high mA cathode / HMC.
How products are marketed is not valid substantiation to change a safety standard.

Ballot Results: Affirmative: 13

18-100 Log #486 NEC-P18 **Final Action: Accept**
(410.81(B))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read:
(B) Within Sight or Locked Type. The switch or circuit breaker shall be located within sight from the luminaires (fixtures) or lamps, or it shall be permitted elsewhere if it is provided with a means for locking in the open position. <u>The provisions for locking or adding a lock to the disconnecting means must remain in place at the switch or circuit breaker whether the lock is installed or not. Portable means for adding a lock to the switch or circuit breaker shall not be permitted.</u>
Substantiation: This proposed change in wording is to provide consistency between other similar rules in the NEC that also call for disconnecting means to be capable of being locked in the open position. The phrase "capable of being locked in the open position" is used over 25 times in the NEC and the purpose is the same in every instance. Electrical safety rules for the worker should be consistent and the wording and requirements should be consistent where this phrase is used. The last sentence is being proposed because there are claims that some of the portable units available for snapping on to circuit breakers do remain with the switch or circuit breaker after they are installed on the breakers when the lock is not installed, but they are portable. The actions by CMP 11 in the 2002 cycle in 430.102(B) Exception were fairly clear that the provisions for adding a lock should be more substantial and not portable units.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-101 Log #2318 NEC-P18 **Final Action: Reject**
(410.83(C))

Submitter: Jimmie Evanisko, National Cathode Corporation
Recommendation: Revise text to read:
(C) Ratings. Transformers shall have a secondary short-circuit current rating of not more than ~~150 mA~~ (120 mA) if the open-circuit voltage is over 7500 volts, and not more than 300 mA if the open-circuit voltage rating is 7500 volts or less.
Substantiation: Over the past few years and the recent IEC proposal #60958-2-27 34/D 843/CD, the lighting consultants, architects, engineers and myself have seen an unbelievable amount of miniature fluorescent used in displays, computers, LCD backlights and neon power sources with very low mA current markings being marketed as cold cathode components which contradicts UL, CSA, NEC, 410.73 through 410.87 and does not fall into the scope of electric signs or outline lighting in Article 100 Definitions.
To substantiate please review the IESNA 8th edition pages 203, 205, 206, and 307, IESNA 9th edition pages 6-21, 6-26, 6-27, 6-29, 6-30, 6-41, and 6-42 which both describe in depth the definition of cold cathode as the IESNA has described in all of their previous editions since 1948.
Note: Supporting Material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: Part XIV of Article 410 is not intended to address the installation of electric discharge lighting in appliances. The rules in Part XIV provide guidance for safe installations of electric discharge lighting that qualifies based on the limits specified. No safety reason is given for lowering the current rating.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-102 Log #276 NEC-P18 **Final Action: Reject**
(410.85)

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
410.85 Exposure to Damage. Lamps shall not be located where normally exposed to ~~physical~~ damage."
Substantiation: Use of the word "physical" is superfluous.
Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every unnecessary instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on. Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."

Panel Meeting Action: Reject
Panel Statement: The adjective "physical" is clearly understood and its deletion does not improve the readability of the Code. The use of "physical damage" is in accordance with the NEC Style Manual.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-103 Log #584 NEC-P18 **Final Action: Accept in Principle**
(410.101(B))

Submitter: Robert Pittman, Sacramento Engineering Consultants
Recommendation: Add new text to read:
(B) CONNECTED LOAD. The connected load on lighting track shall;
(1) Not exceed the rating of the track. Lighting track shall be supplied by a branch circuit having a rating not more than that of the track.
(2) The branch circuit load shall be calculated base on track fittings used. The track length does not enter into the branch-circuit calculation.
Substantiation: The deletion of the FPN from the 1996 NEC 410-102 has led to the limit of 24 ft of track per circuit based on 150 VA per 2 ft. It needs to be clear in the text of the code that 220.43(B) applies only to Feeder and Service Load Calculations and not to the branch circuit. FPN is not sufficient as this is not an enforceable part of the code. And the Handbook text is even less applicable because most do not see that.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 18-65.

Ballot Results: Affirmative: 13

18-104 Log #275 NEC-P18 **Final Action: Reject**
(410.101(C))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
(1) Where likely to be subjected to ~~physical damage~~ blows and abrasion ...
(8) Less than 1.5 m (5 ft) above the finished floor except where protected from ~~physical damage~~ blows and abrasion.
Substantiation: Use of the word "physical" generally is superfluous – the purpose is obvious. In some instances, one could argue for the use of "mechanical" to differentiate that from e.g., "thermal" damage, but context makes the intended sense quite clear, rendering anything like this completely unnecessary.
Here, though, items (2) and (3), for example, refer to sources of physical damage. The proposed rewording is an attempt at precision. If you don't care to reword, I would argue that the term "physical" should be eliminated. Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. ARTICLE 411 — LIGHTING SYSTEMS OPERATING AT 30 VOLTS OR LESS

18-105 Log #2711 NEC-P18 **Final Action: Accept**
(411.2. Lighting Systems Operating at 30 Vols or Less)

Submitter: Steven D. Holmes, Underwriters Laboratories Inc.
Recommendation: Revise as follows:
411.2 Definitions.
~~Lighting Systems Operating at 30 Volts or Less. A lighting system consisting of an isolating power supply operating at 30 volts 942.4 volts peak) or less under any load condition, with one or more secondary circuits, each limited to 25-amperes maximum, and associated equipment each identified for the use.~~
Lighting Systems Operating at 30 Volts or Less. A lighting system consisting of an isolating power supply, the low voltage luminaires (lighting fixtures), and associated equipment, all identified for the use. The output circuits of the power supply shall each be rated for not more than 25 amperes and operate at 30 volts (42.4 volts peak) or less under all load conditions .
Substantiation: Problem Substantiation 1 - Define lighting system to include luminaires - In abbreviated form for ease of consideration, 411.2 defines a lighting system as, literally,
(a) an isolating power supply (that is) supplying (some) luminaires, and
(b) associated equipment.
The terms in parenthesis above are added to better illustrate that the resent definition does not literally state that the luminaires supplied by the power supply are part of the lighting system. That there are luminaires being supplied by the power supply is only a required condition for the power supply to be part of a lighting system. The revised definition in proposed 411.2 now literally states that the lighting system includes the luminaires. This distinction reinforces that, for example, a listed lighting system must include the luminaires and not just a power supply and associated equipment. Proposed 411.2 is also more clear because the many different items or points described in the long sentence of present 411.2 are regrouped into two sentences, the first identifying the lighting system parts and the second identifying the required characteristics of the power supply.
Problem/Substantiation 2 - "Limited to" versus "rated" 25 amperes - 411.2 states the output of the power supply is to be "limited to 25 amperes maximum". Manufactures, inspection authorities, and other persons referring to 411.2 often form different opinions of what it means to be "limited". Whether or not any circuit is "limited" to a maximum ampere value depends on how being "limited" is determined. No method for determining this is defined in the NEC.
Consider that a 25 ampere branch circuit will supply 26 amperes for several minutes and much more than 26 amperes for some nonzero amount of time. Regardless of how long the circuit supplies an amount of current exceeding 25 amperes, 25 amperes is generally considered both the rating and the limit for the circuit.
The standards for Low Voltage Landscape Lighting Systems, UL1838, and Low Voltage Lighting Systems, UL 2108, provide for the low voltage output circuit of the luminaire power supply to be rated up to and including 25 amperes. Note that the standards specify "rated" rather than "limited to". A hypothetical power supply that is somehow designed to deenergize the output circuit when the output current exceeds 25 amperes for any (hence arbitrarily small) amount of time would need an output circuit rated much lower than 25 amperes to prevent tripping of the overcurrent protection device when operated at full rated load until temperature stabilization.
To address the risks of fire resulting from excess output current, UL 1838 and UL 2108 require the power supply to deenergize the output circuit within one hour when the circuit is loaded at 135 percent of 25 amperes. This load and 1 hour period match the load and one hour period of one of the tests required for a 25 ampere circuit breaker in the standard for Molded Case Circuit breakers, UL 489. It is proposed that 411.2 be revised to require that output circuits be rated not more than 25 amperes (rather than an undefined "limited to"), with the awareness that requiring the low voltage luminaire power supply or the entire lighting system to be listed using the above specified standards inherently requires the power supply to limit the output current as defined in the standards.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-106 Log #2712 NEC-P18 **Final Action: Accept**
(411.3)

TCC Action: The Technical Correlating Committee directs that the Panel reconsider the proposal and add headings to (A) and (B). This action will be considered by the panel as a public comment.
Submitter: Steven D. Holmes, Underwriters Laboratories Inc.
Recommendation: Revise as follows:
411.3 Listing Required. Lighting systems operating at 30 volts or less shall comply with (a) or (b) ~~: be Listed~~ .
(a) Be a listed lighting system
(b) Be a lighting system assembled from the following listed parts:
(1) Low voltage luminaires
(2) Low voltage luminaire power supply
(3) Class 2 power supply
(4) Low voltage luminaire fittings
(5) Cord (secondary circuit) that the luminaires and power supply are listed for use with
(6) Cable, conductors in conduit, or other fixed wiring method for the secondary circuit.
The luminaires, power supply, and luminaire fittings (including the exposed bare conductors) of an exposed bare conductor lighting system shall be listed for use as part of the same identified lighting system.
Substantiation: Problem/Substantiation - Field Assembled Systems - The wording of Section 411.3 regularly leaves the reader concluding that all parts of a lighting system operating must be part of one listed entire lighting system. Lighting systems operating at 30 volts or less have long been field assembled from individually listed low voltage luminaires, listed luminaire power units, listed cord, any any involved listed luminaire fittings.

Installers verify that individually listed lighting system parts (regularly from multiple manufacturers) are intended for the use and have the needed ratings, as indicated in items (a) through (d) below, to create and assemble a low voltage lighting system. This practice has been successful for many years and 411.3 should make clear that this practice is permitted.

a) The voltage rating of the luminaires and luminaire fittings is confirmed to match the output circuit voltage marked on the power unit.

b) The total load connected to each power unit output circuit, determined by adding the wattages of the individual luminaires, is confirmed to not exceed the maximum permitted total wattage marked on the power unit.

c) For landscape lighting systems, the low voltage circuit flexible cord is confirmed to be the type and size specified in the power supply installation instructions for the total connected luminaire load.

d) For other than landscape lighting systems, the low voltage circuit conductors are confirmed to have an ampacity suitable for the total connected load.

Proposed 411.3 provides for both (a) the situation where an entire listing system is packaged and listed as a complete lighting system and (b) the situation where individually listed lighting systems parts are field assembled into a lighting system.

The ability of assembled exposed bare conductor lighting system parts to comply with the performance and other requirements in the Standard for Low Voltage Lighting Systems, UL 2108, always depends on only parts of the same identified lighting system being used together. The last sentence of proposed 411.3 addresses this.

Panel Meeting Action: Accept

Panel Statement: The panel accepts the submitter's concerns and urges the standards and certification agencies to consider it important that the power supply installation instructions specify the type of conductor, size, and length.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

18-107 Log #2713 NEC-P18 **Final Action: Accept in Principle in Part (411.4)**

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 17 for Comment.

Submitter: Steven D. Holmes, Underwriters Laboratories Inc.

Recommendation: Revise as follows:

~~411.4 Locations Not Permitted. lighting systems operating at 30 volts or less shall not be installed in the locations described in 411.4(A) and 411.4(B).~~

~~(A) Where concealed or extended through a building wall unless permitted in (1) or (2);~~

~~(1) Installed using any of the wiring methods specified in Chapter 3.~~

~~(2) Installed using wiring supplied by a listed Class 2 power-source and installed in accordance with 725.52.~~

~~(B) Where installed within 3.0 m (10 ft) of pools, spas, fountains, or similar locations, unless permitted by Article 680.~~

411.4 Specific Location Requirements.

(A) Walls, Floors, and Ceilings. Conductors concealed or extended through a wall, floor, or ceiling shall be in accordance with (1) or (2):

(1) Installed using any of the wiring methods specified in Chapter 3.

(2) Installed using wiring supplied by a listed Class 2 power source and installed in accordance with 725.52.

(B) Pools, Spas, Fountains, and Similar Locations. The power supply shall be protected by a ground-fault circuit interrupter where it, a luminaire, system wiring, or any other system component is located less than 3.0 m (10 ft) horizontally from the inside walls of a pool, spa, fountain or similar location. All system components located less than 1.5 m (5 ft) horizontally from the inside walls shall be at a height of not less than 3.7 m (12 ft) above the maximum water level.

Substantiation: Problem/Substantiation 1 - Opportunity for confusion with "Shall not be...unless" language.

The first sentence of 411.4 and then 411.4(A) leads the reader through the thought process of "lighting systems shall not be X unless they meet Y". Further, the use of the reference to subsection 411.4(A) at the end of the first sentence of 411.4 causes the requirements to be more difficult to follow than necessary and, consequently, more opportunity for confusion. The submitter proposes changing the title and rewording 411.4 to state the requirements of the first sentence of 411.4 and subsection 411.4(A) in the form of "what must be done", rather than involving a "what must not be done" form of thought.

In conjunction with change to a "what must be done" format, the submitter proposes rewording 411.4(B) to fit this format as well.

The submitter also proposes adding titles to 411.4(A) and 411.4(B) to make the applicability of their requirements easier to identify.

Problem/Substantiation 2 - Concealed in Floor and Ceilings - 411.4(A) identifies the installation requirements when the lighting systems are concealed or extended through in a wall. The submitter proposes that reference also be made to the floor and ceiling of a building since the installation requirements that apply to walls must also apply to floors and ceilings. The lack of mention of a floor and ceiling in the requirement might lead some readers to conclude that the requirements of 411.4(A) do not apply to floors and ceilings. The proposal above includes the terms floor and ceiling.

Problem/Substantiation 3 - Conductors versus Luminaires/power Units Not Located in Wall - 411.4(A) addresses installations where "lighting systems" (the subject of the requirement as presented in the first sentence of 411.4) are "concealed or extended through a building wall". Where concealed or extended through a building wall, the installation is required to comply with one of the wiring methods specified in 411.4(A)(1) or 411.4(A)(2). Since the installation specified in 411.4(A)(1) or 411.4(A)(2) can only apply to conductors, and not to luminaires and power units, the submitter proposes specifying that the requirement of 411.4(A) applies to conductors. The submitter also proposes introducing the term "lighting system" to the requirement of 411.4(B) to make more apparent that 411.4(B) applies to the entire lighting system (all parts of it, not just the conductors). The submitter also proposes removing the term "building" since the requirement might be found to apply to walls, floors, or ceilings of another structure.

Problem/Substantiation 4 - Distance of Lighting Systems from Pools, Spas, Fountains, and Similar Locations - 411.4(B) requires low voltage lighting systems to be located not less than 3.0 m (10 ft) from pools, spas, fountains, and similar locations "unless permitted by Article 680." 680.22(B), 680.40, and 680.43(B) identify installation characteristics for luminaires near or above a permanent swimming pool, spa and hot tub. Parts I, III, and IV of Article 680 do not identify the minimum distance between a luminaire and a storable pool or fountain. This results in low voltage lighting systems being required to be installed not less than 3.0 m (10 ft) or more from a storable pool or fountain, as specified in 411.4(B).

People want low voltage landscape lighting systems located less than 3.0 m (10 ft) from a storable pool or fountain and there is no provision for locating the lighting system as near as 1.5 m (5 ft) of a storable pool or fountain like there is for permanent swimming pools and spas. Proposed 411.4(B) provides for this and the following benefits.

a) Conveniently specifies installation characteristics for all of pools, spas, fountains, and similar locations and does not require the reader to locate those requirements that are in Article 680.

b) Provides installation characteristics for system parts for storable pools and fountains and eliminates the need for the reader to attempt to locate in Article 680 the nonexistent requirements for installing nonimmersed luminaires near storable pools and fountains.

c) Clarifies that GFCI protection applies to the power supply of the lighting system and not the luminaries. This eliminates the possibility that a reader of present 411.4(B) will conclude that a GFCI is required in the low voltage isolated system circuit for the low voltage luminaires because Article 680 requires GFCI protection for luminaries.

d) Specifies installation distance, height, and GFCI protection that match or are more stringent than specified in Article 680 for 120 volt luminaires for permanent pools and spas.

Panel Meeting Action: Accept in Principle in Part

First, the panel accepts the changes shown in the proposal to the title of 411.4 and Section 411.4(A).

Secondly, the panel has modified 411.4(B) to read as follows:

(B) Pools, Spas, Fountains, and Similar Locations.

Lighting systems shall be installed a minimum of 3 m (10 ft) horizontally from the nearest edge of the water, unless permitted by Article 680.

Panel Statement: Proposed text of 411.4(B) was not accepted because the proposed requirements are in conflict with the requirements of 680.22(b). The panel does not agree that the proposed language is more strintgent, when in fact it is less.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

Comment on Affirmative:

KEMPEL, K.: This proposal should be ACCEPTED IN PRINCIPLE. We agree with the Panel action except for the rejection of the proposed text of 411.4(B).

The panel concluded the proposed text of 411.4(B) was in conflict with, and less stringent than, the requirements of Section 680.22(B). Regrettably, the panel did not identify in the panel statement which of the multiple requirements that make up 680.22(B) of the 2005 NEC were more stringent than, or in conflict with, the requirements of proposed 411.4(B).

Proposed 411.4(B) required the following:

Power supply GFCI protected if less than 10 ft horizontal from pool

All system components less than 5 ft horizontal shall be minimum 12 ft above water

The following table compares 411.4(B) with each sub-section of 680.22(B):

Subsection and scope of requirement	Key required parameters
Proposed 411.4(B)	GFCI if < 10 ft horiz.
680.22(B)(1) New Outdoor Installation Clearances	12+ ft vert. if < 5 ft horiz.
680.22(B)(2) Indoor Clearances	Same as outdoor unless, for certain luminaires, GFCI and 7+ ft 6+ in vert.
680.22(B)(3) Existing Installations	5+ ft horiz. if GFCI, attached to structure, and 5+ ft vert
680.22(B)(4) GFCI Protection in Adjacent Areas	If 5+ ft to 10 ft horiz, GFCI or (5+ ft vert. and attached to structure)
680.22(B)(5) Cord-and-Plug-Connected Luminaires	If < 16 ft horiz, comply with 680.7 which requires (for cord-and-plug-connected equipment) <3 ft cord, 12+ AWG grounding conductor, and grounding-type attachment plug

The comparison of requirements in the above Table does not support the premise in the Panel Statement that proposed 411.4(B) is in conflict with or less stringent than required by 680.22(B). It does support that the proposed 411.4(B) does not conflict with 680.22(B) and is at least equally rigorous. Therefore it should be concluded that 411.4(B) be accepted and proposal 18-107 accepted in principle.

18-108 Log #871 NEC-P18 **Final Action: Reject**
(411.5(D) (New))

Submitter: Michael J. Timpanaro, Lake County Building Services
Recommendation: Add new text to read:
(D) Circuits for control of landscape lighting limited to not more than 30 volts shall comply with the minimum cover requirements of 300.5. (Table 300.5 Column 5).
Substantiation: It is necessary to provide uniformity between Article 411 and the minimum cover requirements for landscape lighting under 30 volts referenced in Table 300.5 Column 5.
Panel Meeting Action: Reject
Panel Statement: The arrangement of the Code specified in 90.3 makes this reference to 300.5 unnecessary. Section 4.1 of the 2003 Style Manual (available at www.nfpa.org) instructs the panel not to use a reference if 90.3 already covers this requirement.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-109 Log #2715 NEC-P18 **Final Action: Accept in Principle in Part**
(411.5(D) (New))

Submitter: Steven D. Holmes, Underwriters Laboratories Inc.
Recommendation: Revise as follows:
411.5 Secondary Circuits.
(A) Grounding. Secondary circuits shall not be grounded.
(B) Isolation. The secondary circuit shall be insulted from the branch circuit by an isolating transformer.
(C) Bare Conductors. Exposed bare conductors and current-carrying parts shall be permitted for indoor installations only. Bare conductors shall not be installed less than 2.1 m (7 ft) above the finished floor, unless specifically listed for a lower installation height.
<u>(D) Insulated Conductors. Exposed insulated secondary circuit conductors shall be of the type and installed as, described in (1), (2), or (3).</u>
<u>(1) Class 2 cable supplied by a Class 2 power source and installed in accordance with Parts I and III of Article 725.</u>
<u>(2) Conductors, cord or cable of the listed system and installed not less than 2.1 m (7 ft) above the finished floor unless the system is specifically listed for a lower installation height.</u>
<u>(3) Conductors or cable of the type, and installed as, described in Chapter 3.</u>
Substantiation: Problem/Substantiation - Installation Requirements for Exposed Insulated Low Voltage Conductors. Article 411 does not identify the required characteristics of a low voltage lighting system and its installation where insulated conductors, cord, or cable are exposed. This has resulted in confusion on the required characteristics among system manufacturers, installers, and others.
The submitter believes such confusion is likely to continue unless better addressed in the NEC.
The low voltage circuit is permitted to have a voltage rating of up to 30 volts and a current rating of up to 25 amperes. These secondary circuit ratings present a risk of fire that needs to be addressed by characteristics of the lighting system and its installation. To address this risk, the Standard for Low Voltage Lighting Systems, UL2108, requires the exposed insulated low voltage conductors to comply with item (a), (b), or (c).
a) The conductors are supplied by a Class 2 power source.
b) The conductors are supplied by a power supply that includes integral protection against inadvertent shorting and overloading, like is required for the power supplies for exposed bare conductors.
c) The conductors comply with a 1 minute 500 volt dielectric voltage withstand test and are installed not less than 2.1 m (7 ft) above the floor.
In addition to the installation options described in the above three items, an insulated conductor or cable that is permitted to be exposed as described in Chapter 3 of the NEC could also be used for exposed insulated secondary circuit conductors.
To reduce confusion about required characteristics for installations that involve exposed insulated secondary circuit conductors, the submitter proposes adding a new 411.5(D) that identifies the permitted configurations. Items (b) and (c) of the preceding paragraph of this problem/substantiation description are both addressed by item (2) of proposed 411.5(D).
Panel Meeting Action: Accept in Principle in Part
First, The panel accepts (D)(1) and (2). Second, revise 411.5(D)(3) to read as follows:
(3) Wiring methods described in Chapter 3.
Panel Statement: This clarifies that any wiring methods in Chapter 3 can be used as long as it is listed for this type of condition.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-110 Log #3496 NEC-P18 **Final Action: Reject**
(414 (New))

Submitter: Alan Manche, Square D Co.
Recommendation: Add new <u>Article 414 Power-Limited Lighting Systems</u>
Article 414 Power-Limited Lighting Systems
I. General
414.1 Scope. This article covers lighting systems supplied by a power-limited source and the associated wiring and lighting components.
414.2 Definition.
Power-Limited Lighting System. A lighting system consisting of a power-limited supply with one or more secondary circuits supplying luminaires (lighting fixtures) and associated equipment identified for use with the system
Power-Limited Supply. An isolating power supply operating with power limitation characteristics that considers safety from a fire initiation standpoint. Additional safeguards are specified to provide protection from an electric shock hazard.
414.3 Other Articles. The construction and installation of the luminaire(s) shall comply with Article 410. Where the requirements of Article 410 and Article 414 differ, the requirements of Article 414 shall apply.
Lighting systems that operate at 30 volts or less shall be installed in accordance with the requirements of Article 411.
414.5 Secondary Circuits.
(A) Isolation. The secondary circuits shall be insulated from the branch circuit by an isolating power supply.
(B) Bare Conductors. Bare conductors shall not be permitted in the secondary circuits.
414.6 Listing. A power-limited lighting system shall be listed. The power-limited supply shall be identified for use on a power-limited lighting system.
II. Installation
414.20 Wiring Methods
(A) Supply. Conductors and equipment on the supply side of the power-limited supply shall be installed in accordance with Chapters 1 through 4. The power limited supply shall be protected by overcurrent protection not exceeding 20 amperes.
(B) Secondary. Conductors and equipment on the load side of the power-limited supply shall be installed in accordance with (1) or (2).
(1) A Class 1 wiring method meeting the requirements of 725.52(A).
(2) A Class 3 wiring method meeting the requirements of 725.52(B).
414.22 Equipment Location . The power limited supply shall be permitted to be part of the luminaire or separately mounted. Where the power limited supply is separately mounted and intended for direct connection to a wiring system, the power limited supply shall be required to be separately enclosed.
Substantiation: The objective of this proposal is to add a new Article 414 to the NEC to properly address the installation of a power limited lighting system. The concept of this system is not new, however the present NEC rules are not adequate to cover the unique aspects of the system and to fully allow the system to be utilized.
The need for this Article is not unlike the need shown for Article 411 that was introduced in the 1996 NEC.

The proposal combines aspects of Articles 410, 411 and 725 that are needed to address the unique requirements.

The most unique component for this system is the power-limited supply that converts 120 or 277V line power to a lower voltage, higher frequency output to supply fixtures specifically designed for the system. Typical wiring methods between the power supply and the luminaire utilize Class 1 or Class the wiring assemblies.

Information is included that describes the power supply as it exists today. It carries a Class 3 listing, however the energy levels of the Class 3 output are too limiting for the technology employed. Class 3 power supplies have a number of applications outside of lighting, but the power outputs for those systems were established in the early 1970s based on technology available at that time. The power supplies used in these systems can have higher power outputs and still be listed as safe from a fire initiation standpoint (Class 3 objective) because of specific characteristics integrated into the supply for the lighting system. The listing requirements of the power supply would detail the power output requirements based on the limitation of fire initiation.

Lighting systems exists that utilize power-limited supplies enabling the system to utilize a Class 3 wiring method. This article is necessary to provide guidance on which wiring means are permitted, and ensure the lighting system has appropriate construction and installation requirements for the fixtures.

Substantiation follows for the specific sections of the Article:

414.1 – The scope is modeled after the scope of 411 and modified to be specific to power limited systems.

414.2 – The definitions section establishes what a power limited lighting system is and also establishes the baseline requirement of the power limited supply making it clear that the supply must consider safety from a fire initiation standpoint.

414.3 – Applies the requirements of Article 410 to the construction and installation of the luminaire. The objective is to not create any new rules for where or how the luminaires can be installed.

A statement has also been added to make it clear that systems operating at 30V and less need to comply with Article 411.

414.5 – This section establishes the basic requirements for the secondary circuits. The power supply must be isolating and since the system may not inherently limit the electric shock aspect, no bare conductors are permitted.

414.6 – Requires that the system be listed and requires that the power limited supply be identified for use with the system.

414.20 – The branch circuit supply must comply with Chapters 1-4. Secondary wiring could be a Class 1 wiring method as allowed for Class 3 circuits today or, since the system is power limiting with respect to fire initiation, a Class 3 wiring method.

The reference to 725.52(A) for Class 1 is the appropriate reference since it references 725.25 which picks up the circuit separation requirements for Class 1 circuits in 725.26 and the Class 1 conductor and insulation requirements of 725.27.

The reference to 725.52(B) for Class 3 circuits will pick up the 725.82 requirements for listing of the Class 3 cable, the separation requirements for Class 3 circuits specified in 725.54 and the application limitations in 725.61.

414.22 – This section is a parallel to 410.77(B) and will make it clear that the power supply could be integral or remote from the luminaire. As with the ballast requirement in 410.77(B), the power supply would not have to be separately enclosed where it has provisions for direct connection to a branch circuit.

In summary, the new article is very much needed to clear up confusion associated with these systems that use new technology. Present code requirements are not adequate to address the unique requirements of these systems and, in some aspects, are too limiting to allow full application of the technology.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The submitter hasn't offered sufficient technical substantiation to justify exceeding existing wiring methods. The proposed 414.1 Scope does not provide or justify specific current, voltage and frequency limits similar to 411.1. The submitter hasn't provided justification for the necessity of a new article versus using existing code language. The panel would like to see data or fact-finding reports demonstrating the shock and fire ignition safety aspects within the context of the proposed application limits.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

ARTICLE 422 — APPLIANCES

17-1 Log #1528 NEC-P17 **Final Action: Accept in Principle**
(422, 426, 680, and 682)

Submitter: Technical Correlating Committee on National Electrical Code

Recommendation: Revise Articles 422, 426, 680, and 682 as described in the following, relative to the terms bonding and grounding.

422.15(C) Revise 422.15(C) to read as follows:

~~An equipment grounding conductor shall be used where the central vacuum outlet assembly has accessible non–current-carrying metal parts.~~ Accessible non–current-carrying metal parts of the central vacuum outlet assembly shall be connected to an equipment grounding conductor.

426.44 Revise 426.44 to read as follows:

The ferromagnetic envelope shall be ~~grounded~~ connected to an equipment grounding conductor at both ends; and, in addition, it shall be permitted to be ~~grounded~~ connected to an equipment grounding conductor at intermediate points as required by its design.

The provisions of 250.30 shall not apply to the installation of skin-effect heating systems.

FPN: For grounding methods, see Article 250 .

680.55(B) Revise 680.55(B) to read as follows:

(B) Supplied by a Flexible Cord. Electrical equipment that is supplied by a flexible cord shall have all exposed non–current-carrying metal parts grounded by an insulated copper equipment grounding conductor that is an integral part of this cord. The equipment grounding conductor shall be connected to ~~a~~ an equipment grounding terminal in the supply junction box, transformer enclosure, or other enclosure.

680.62(D)(1) Revise 680.62(D)(1) to read as follows:

(D) Grounding.

(1) Fixed or Stationary Equipment. The equipment specified in (D)(1)(a) and (D)(1)(b) shall be ~~grounded~~ connected to the equipment grounding conductor .

680.62(D)(1)(a) Revise 680.62(D)(1)(a) to read as follows:

(a) Location. All electrical equipment located within 1.5 m (5 ft) of the inside wall of the tub shall be ~~grounded~~ connected to the equipment grounding conductor.

680.62(D)(1)(b) Revise 680.62(D)(1)(b) to read as follows:

(b) Circulation System. All electrical equipment associated with the circulating system of the tub shall be ~~grounded~~ connected to the equipment grounding conductor.

682.31(B) Revise 682.31(B) to read as follows:

Where a feeder supplies a remote panelboard, an insulated equipment ~~grounded~~ grounding conductor shall extend from a grounding terminal in the service to a grounding terminal and busbar in the remote panelboard.

Substantiation: 422.15(C): Clarified for the use of the wording "equipment grounding conductor" that accurately describes the intentional connection to ground.

426.44: Using the wording "connected to an equipment grounding conductor" accurately describes the intentional connection to ground.

680.55(B): The wording was changed to specifically describe the insulated grounding connection. The use of equipment grounding conductor accurately describes the intentional connection to ground.

680.62(D)(1): The wording was changed to specifically describe the grounding connection. The use of equipment grounding conductor accurately describes the intentional connection to ground.

680.62(D)(1)(a): The wording was changed to specifically describe the grounding connection. The use of equipment grounding conductor accurately describes the intentional connection to ground.

680.62(D)(1)(b): The wording was changed to specifically describe the grounding connection. The use of equipment grounding conductor accurately describes the intentional connection to ground.

682.31(B): The wording was changed to specifically describe the grounding connection. The use of equipment grounding conductor accurately describes the intentional connection to ground.

This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to the proposed revision to the terms "bonded", "grounded", and "equipment grounding conductor" in Article 100 relative to this Task Group's recommendations. These changes clarify the present requirement in more prescriptive language.

Note: Supporting material is available for review at NFPA Headquarters.

Ballot Results: Affirmative: 14

17-2 Log #1145 NEC-P17 **Final Action: Accept in Principle in Part**
(422.10(A))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Revise first sentence of third paragraph:

The branch-circuit rating for an appliance that is considered a continuous load ~~continuously loaded other than a motor-operated appliance~~ ...(remainder unchanged).

Substantiation: Edit. "Continuously loaded" is not defined whereas "continuous load" is. Present wording exempts the requirement if a motor is associated with a non-motor continuous load.

Panel Meeting Action: Accept in Principle in Part

Revise the first sentence of the third paragraph as follows:

The branch-circuit rating for an appliance that is a continuous load ~~continuously loaded~~ other than a motor-operated appliance...(remainder unchanged).

Panel Statement: The panel agreed with the submitter to comply with Article 100 but removed the word "considered" for clarity.

The panel retained the text "...other than a motor-operated appliance." Motor- operated appliances are not exempted per 422.3. See 430.52(C) for motor- operated appliances on a motor circuit. See 430.42 for motor-operated appliances on a general-purpose branch circuit.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

17-3 Log #1353 NEC-P17 **Final Action: Accept**

(422.10(A))

Submitter: Mike Holt, Mike Holt Enterprises

Recommendation: Revise as follows:

Branch circuits <u>and branch circuit conductors</u> for household <u>ranges and</u> cooking appliances shall be permitted to be in accordance with Table 220.55 <u>, and shall be sized in accordance with 210.19(A)(3)</u> .

Substantiation: The existing wording omits alerting the *Code* user to the important text of 210.19(A)(3), especially to that portion which states that "(for) ranges of 8 3/4 kW or more rating, the minimum branch-circuit rating shall be 40 amperes." This proposal remedies that omission.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

17-4 Log #3217 NEC-P17 **Final Action: Reject**

(422.10(C))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education

Recommendation: Add text to read as follows:

"Recessed Appliances shall be treated as outlet boxes for the purpose of applying 314.20 and 314.21."

Substantiation: Penetrations for these installations appear to compromise a fire barrier similarly. If the purpose of those requirements is solely to contain sources of ignition within outlet boxes, this proposal is inappropriate. However, if they also have the purpose of maintaining the fire rating of a ceiling or wall (or floor), on the grounds that a cover plate is not sufficient to restore the barrier between the room and the inside of the wall or ceiling space, then they should apply as well to bathroom exhaust fans, for example, even though their actual wiring compartments are within internal enclosures. There is no reason to presume that fans' grilles serve to restore the barrier between the room and the inside of the ceiling any better than receptacles' cover plates manage to restore wall integrity.

Panel Meeting Action: Reject

Panel Statement: The requirements for outlet boxes are to contain sources of ignition and enclose live parts. The panel agrees with the submitter that the proposal would then become inappropriate.

The integrity of the fire assembly is the requirement of the building code.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

YASENCHAK, R.: I do believe the submitter has a valid point. In accordance with Article 300 requiring electrical equipment installed in hollow spaces that could cause the spread of fire, or be a product to cause combustion, shall meet the requirements set forth in 300.22(C)(2). This panel should have accepted in principle and inserted language equal to the above stated article. Not all appliances are installed in residential settings, and Article 422 covers ALL occupancies.

17-5 Log #1643 NEC-P17 **Final Action: Reject**

(422.11(F)(1))

Submitter: Francois Tanguay, Pyradia, Inc

Recommendation: Add new text as follows:

<u>Branch circuits and branch circuit protection for all electrical circuits in the furnace heating system shall be provided in accordance with NFPA 70 or with NFPA 79. The requirements for resistance heaters larger than 48 amperes to be broken down into subdivided circuits not to exceed 48 amperes shall not apply to industrial ovens and furnaces.</u>

Substantiation: My problematic comes with the fact that CSA INTERNATIONAL which does our equipment certification for the US market are telling us that all our control panels for our ovens and furnaces shall have branch circuit for resistance heating elements divided in 48 A load, which is impossible to do on many ovens and furnaces. The company I work for, PYRADIA, manufactures industrial ovens and furnaces; some of which have heating power as high as 2.2 MW (2200 kW). It is impossible to design that kind of equipment with subdivided heating load of 48 A.

Certification agencies uses UL 499 Electrical Heating Appliances (at article 17.6) and UL 508A Industrial Control Panels (at 31.6), both of which have branch circuit requirements based on 422.11(F) and 424.22(B) of NFPA 70. In mind they both do not apply to industrial ovens and furnaces. Overcurrent protection for resistance heating elements as per 422.11(F) is for appliances.

NFPA 70 defines appliance as "Utilization equipment, generally other than industrial, that is normally built in standardized sizes or types and is installed or connected as a unit to perform one or more functions such as clothes washing, air conditioning, food mixing, deep frying, and so forth". Which would exclude industrial ovens and furnaces.

Overcurrent protection for resistance heating elements as per article 424.22(B) is for fixed electric space-heating equipment. Which would exclude industrial ovens and furnaces.

670.4(C), which covers Industrial Machinery, does not specify limitation for overcurrent protection.

In NFPA 86 version 2003, Standard for Ovens and Furnaces;

It is written at the article 7-18.1.3 that:

"Branch circuits and branch circuit protection for all electrical circuits in the furnace heating system shall be provided in accordance with NFPA 70, National Electrical Code, and with NFPA 79, Electrical Standard for Industrial Machinery.

Exception: The requirements for resistance heaters larger than 48 amperes to be broken down into subdivided circuits not to exceed 48 amperes shall not apply to industrial ovens and furnaces."

Even though NFPA 86 at article 7.18.1.3 specify that the 48A breakdown is not required for industrial ovens and furnaces, the certification agencies (UL or CSA) do not base their certification of that NFPA code, which is a problem for us. And, it seems UL standards 499 and 508A can only be modified if NFPA 70 is modified to permit that exception.

Panel Meeting Action: Reject

Panel Statement: Increasing the size of the fuse or circuit breaker will result in greater energy let-through and therefore greater potential for damage. The amount of energy that may be generated in a short circuit can be calculated as I 2 t, where I is current and t is time. The proposed elimination of subdivision of heater circuits greatly increases the risk of fire.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

BLEWITT, T.: The Submitter sought relief from 48-ampere subdivision of circuits but failed to specify a limitation. Though the Panel Statement is supported where there is no limitation, 422.11(F)(2) and (3) already provide for 120 ampere subdivision under certain circumstances. Given the intended application and typical protection afforded to heating elements within ovens, dryers and furnaces, 120 A subdivision is appropriate. The Submitter's intent can be satisfied, in part, by a new 422.11(F)(4) as follows:

(4) Industrial Ovens, Dryers and Furnaces. Industrial ovens, dryers and furnaces using unexposed sheathed-type heating elements shall be permitted to be subdivided into circuits not exceeding 120 amperes and protected at not more than 150 amperes where one of the following is met:

(1) Elements are integral with and enclosed within a heating surface.

(2) Elements are completely contained within an enclosure identified as suitable for this use.

(3) Elements are contained within an ASME-rated and stamped vessel.

17-6 Log #2954 NEC-P17 **Final Action: Reject**

(422.12)

Submitter: James J. Rogers, Bay State Inspectional Agency

Recommendation: Rewrite the two exceptions and add the following additional language as follows:

It shall be permissible to connect the following additional loads to the central heating circuit:

1. Auxiliary equipment, such as a pump, valve, humidifier, or electrostatic air cleaner directly associated with the heating equipment.
2. Permanently connected air-conditioning equipment.
3. A single lighting outlet at the heating equipment.
4. Not more than one duplex receptacle for service purposes at the heating equipment.

Substantiation: There are many times where central heating equipment is installed in remote locations. There appears to be no solid technical reason for not allowing a lighting outlet and a service receptacle on this circuit.

Panel Meeting Action: Reject

Panel Statement: The submitter is referred to 210.63 and 217.70(C).

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

17-7 Log #1491 NEC-P17 **Final Action: Reject**

(422.12 Exception No. 1)

Submitter: Thomas E. Purpura, City of Quincy Wire Department

Recommendation: 422.12 Exception No. 1: after the word humidifier, add <u>carbon monoxide detector</u> .

Substantiation: Carbon monoxide detectors are now required in Massachusetts to be installed in the area of a central heating system when some types of heating systems are installed. There have been deaths due to Carbon Monoxide poisoning from central heating systems. When a replacement

heating system is installed, many times it is not practical to connect to other or a dedicated circuit for this detector. Adding this device to a heating circuit would have minimal effect on the circuit and would encourage the use of these detectors for all heating systems thus saving many lives over time.
Panel Meeting Action: Reject
Panel Statement: A carbon monoxide detector is not considered auxilliary equipment to the heating system.
Although the electric power to the furnace is turned off, the risk is still present due to other sources of carbon monoxide.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

17-8 Log #2431 NEC-P17 **Final Action: Reject**
(422.12 Exception No. 1)

Submitter: Robert P. McGann, City of Cambridge
Recommendation: Revise text to read as follows:
Exception No. 1: Auxilary equipment, such as a carbon monoxide detector , a pump, valve, humidifier.
Substantiation: NFPA 720 requires this to be installed on the same circuit.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 17-7.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

17-9 Log #1017 NEC-P17 **Final Action: Reject**
(422.12 Exception No. 2)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:
Except in dwelling units , ~~permanently connected~~ air-conditioning equipment and central heating equipment shall be permitted to be connected to the same branch circuit where means are provided to prevent simultaneous operation .
Substantiation: Even if the parameters for circuit conductors overcurrent protection, etc. could be met, safety and reliability should not permit nonrelated equipment on the same circuit with gas and oil furnaces, especially where older or infirm persons may suffer serious consequences during winter if reliability is compromised by other load, and no requirements to prevent simultaneous operation. If this is to be permitted, there is no reason to exclude cord-connected air conditioners.
Panel Meeting Action: Reject
Panel Statement: Defining a requirement that pertains specifically to dwelling units is beyond the scope of Article 422.1, as this scope pertains to any occupancy.
If an appliance is not permanently connected, there is no means to prevent simultaneous operation.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

17-10 Log #884 NEC-P17 **Final Action: Reject**
(422.12 Exception No. 2, FPN (New))

Submitter: Noel Williams, Noel Williams Consulting
Recommendation: Add FPN following Exception No. 2 as follows:
FPN: For permissible loads on branch circuits see 210.23.
Substantiation: Exception No. 2 in the 2005 NEC was based partly on the heating and AC loads being non-coincident. But non-coincident load rules (220.60) apply to feeders only. Therefore, Exception No. 2 applies only where the BC rating is at least equal to all the load (210.23). The exception and 2005 panel statements imply otherwise.
Panel Meeting Action: Reject
Panel Statement: The submitter did not address what can and what cannot be installed on the branch circuit.
The addition of the FPN would mislead the user to believe that additional undefined loads could be added to the circuit dedicated to central heating equipment.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

17-11 Log #2567 NEC-P17 **Final Action: Reject**
(422.12 Exception No. 3 (New))

Submitter: Joel Ebersole, Coffman Electric Inc.
Recommendation: Add new text as follows:
Exception No. 3: The equipment outlet may be installed on the circuit when labeled for service technician use only not for any other purpose.
Substantiation: When installing/replacing a furnace in an existing home, the panel may be full and there is no room for a new circuit or access to an existing circuit. When the furnace is being serviced it is not in operation at that time.
Panel Meeting Action: Reject
Panel Statement: See panel action statement on Proposal 17-6.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

17-12 Log #885 NEC-P17 **Final Action: Reject**
(422.13)

Submitter: Noel Williams, Noel Williams Consulting
Recommendation: Revise as follows:
"A fixed storage-type water heater that has a capacity of 450L (120 gal) or less shall be considered a continuous load for the purposes of sizing branch circuits ."
Substantiation: This requires the water heater to be considered a continuous load at all stages, including on feeders and services. This change was not substantiated in the 2005 code cycle. This is inconsistent with 220.53, and 424.3 (424.3 applies only to branch circuits and is therefore consistent with 220.51.)
Panel Meeting Action: Reject
Panel Statement: The sizing of branch circuits is already covered by the Code.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

17-12a Log #CP1700 NEC-P17 **Final Action: Accept**
(422.15(C))

Submitter: Code-Making Panel 17,
Recommendation: Revise 422.15(C) to read as follows:
~~An equipment grounding conductor shall be used where the central vacuum outlet assembly has accessible non–current-carrying metal parts.~~
Accessible non–current-carrying metal parts of the central vacuum outlet assembly shall be connected to an equipment grounding conductor.
Substantiation: As Proposal 17-1 pertained to several articles (Articles 422, 426, 680 and 682), the panel chose to separate these into four (4) separate committee proposals to minimize confusion and act on them separately.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

17-13 Log #3563 NEC-P17 **Final Action: Reject**
(422.16(B)(5))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
Submitter: Edward A. Schiff, Technology Research Corp.
Recommendation: Add new text to read:
422.16(B)(5) Room Air Heaters. Single-phase cord-and-plug-connected room air heaters shall be provided with factory-installed LCDI or AFCI protection. The LCDI or AFCI protection shall be an integral part of the attachment plug or be located in the power supply cord within 300 mm (12 in.) of the attachment plug.
Substantiation: Portable electric space heaters have accounted for the highest civilian fire death toll of all home heating devices in 10 of the 14 years studied (1985-1998) according to the U.S. Home Heating Fire Patterns and Trends published in June, 2001 by the NFPA. The risk of fire death for these appliances relative to the number of households using the devices was much higher in 1997 than in 1987. Portable electric space heaters caused an average of 2,800 fires per year from 1994 to 1998 resulting in 95 deaths, 242 injuries and $52.1 million in property damage per year.
Short circuit or ground faults account for 20.7% of the fires and electrical failure other than short circuit account for 10.1% of the fires. Damaged power supply cords account for the majority of these fires.
The space heater's power supply cord can be damaged in a number of ways.
1. Pinched or crimped by furniture or doors
2. Overheated by covering or coiling of the cord
3. Crushed by pedestrian traffic or furniture
4. Improper handling in storage
5. Splicing of the cord
6. Pets or children chewing on the cord
7. Normal aging of the cord

The damage in many of the instances is internal and may not be detectable by inspection. Space heaters, by the nature of the product and application, present a high risk of fire. They are a high current appliance, used around elderly and children (the likely victims of fires), unattended operation, used while people are sleeping, portable, and frequently handled. All of these factors increase the risk of a serious fire.
There are two primary types of cord faults. Series faults (the fault is in series with the load) are partially or completely severed conductors within the cord set. A parallel fault, either line to neutral or a ground fault, is typically caused by degraded insulation. Both of these faults will lead to tracking within the cord set, leakage current, arcing and then combustion.

AFCI protected cord sets sense an arcing fault, at a predetermined level an disconnect power. This technology is being employed in circuit breakers for residential load centers.

LCDI protected cord sets sense leakage current flowing from or between conductors. Leakage current is the precursor to an arcing fault. This technology employs a ground fault sensing circuit as the disconnecting means so it also will prevent ground fault fires within the appliance (beyond the power supply cord) and provide shock protection for the appliance. There are 100,000's of LCDI protected cord sets on heaters. In addition, LCDI protected cords have been employed on extension cords, power strips, and other appliance cords for the past six years.

Adopting this proposal will have a positive economic impact on society. The CDI cord set will add approximately $5.00 to the retail cost of the electric space heater. There are 5 million heaters manufactured each year for a total cost to the consumer of $25 million.

The 2,800 attended portable electric heater fires are responsible for $52.1 million in property damage per year. These fires resulted in 242 serious injuries. The costs associated with the medical treatments, lost work expense, quality of life and pain and suffering, and product liability from these injuries will likely exceed the property damage. The reduction in fire fighting expenses associated with the 2,800 fires per year will also be in the millions. The estimated economic impact of all electric heater fires is well over $100,000,00.00 in annual costs. The cord set is involved in as many as 30% of these fires. Reduction in the cord fires should be able to offset the added cost of the heater.

It is difficult to put a price tag on the loss of life. The fact that most of the victims are children, makes this cost to society even greater. Approximately 10 people each year die from heater cord fires. The ground fault protection provided for the complete appliance will prevent additional fires,electrocutions, and the related costs of property damage and injuries.

Precedent exists for the incorporation of this requirement into the NEC. 440.65 of the 2002 NEC requires AFCI or LCDI protection for room air conditioner power supply cords. Immersion protection for hair dryers, GFCI protection for cord sets of pools, spas and pressure washers have been code requirements for some years.

Power supply cords for space heaters continue to cause residential fires. A proven economical solution exists and should be adopted.

Panel Meeting Action: Accept in Principle

Add new text in Part IV to read as follows:

422.53 Cord-and-Plug-Connected Room Heaters. Single-phase cord-and-plug-connected room heaters shall be provided with factory-installed LCDI, AFCI or other listed protection equal to or exceeding that of an LCDI or AFCI. The protection shall be an integral part of the attachment plug or be located in the power supply cord within 300 mm (12 in.) of the attachment plug.

Panel Statement: Today's developing technologies of protection mitigate against fires and may go beyond only LCDI and AFCI.

This would permit the implementation and development of other technologies in addition to LCDI or AFCI.

The panel has relocated the submitter's proposed text as modified to Part IV.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 6 Negative: 8

Explanation of Negative:

BLEWITT, T.: The Panel attempted to avoid a prescriptive requirement that would preclude alternative approaches. This is supported. However, the text "…or other listed protection equal to or exceeding that of an LCDI or AFCI" is subjective and will open the door to confusion. As proposed, 422.53 does not require the heater, the LCDI or the AFCI to be listed. As written only the alternative protection needs to be listed. Who makes the determination that the alternative protection is equivalent to these other protective devices if the entire assembly is not listed? The listed protective device could be a listed glass fuse. Does that meet the requirement of 422.53? The AHJ is not in any position to evaluate the performance of the protective device as being equivalent to an AFCI or LCDI, nor is he in any position to determine the suitability of the entire assembly. There are no established criteria for "equal to or exceeding" which therefore can result in differing interpretations by the listing organizations. It is better to require that heaters be listed and be provided with features to mitigate the hazards associated with damaged power supply cords and connections.

A UL Standards Technical Panel (STP) Task Group has reviewed available data, current requirements for heaters, flexible cords, wiring devices, and the AFCI / LCDI protective devices. The recommendation of the Task Group to the STP (consensus standards body) is to address cord fires via new performance testing of cords, additional requirements for electrical connections and changes in markings / instructions that would be supported by an educational campaign(s). The intention is to prevent the hazard from occurring as opposed to mitigating it once it has occurred. AFCI and LCDI protective devices would be an acceptable alternative when accompanied by additional requirements that mitigate non-arc fault cord fire risks. Adoption of such requirements in the product standards would facilitate consistency by the listing organizations while retaining the opportunity for technological innovation.

Lastly, the Submitter did not substantiate the need for the devices in heaters intended for commercial applications. The Panel Action would apply to all cord-and-plug-connected room heaters.

CRIPPS, R.: I oppose the panel action on this proposal on the following grounds:

1) The language of the proposal as amended by the panel is inappropriate, and will lead to controversy and confusion when attempts are made to interpret it for practical purposes. LCDI and AFCI devices are not equivalent to each other. They operate on different principles and respond to different fault conditions. It is inappropriate to cite technology not in existence as being "equal to or exceeding..." as that is a judgment to be made by testing and certification. Therefore, the phrase "...protection equal to or exceeding that of an LCDI or AFCI" would be difficult, if not impossible, for code authorities, authorities having jurisdiction or certification organizations to interpret.

2) Code Making Panel 17 has been made aware of the activities of a UL joint task group which is actively developing proposals to improve the protection of power supply cords for electric fans and heaters. Those proposals will address the issues from a fundamental design standpoint, and will aim to prevent from developing the types of fault which AFCI/LCDI devices are intended to detect. The requirement of cord and plug mounted LCDI/AFCI devices should not be imposed on manufacturers until the proposals of the UL standards task group have been incorporated into product standards and their results evaluated through experience. Allowing the UL standards development process to address this issue is a more expeditious and substantive solution.

3) There remain serious technical issues with the overall reliability of LCDI/AFCI devices and their ability to respond dependably to the fault conditions against which they are claimed to protect.

4) The proponents of AFCI/LCDI devices continue to use unsubstantiated and outdated data as justification for their proposals. In particular, they do not take into account a substantial and sustained reduction in overall cord-and-plug initiated fires which have already occurred over the past ten years and has been reported in NFPA statistics. In addition, the proponents ignore other large causes of cord and plug related incidents that should be addressed before those of fans and heaters.

CRIVELL, P.: 1. LCDI/AFCI device would tend to lead to the use of plug strips because the device, would most likely be an integral part of the attachment plug, which could not share a duplex receptacle with another cord-and-plug device which has a transformer or an LCDI/AFCI device.

2. LCDI/AFCI device would have a reliability less than that of a simple attachment plug and if it fails would likely lead to consumer modification of cord (e.g., cutting off LCDI/AFCI device and installation of an after market attachment plug with or without adequate termination, and with or without a ground prong.)

3. Potential for mechanical damage to LCDI/AFCI device if stepped on when plugged into a plug strip on the floor.

EILS, L.: It was stated during the meeting that the power cords attached to room heaters are subject to testing by UL concerning abuse these cords may be subjected to in the normal course of the appliance use. If there are series faults in the cord design, they should be corrected by the manufacturer based on these UL tests or reports in the field of failure. The best place to make a change is by revising the UL standard to require better power cords and/or internal components related to the cord set to prevent a cord from failing because of abuse. This is a more economical and faster approach to resolve a safety issue such as this one.

There was much discussion by the members about the efficacy and use of LCDIs and AFCIs on power cords for this type of appliance. No one could answer the question if one was better than the other since they operate somewhat differently. It appears more work needs to be done on the application of these devices to appliances.

I do not believe the language proposed "equal to or greater than" is appropriate when the devices referred to do not function the same. How will a testing organization decide which device should be held as the standard for a particular test?

I propose this proposal be deleted.

HIRSCH, B.: It is the Edison Electric Institute's position that the requirements for end-use electrical devices that are not installed as part of the permanent premises wiring system are best covered by appropriate product standards. It is not the National Electrical Code's intent or scope to set requirements for end-use electrical devices that would typically be purchased by the after market consumer.

Work done by the Panel 17 Task group on Protective Devices Integral with Electric Appliance Power Supply Cords revealed that there is no one solution that will provide complete protection in all cases. Thus, for the NEC to attempt to legislate a particular protection scheme makes no sense. EEI recognizes that a Joint Task Group on Power Supply Cord Safety, set up by UL and others, is currently in operation. A preliminary report was issued by the task Group in January, 2006 which calls for performance based requirements for electric fans and electric room heaters. This approach allows manufacturers an option of meeting safety criteria in a number of ways. The EEI supports this approach.

The Edison Electric Institute supports the entire electrical safety system that integrates product standards, installation standards, product testing and evaluation, electrical inspection, manufacturer's products, qualified electrical installation and maintenance, electric supply system characteristics, and the owner's use and operation. Covering product standards in the National Electrical Code installation standard could negate the responsibility of the appropriate product standard and adversely impact the entire process.

The integrity of the electrical safety system is anchored in the systematic integration of the National Electrical Code, installation inspection, product safety standards and product testing. If non-premises end-use product safety issues are unsurpassed by the National Electrical Code, the product safety standard process will be weakened resulting in the entire process being weakened. In addition, since non-premises end-use products are not normally in place during the inspection process, enforcement of such a requirement under the NEC would be impossible.

KOESSEL, W.: New Text: Single phase cord and plug connected heaters. Reason being AFCIs and LCDIs do not act in the same way. The question arises as to the validity of these devices. There are concerns with manufacturers and testing laboratories as if this is the way to proceed. Even with the additional wording added by CMP 17 could be confusing to NRTL agencies as what is "equal to or exceeding...".

I feel there are alternate methods that may be more useful.

SARDINA, A.: ARI and AHAM are supportive of the development of new technology to increase safety and particularly of AFCIs as they technology progresses. However, Proposals 17- 13 and 17- 29 fall short of the mark on several accounts. While we believe there are several arguments against this approach, we would like to raise a few at this time.

1. AFCIs and LCDIs are not equal in all aspects. One looks at one aspect of the power cord and another looks at the hazards and functions differently. We find it inappropriate to cite in the NEC technologies which address different aspects of safety.

2. Underwriters Laboratories Standards Development Panels for Standards 507 and 1042/1278 have met concerning this issue and formed a joint task group which has met over the last 14 months to review this situation. This Joint Task Group was composed of manufacturers of LCDIs and AFC's, manufacturers of fans and heaters, UL staff and CPSC staff. The final report of this Task Group has been presented and calls for significant changes to the UL standards for fans and heaters to address the concerns that have been raised. While the recommendations of the Task Group do not prevent the use of AFCIs or LCDIs, they suggest that there are other ways to achieve the increase to safety without relying on AFCIs or LCDIs. ARI and AHAM members support these recommendations and will work to implement these changes to the standards through the appropriate standards development process. I believe ITS has representatives on these ST's and we hope your company will likewise support the adoption of these changes.

3. At the meeting, AHAM raised some serious questions as to the validity of these devices. AHAM prepared a report on the efficacy of LCDI's in 2003 and many of our concerns have still not been addressed. At the January 2006 CMP 17 meeting, AHAM raised still other questions about whether AFCIs will perform adequately when compared to a solution in the UL Joint Task Group report, a simple over-current device. It would appear that it is possible that AFCI's may not function soon enough in a "cut-cord" situation to prevent ignition of the cord set, and may give a false sense of protection.

4. We still have questions whether the NEC is the place to write specific product-related safety requirements. In the case of electrical appliances, we continue to believe that the ANSI/UL standards are a more appropriate venue.

5. The slight wording changes made by the CMP 17, do nothing to improve the situation, and could lead to more confusion, inconsistency and debate.

The Code Making Panel made some slight changes to the wording of the proposals.

"Proposal 17-13, Log 3563, Section 422.15(B)(5) New Text: Single phase cord and plug connected heaters shall be provided with factory installed LCDI, AFCI <u>or other listed protection equal to or exceeding that of an LCDI or AFCI. The protection</u> shall be an integral part of the attachment plug or be located in the power supply cord within 300 mm of the attachment plug."

"Proposal 17-29, Log 3301, Section 422.52. New Text: Single phase cord and plug connected fans shall be provided with factory installed LCDI, AFCI <u>or other listed protection equal to or exceeding that of an LCDI or AFCI. The protection</u> shall be an integral part of the attachment plug or be located in the power supply cord within 300 mm of the attachment plug."

(Underlined section of the proposal is what the Code Panel changed to at the CMP meeting.) We believe such an addition would only cause continuous debate by NRTL agencies as to whether a particular method is "equal to or exceeding…".

SWEIGART, R.: Log 3563, Section 422.16(B)(5) New Text: Single phase cord and plug connected room heaters shall be provided with factory installed LCDI, AFCI, or other listed protection equal to or exceeding that of an LCDI or AFCI. The protection shall be an integral part of the attachment plug or be located in the power supply cord within 300 mm (12 in.) of the attachment plug.

As an example, the NEC's requirement for GFCIs on hair dryers was an attempt to solve a known safety problem where existing homes didn't have GFCIs installed, and were unlikely to retrofit. The NEC was not intended to be a product code. The NEC's intent is to cover the safe installation of fixed wiring and appliance wiring in residences and businesses (commercial and residential).

It should be noted that manufacturers are not prevented from installing AFCIs, LCDIs, or GFCIs on any product. I also believe that the phrase "equal to or exceeding" is ambiguous, and subject to AHJ interpretation.

ANSI/UL product standards are a more appropriate channel to address any fire hazard risks or product safety issues.

17-14 Log #3157 NEC-P17 **Final Action: Reject**
(422.16(A), FPN (New))

Submitter: Wally Harris, Atlantic Inland Inspections
Recommendation: Add FPN as follows in underlined type:
<u>See 210.50(C) for location of Appliance Receptacle Outlets.</u>
Substantiation: This proposed change would help assure that too long of an appliance cord was not used, and would help in assuring that cords supplied with specific appliances are not altered to a longer length than was intended by the manufacturers. This proposed change would also "light the light" to Code users to double check the material referenced in 210.50(C).
Panel Meeting Action: Reject
Panel Statement: The cord lengths in Article 422 are presently established. Acceptance of the proposal would encourage cord length to be increased.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

17-15 Log #256 NEC-P17 **Final Action: Reject**
(422.16(B)(1)(3))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
(3) Receptacles shall be located to avoid ~~physical~~ damage to the flexible cord.
Substantiation: Use of the word "physical" is superfluous - the purpose is obvious.

Submitting proposals removing the adjective "physical" may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every unnecessary instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.

Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."
Panel Meeting Action: Reject
Panel Statement: The panel refers the submitter to the NEC Style Manual, 3.2.5.5.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

17-16 Log #255 NEC-P17 **Final Action: Reject**
(422.16(B)(2))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
(3) Receptacles shall be located to avoid ~~physical~~ damage to the flexible cord.
Substantiation: Use of the word "physical" is superfluous - the purpose is obvious.,

Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. Ballot Results: Affirmative: 14

17-17 Log #1118 NEC-P17 **Final Action: Reject**
(422.16(B)(4)(5))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Delete (5) The receptacle shall be supplied by an individual branch circuit.
Substantiation: Range hoods "permanently connected" (hard wired) do not require an individual circuit. There was no substantiation in Proposal 17-21 in the 2004 ROP for an individual circuit. The definition of Branch Circuit, Appliance permits more than one appliance.
Panel Meeting Action: Reject
Panel Statement: The panel intends to retain this requirement. The requirement is for possible replacement by a microwave oven. The requirement is for a cord-and-plug-connected appliance, and not a hard-wired appliance.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

17-18 Log #1001 NEC-P17 **Final Action: Reject**
(422.16(B)(5))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Delete (5) The receptacle shall be supplied by an individual branch circuit.
Substantiation: Individual branch circuit was seemingly intended to provide for future possible load which 90.1(A) indicates is not a Code function. Permanently connected (hardwired) range hoods do not require an individual circuit.
Panel Meeting Action: Reject
Panel Statement: See panel action statement on Proposal 17-17.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

17-19 Log #2729 NEC-P17 **Final Action: Reject**
(422.16(B)(5))

Submitter: Doug Boggus, City of Grand Prairie
Recommendation: Revise text to read:
422.16(B) Specific Appliances
(5) Water Heaters. Water heaters shall be permitted to be cord-and-plug connected with a flexible cord identified as suitable for use on water heaters in the installation instructions of the appliance manufacturer, where all of the following conditions are met:
(1) The flexible cord is terminated with a grounding-type attachment plug.
(2) The length of the cord is not less than 610 mm (2 ft) and not more than 1.8 m (6 ft).
(3) The receptacle is accessible.
(4) The flexible cord is not subject to physical damage.
(5) The flexible cord has a temperature rating not less than that marked on the appliance nameplate or in the appliance's connection wiring compartment.
(6) The water heater is identified for cord-and-plug connection.
Substantiation: Throughout the US, jurisdictions are constantly approached to allow water heaters to be connected to 120-volt and 240-volt power supply through plug-and-cord connection in violation of 422.16(A) as such appliances are generally not identified for flexible cord connection. The most commonly proposed type cord is "dryer cords" rated at 30-amperes for connections to 30-50 gallon storage type units. This is because of local demand for a quick and safe way to facilitate removal and replacement of such appliances. The proposed wording is intended to set necessary requirements for installations where cord-and-plug connection of a water heater is chosen as the connection wiring method. Such specific requirements will allow cord manufacturers to address this issue with properly rated cord insulation and connections while also allowing manufacturers of water heater appliances to be able to allow a connection method that is favored by both electricians and plumbers making new installations and by plumbers and homeowners replacing such appliances.
Panel Meeting Action: Reject
Panel Statement: The submitter has not substantiated a need for an exception to 400.8(1): "…cords shall not be used…as a substitute for fixed wiring of a structure." The panel notes that water heaters are often installed near other heating equipment or in areas used for storage of tools and other implements that can damage cords. They are infrequently replaced, have no vibration concerns, and can be serviced in place. Cellar installation of water heaters may also necessitate that the cord be plugged into a ceiling receptacle, requiring a cord longer than proposed and increasing the risk of cord damage.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

17-20 Log #3564 NEC-P17 **Final Action: Reject**
(422.16(B)(6)(a) & (b) (New))

Submitter: Edward A. Schiff, Technology Research Corp.
Recommendation: Add new text to read:
422.16(B)(6) Extension Cords for use with Appliances.
(a) Definition: Leakage Current Detection and Interruption (LCDI) Protection. A device provided in a power supply cord or cord set that senses leakage current flowing between or from the cord conductors and interrupts the circuit at a predetermined level of leakage current.
(b) Leakage Current Detection and Interruption (LCDI). Extension Cords for use with appliances shall be provided with factory-installed LCDI protection. The LCDI protection shall be an integral part of the attachment plug or be located in the power supply cord within 300 mm (12 in.) of the attachment plug.
Substantiation: Extension Cord Fire Problem
Faulty or damaged cords or plugs caused an estimated 6,900 attended fires, 91 civilian deaths, 421 civilian injuries, and $115.9 million in direct property damage per year in US homes between 1994 and 1998 according to The US Home Product Report , published January, 2002 by the NFPA. The leading cause of cord and plug fires was short circuits and ground faults (52.3% of fires and 39.2% of deaths). Other electrical failure and overloads account for the majority of the balance.
Electrical cord fires are a leading cause of residential fires in the United States. During the five year period from 1994 to 1998, there were 27,400 cord fires attended by the fire service according to the 1998 Residential Fire Loss Estimates published by the U.S. Consumer Product Safety Commission (CPSC) in 2002. These fires resulted in 350 deaths and 1,680 injuries. Extension cords were responsible for over half of these incidents.
The extension cord fire problem is getting worse. 2002 has been another terrible year for extension cord fires. In January alone, there were seven different fatal extension cord fires in US residences. Additionally, two catastrophic fires have occurred that summer.
1. On August 3, 2002 an overloaded extension cord caused the fire that killed six children (ages 10, 4, 3, 2 and eight month old twins) in Baton Route, LA.
2. On June 11, 2002, an overloaded extension cord melted and set the couch on fire in Silver City, NC killing six family members. The 33 year old mother, daughter 6, two stepsons age 10 and 13, 48 year-old brother, and the children's 41 year-old aunt died of smoke inhalation. The father and their 2 year-old daughter escaped by braking out a rear window.
These two fires accounted for 12 deaths, nine of which were children. The table entitled, "Fire Event Summary Report", highlights the severity of the problem.
Causes of Extension Cord Fires.
Extension cord fires have been and continue to be a major problem. There are many causes of cord fires including overload, overheating, pinching, crimping, crushing, customer misuse, fraying, and aging of the cord. These problems can cause combustion on their own or in conjunction with one another.
Extension cords are easily overloaded by exceeding the typical 13 Amp rating of the cord with multiple loads. Circuit breakers are designed to protect the fixed wiring in a dwelling. Their continuous current rating is typically 15A or 20A. A breaker allows an overload to exist for a period of time depending on its inverse-time trip curve; therefore, they do not provide overload protection for cords. Overloading damages the insulation from the inside (next to the conductor) to the outside of the cord.
Extension cords are frequently overheated. Consumers often run them under carpet or leave them coiled for ascetic reasons. Combustibles such as clothes or newspapers are put onto the cords. These scenarios prevent proper cooling and will overheat the cord. As with the overload condition, the insulation is damaged from the inside out. This damage is irreversible and may not be visible to inspection.
Extension cords can be mechanically damaged. They are frequently pinched or cramped by furniture and doorways. This will result in broken conductors within the cord and can cut or scrape the insulation. Cords may also be crushed by pedestrian traffic or by heavy items (furniture being placed on top of the cord). This damage is also irreversible and not visible to inspection.
Customer misuse comes in a variety of fashions including leaving the cord in pedestrian traffic, stapling of the cord to baseboards, using the cord as a permanent extension of premises wiring, and using the cord around pets or infants who chew cords. This misuse can result in fires caused by broken conductors and degraded insulation.
Finally, extension cords wear out in time resulting in cracked insulation and fraying of the conductors. Unlike the proposed LCDI cords, they will continue to pass current even though they present a major fire, injury and loss of life risk.
This damage described above results in insulation degradation and breaking of the current carrying conductors. The damage is irreversible and may not be visible to inspection. Circuit breakers and fuses are not sensitive enough to detect this damage before combustion can occur. Even the arc fault breakers (AFCIs) require a significant arc over a period of time which may be a fire in progress before detection. AFCIs are only being required on certain branch circuits in new homes, when the majority of electrical fires occur in older homes that do not have this limited protection.

Extension cords are used in high risk applications. Some of the common characteristics of these applications include unattended operation, high current loads, operation while people are sleeping and used around children and elderly people.

There are two primary types of cord faults. Series faults (the fault is in series with the load) are partially or completely severed conductors within the cord set. A parallel fault, either line to neutral or a ground fault is typically caused by degraded insulation. Both of these faults will lead to tracking within the cord set, leakage current, arcing and then combustion.

Over the past two decades, efforts have been made to reduce the number of extension cord fires including increased conductor size, improved labeling, improved materials and education. These efforts have reduced the annual number of extension cord fires by 35 percent since 1980. However, data for the most current years (1996 to 1998) demonstrates a plateau in number of extension cord fires (the same is true for other electrical cords). The fires cited in the table indicate the actual number of fatalities for 2002 will show a significant increase. LCDI protected cords provide the ability to eliminate extension cord fires.

LCDI protected cord sets sense leakage current flowing from or between conductors. Leakage current is the precursor to an arcing fault. This technology employs a ground fault sensing circuit as the disconnecting means so it also will prevent ground fault fires beyond the power supply cord and provide shock protection for the cord. Over the past six years, millions of LCDI protected cords have been field proven on extension cords, power strips, space heaters, and other appliance cords.

An additional benefit to this technology is preventing electrocutions and serious injury from electrical shock. According to the 1998 Electrocutions Associated with Consumer Products , published by the U.S. Consumer Product Safety Commission in July, 2001 there were 12 electrocutions caused by extension cords in 1998. Since the LCDI utilizes a ground fault sensing circuit as the disconnect means, these deaths would also be prevented.

Economic Impact

This improvement in safety will have a positive economic impact on society. The current retail price of an eight foot 120V/13A two wire LCDI protected extension cord is under $9.00. TRC anticipates the retail price will be under $5.00 for this product in large scale production. Unprotected indoor extension cords currently sell for between $1.00 and $7.00 dependent on length, gauge, number of conductors and receptacle type. The added cost borne by the consumer will be minimal.

In 1998, the property damage from the 2,800 attended extension cord fires was $57.5 million. These fires resulted in 170 serious injuries. The costs associated with the medical treatments, lost work expense, quality of life and pain and suffering, and product liability from these injuries will likely exceed the property damage. The reduction in fire fighting expenses associated with the 2,800 fires per year will also be in the millions. The rough estimate of well over $100,00,000.00 in annual costs caused by these fires will offset the majority of the added cost of the cords.

It is difficult to put a price tag on the loss of life. The fact that the most of the victims are children, makes this cost to society even greater. 40 people each year die from extension cord fires. An additional 12 lives are lost from electrocution. The ground fault protection provided down stream of the extension cord will prevent additional fires electrocutions, and the related costs of property damage and injuries.

Incorporation into the NEC

There are many precedents for incorporation of this requirement in the code. 440.63 requires either AFCI or LCDI protected cord sets for room air conditioners. Ground fault protection on the cord sets for pressure washers and portable hot tubs are long standing NEC requirements. Immersion protection for hair dryers has been part of the code for years.

The NEC code panels provides the only complete representation of the electrical community. This includes standards organizations, industry trade associations, insurance industry, electrical inspectors, contractors, and electricians. Safety is the primary reason for the code and clearly this is a critical safety issue.

Conclusion

Today's indoor extension cords are cheap. The U.S. Consumer Product Safety Commission (CPSC) recalls hundreds of thousands of extension cords every year. Undersized conductors and fake UL markings are common reasons. Raising the bar on performance to an LCDI protected cord set should reduce the likelihood of recalls.

A serious safety problem continues to exist. A proven, cost effective solution exists. There are many precedents for incorporation of this safety improvement into the NEC including the new requirement for AFCI or LCDI protected cord fires, injuries and reduce property damage and have a positive economic impact on society. Most importantly, adoption of this proposal will save lives!

This proposal was referred by Panel 6 to Article 240 and Article 210 during the last code cycle. None of the panels felt it was in their domain (the opinion of those panels was this is not an overcurrent device nor part of the branch circuit). From the work on the task force, Panel 17 is uniquely aware of the problem and the solution. The submitter respectfully requests that the panel take action on this proposal.

Panel Meeting Action: Reject

Panel Statement: The submitter's language is unenforceable, in that it cannot be determined that the extension cord will specifically be used for an appliance.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

Comment on Affirmative:

BLEWITT, T.: Extension cords are Listed as "cord sets." The UL Guide covering cord sets (ELBZ) indicates that cord sets are designated as one of the following types and are so identified by the Listing Mark:

- Cord Set
- Outdoor Use Cord Set
- Adapter Cord Set
- Cord Set for Recreational Vehicles
- Shore Power Cable Set

None are identified or Listed as "Extension Cords for use with Appliances." There currently is no means in the safety standards or Code to differentiate between "extension cords for use with appliances" and any other general use cord set.

YASENCHAK, R.: I agree that this type of protective device should be installed, but the submitter did not specify on what and where these cords would be used.

17-21 Log #2732 NEC-P17 **Final Action: Reject**
(422.19)

Submitter: Doug Boggus, City of Grand Prairie

Recommendation: Revise text to read:

422.19 Boxes and Wiring Compartments for Appliances. Boxes or wiring compartments used for a point of junction to an electrical power source, whether separate or furnished as a part of the appliance, shall comply with (1) through (5) where applicable:

(1) Where wire leads are provided by an appliance manufacturer for connection to an electrical power source, at least 150 mm (6 in.) of free conductor, measured from the wall of the box or wiring compartment opposite where the conductors emerge for termination to an electrical power source, shall be provided for splices to either a permanent wiring method or a cord connection.

(2) For either permanent wiring methods or cord connections used to supply the appliance, at least 150 mm (6 in.) of free conductor, measured from the point in the box or wiring compartment where the conductors emerges from its raceway or cable sheath shall be left for splices or for connection to terminals provided as a part of the appliance.

(3) Where the provided opeining in a box or wiring compartment is less than 200 mm (8 in.) in any dimension and where wire leads are provided by the appliance manufacturer for connection to an electrical power source, each conductor shall be long enough to extend at least 75 mm (3 in.) outside the opening.

(4) Boxes and wiring compartments shall be of sufficient size to provide free space for all enclosed conductors. In no case shall the volume of the box or wiring compartment be less than the fill calcuation as calculated in Table 422.19(A). Volumes of standard boxes that are not marked with their volume shall be as given in Table 314.16(A). Other boxes shall be durably and legibly marked with their volume by the box manufacturer, and appliance wiring compartments shall be durably and legibly marked with their volume by the appliance manufacturer.

(5) Conductors shall not be deflected within a box or wiring compartment unless a minimum wire-bending space per Table 422.19(B) is provided.

Table 422.19(A) Volume Allowance Required per Conductor

Size of Conductor (AWG)	mm^2	Free Space Within Box for Each Conductor cm^3	$in.^3$
14 or smaller	2.1	32.8	2.00
12	3.3	36.9	2.25
10	5.3	41.0	2.50
8	8.4	49.2	3.00
6	13.3	81.9	5.00

Table 422.19(B) Minimum Wire-Bending Space within Box or Wiring Compartment

Size of Conductor (AWG)	Wire Bending Space mm	in.
14-10	Not Specified	
8-6	38.1	$1^1/_2$
4-3	50.8	2
2	63.5	$2^1/_2$
1	76.2	3

Substantiation: 314.16 requires boxes and conduit bodies to be of sufficient size to provide free space for all enclosed conductors but is silent on appliance wiring compartments where a general use junction or splice box is not utilized. 300.14 requires at least 6-inches of free conductor, 3-inches past the box opening for boxes less than 8-inches in any dimension, for outlet, junction, and switch points, yet this rule does not seem to be applied to appliances with wire leads and in some cases terminals used for the power connection to the appliances by appliance manufacturers. Also, the physical cubic inches allowed in appliance wiring compartments for both factory lead conductors and field installed connection conductors will in most cases not allow 6-inches of free conductor as required for a non-appliance termination box or wiring compartment. This is especially noticeable in the provided appliance wiring compartments of water heaters and in many dishwashers, trash compactors, and hood vents. The 6-inches of free conductor requirement dates back to the 1937 NEC where in section 3011 it stated that "at least six inches of free conductor shall be left at each outlet and switch point for the making up of joints or the connection of fixtures and devices." 300.14 was revised in the 1999 NEC to clarify how 6-inches of free conductor is measured and to add the requirement that 3-inches past the box opening for boxes less than 8-inches in any dimension with the focus of this clarification and additional language addressing the need to assure adequate connectability, and safe workability on the conductors once the conductors are installed. There should be no differentiation between conductor requirements involving a junction or splice box regardless of its intended purpose. The acceptance of this proposal will assure that boxes and wiring compartments of appliances used to connect supply conductors can be accomplished in a safe manner with the installer being able to make connections without being subjected to the sharp edges of inadequately sized appliance wiring compartments. Companion proposals have also been submitted to Code-Making Panel 9 for 314.16 for the addition of a FPN No. 2 that will state, "For volume requirements for appliance terminal connections, see 422.19." and to 314.28 for the addition of an Exception No. 2 that will state, "Boxes and wiring compartments utilized for the connection of appliances to supply conductors shall comply with 422.19."

Panel Meeting Action: Reject

Panel Statement: The submitter combined requirements in Article 422 that would belong in Articles 300 and 314.

The requirements for boxes and wiring compartments for appliances are adequately addressed by product-specific standards.

The submitter's proposal is new text rather than revised text.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

17-22 Log #128 NEC-P17 **Final Action: Reject**

(422.31(A) and (B))

Submitter: Yakov Fonarev, Allston, MA

Recommendation: Revise as follows:

(A) Rated at Not Over 300 (Should be 100 instead of 300) Volt-Amperes or 1/8 Horsepower. For permanently connected appliance rated at not over 300 (Should be 100 instead of 300) volt-ameperes or 1/8 hp.

(B) Appliances Rated Over 300 (Should be 100 instead of 300) Volt-Amperes or 1/8 Horsepower. For permanently connected appliance rated over 300 (Should be 100 instead of 300) volt-amperes or 1/8 hp.

Substantiation: The problem is 1 hp=800 volt-amperes, so 300 volt-ameperes = 0.375 hp.

Then 1/8 hp = 100 Va.

NEC 1999 and NEC 2002 and Electrician's Exam Preparation Guide Revised by Dale C. Brickner (John E. Traisten) have the same statement.

I would like to have got an answer from you and NEC 2002 for more investigation.

Panel Meeting Action: Reject

Panel Statement: The section is intended for non-motor-rated and motor-rated appliances. The 300 volt-amperes applies to non-motor-rated appliances. 1/8 Horsepower is calculated to be approximately 400 VA full load.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

17-23 Log #1501 NEC-P17 **Final Action: Accept in Part**

(422.33(A) and (B))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Revise last sentence of (A):

Where the separable connector or plug and receptacle are not <u>readily</u> accessible...(remainder unchanged).

In (B), delete "household" or delete (B).

Substantiation: Edit. Cord connectors, receptacles, and plugs cannot be "not accessible" (closed in by the building finish) through they may be not "readily" accessible. There is no apparent reason (B) should be limited to household ranges; subsection (A) appears to be inclusive of commercial ranges.

Panel Meeting Action: Accept in Part

Revise the last sentence of 422.33(A) as follows:

Where the separable connector or plug and receptacle are not <u>readily</u> accessible...(remainder unchanged).

Panel Statement: The panel accepts the first part of the submitter's recommendation.

The panel rejects the change or deletion of 422.33(B) because there are significant differences between household and commercial ranges.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

17-24 Log #2549 NEC-P17 **Final Action: Reject**

(422.34(E))

Submitter: Gary W. Williamson, State of Oklahoma

Recommendation: Add new text as follows:

<u>(E) Commercial Kitchens. All appliances in commercial kitchens shall have an integral disconnecting means that disconnects all ungrounded conductors.</u>

Substantiation: On October 25th, 2005, an electrical journeyman was killed in a new school cafeteria. A disconnecting means was in sight but it's not possible to tell if the circuit breaker was in the off or on position. The journeyman removed the cover of the control panel for a dishwasher and came into contact with a live circuit while installing control wiring. Commercial kitchens are hazardous areas to work. Floors are generally wet and conductive. Stainless Steel tables are wet and block access to disconnecting means mounted on walls. Disconnects are commonly found beneath tables and presents extra hazards when operating. A disconnecting means integral with the equipment served provides a high level of safety for persons who service and maintain electrical equipment.

Panel Meeting Action: Reject

Panel Statement: The requirements of 422.34(D) and 422.35 for the marking of the disconnect are clear.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

17-25 Log #1253 NEC-P17 **Final Action: Reject**

(422.45)

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Delete.

Substantiation: This is impractical and impossible to enforce. These appliances may not be present at time of inspection. Some smoothing appliances are designed to press clothing, curtains, drapes suspended from hangers. After many years in the trade, I have never seen or heard of this being enforced.

Panel Meeting Action: Reject

Panel Statement: This is an important safeguard to guard against fires.

The submitter has not provided adequate substantiation to delete the text.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

HIRSCH, B.: The submitter makes the point that this is impossible to enforce. The EEI agrees with this comment. The EEI also believes this is an appliance requirement and as such does not belong in the code. See my comment for Proposal 17-13.

17-26 Log #478 NEC-P17 **Final Action: Reject**

(422.51)

Submitter: Joseph Rossi, Township of Clinton

Recommendation: Revise the last sentence to read:

Cord-in-Plug-connected vending machines not incorporating integral GFCI protection shall be connected to a GFCI protected outlet.

Substantiation: During a 2005 update class some discussion came up on this article. I asked the question "If in an existing hotel where vending machines are installed, and the hotel moves the vending machine from the 7th floor to the 8th floor, does this now require a GFCI protected outlet?" We spent some time on this and of course we all had different views. Therefore, we either need a fine print note or have this article reworded for better clarification.

Panel Meeting Action: Reject

Panel Statement: The Code requires GFCI protection for such cord-and-plug-connected vending machines.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

EILS, L.: On behalf of the food and beverage industry, NAMA has not seen any compelling evidence the vending machines now in operation need GFCI protection. When NAMA received information from the Consumer Product Safety Commission on electrocutions caused by machines that had their power cords abused, NAMA alerted its members to inspect all their machines to assure all power cords were intact. To the best of our knowledge, there have been no new incidents of electrocutions from vending machines.

You also need to know that vending operators do not have control of the receptacles where machines are placed. Operators are invited to provide a service for the employees of our client. A simple installation now becomes a complicated situation that will cause unnecessary expense when the safety of the operator's clients has already been ensured.

We recommend the sentence "Cord-and-plug connected vending machines not incorporating integral GFCI protection shall be connected to a GFCI protected outlet" be deleted from 422.51.

17-27 Log #1739 NEC-P17 **Final Action: Accept in Part**

(422.51)

Submitter: Daniel Cuddy, Inspectional Service, Town of Methuen, MA

Recommendation: Revise the section and add a definition for the term "vending machine" as follows:

422.51 Cord- and Plug-Connected Vending Machines. <u>A</u> cord- and plug-connected vending machine <u>served by a 15- or 20-ampere, 120-volt branch circuit and</u> manufactured on or after January 1, 2005 shall include...

<u>For the purposes of this section, the term vending machine is defined as a coin-operated machine for dispensing merchandise.</u>

Substantiation: The Ampere/Voltage rating needs to be addressed as there are coin-operated 30 A, 250V electric clothes dryers that, possibly were not intended to be included. The definition is needed to distinguish that you put a coin into the slot and you receive merchandise or a product. Many cord-connected coin-operated machines do not vend merchandise or a product, instead they offer a service such as clothes washers, clothes dryers, ATM machines, ice machines (no coin needed), slot machines (some are cord-and plug-connected; of course, you get nothing back). The intent of this proposal is to give the Code-Making Panel some thoughts toward clarifying this section for 2008.

Panel Meeting Action: Accept in Part

Revise 422.51 to read as follows:

Cord-and-plug-connected vending machines, manufactured or re-manufactured on or after January 1, 2005, shall include a ground-fault-circuit-interrupter as an integral part of the attachment plug or located within 300 mm (12 in) of the attachment plug. Older vending machines manufactured or remanufactured prior to January 1, 2005, shall be connected to a GFCI-protected outlet. For the purpose of this section, the term "vending machine" means any self-service device that dispenses products or merchandise without the necessity of replenishing the device between each vending operation and designed to require insertion of a coin, paper currency, token, card, key, or receipt of payment by other means.

Add FPN to read as follows:

FPN: For further information, see ANSI/UL 541-2005, Standard for Refrigerated Vending Machines, or ANSI/UL 751-2005, Standard for Vending Machines.

Panel Statement: The panel rejects the deletion of re-manufactured vending machines as well as the branch circuit limitations. There is no substantiation for not providing the same level of safety for vending machines that are on branch circuits of greater than 20 amperes or 120 v.

The panel accepts the submitter's statement defining vending machines as modified.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

17-28 Log #506 NEC-P17 **Final Action: Reject**

(422.52)

Submitter: Jessica King, Oswego County Boces

Recommendation: Water fountains should be GFCI protected by code.

Substantiation: This is to ensure the safety of individuals who drink or even touch the water/drinking fountains. If the fountain is metal, an individual will get shocked when they come in contact with the button, if they don't get shocked by the side for a certain reason and there is a bad connection, they will get shocked from the electricity flowing through the water.

Panel Meeting Action: Reject

Panel Statement: The submitter did not provide a recommendation for consideration in accordance with the Regulations Governing Committee Projects, Section 4-3.3(c).

The submitter is encouraged to review and resubmit for the ROC with specific proposed text.

A definition for a "water fountain" would be in order.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

Comment on Affirmative:

YASENCHAK, R.: We agree with the submitter and believe their intent could be met with the following text:

"Drinking fountains should be GFCI protected by code."

17-29 Log #3301 NEC-P17 **Final Action: Reject**

(422.52)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.

Submitter: Aaron B. Chase, Leviton Mfg. Co. Inc.

Recommendation: Add text to read as follows:

422.52 Cord-and-Plug-Connected Electric Fans. All single-phase cord-and plug-connected electric fans shall be provided with factory-installed LCDI or AFCI protection. The LCDI or AFCI protection shall be an integral part of the attachment plug or be located in the power supply cord within 300 mm (12 in.) of the attachment plug.

Substantiation: Electric fans were responsible for 2,600 fires attended by the Fire Services in 1998 according to the 1998 Residential Fire Loss Estimates published by the U.S. Consumer Product Safety Commission (CPSC) in 2002. These fires resulted in 10 deaths, 120 civilian injuries and $35.9 million in property damage. This is the highest number of electric fan fires over the past five years. The CPSC conducted 243 in-depth incident investigations from 1990 to 2001. Sixty-three of these fires (26 percent) involved cord failures.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle

Add new text in Part IV to read as follows:

422.52 Cord-and-Plug-Connected Electric Fans. Single-phase cord-and plug-connected electric fans shall be provided with factory-installed LCDI, AFCI, or other listed protection equal to or exceeding that of an LCDI or AFCI. The protection shall be an integral part of the attachment plug or be located in the power supply cord within 300 mm (12 in.) of the attachment plug.

Panel Statement: Today's developing technologies of protection mitigate against fires and may go beyond only LCDI and AFCI. This would permit the implementation and development of other technologies in addition to LCDI or AFCI.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 6 Negative: 8

Explanation of Negative:

BLEWITT, T.: The Panel attempted to avoid a prescriptive requirement that would preclude alternative approaches. This is supported. However, the text "…or other listed protection equal to or exceeding that of an LCDI or AFCI" is subjective and will open the door to confusion. As proposed, 422.52 does not require the fan, the LCDI or the AFCI to be listed. As written only the alternative protection needs to be listed. Who makes the determination that the alternative protection is equivalent to these other protective devices if the entire assembly is not listed? The listed protective device could be a listed glass fuse. Does that meet the requirement of 422.52? The AHJ is not in any position to evaluate the performance of the protective device as being equivalent to an AFCI or LCDI, nor is he in any position to determine the suitability of the entire assembly. There are no established criteria for "equal to or exceeding" which therefore can result in differing interpretations by the listing organizations. It is better to require that fans be listed and be provided with features to mitigate the hazards associated with damaged power supply cords and connections.

A UL Standards Technical Panel (STP) Task Group has reviewed available data, current requirements for fans, flexible cords, wiring devices, and the AFCI / LCDI protective devices. The recommendation of the Task Group to the STP (consensus standards body) is to address cord fires via new performance testing of cords, required overcurrent protection at or near the attachment plug, and changes in markings / instructions that would be supported by an educational campaign(s). The intention is to prevent the hazard from occurring as opposed to mitigating it once it has occurred. AFCI and LCDI protective devices would be an acceptable alternative when accompanied by additional requirements that mitigate non-arc fault cord fire risks. Adoption of such requirements in the product standard would facilitate consistency by the listing organizations while retaining the opportunity for technological innovation. Lastly, the Submitter did not substantiate a need for such devices in commercial or rangehood applications, both of which are Listed as "fans." The Panel Action would apply to all cord-and-plug-connected fans.

CRIPPS, R.: See my comment on Proposal 17-13.

CRIVELL, P.: 1. LCDI/AFCI device would tend to lead to the use of plug strips because the device, would most likely be an integral part of the attachment plug, which could not share a duplex receptacle with another cord-and-plug device which has a transformer or an LCDI/AFCI device.

2. LCDI/AFCI device would have a reliability less than that of a simple attachment plug and if it fails would likely lead to consumer modification of cord (e.g., cutting off LCDI/AFCI device and installation of an after market attachment plug with or without adequate termination, and with or without a ground prong.)

3. Potential for mechanical damage to LCDI/AFCI device if stepped on when plugged into a plug strip on the floor.

EILS, L.: It was stated during the meeting that the power cords attached to cord-and-plug-connected electric fans are subject to testing by UL concerning abuse these cords may be subjected to in the normal course of the appliance use. If there are series faults in the cord design, they should be corrected by the manufacturer based on these UL tests or reports in the field of failure. The best place to make a change is by revising the UL standard to require better power cords and/or internal components related to the cord set to prevent a cord from failing because of abuse. This is a more economical and faster approach to resolve a safety issue such as this one.

There was much discussion by the members about the efficacy and use of LCDIs and AFCIs on power cords for this type of appliance. No one could answer the question if one was better than the other since they operate somewhat differently. It appears more work needs to be done on the application of these devices to appliances.

I do not believe the language proposed "equal to or greater than" is appropriate when the devices referred to do not function the same. How will a testing organization decide which device should be held as the standard for a particular test?

I propose this proposal be deleted.

HIRSCH, B.: See my explanation of negative vote on Proposal 17-13.

KOESSEL, W.: Reason being AFCIs and LCDIs do not act in the same way. The question arises as to the validity of these devices. There are concerns with manufacturers and testing laboratories as if this is the way to proceed. Even with the additional wording added by CMP 17, could be confusing to NRTL agencies as what is "equal to or exceeding...".
Especially when you get into fractional horsepower fans such as range hoods with fans. I feel there are alternate methods that may be more useful.

SARDINA, A.: ARI and AHAM are supportive of the development of new technology to increase safety and particularly of AFCIs as they technology progresses. However, Proposals 17- 13 and 17- 29 fall short of the mark on several accounts. While we believe there are several arguments against this approach, we would like to raise a few at this time.

1. AFCIs and LCDIs are not equal in all aspects. One looks at one aspect of the power cord and another looks at the hazards and functions differently. We find it inappropriate to cite in the NEC technologies which address different aspects of safety.

2. Underwriters Laboratories Standards Development Panels for Standards 507 and 1042/1278 have met concerning this issue and formed a joint task group which has met over the last 14 months to review this situation. This Joint Task Group was composed of manufacturers of LCDIs and AFC's, manufacturers of fans and heaters, UL staff and CPSC staff. The final report of this Task Group has been presented and calls for significant changes to the UL standards for fans and heaters to address the concerns that have been raised. While the recommendations of the Task Group do not prevent the use of AFCIs or LCDIs, they suggest that there are other ways to achieve the increase to safety without relying on AFCIs or LCDIs. ARI and AHAM members support these recommendations and will work to implement these changes to the standards through the appropriate standards development process. I believe ITS has representatives on these ST's and we hope your company will likewise support the adoption of these changes.

3. At the meeting, AHAM raised some serious questions as to the validity of these devices. AHAM prepared a report on the efficacy of LCDI's in 2003 and many of our concerns have still not been addressed. At the January 2006 CMP 17 meeting, AHAM raised still other questions about whether AFCIs will perform adequately when compared to a solution in the UL Joint Task Group report, a simple over-current device. It would appear that it is possible that AFCI's may not function soon enough in a "cut-cord" situation to prevent ignition of the cord set, and may give a false sense of protection.

4. We still have questions whether the NEC is the place to write specific product-related safety requirements. In the case of electrical appliances, we continue to believe that the ANSI/UL standards are a more appropriate venue.

5. The slight wording changes made by the CMP 17, do nothing to improve the situation, and could lead to more confusion, inconsistency and debate.

The Code Making Panel made some slight changes to the wording of the proposals.

"Proposal 17-13, Log 3563, Section 422.15(B)(5) New Text: Single phase cord and plug connected heaters shall be provided with factory installed LCDI, AFCI <u>or other listed protection equal to or exceeding that of an LCDI or AFCI. The protection</u> shall be an integral part of the attachment plug or be located in the power supply cord within 300 mm of the attachment plug."

"Proposal 17-29, Log 3301, Section 422.52. New Text: Single phase cord and plug connected fans shall be provided with factory installed LCDI, AFCI <u>or other listed protection equal to or exceeding that of an LCDI or AFCI. The protection</u> shall be an integral part of the attachment plug or be located in the power supply cord within 300 mm of the attachment plug."

(Underlined section of the proposal is what the Code Panel changed to at the CMP meeting.) We believe such an addition would only cause continuous debate by NRTL agencies as to whether a particular method is "equal to or exceeding…".

SWEIGART, R.: Log 3301, Section 422.52 New Text: Single phase cord and plug connected electric fans shall be provided with factory installed LCDI or AFCI protection. The LCDI or AFCI protection shall be an integral part of the attachment plug or be located in the power supply cord within 300 mm (12 in.) of the attachment plug.

As an example, the NEC's requirement for GFCIs on hair dryers was an attempt to solve a known safety problem where existing homes didn't have GFCIs installed, and were unlikely to retrofit. The NEC was not intended to be a product code. The NEC's intent is to cover the safe installation of fixed wiring and appliance wiring in residences and businesses (commercial and residential).

It should be noted that manufacturers are not prevented from installing AFCIs, LCDIs, or GFCIs on any product. I also believe that the phrase "equal to or exceeding" is ambiguous, and subject to AHJ interpretation.

ANSI/UL product standards are a more appropriate channel to address any fire hazard risks or product safety issues.

ARTICLE 424 — FIXED ELECTRIC SPACE-HEATING EQUIPMENT

17-30 Log #258 NEC-P17 **Final Action: Reject**
(424.12(A))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:

Where subject to ~~physical~~ damage, fixed electric space-heating equipment shall be protected in an approved manner.

Substantiation: Use of the word "physical" is superfluous - the purpose is obvious.,

Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every unnecessary instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.

Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."

Panel Meeting Action: Reject
Panel Statement: The panel refers the submitter to the NEC Style Manual, 3.2.5.5.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-31 Log #388 NEC-P17 **Final Action: Accept in Principle**
(424.19)

Submitter: Bryan P. Holland, Holland Electric
Recommendation: Add to the end of 424.19 Disconnecting Means: <u>The disconnecting means specified in 424.19(A) and 424.19(B) shall have an ampere rating not less than 115 percent of the total load of the motors and the heaters.</u>
Substantiation: There is no specification in Article 424 on the rating of the disconnecting means for fixed electric space-heating equipment. This change would be consistent with disconnect ratings in other similar articles such as motors and air conditioning and refrigeration equipment.
Panel Meeting Action: Accept in Principle
Add to the end of 424.19 as follows:

<u>The disconnecting means specified in 424.19(A) and 424.19(B) shall have an ampere rating not less than 125 percent of the total load of the motors and the heaters.</u>

Panel Statement: The disconnect must be rated at least equal to the rating of the branch circuit overcurrent device.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-32 Log #958 NEC-P17 **Final Action: Reject**
(424.19)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:

~~Means~~ <u>A switch or circuit breaker that simultaneously disconnects all ungrounded conductors of the circuit</u> shall be provided to disconnect the heater(s), motor(s), controller(s), and supplementary overcurrent device(s) ~~from all ungrounded conductors~~ . In (A)(1) and (2) delete the second word "above."

Substantiation: Edit. No specific type of disconnect is indicated. Lugs, terminals, wire connectors, etc. are means of disconnecting. The word "above" can be perceived as referring to the immediate preceding paragraph or all preceding paragraphs.
Panel Meeting Action: Reject
Panel Statement: The disconnecting means can be other than a switch or circuit breaker. Specific means via reference to other articles and their respective permitted disconnect types are indicated in the remainder of 424.19.

Article 424, in general, and 424.19(A)(2) specifically, indicate disconnects for motor controllers from Article 430. These are not limited to switches and circuit breakers.

Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-33 Log #2036 NEC-P17 **Final Action: Accept**
(424.19)

Submitter: James T. Dollard, Jr., IBEW Local 98
Recommendation: Revise text to read as follows:

424.19 Disconnecting Means

Means shall be provided to disconnect the heater, motor controller(s), and supplementary overcurrent protective device(s) of all fixed electric space-heating equipment from all ungrounded conductors. Where heating equipment is supplied by more than one source, the disconnecting means shall be grouped and marked. <u>The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed.</u>

Substantiation: The problem with the present wording of this section is that the disconnect in many Fixed Electric Space-Heating Equipment applications is a circuit breaker in a panelboard or a switch that is not made with permanent provisions for locking the circuit breaker or switch in the open position.

This requirement for a disconnect is for the safety of the installer/maintainer of the equipment. Permanent provisions for making circuit breakers and switches capable of being locked in the open position are readily available from circuit breaker and switch manufacturers.

This proposal does not represent a large increase in the cost of an installation but will result in a dramatic increase in safety.

Where Fixed Electric Space-Heating Equipment is involved we know that maintenance will take place, we must ensure that only a lock is needed by an installer/maintainer to work safely.

The practical safeguarding of persons from electrical hazards as detailed in the scope of the NEC must not be permitted to hinge on whether or not an installer just happens to have enough different types of devices and hopefully one that that happens to fit the circuit breaker or switch in an installation.

Note that this language was accepted by CMP-11 and is a present requirement, in the 2002 NEC, when a circuit breaker or switch is used as a disconnecting means not within sight of a motor. Also included in the 2005 NEC is the same language in 422.31 for appliances

The same level of safety is needed for these disconnecting means for Fixed Electric Space-Heating Equipment.

Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-34 Log #2056 NEC-P17 **Final Action: Reject**
(424.44)

Submitter: William Carter, Easy Heat, Inc.
Recommendation: Revise text to read as follows:

424.44 Installation of Cables in Concrete or Poured Masonry Floors

~~(G) Ground Fault Circuit Interrupter Protection~~

~~Ground fault circuit interrupter protection for personnel shall be provided for cables installed in electrically heated floors of bathrooms and in hydromassage bathtub locations.~~

(G) Ground Fault Equipment Protection Circuit Interruption. Ground fault equipment protection circuit interrupter shall be provided for cables in all electrically heated floors.

Substantiation: 1. The existing requirement for ground fault circuit protection (GFCI) for personnel should be changed to ground fault equipment protection circuit interruption for the following reasons:

a. Heating cables protected by GFCIs have resulted in field complaints of nuisance tripping - i.e. where no fault exists but the GFCI trips due to natural leakage current of the cables and noise on the power lines. This nuisance tripping often result in users bypassing the GFCI protection, usually leaving them with no protection whatsoever.

Heating cables typically have much higher normal leakage than other heating appliances due to the length of cable involved in applications. Often, 400 ft of cable or more can be required for even bathroom areas, and, when the cable is operating at normal temperature, this results in leakage current of several milliamps, often very close to the trip threshold of a GFCI. Minor disturbances on the power line, such as another household appliance starting up, can then momentarily cause the leakage current to appear to increase above the GFCI trip level, thereby de-energizing the floor heating cables when no fault exists.

b. Heating cables are buried in concrete and are not in direct contact with persons. Even the potential for water coming in contact with the cables is a remote possibility, and, in the event of a breach in the cable insulation AND a breach in the grounding path, is certain to trip a ground fault equipment protection circuit interrupter.

c. Heating cables for snow melting applications require only GFEPCI protection. This protection ensures that faults in these cables are detected and the cables de-energized. Heating cables in snow melting applications expose persons to the virtual same risk as floor heating cables, and arguably, likely even more due to the routine presence of moisture on these cables.

Panel Meeting Action: Reject
Panel Statement: This proposal attempts to substitute GFPE for equipment vs. GFCI for personnel.

The panel rejects the substantiation for the submitter's items b. and c.

Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-35 Log #2058 NEC-P17 **Final Action: Reject**
(424.44)

Submitter: William Carter, Easy Heat, Inc.
Recommendation: Add text to read as follows:

424.44 Installation of Cables in Concrete or Poured Masonry Floors

(C) Secured in Place. Cables shall be secured in place by nonmetallic frames or spreaders or other approved means while the concrete or other finish is applied. Frames or spreaders may be metallic if the heating cable is protected by either ground fault equipment protection circuit interrupter (GFEPCI) or ground fault circuit interrupter (GFCI) or approved equivalent.

Cables shall not be installed where they bridge expansion joints unless protected from expansion and contraction.

(D) Spacings Between Heating Cable and Metal Embedded in the Floor. Spacings shall be maintained between the heating cable and metal embedded in the floor, unless the cable is a Listed grounded metal-clad or is protected by either ground fault equipment protection circuit interrupter (GFEPCI) or ground fault circuit interrupter (GFCI) or approved equivalent.

Substantiation: I. The requirement for nonmetallic frames or spreaders is not necessary if ground fault protection is provided for the cable as proposed for 424.44(G). Any fault that develops in the cable will be sensed by the GFEPCI or GFCI and it will de-engerize the circuit.

II. There has been some confusion regarding the term "metal-clad" cable; by adding the "Listed" requirement, this ensures it qualifies with the agency requirements for metal-clad cable.

III. The requirement for spacings between heating cable and metal embedded in the floor is not necessary if ground fault protection is provided for the cable as proposed for 424.44(G). Any fault that develops in the cable will be sensed by the GFEPCI or GFCI and it will de-energize the circuit.

Panel Meeting Action: Reject
Panel Statement: This proposal attempts to substitute GFPE for equipment vs. GFCI for personnel.

The panel rejects the substantiation for item III.

Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-36 Log #2112 NEC-P17 **Final Action: Reject**
(424.44)

Submitter: William Carter, Easy Heat, Inc.
Recommendation: Add the following text as a preamble:

The provisions of 424.44(A) through (G) shall apply to Listed cables embedded in concrete or poured masonry floors; additionally, tile or wood floor finishing may be set on top of these. Cables may be laid directly on wood sub-floors but must be covered with concrete or mortar or other approved material and must be at least 1/4 in. below the finished surface of the concrete, tile, wood or poured masonry floor. Other flooring materials may be placed on top of these floors, but these are not considered herein.

Substantiation: I. The term Listed ensures that heating cables have the appropriate agency approval.

II. Tile and wood are common flooring materials that floor heating cables are now being installed under, so it is reasonable to expand the scope of this section to include requirements for these materials.

III. Wood subfloors are commonly used as the base for heating cables, with the cables covered with mortar and then ceramic tile or wood type floor covering laid on top. Addressing this directly in the code provides a "vehicle" for ensuring that such installations are safely constructed.

IV. The requirement for a minimum coverage of mortar, tile, etc. ensures that cables are adequately protected from mechanical abuse that would result if they are flush with the floor surface.

V. The reference to "other flooring materials" reinforces that the "floor" is to be considered as the concrete, tile, wood or poured masonry ONLY and that other flooring materials laid on top of this floor, while permissible, are not considered in this section.

Panel Meeting Action: Reject
Panel Statement: This Code is not intended as a design specification or an instruction manual for untrained persons. The panel refers the submitter to 90.1(C).

Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-37 Log #2020 NEC-P17 **Final Action: Reject**
(424.44(G))

Submitter: Russell Childs, Heatizen System
Recommendation: First Example:

424.44(G) Ground-Fault Circuit-Interrupter Protection

Ground-fault circuit-interrupter protection for personnel shall be provided for cables installed in electrically heated floors of bathrooms and in hydromassage bathtub locations.

Exception: Ground-Fault Circuit-Interrupter Protection. Ground-fault circuit-interrupter protection is not required for cable installed in electrically heated floor for bathroom and in hydromassage bathtub location where the cables are part of a Listed system which includes powering the cables from the secondary of an isolation transformer where the transformer is provided with a grounded metal barrier between the primary and secondary.

Example 2:

424.44(G) Ground-Fault Circuit-Interrupter Protection.

Ground-fault circuit- interrupter protection for personnel shall be provided for cables <u>supplied directly by a branch circuit</u> and installed in electrically heated floors of bathrooms and in hydromassage bathtub locations.

Example 3:

424.44(G) Ground-fault circuit- interrupter protection for personnel shall be provided for cables installed as part of electrically heated floors of bathrooms and in hydormassage bathtub locations. <u>Listed Equipment provided with an isolation transformer including a grounded shield between primary and secondary windings does not need to be additionally protected by Ground-fault Circuit interrupter protection.</u>

Substantiation: The need to provide GFCI protection on the secondary of an isolation transformer does not serve the purpose intended. First, when a GFCI is placed on the secondary of an isolation transformer there is no reference to ground and a ground fault would not trip a GFCI as there is no current to ground. Secondly, the systems in question are heater systems rated 120V for connection to a normal branch circuit, but the heater cables are connected to the secondary of an isolation transformer that includes a grounded shield between primary and secondary. These products are Listed by a NRTL as a complete product in compliance with UL standard. Having a GFCI inserted into the circuitry between the secondary of the transformer and the heater leads is modifying a listed product which should not be done in the field.

The transformer in use in these products have an isolated ungrounded secondary winding that has a grounded metal barrier between the primary and secondary and are the same construction as permitted for the lighting for swimming pools and spas in Section 680.25 of the 2005 NEC.

Panel Meeting Action: Reject
Panel Statement: The submitter did not provide a specific recommendation for consideration in accordance with the Regulations Governing Committee Projects, Section 4-3.3(c).
The submitter is encouraged to review and resubmit for the ROC with specific proposed text.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-38 Log #1252 NEC-P17 **Final Action: Accept**
(424.85)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Delete: "...in accordance with Article 250".
Substantiation: To conform to the Style Manual. Article 250 already applies per 90.3.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

17-39 Log #2057 NEC-P17 **Final Action: Reject**
(424.90)

Submitter: William Carter, Easy Heat, Inc.
Recommendation: Add text to read as follows:
424.90 Scope. The provisions of Part IX of this article shall apply to radiant heating panels and heating panel sets. This section shall not apply to cables, or cables provided in a fixed form, embedded in mortar/concrete and installed in floors according to 424.44.
Substantiation: There has been confusion in the field between sections V Electric Space Heating Cables 424.44 (Installation of Cables in Concrete or Poured Masonry Floors) and IX Electric Radiant Heating Panels and Heating Panel Sets 424.90. By adding the sentence excluding cables installed according to 424.44, confusion will be alleviated.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree with the submitter's recommendation for "cables provided in fixed form". Cables provided in fixed form are covered by 424.90.
The proposal would change the scope of the article.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13
Comment on Affirmative:
BLEWITT, T.: The Submitter is correct that there has been confusion in the field regarding heating panel sets incorporating heating cable. Although the Panel Action and Statement are affirmed, the confusion in the field is not resolved. A modification of the definitions in 424.91 as indicated clarifies the intent that heating cables, factory pre-assembled in a standardized size (Submitter's "fixed form"), are covered by 424.90 unless identified otherwise.
424.91 Definitions.
Heating Panel . A complete factory fabricated unit ~~assembly~~ provided with a junction box or a length of flexible conduit for connection to a branch circuit.
Heating Panel Set. A field assembled system ~~rigid or nonrigid assembly~~ provided with nonheating leads or a terminal junction assembly identified as being suitable for connection to a wiring method specified in Chapter 3 ~~system~~ . Heated portions are normally factory pre-assembled in standardized widths. Heating cables pre-assembled in standardized widths are heating panel sets unless identified as electric space-heating cables.

17-40 Log #248 NEC-P17 **Final Action: Reject**
(424.93(A)(2)(1))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
(1) In or behind surfaces where subject to ~~physical~~ damage.
Substantiation: Use of the word "physical" is superfluous - the purpose is obvious.
Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every unnecessary instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."
Panel Meeting Action: Reject
Panel Statement: The panel refers the submitter to the NEC Style Manual, 3.2.5.5.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13 \

17-41 Log #257 NEC-P17 **Final Action: Reject**

Panel Meeting Action: Reject

Panel Statement: The panel refers the submitter to the NEC Style Manual, 3.2.5.5.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

17-45 Log #2900 NEC-P17 **Final Action: Reject**
(426.28)

Submitter: Eugene Lucas, American Electronic Components

Recommendation: None.

Substantiation: I believe that in this article that GFCI should be used for dwelling units that are snow and ice melting devices. If the dwelling unit has a metal roof.

Panel Meeting Action: Reject

Panel Statement: The submitter did not provide a recommendation for consideration in accordance with the requirements of the Regulations Governing Committee Projects, Section 4-3.3(c).

The submitter is encouraged to review and resubmit for the ROC with specific proposed text.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

17-46 Log #1744 NEC-P17 **Final Action: Reject**
(426.32 Exception (New))

Submitter: Neal Fenster, Thermo Systems Technology, Inc.

Recommendation: Revise paragraph 426.32 for the 2008 National Electrical Code. In the 2005 NEC currently the paragraph reads as follows:

"Unless protected by a ground-fault circuit-interrupter protection for personnel, the secondary winding of the isolation transformer connected to the impedance heating elements shall not have an output voltage greater than 30 volts ac.

Where ground-fault circuit-interrupter protection for personnel is provided, the voltage shall be permitted to be greater than 30 but not more than 80 volts.

We propose adding an exception to read:

<u>"Exception: Where conditions of maintenance and supervision ensure that only qualified personnel will service and maintain the heating elements and system, the voltage shall be permitted to be not more than 80 volts where ground-fault protection is provided with a trip setting not to exceed 30 Ma above the inherent leakage characteristic of the heating system."</u>

Substantiation: 1) These systems are normally located inside large fenced industrial facilities.

2) The piping systems involved are insulated and jacketed which will prevent contact with the internal metallic piping system.

3) Impedance systems, because of their higher current levels, are not compatible with a 5 Ma trip ground-fault circuit interrupter.

4) In a system designed to maintain desired operating temperatures, the inherent capacitive leakage current could be several amperes.

5) The leakage current at any point along the pipeline will typically be below 5 Ma, while the protective device with ground fault protection will monitor the total leakage.

Panel Meeting Action: Reject

Panel Statement: This proposal attempts to substitute GFPE for equipment vs. GFCI for personnel.

The panel rejects the substantiation because it does not pertain to the submitter's proposed text. The requirements for pipe tracing are not in this article.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

17-46a Log #CP1701 NEC-P17 **Final Action: Accept**
(426.44)

Submitter: Code-Making Panel 17,

Recommendation: Revise 426.44 to read as follows:

The ferromagnetic envelope shall be ~~grounded~~ <u>connected to an equipment grounding conductor</u> at both ends; and, in addition, it shall be permitted to be ~~grounded~~ <u>connected to an equipment grounding conductor</u> at intermediate points as required by its design.

The provisions of 250.30 shall not apply to the installation of skin-effect heating systems.

FPN: For grounding methods, see Article 250.

Substantiation: As Proposal 17-1 pertained to several articles (Articles 422, 426, 680 and 682), the panel chose to separate these into four (4) separate committee proposals to minimize confusion and act on them separately.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

17-47 Log #957 NEC-P17 **Final Action: Reject**
(426.50(A))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Revise as follows:

All fixed outdoor deicing and snow-melting equpment shall be provided with ~~a means for disconnection from~~ <u>a switch or circuit breaker that simultaneously disconnects</u> all ungrounded conductors <u>of the circuit</u> . Where readily accessible to the user of the equipment, the branch circuit switch of circuit breaker shall be permitted to serve as the disconnecting means. Switches <u>or circuit breakers</u> used as the disconnecting means shall be of the indicating type <u>and provided with a positive lockout means in the "off" position.</u>

Substantiation: Edit. No specific type of disconnect is indicated; many types of devices will disconnect conductors. Disconnection should be simultaneous for all ungrounded conductors. The temperature controller of 426.51(A) is required to open all ungrounded conductors and have a positive lockout means. The disconnecting means of 427.55(A) and 427.56(A) require positive lockout provisions and the same should be required for these disconnecting means which may be remote from the equipment.

Panel Meeting Action: Reject

Panel Statement: The disconnecting means can be other than a switch or circuit breaker.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

17-48 Log #3408 NEC-P17 **Final Action: Accept**
(426.50(A))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: Delete the phrase "provided with a positive lockout in the 'off' position" and replace it with "capable of being locked in the open position."

Substantiation: The term "positive lockout" is undefined in the NEC and not clear as to meaning. Disconnects that are to be capable of being locked open are familiar to all code users and the terminology is widely used throughout the NEC.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

17-48a Log #CP1704 NEC-P17 **Final Action: Accept**
(426.51 and 427.56)

Submitter: Code-Making Panel 17,
Recommendation: Change 426.51(A) to read as follows:
(A) Temperature Controller with ``Off'' Position Temperature controlled switching devices that indicate an ``off'' position and that interrupt line current shall open all ungrounded conductors when the control device is in the ``off'' position. These devices shall not be permitted to serve as the disconnecting means unless capable of being locked in the open position.
Change 426.51(D)(3) to read as follows:
(3) Be capable of being locked in the open position
Change 427.56(A) to read as follows:
A) Temperature Control with ``Off'' Position Temperature controlled switching devices that indicate an ``off'' position and that interrupt line current shall open all ungrounded conductors when the control device is in this ``off'' position. These devices shall not be permitted to serve as the disconnecting means unless capable of being locked in the open position.
Change 427.56(D)(3) to read as follows:
(3) Be capable of being locked in the open position
Substantiation: The panel changed 426.51 and 427.56 t o establish consistency with Proposal 17-48.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

17-49 Log #1251 NEC-P17 **Final Action: Accept**
(426.52)

TCC Action: It is the action of the Technical Correlating Committee that the panel reconsider the proposal and clarify that branch circuit sizing does not provide overcurrent protection. This action will be considered by the panel as a public comment.
Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise text: Fixed outdoor electric de-icing and snow melting equipment shall be ~~permitted to be~~ protected against overcurrent by a branch circuit ~~as specified in 426.4~~ rated not less than 125 percent of the load.
Substantiation: 426.4 does not specify a branch circuit. The intent appears to require a branch circuit rated for continuous load. This should be a requirement, not "permitted".
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 427 — FIXED ELECTRIC HEATING EQUIPMENT

17-50 Log #2268 NEC-P17 **Final Action: Accept in Principle in Part**
(427.5)

Submitter: H. Brooke Stauffer, National Electrical Contractors Assn. (NECA)
Recommendation: Add new text to read:
427.xx Fixed electric heating equipment for pipelines and vessels shall be installed in a neat and workmanlike manner.
FPN: Accepted industry practices are described in ANSI/NECA 202-2001, Recommended Practice for Installing and Maintaining Industrial Heat Tracing Systems, and other ANSI-approved installation standards.
Substantiation: The general workmanship requirement of 110.12 applies to electrical equipment covered by Article 427. However, safety would be improved by offering more detailed installation guidance for fixed electric heating equipment for pipelines and vessels.
Panel Meeting Action: Accept in Principle in Part
Revise FPN following 427.1 to read as follows:
FPN: For further information, see ANSI/IEEE Std. 515-2002, Standard for the Testing, Design, Installation and Maintenance of Electrical Resistance Heat Tracing for Industrial Applications; ANSI/IEEE Std. 844-2000, Recommended Practice for Electrical Impedance, Induction, and Skin Effect Heating of Pipelines and Vessels; and ANSI/NECA 202-2001, Recommended Practice for Installing and Maintaining Industrial Heat Tracing Systems.
Panel Statement: The panel did not include the submitter's sentence that included "in a neat and workmanlike manner" in order to comply with the NEC Style Manual, 3.2.1.
The panel incorporated the proposed FPN in the existing FPN of 427.1.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
ROCK, B.: NEMA opposes the portion of the Panel Action and Panel Statement to revise 427.1 FPN. This reference should not be included in the NEC since the NEC is not a design, installation or maintenance manual. NEC 90.1(C) specifically states: "This Code is not intended as a design specification or an instruction manual for untrained persons." NEMA does concur with the portion of the panel statement rejecting the addition of the sentence that included "in a neat and workmanlike manner," as this sentence would be redundant to the main requirement of 110.12.

17-51 Log #244 NEC-P17 **Final Action: Reject**
(427.11)

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
Electrical heating equipment shall be installed in such a manner as to be afforded protection from ~~physical~~ damage.
Substantiation: Use of the word "physical" is superfluous - the purpose is obvious.
Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every unnecessary instance, as I am attempting to do, we actually cut the NEC down by up to oh, maybe a quarter page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on. Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."
Panel Meeting Action: Reject
Panel Statement: The panel refers the submitter to the NEC Style Manual, 3.2.5.5.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

17-52 Log #243 NEC-P17 **Final Action: Reject**
(427.12)

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise text as follows:
External surfaces of pipeline and vessel heating equipment that operate at temperatures exceeding 60°C (140°F) shall be ~~physically~~ guarded, isolated, or thermally insulated to protect against contact by personnel in the area.
Substantiation: Use of the word "physical" generally is superfluous - the intent is obvious. In some instances, one could argue for the use of "mechanical" to differentiate that from e.g., "thermal" damage, but context makes the intended sense quite clear, rendering anything like this completely unnecessary.
Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "protection" means "physical protecton."
Panel Meeting Action: Reject
Panel Statement: The panel refers the submitter to the NEC Style Manual, 3.2.5.5.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

17-55 Log #1745 NEC-P17 **Final Action: Reject**
(427.27 Exception (New))

Submitter: Neal Fenster, Thermo Systems Technology, Inc.
Recommendation: Revise paragraph 427.27 and the 2008 National Electrical Code. In the 2005 NEC currently the paragraph reads as follows:
"Unless protected by a ground-fault circuit-interrupter protection for personnel, the secondary winding of the isolation transformer connected to the impedance heating elements shall not have an output voltage greater than 30 volts ac.
Where ground-fault circuit-interrupter protection for personnel is provided, the voltage shall be permitted to be greater than 30 but not more than 80 volts.
We propose add an exception to read:
" Exception: Where conditions of maintenance and supervision ensure that only qualified personnel will service and maintain the heating elements and system, the voltage shall be permitted to be not more than 80 volts where ground-fault protection is provided with a trip setting not to exceed 30 Ma above the inherent leakage characteristic of the heating system."
Substantiation: 1) These systems are normally located inside large fenced industrial facilities.
2) The piping systems involved are insulated and jacketed which will prevent contact with the internal metallic piping system.
3) Impedance systems, because of their higher current levels, are not compatible with a 5 Ma trip ground-fault circuit interrupter.
4) In a system designed to maintain desired operating temperatures, the inherent capacitive leakage current could be several amperes.
5) The leakage current at any point along the pipeline will typically be below 5 Ma, while the protective device with ground fault protection will monitor the total leakage.
6) This exception would be for systems not enclosed in a grounded metal enclosure, but would allow practical safe systems above 30 volts.
Panel Meeting Action: Reject
Panel Statement: This proposal attempts to substitute GFPE for equipment vs. GFCI for personnel, which would reduce safety for personnel.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

17-56 Log #1148 NEC-P17 **Final Action: Reject**
(427.55)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:
~~Means~~ A switch or circuit breaker that simultaneously disconnects all ungrounded conductors of the circuit shall be provided to disconnect all fixed electric pipeline or heating vessel equipment ~~from all ungrounded conductors.~~
Substantiation: Edit. No specific type disconnect is indicated. Lugs, terminals, wire connectors, etc. are means of disconnection per definition. Simultaneous disconnection should be specified.
Panel Meeting Action: Reject
Panel Statement: The disconnecting means can be other than a switch or circuit breaker.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

17-57 Log #1027 NEC-P17 **Final Action: Reject**
(427.55(A))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise first sentence:
A ~~means~~ switch or circuit breaker shall be provided to simultaneously disconnect all ungrounded conductors of the circuit supplying fixed electric pipeline or vessel heating equpment ~~from all ungrounded conductors~~ .
Substantiation: Edit. No specific type of disconnect is indicated. Plug/receptacle, lugs, terminals, wire connectors are means of disconnection. E.g., removable links are permitted in 669.8(B).
Panel Meeting Action: Reject
Panel Statement: The disconnecting means can be other than a switch or circuit breaker.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 430 — MOTORS, MOTOR CIRCUITS, AND CONTROLLERS

11-16 Log #1690 NEC-P11 **Final Action: Reject**
(Figure 430.1)

Submitter: Paul E. Guidry, Fluor Enterprises, Inc.
Recommendation: Add text to read as follows:
Figure 430.1 Valve Actuator Motors Part XI
Substantiation: This is a companion proposal for a new addition for valve actuator motors. Companion proposal section numbers are: 430.2, 430.6(D) and 430 Part XI.
The NEC doesn't presently address valve actuator motors. Users in the industrial/petrochemical have tried for years to apply Article 430 to valve actuator motors without success. These motors do not fit into many of the present rules that are in Article 430. I believe they need their own section and special rules.
Panel Meeting Action: Reject
Panel Statement: Refer to the panel action and statement on Proposal 11-81.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
GOETZ, C.: It is understood that the proposed revision is not necessary as the companion proposal 11-81 to create a new part in Article 430 was not accepted.

11-16a Log #CP1101 NEC-P11 **Final Action: Accept**
(430.2)

TCC Action: The Technical Correlating Committee Rejects the panel action to add a new definition for "Engineering Supervision" to Article 430. The term is used throughout the NEC and if a definition is needed it should be under the purview of Code-Making Panel 1. The Technical Correlating Committee directs that this proposal be sent to Code-Making Panel 1 for consideration of action in Article 100 during the comment phase. This action will be considered by Code-Making Panel 1 as a Public Comment.

The Technical Correlating Committee directs that this proposal be forwarded to Panels 1, 2, 3, 6, 10, and 14 for public comment to Code-Making Panel 1.

Submitter: Code-Making Panel 11,

Recommendation: Add a new definition in 430.2 to read as follows:

Engineering Supervision. Direct supervision by an electrical engineer engaged primarily in the design or maintenance of electrical installations and who has skills and knowledge related to the construction and operation of the electrical equipment and installation.

Substantiation: The panel has provided a definition to correlate with the action on Proposal 11-34 and Proposal 11-45 where the term is used. The definition is needed to provide a clear indication of the level of qualification required to apply these calculations.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 12 Negative: 3

Explanation of Negative:

GLOVER, W.: The action on this proposal should have been Reject. Refer to my comments on proposals 11-34 and 11-45.

HAMER, P.: The term "Engineering Supervision" is used in many Articles of the NEC and as such, if the term is to be defined at all, it should be the responsibility of CMP-1 and not of CMP-11. The definition as recommended in this proposal does not provide a clear and objective set of criteria to determine qualifications. The AHJ would need to check the skills and knowledge of each engineer based on his or her own standards. This level of scrutiny should not be required for checks that could simply be made by references to tables or graphs (Proposals 11-34 and 11-45).

WRIGHT, J.: See NEMA negative comment on Proposals 11-34 and 11-45. NEMA does not support the Panel Meeting action. The proposed changes to the tap rules, even under engineering supervision, could reduce electrical safety. The proposed tap rules require an in-depth knowledge of the overcurrent device characteristics. In particular, this information is required not only during initial system installation but throughout the maintenance life of the system to ensure replacement by an identical device.

11-17 Log #1691 NEC-P11 **Final Action: Reject**
(430.2)

Submitter: Paul E. Guidry, Fluor Enterprises, Inc.

Recommendation: Revise text to read as follows:

<u>430.2 Valve Actuator Motor Assemblies. A manufactured assembly consisting of a valve, valve actuator motor, and other components such as controllers, torque switches, limit switches, and overload protection. Valve actuator motor assemblies are also referred to as "motor-operated valves" or "MOVs".</u>

<u>FPN: Valve actuator motors have a unique design that can result in significantly different operating characteristics than NEMA Design B motors. Continuous duty motors, such as NEMA Design B motors, are rated in horsepower, which implies a constant torque. Valve actuator motors are neither continuous duty nor constant torque at rated speed. They can be characterized as short duty time, high starting torque motors.</u>

Substantiation: This is a companion proposal for a new addition for valve actuator motors. Companion proposal section numbers are: Figure 430.1, 430.6(D) and 430 Part XI.

The NEC doesn't presently address valve actuator motors. Users in the industrial/petrochemical have tried for years to apply Article 430 to valve actuator motors without success. These motors do not fit into many of the present rules that are in Article 430. I believe they need their own section and special rules.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: Refer to the panel action and statement on Proposal 11-81.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

GOETZ, C.: It is understood that the proposed new definition is not necessary as the companion proposal 11-81 to create a new part in Article 430 was not accepted. Additionally, the defined term "Valve actuator motor assemblies" is not used anywhere in the current text of Article 430.

11-18 Log #2689 NEC-P11 **Final Action: Reject**
(430.6(A)(1) and (2))

Submitter: Charles M. Trout, Maron Electric Co. Inc.

Recommendation: Delete all of the present text in 430.6(A)(1) and (2) and replace with text as follows:

(1) Nameplate Values. Motor nameplate current ratings shall be used to determine the ampacity of conductors used or ampere ratings of switches, branch-circuit short-circuit and ground-fault protection.

Exception No. 1: The values given in Table 430.247, Table 430.248, Table 249, and Table 250 in Annex F shall be permitted to be used in lieu of the motor nameplate current rating.

(2) Separate motor overload protection shall be based on the motor nameplate current rating.

Substantiation: This proposal is contingent on acceptance of the proposal to relocate Table 430.247, Table 430.248, Table 249 and Table 250 to a new Annex F or wherever the panel should decide.

Apparently the existence of 430.6(A)(1) is to provide oversize conductors that would be available if and when the motors are replaced because there is no assurance that these future replacement motors will be as efficient as the motors being replaced This puts the National Electrical Code in the position of designing electrical installations for future use. Using motor nameplate current ratings to determine ampacity of conductors used, ampere ratings of switches, branch-circuit short-circuit and ground-fault protection and separate motor overload protection is a prescribed manner of electrical design and provides the proper degree of safety desired. If and when it becomes necessary to replace a motor, the qualified electrical installer will be competent enough to size conductors and equipment properly without pre-installed oversized conductors installed "just in case".

It is not the purpose of the National Electrical Code to mandate electrical design beyond that which is considered necessary for safety. If nameplate current ratings are safe enough for all the sizes and types of motors not included in the Tables 430.247, -48, -49 and 50 in addition to all the motors excepted from the tables then the nameplate ratings should be acceptable for all motors.

Panel Meeting Action: Reject

Panel Statement: The submitter has to consider that many times motors are changed under emergency conditions that even under the normal design process do not always lend themselves to any consideration other than the horsepower and voltage ratings of the motor. The tables provided in the NEC provide a consistent source that guarantees safety over a wide range of motor applications.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

11-19 Log #1692 NEC-P11 **Final Action: Reject**
(430.6(D))

Submitter: Paul E. Guidry, Fluor Enterprises, Inc.

Recommendation: Add text to read as follows:

<u>430.6(D) Valve Actuator Motors. Valve actuator motor conductor ampacity, the ampere ratings of switches and branch-circuit short-circuit and ground fault protection will vary based on the type of valve actuator motor. The valve actuator motor shall be installed in accordance with manufacturer's instructions and all calculations shall be made under engineering supervision.</u>

Substantiation: This is a companion proposal for a new addition for valve actuator motors. Companion proposal section numbers are: Figure 430.1, 430.2 and 430 Part XI.

The NEC doesn't presently address valve actuator motors. Users in the industrial/petrochemical have tried for years to apply Article 430 to valve actuator motors without success. These motors do not fit into many of the present rules that are in Article 430. I believe they need their own section and special rules.

Panel Meeting Action: Reject

Panel Statement: Refer to the panel action and statement on Proposal 11-81.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

Comment on Affirmative:

GOETZ, C.: The first sentence of the recommended text is not a requirement and refers to the ratings of switches and branch circuit short circuit and ground fault protection that are not covered under Section 430.6 for determining the size of conductors. IEEE Standard 1296 suggests that most valve-actuated motors draw less than 15A where 14AWG conductors would normally be installed. The submitter has not provided substantiation as to why the valve actuator motor current ratings cannot be established so that installers may select suitable conductors.

11-20 Log #3158 NEC-P11 **Final Action: Accept**
(Table 430.7(B))

Submitter: Wally Harris, Atlantic Inland Inspections
Recommendation: Insert lines into table as shown below:

Table 430.7(B) Locked-Rotor Indicating Code Letters

Code Letter	Kilovolt-Amperes per Horsepower with Locked Rotor
A	0–3.14
B	3.15–3.54
C	3.55–3.99
D	4.0–4.49
E	4.5–4.99
F	5.0–5.59
G	5.6–6.29
H	6.3–7.09
J	1–7.99
K	8.0–8.99
L	9.0–9.99
M	10.0–11.19
N	11.2–12.49
P	12.5–13.99
R	14.0–15.99
S	16.0–17.99
T	18.0–19.99
U	20.0–22.39
V	22.4 and up

Substantiation: Inserting these lines will make the Table easier to use, more "user friendly", and perhaps reduce the possibility of user error.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-21 Log #2346 NEC-P11 **Final Action: Reject**
(430.9(C))

Submitter: Andre R. Cartal, Princeton Borough Building Dept.
Recommendation: Delete torque requirements (C).
Substantiation: The 2002 cycle rejected the inclusion of torque requirements as this places the responsibility of torque verification on the electrical inspector. This is the responsibility of the installer.
Panel Meeting Action: Reject
Panel Statement: Proper torque is essential for safe and reliable connections and consistent with
Section 110.14(B). Deletion of these requirements could result in unreliable connections. If the terminal strip or other small equipment does not have information on what the torque value is, then this Code section gives the installer a minimum value to use for that equipment.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-22 Log #1502 NEC-P11 **Final Action: Accept in Part**
(430.11)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Change "injurious" to "damaging".
Substantiation: Edit. Materials and equipment are not sensate, they may be damaged but not injured.
Panel Meeting Action: Accept in Part
The panel accept the deletion of the word "injurious". The panel does not accept insertion of the word "damaging".
Panel Statement: The current adjective "injurious" and as recommended replacement, "damaging", describing the nature of a liquid is not useful or enforceable in terms of this requirement. Motor enclosures and guards are intended to provide protection from spraying or dripping liquids.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-23 Log #3001 NEC-P11 **Final Action: Reject**
(Table 430.12(B))

Submitter: Jerry D. Cain, Charolais Coal No. 1 LLC
Recommendation: Revise text as follows:

Motors Over 275 mm (11 in.) in Diameter – Alternating-Current Motors

Maximum Full Load Current for 3-Phase Motors with Maximum of 12 Leads (Amperes)	Terminal Box Cover Opening Minimum Dimension mm	in.	Usable Volume Minimum cm³	in.³	Typical Maximum Horsepower 3-Phase 230 Volt	460 Volt
45	~~65~~	~~2.5~~	~~595~~	~~36.4~~	~~15~~	30
70	~~84~~	~~3.3~~	~~1,265~~	~~77~~	~~25~~	50
110	~~100~~	~~4.0~~	~~2,295~~	~~140~~	~~40~~	75
160	~~125~~	~~5.0~~	~~4,135~~	~~252~~	~~60~~	125
250	~~150~~	~~6.0~~	~~7,380~~	~~450~~	~~100~~	200
400	~~175~~	~~7.0~~	~~13,775~~	~~840~~	~~150~~	300
600	~~200~~	~~8.0~~	~~25,225~~	~~1540~~	~~250~~	500
45	100	4.0	2,295	140	15	30
70	150	6.0	7,380	450	25	50
110	200	8.0	8,960	560	40	75
160	250	10.0	13,775	840	60	125
250	300	12.0	25,255	1540	100	200
400	325	14.0	35,840	2240	150	300
600	400	16.0	46,080	2880	250	500

Substantiation: It is common practice in industry to connect motors via conduit and a short section of flex to allow for motor alignment and adjustment. The leads from the motor are several sizes smaller than the NEC requires to operate the motor. Most terminal boxes supplied with large frame motors do not provide ample room to make connections and insulate such connections, especially if wire is oversized for voltage drop or temperature correction factors.
One could extend the motor leads to a junction box and connect to the larger wire, however this would add significant cost. I have seen motors where the terminal box has been replaced with a NEMA 4X Enclosure to obtain additional wiring space. Article 314 addresses space requirements for junction boxes, Article 430 should at a minimum apply the same requirements. Note, if don't understand what I am trying to convey, just imagine crimping a terminal on 350 MCM then connect it to the motor lead and insulate it in a box the size of letter size paper, then do it two more times and try to stuff it all in the box and close the lid. I can generally hook up a motor on a new installation without a lot of trouble, however, when you have to change one that has operated for years and the wires have become stiff is a different matter. Please address this problem and give everyone that has to deal with these situations a little relief.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided sufficient technical substantiation for increasing the sizes of these enclosures. In 430.12(D) the Code specifies minimum sizes and allows larger sizes to be installed.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-24 Log #652 NEC-P11 **Final Action: Reject**
(430.14(A))

Submitter: Darrell Morrow, Morrow Electric Company
Recommendation: Add new text as follows:
Attic ventilation should be installed where they can be serviced without having to construct a way to get to them.
Substantiation: Most attic ventilators are installed at the highest point of the roof. To replace a ventilator you either have to install plywood on the rafter and set a ladder on it or let a latter straddle the rafter. Either way is very dangerous.
Panel Meeting Action: Reject
Panel Statement: The Code does not require motors to be readily accessible. Location of ventilation equipment is a design consideration and the responsibility of the mechanical code.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-25 Log #2269 NEC-P11 **Final Action: Reject**
(430.19 (New))

Submitter: H. Brooke Stauffer, National Electrical Contractors Assn. (NECA)
Recommendation: Add new text to read:
430.xx Motors and motor controllers shall be installed in a neat and workmanlike manner.
FPN: Accepted industry practices are described in ANSI/NECA 230-2003, Standard for Selecting, Installing, and Maintaining Electric Motors and Motor Controllers, and other ANSI-approved installation standards.
Substantiation: The general workmanship requirement of 110.12 applies to electrical equipment covered by Article 430. However, safety would be improved by offering more detailed installation guidance for motors and motor controllers.
Panel Meeting Action: Reject
Panel Statement: The submitter's concerns are presently covered in 110.12.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-26 Log #1158 NEC-P11 **Final Action: Reject**
(430.22(C))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:
For a wye-start delta-run connected motor the ~~selection~~ ampacity of the branch circuit conductors on the line side of the controller shall be ~~based on~~ not less than 25 percent of the motor full-load current. The ~~selection~~ ampacity of conductors between the controller and the motor shall be ~~based on~~ not less than ~~58~~ 72 percent of the motor full-load current.
Substantiation: Edit. Proposal is a positive statement consistent with similar code wording. Ampacity is what is addressed, "selection" may infer other criteria. The proposal is specific and not prone to misinterpretation.
Panel Meeting Action: Reject
Panel Statement: The current text in 430.22(C) properly and clearly provide the requirements. The panel advises that the general requirements of 430.22(A) are applicable to 430.22(C). The term "selection" is consistently used in 430.22(B), (C), and (D) and refers back to the ampacity requirements in (A). The submitter's proposal does not improve clarity.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-27 Log #3154 NEC-P11 **Final Action: Accept**
(Table 430.22(E))

Submitter: Wally Harris, Atlantic Inland Inspections
Recommendation: Insert lines into table as shown:

Table 430.22(E) Duty-Cycle Service

	Nameplate Current Rating Percentages			
Classification of Service	**5-Minute Rated Motor**	**15-Minute Rated Motor**	**30- & 60-Minute Rated Motor**	**Contin-uous Rated Motor**
Short-time duty operating valves, raising or lowering rolls, etc.	110	120	150	—
Intermittent duty freight and passenger elevators, tool heads, pumps, drawbridges, turntables, etc. (for arc welders, see 630.11)	85	85	90	140
Periodic duty rolls, ore- and coal-handling machines, etc.	85	90	95	140
Varying duty	110	120	150	200

Substantiation: Inserting these lines will make the Table easier to use, more "user friendly", and perhaps reduce the possibility of user error.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-28 Log #2834 NEC-P11 **Final Action: Reject**
(430.24 Exception (New))

Submitter: Russell A. Tiffany, York International Corp.
Recommendation: Where one or more of the motors of the group are powered from an equipment mounted variable frequency drive, the ampere rating of the drive and/or drives shall be permitted in the summation of the full-load current ratings of the group.
Substantiation: UL allows the equipment wiring lugs to be sized per the nameplate ampacity on equipment based on the ampacity of the drive/drives, but 430.24 only considers the motors, but does not consider the drives. By allowing the smaller conductors, you allow the designer to increase the impedance of the circuit, now reducing the available fault current and helping reduce the risk of injury if a fault occurs.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided sufficient substantiation for the change. In addition the panel does not agree with the second sentence of the submitter's substantiation. Furthermore, it is unclear as to exactly what the submitter intends.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
BUNCH, R.: The panel action was appropriate as we had several questions related to what the submitter was asking for and what we thought he might be asking. Since the ROP, I spoke with Mr. Tiffany and he, in fact, was asking for the exception only for equipment with the drive mounted as part of the original equipment. The panel may not change its basic position, but does need to reevaluate the proposal under the clarified intent of the submitter.

11-29 Log #2705 NEC-P11 **Final Action: Reject**
(430.26)

Submitter: Dorothy Kellogg, American Chemistry Council
Recommendation: Revise as follows:
430.26 Feeder Demand Factor.
(A) For the purposes of this article, Supervised Industrial Installations shall be defined as installations meeting the following conditions:
(1) Conditions of maintenance and engineering supervision ensure that only qualified persons design, control, monitor and service the system.
(2) The premises has at least one service or feeder that is more than 150 volts to ground and more than 300 volts phase to phase.
This definition excludes installations in buildings used by the industrial facility for offices, warehouses, garages, machine shops, and recreational facilities that are not an integral part of the industrial plant substation, or control center.
(B) Supervised Industrial Installations. For Supervised Industrial Installations, allowable ampacity of feeder conductors supplying several motors, or a motor(s) and other load(s) shall be permitted to be the product of the ampacity calculated in 430.24 and a demand factor. The demand factor shall be calculated and applied under engineering supervision and meet the following requirements:
(1) The application of a determined demand factor must yield sufficient ampacity capable of serving the actual operating load in accordance with the size and number of motors supplied and the character of their loads and duties.
(2) The minimum allowable demand factor applied shall not be less than 50%.
(C) All Other Installations. Where reduced heating of the conductors results from motors operating on duty-cycle, intermittently, or from not all motors operating at the same time, the authority having jurisdiction may grant permission for feeder conductors to have an ampacity less than specified in 430.24, provided the conductors have sufficient ampacity for the maximum load determined in accordance with the size and number of motors supplied and the character of their loads and duties.
FPN: Demand factors determined in the design of new facilities can often be validated against actual historical experience from similar installations. Refer to ANSI/IEEE Std. 141, Recommended Practice for Electric Power Distribution for Industrial Plants and ANSI/IEEE Std. 241, Recommended Practice for Electric Power Systems in Commercial Buildings, for information on the calculation of loads and demand factor.
Substantiation: The National Electrical Code does not specifically recognize the use of demand factors in the determination of loads in Supervised Industrial Installations. As a result, the NEC determined loads are overly conservative and require distribution systems with higher than needed ratings at a significant cost to owners. 430.26 recognizes ampacities calculated per 430.24 may be overly conservative for motor installations where not all motors operate at the same time and/or motors are oversized with respect to the actual mechanical load served. However, it does not offer a practical guideline for determination of a safe operating ampacity in these circumstances. This proposal offers such a guideline for Supervised Industrial Installations in which condition of maintenance and engineering supervision ensure that only qualified persons design, monitor and service the system. This proposal makes use of concepts

the NEC already recognizes such as demand factor, Supervised Industrial Installations, and engineering supervision. For Supervised Industrial Installations, it appropriately puts the responsibility for the proper determination of demand factor on engineering supervision.
Panel Meeting Action: Reject
Panel Statement: The new sub-item (A) of the recommended text is a modified version of the definition of supervised industrial installation in the current Section 240.2. No substantiation is provided as to why the existing definition is not suitable for Article 430.26(A). No technical substantiation is given as the basis or conditions when conductor ampacity may be 50 percent of the ampacity required by Section 430.24.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
GLOVER, W.: The action on this proposal should have been Accept in Principle in Part.
Paragraph (A) of the proposal should have been rejected since there is an existing definition of supervised industrial installations in 240.2.
The submitter requests a means to assure acceptance during final construction, of a properly determined demand factor that was applied during the initial design and estimating phase of an industrial project. The need to apply this demand factor may occur a few years before the AHJ acts on its acceptability per 430.26. The risk of not having any prior assurance of acceptance prevents engineers from taking proper advantage of a demand factor that would reduce the cost of their facilities.
The basis for a minimum demand factor of 50 percent is for those applications where all motors have a standby (non-running) spare.

11-30 Log #207 NEC-P11 **Final Action: Accept**
(430.28)

TCC Action: The Technical Correlating Committee understands that the panel action on this proposal results in no change to the existing text.

NOTE: The following proposal consists of Comment 11-18 on Proposal 11-26 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 11-26 was: Revise text as follows:
Feeder tap conductors shall have an ampacity not less than that required by Part II, shall terminate ~~in a branch circuit~~ <u>an</u> overcurrent protective device and in addition, shall meet at least one of the following conditions:
(1) no change;
(2) no change;
(3) have ~~the same~~ <u>an</u> ampacity <u>not less than</u> ~~as~~ the feeder conductors.
Make present exception Exception No. 1.
Add <u>Exception No. 2: Feeder taps in accordance with 240.21(B)(5) shall be permitted.</u>
The Technical Correlating Committee directs that this comment be reported as "hold" and returned to the Panel for futher processing during the next code cycle.
The Technical Correlating Committee does not agree with the panel statement that 240.21(B) can be applied to motor branch circuits. If this were the case, 430.28 and 240.21(B) would be in conflict in a number of instances. Specifically, in the application of the 10 ft. and 25 ft. tap rules. The panel is directed to reconsider the issue during the next code cycle and ensure that, if the panel desires, 430.28 includes language to allow the use of other taps for motor circuits.
Submitter: Technical Correlating Committee on National Electrical Code
Recommendation: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal with respect to the reference being in conflict with the NEC Style Manual. This action will be considered by the Panel as a Public Comment
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: Accept TCC direction to review this proposal from the 2005 Code cycle but continue to reject the proposal, as the substantiation does not provide sufficient examples of field problems that would be rectified by this new text.
Further, the panel does not accept the addition of the proposed Exception No. 2 to Section 430.28. Section 430.28 only deals with the conductor size of feeder taps. In the proposed reference to Section 240.21(B)(5), only subpart (2) deals with the conductor size and is no different from the current Section 430.28(3). The proposed Exception No. 2 adds no new information with regard to the conductor size used for feeder taps and would create confusion that the balance of the requirements of Section 240.21(B)(5) referring to the location and accessibility of overcurrent protection and disconnecting means could be employed in motor feeder circuits.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
CACCAMESE, J.: In order to be clear, the proposal should be and was reviewed. However, the panel action should be to "reject" the proposal. It is my concern that with the panel action indicating an "accept" there will be a misunderstanding that the proposal was accepted when the panel statement indicates that it should be rejected.
Comment on Affirmative:
GOETZ, C.: It is understood that by accepting the TCC proposal 11-30, no text in Section 430.28 is revised.
SAPORITA, V.: It is imperative that the tap terminates in a branch-circuit protective device. All overcurrent devices are not branch-circuit overcurrent devices. Only a branch-circuit overcurrent device with full range (overload and short-circuit) capability shall be permitted at the tap's termination. Tap conductors are not fully protected at their point of connection and, therefore, must be protected with a branch-circuit overcurrent device at their termination for safety reasons. See CMP 10 actions on 10-1a.

11-31 Log #208 NEC-P11 **Final Action: Accept**
(430.28)

TCC Action: The Technical Correlating Committee understands that the panel action on this proposal results in no change to the existing text.

NOTE: The following proposal consists of Comment 11-20 on Proposal 11-26 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 11-26 was: Revise text as follows:
Feeder tap conductors shall have an ampacity not less than that required by Part II, shall terminate in ~~a branch circuit~~ <u>an</u> overcurrent protective device and in addition, shall meet at least one of the following conditions:
(1) no change;
(2) no change;
(3) have ~~the same~~ <u>an</u> ampacity <u>not less than</u> ~~as~~ the feeder conductors.
Make present exception Exception No. 1.
Add <u>Exception No. 2: Feeder taps in accordance with 240.21(B)(5) shall be permitted.</u>
The Technical Correlating Committee directs that this comment be reported as "Hold and returned to the committee for futher processing during the next cycle. See Technical Correlating Committee Note on Comment 11-18.
Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Accept the proposed Exception No. 2 in the original proposal.
Substantiation: The proposed exception is in full agreement with the Style Manual. There is no hazard in running a tap conductor of indefinite length from outside the building, as the experience with this provision in 240.21(B) has demonstrated over the years.
Panel Meeting Action: Accept
Panel Statement: Refer to the panel action and statement on Proposal 11-30.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
GOETZ, C.: It is understood that by accepting the TCC proposal 11-31, no text in Section 430.28 is revised.

11-32 Log #241 NEC-P11 **Final Action: Reject**
(430.28(2))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
Have an ampacity of at least one-third that of the feeder conductors, be suitably protected from ~~physical~~ damage or enclosed in a raceway, and be not more than 7.5 m (25 ft) in length.
Substantiation: Use of the word "physical" is superfluous - the intent is obvious.
Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every unnecessary instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on. Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."

Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 11-33.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-33 Log #240 NEC-P11 **Final Action: Reject**
(430.28(3) Exception (c))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
The tap conductors are suitably protected from ~~physical~~ damage and are installed in raceways.
Substantiation: Use of the word "physical" is superfluous - the intent is obvious given the context.
Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."
Panel Meeting Action: Reject
Panel Statement: The term "physical" is used in many sections of the Code. This term needs to remain in this section to provide descriptive information to the installer on what type of damage the Code section is concerned with. The adjective "physical" is necessary to differentiate from other types of damage such as cosmetic damage. The intent of the Code is clear as written.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-34 Log #2880 NEC-P11 **Final Action: Reject**
(430.28(4) (new) and Table 430.28(4) (new))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
The reader is directed to the panel statement on Proposal 11-45 for reference. The panel statement shown in Proposal 11-34 does not correlate with the action taken by the panel.
Submitter: Robert Padgham, Jacksonville, FL
Recommendation: Add the following new text as 430.28(4) and the following new table as Table 430.28(4).
430.28(4) Be suitably protected from physical damage or enclosed in a raceway, and protected in accordance with Table 430.28(4).
Table 430.28(4) Conductor Short-Circuit Current Ratings. Conductors are considered to be protected under short-circuit conditons when their short-circuit temperature limit is not exceeded. Conductor heating under short-circuit conditions is determined by (1) or (2):
(1) Short-Circuit Formula for Copper Conductors
$(I^2/A^2)\,t = 0.0297 \log_{10} ((T_2 + 234)/(T_1 + 234))$
(2) Short-Circuit Formula for Aluminum Conductors
$(I^2/A^2)\,t = 0.0125 \log_{10} ((T_2 + 228)/(T_1 + 228))$
where
I = short-circuit current in amperes
A = conductor area in circular mils
t = time of short-circuit in seconds (for times less than or equal to 10 seconds)
T_1 = initial conductor temperature in degrees Celsius.
T_2 = final conductor temperature in degrees Celsius.
Copper conductor with paper, rubber, varnished cloth insulation $T_2 = 200$
Copper conductor with thermoplastic insulation $T_2 = 150$
Copper conductor wiht crosslinked polyethylene insulation $T_2 = 250$
Copper conductor with ethylene propylene rubber insulation $T_2 = 250$
Aluminum conductor with paper, rubber, varnished cloth insulation $T_2 = 200$
Aluminum conductor with thermoplastic insulation $T_2 = 150$
Aluminum conductor with crosslinked polyethylene insulation $T_2 = 250$
Aluminum conductor with ethylene propylene rubber insulation $T_2 = 250$
Substantiation: North American industry is in a daily struggle to compete with global competitors. As such, we need every possible chance to reduce costs, but with safety as the number one directive. That is the intent of this proposal.
The existing NEC requirements for motor circuit feeder taps dictate that the ampacity of the tap conductors be at least 1/10 of the feeder overcurrent device (ten foot tap) or 1/3 of the feeder conductor ampacity (twenty-five foot tap). At first, this sizing seems reasonable when considering that the feeder circuit device is being asked to provide short-circuit protection for the smaller tap conductors. But, this is often extremely conservative and frequently results in a conductor sized much larger than is actually required according to the laws of physics. By using formulas that have been widely utilized by IEEE, the Canadian Electrical Code, and the IEC, much smaller conductors can be installed. This will provide significant cost savings for industrial distribution systems, allowing North American manufacturers to be more competitive in the global marketplace.
An example would be helpful. Assume a feeder conductor is a 3/0 with an ampacity of 200 amperes. According to the 2005 NEC, the smallest 25 foot tap conductor would be a 4 AWG with an ampacity of 85 amperes, even if it were only supplying a 5 hp motor at 7.6 amperes. (Three times the ampacity of a 6 AWG, with an ampacity of 65 only gives 195 amperes, which doesn't meet the 200 ampere requirement.) According to the physics formula, and UL standards, a 200 ampere Class J fuse will protect a 10 AWG conductor for faults up to 200,000 amperes. (Maximum I^2t let-through of a 200 ampere Class J fuse at 600 volts with 200,000 amperes available is 300×10^3 ampere squared seconds, while the short-circuit withstand of a 10 AWG copper conductor is 303×10^3 ampere squared seconds.) As we can imagine the cost savings here will be substantial, and within the safety umbrella of internationally accepted standard physics formulas.
The physics formulas submitted with this proposal are the accepted basis for conductor short-circuit temperatures throughout the world. They are found in the ANSI/IEEE Red, Gray, Buff, and Blue Books and in the Canadian Electrical Code. Similar versions of these formulas are found in IEC 60204-1 (IEC Machinery Standard), SAE HS-1738 (Automotive Industry Machinery Standard), and IEC 60364-4-43 (IEC Installation Standard).
Let's give North American industry every possible (safe) option to be competitive in the global market by accepting this proposal.
Panel Meeting Action: Accept in Principle
Add new 430.28(4) to read as follows:
(4) Be suitably protected from physical damage or enclosed in a raceway and determined under engineering supervision to be protected under short-circuit conditions. Conductors are considered to be protected under short-circuit conditions when their short-circuit temperature limit is not exceeded as calculated by the following general formulas:
(1) Short-Circuit Formula for Copper Conductors
$(I^2/A^2)t = 0.0297 \log_{10} ((T_2 + 234)/(T_1 + 234))$
(2) Short-Circuit Formula for Aluminum Conductors
$(I^2/A^2)t = 0.0125 \log_{10} ((T_2 + 228)/(T_1 + 228))$
where
I = short-circuit current in amperes
A = conductor area in circular mils
t = time of short-circuit in seconds (for times less than or equal to 10 seconds)
T_1 = initial conductor temperature in degrees Celsius
T_2 = final conductor temperature in degrees Celsius
Copper conductor with paper, rubber, varnished cloth insulation $T_2 = 200$
Copper conductor with thermoplastic insulation $T_2 = 150$
Copper conductor with crosslinked polyethylene insulation $T_2 = 250$
Copper conductor with ethylene propylene rubber insulation $T_2 = 250$
Aluminum conductor with paper, rubber, varnished cloth insulation $T_2 = 200$
Aluminum conductor with thermoplastic insulation $T_2 = 150$
Aluminum conductor with crosslinked polyethylene insulation $T_2 = 250$
Aluminum conductor with ethylene propylene rubber insulation $T_2 = 250$
Panel Statement: The proposal includes calculations that would be difficult for the installer to use. The smaller wire sizes proposed would not enhance the safety of the electrical system. Unless performed under engineering supervision, the enforcement would be difficult to ensure the calculations are accurate.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 9 Negative: 6
Explanation of Negative:
BRINKMEYER, W.: The primary reason given in the submitter's substantiation is that cost savings could be realized by reducing the size of these tap conductors through the proposed use of very complex formulas and difficult calculations. The stated purpose of the NEC is the practical safeguarding of persons and property arising from the use of electricity. This proposal is not practical and does nothing to enhance safety. Cost savings should not be the primary reason to make this change. The panel statement itself concludes that the calculations would be difficult for the installer to use and the smaller wire sizes would not enhance safety of the electrical system. Further, enforcement would be difficult to ensure the accuracy of the calculations.
FAHEY, R.: The panel action should have been to reject this proposal to add new Section 430.28(4) and Table. The proposal as submitted does not enhance a safer installation. I do not agree tap conductors should be permitted in unlimited lengths, thereby increasing resistance in the conductor and limiting proper opening of the overcurrent device under fault conditions.
The substantiation that this proposed change will assist in competitiveness should not be considered as justification to reduce safety.
As accepted, there would be no limitations on the type of occupancy for which this installation would be permitted. This new calculation should only be permitted where installed and serviced by qualified personnel.
The substantiation for the proposal references the Canadian Electrical Code (CEC). CEC Section 28 covers motors, this Section does not have a similar formula to calculate conductor sizes for motor taps as is proposed for the

National Electrical Code (NEC). Section 28 of the CEC has rules similar to the existing NEC rules for tap conductors.

If accepted, this will reduce the safety of the installations of tap conductors and increase the possibility of injury to people who service these installations.

I would be in favor of acceptance if only permitted under engineering supervision by special permission in industrial locations where qualified personnel service the equipment. This should help satisfy the submitter's concerns and at the same time guarantee a safer installation that is enforceable by the authority having jurisdiction.

GLOVER, W.: The action on this proposal should have been Accept.

The calculations may be difficult for some persons to perform, but I do not agree they are of such a difficulty to require by code an engineer. We should insist on qualified persons making the calculations (on this and any other calculation in the code) rather than insisting on engineers. There are other personnel with skills and knowledge related to the design, construction and operation of electrical equipment and installations that are fully qualified to perform these calculations.

GOETZ, C.: The proposed requirement as modified by the panel does not adequately consider overload protection of the tap conductors. The overcurrent protection at the end of a motor feeder tap is permitted to be sized greater than the ampacity of the conductors, such as when the feeder tap is to supply another feeder, or combination loads. The proposed equation should be rearranged so that it is clear that the conductor area, A, is the number to be found from the equation based upon entering appropriate data under engineering supervision. While the submitter used the maximum allowable I squared t for a specific size and type of fuse, this data is not required or referenced by the proposed new text. Presumably, the lowest published numbers available will be sought so that conductors even smaller than those determined by the example in the substantiation would meet this requirement. Not all overcurrent protective devices have such standardized characteristics whereby replacement overcurrent protective devices characteristics may vary from those used for the original calculations. Replacement branch circuit short circuit and ground fault protection having let-through characteristics greater than those used originally to justify the reduced conductor size could lead to dangerous overheating and damage to the tap conductor insulation. Therefore, it is strongly suggested that a warning marking be placed by the branch circuit protective device so that when a replacement branch-circuit short -circuit and ground-fault protective device is subsequently installed, that the calculations be re-performed under engineering supervision to ensure that the new overcurrent protective device provides protection under short circuit conditions that are suitable for the conductors that are already installed.

TODD, L.: After review and consideration of the comments on negative votes, I now believe that this change in wire size is more complicated than the proposal makes it seem. Also, once installed as changes are made in the future is there going to be consideration of the smaller size wire already installed? Also, there is considerable uncertainity on the qualification of those who should make these calculations. The main substantiation was the cost of current methods. I think that testing showing that these smaller sizes of wire are acceptable should be provided.

WRIGHT, J.: NEMA does not support the Panel Meeting action. The proposed changes to the tap rules, even under engineering supervision, could reduce electrical safety. The proposed tap rules require an in-depth knowledge of the overcurrent device characteristics. In particular, this information is required not only during initial system installation, but throughout the maintenance life of the system to ensure replacement by an identical device.

11-35 Log #841 NEC-P11 **Final Action: Accept**
(430.31)

Submitter: Stephen W. Drayton, Eastern Idaho Electrical JATC
Recommendation: Revise text to read as follows:

~~Overload in electrical apparatus is an operating overcurrent that, when it persists for a sufficient length of time, would cause damage or dangerous overheating of the apparatus. It does not include short circuits or ground faults.~~ FPN: See definition of overload in Article 100.
Substantiation: We believe that definitions should not have to repeated throughout the NEC. This will also help in reducing the size of the NEC. i.e., see also 210.21(B)(1), FPN.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-36 Log #156 NEC-P11 **Final Action: Accept in Principle**
(430.32(C))

Submitter: Steven Duritt, Empire Abrasive Equipment Co.
Recommendation: Revise as follows:

(C) Selection of Overload Relay. Where the sensing element or setting of ~~the~~ an overload relay selected in accordance with 430.32(A)(1) and 430.32(B)(1) is not sufficient to start the motor or to carry the load, higher size sensing elements or incremental settings shall be permitted to be used, provided the trip current of the overload relay does not exceed the following percentage of motor nameplate full-load current rating:
Substantiation: 430.32(A)(1) and 430.32(B)(1) refer to overload devices. An overload relay is one type of overload device. Using "the" implies an overload relay is the only type of overload device which may be selected. Using "an" correctly states that an overload relay is only one type of overload device which may be selected.
Panel Meeting Action: Accept in Principle

See Panel Action Proposal 11-37.
Panel Statement: Changing "the" to "an" is not needed because the panel action on Proposal 11-37 achieves the same goal.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-37 Log #157 NEC-P11 **Final Action: Accept**
(430.32(C))

Submitter: Steven Duritt, Empire Abrasive Equipment Co.
Recommendation: Revise as follows:

(C) Selection of Overload ~~Relay~~ Device. Where the sensing element or setting or sizing of the overload ~~relay~~ device selected in accordance with 430.32(A)(1) and 430.32(B)(1) is not sufficient to start the motor or to carry the load, higher size sensing elements or incremental settings or sizing shall be permitted to be used, provided the trip current of the overload ~~relay~~ device does not exceed the following percentage of motor nameplate full-load current rating:
Substantiation: 430.32(A)(1) and 430.32(B)(1) refer to overload devices. 430.32(C) should, therefore, refer to all types of overload devices, not exclusively overload relays. The inserted wording "or sizing" is applicable when properly selected fuses are ued for motor overload protection.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-38 Log #1597 NEC-P11 **Final Action: Accept**
(Table 430.37)

Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Make the following change in 430.37 Table 430.37, line 3:

Change "neutral" to "neutral conductor."

The revised text would appear as follows:

3-wire, 1-phase ac or dc, grounded neutral conductor
Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).

The Task Group has proposed the following definitions to be added to Article 100:

● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.

● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals

● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.

● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.

Additional information is available in the Task Group report.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-39 Log #409 NEC-P11 **Final Action: Accept**
(430.51)

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read as follows:

IV. Motor Branch-Circuit Short-Circuit and Ground-Fault Protection.

430.51 General

Part IV specifies devices intended to protect the motor branch-circuit conductors, the motor control apparatus, and the motors against overcurrent due to short circuits or ground faults ~~grounds~~. These rules add to or amend the provisions of Article 240. The devices specified in Part IV do not include the types of devices required by 210.8, 230.95, and 590.6.
Substantiation: This proposal is an effort to promote consistency with the use of terms related to grounding and bonding. Ground fault is defined in Section 250.2 and is more appropriate to be used here because this is the type of event

that the protection required in this part of Article 430 is intended to provide. This change brings the proposed text in this section consistent with the title of this section which is "Motor Branch-Circuit Short-Circuit and Ground-Fault Protection."

Note: There are also proposals to revise the current definition of the word "ground" in Article 100 which could impact how it is currently used in this section.

Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-40 Log #79 NEC-P11 **Final Action: Reject**
(Table 430.52)

Submitter: Joe Riley, City of Arlington
Recommendation: Revise as follows:

Table 430.52 Standard Rating of Setting of Motor Branch-Circuit Short-Circuit and Ground-Fault Protective Devices.

Substantiation: The heading over this table is deceiving using the word "Maximum". This table is really a starting point for sizing the branch-circuit short-circuit ground-fault device and would be better described as "Standard" rating since Exception No. 1 allows a higher rating and Exception No. 2 allows the maximum rating.
Panel Meeting Action: Reject
Panel Statement: The present title of the table is correct. The panel disagrees that the table is really a starting point. The table provides the maximum values intended by 430.52(C)(1).
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-41 Log #3155 NEC-P11 **Final Action: Accept**
(Table 430.52)

Submitter: Wally Harris, Atlantic Inland Inspections
Recommendation: Reformat Table as present below:
Substantiation: As an inspector and instructor in the electrical trades for a number of years, I have found that this Table is more often than not the most confusing to class participants and clients than any other Table in the Code. The present format in use leaves too much room for error and confusion. The format as proposed will clarify the Table and make using it much simpler.
Panel Meeting Action: Accept
Panel Statement: The panel advises that the only change intended by this proposal is to add separator lines to allow easier reading of the table.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-42 Log #2177 NEC-P11 **Final Action: Accept**
(430.52(C) Exception No. 2)

Submitter: Dann Strube, Strube Consulting
Recommendation: Revise text to read as follows:

"Exception No. 2: Where the rating specified in Table 430.52 or the rating modified by Exception No. 1...".

Substantiation: Given a 3 phase 460V 10 HP motor protected by a circuit breaker.

Table FLA = 14A
Table 430.52 = 250 percent
14A X 2.5 = 35A

35 amps is a standard size so Exception No. 1 cannot be used. With the current rule, Exception 2 cannot be used if this motor will not start.

This problem does not occur in NFPA 79 because the wording is not the same there.

Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

(430.52(C)(8))

Submitter: Travis Foster, Lyondell Chemical Company
Recommendation: Add text to read as follows:
(8) Series Ratings for Combination Motor Controllers. The components of a combination motor controller shall be permitted to use a series short circuit current rating if the components are listed for the purpose.
Substantiation: This addition will clarify some general confusion among the end users of combination motor controllers with regards to series ratings. Many end users do not presently understand that a typical combination motor controller utilizes a series rating and the components when replaced, must be properly matched.
Panel Meeting Action: Reject
Panel Statement: Individual components are not listed with a series short-circuit current rating. For a listed combination motor controller, any series connection rating must include the disconnecting means, branch circuit protection, motor controller, and overload relay.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-44 Log #3514 NEC-P11 **Final Action: Reject**
(430.53(C)(3) (New))

Submitter: Todd Lottmann, Cooper Bussmann
Recommendation: Add new text to read:
(3) Each circuit breaker is one of the inverse time type and listed for group installation.
Substantiation: Circuit Breakers need to be listed for group installation in order for a safe installation for the following reasons:
1) Group motor applications in and of themselves are provided with a lower level of short circuit and ground fault protection compared to that of single motor circuits. This is due to the fact that the short circuit and ground fault protective device, in group motor applications, is allowed to be sized much larger than allowed for single motor circuits. This increase in sizing decreases the level of short circuit and ground fault protection that is provided for the components and equipment used in the group motor application. There are specific conditions, which must be met, to qualify for the use of group motor installations, as shown in 430.53. However, that does not preclude the fact of assuring that the components and equipment, which is used in the group installation, must be able to handle the increased level of ground faults and short circuit currents which will be available due to the increased size of the ground fault and short circuit protective device.
2) Circuit breakers do not have short circuit let through limits to which they must adhere. Rather, evaluation of conductors and the circuit breaker itself are used to determine whether or not a circuit breaker provides suitable short circuit protection. Therefore, one manufacturer's circuit breaker can have different short circuit performance than other manufacturers' circuit breakers as long as they meet the evaluation criteria provided in UL 489. This variance in short circuit performance in and of itself justifies the need to evaluate and mark which circuit breakers are suitable for protection of components and equipment used in a group motor application, thus leaving out the ones that are not.
3) Industrial control equipment, such as motor starters, tested to UL 508 are not required to be marked with the specific manufacturer and part number of the circuit breaker used in the short circuit testing. This deficiency along with the varying short circuit performance of circuit breakers discussed in item 2 above supports the need for the requirement contained in existing 430.53(C). While some manufacturers make both motor starters and circuit breakers, leading to the assumption that testing was conducted with starters and circuit breakers built by that manufacturer, not all of them do. There is no marking requirement for the starter to guide the installer and AHJ as to which manufacturer's circuit breaker and part number to use. How will the installer and inspector know whether the circuit breaker used in the group installation will provide a level of protection which meet the minimum safety levels that this code is supposed to provide per 90.1?
Panel Meeting Action: Reject
Panel Statement: While the panel recognizes there may be an issue with the lack of a marking on end-use equipment that designates the particular circuit breaker utilized in the group motor installation testing, simply listing the circuit breaker for group installation will not provide the needed end-use equipment marking.

(2) Short-Circuit Formula for Aluminum Conductors
$(I^2/A^2)t = 0.0125 \log_{10} ((T_2 + 228)/(T_1 + 228))$
where
I = short-circuit current in amperes
A = conductor area in circular mils
t = time of short-circuit in seconds (for times less than or equal to 10 seconds)
T_1 = initial conductor temperature in degrees Celsius
T_2 = final conductor temperature in degrees Celsius
Copper conductor with paper, rubber, varnished cloth insulation $T_2 = 200$
Copper conductor with thermoplastic insulation $T_2 = 150$
Copper conductor with crosslinked polyethylene insulation $T_2 = 250$
Copper conductor with ethylene propylene rubber insulation $T_2 = 250$

Aluminum conductor with paper, rubber, varnished cloth insulation $T_2 = 200$
Aluminum conductor with thermoplastic insulation $T_2 = 150$
Aluminum conductor with crosslinked polyethylene insulation $T_2 = 250$
Aluminum conductor with ethylene propylene rubber insulation $T_2 = 250$

Panel Statement: The panel accepts the submitter recommendation and the use of formulas rather than tables and has reformatted the recommendation to reflect this. In addition the application has been limited to being performed only under engineering supervision.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 9 Negative: 6
Explanation of Negative:
BRINKMEYER, W.: See my explanation of negative vote on Proposal 11-34.
FAHEY, R.: See my Explanation of Negative Vote on Proposal 11-34.
GLOVER, W.: The action on this proposal should have been Accept.
The calculations may be difficult for some persons to perform, but I do not agree they are of such a difficulty to require by code an engineer. We should insist on qualified persons making the calculations (on this and any other calculation in the code) rather than insisting on engineers. There are other personnel with skills and knowledge related to the design, construction and operation of electrical equipment and installations that are fully qualified to perform these calculations.
GOETZ, C.: By accepting this proposal the motor tap conductors are permitted to be of unlimited length and there is no requirement for the conductors to be enclosed or otherwise protected from physical damage as is stipulated in the current 430.53(D)(2) and (3). In the first sentence, the phrase “short circuit current rating” is misleading and inconsistent with the terminology of the substantiation and that used in the referenced documents. Conductors do not have short circuit current ratings. The proposed equation should be rearranged so that it is clear that the conductor area, A, is the number to be found from the equation based upon entering appropriate data under engineering supervision. While the submitter used the maximum allowable I squared t for a specific size and type of fuse, this data is not required by the proposed new text. Presumably, the lowest published numbers available will be sought so that conductors even smaller than those determined by the example in the substantiation would meet this requirement. Not all overcurrent protective devices have such standardized characteristics whereby replacement overcurrent protective devices characteristics may vary from the original calculations. Replacement branch circuit short circuit and ground fault protection having characteristics greater than those used originally to justify the reduced conductor size could lead to dangerous overheating and damage to the tap conductor insulation. Therefore, it is strongly suggested that a warning marking be placed by the branch circuit protective device so that when a replacement branch-circuit short -circuit and ground-fault protective device is subsequently installed, that the calculations be re-performed under engineering supervision to ensure that the new overcurrent protective device provides protection under short circuit conditions that are suitable for the conductors that are already installed.
TODD, L.: See my explanation of negative vote on Proposal 11-34.
WRIGHT, J.: NEMA does not support the Panel Meeting Action. The proposed changes to the tap rules, even under engineering supervision, could reduce electrical safety. The proposed tap rules require an in-depth knowledge of the overcurrent device characteristics. In particular, this information is required not only during initial system installation, but throughout the maintenance life of the system two ensure replacement by an identical device.
Comment on Affirmative:
COLE, T.: While I agree with the panel on the intent of the proposal, I believe the proposal can be simplified by making reference to the same formula that was accepted in Proposal 11-34. This should be corrected at the comment stage.

11-46 Log #254 NEC-P11 **Final Action: Reject**
(430.53(D)(2))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
No conductor to the motor shall have an ampacity less than one-third that of the branch-circuit conductors, with a minimum in accordance with 430.22; the conductors to the motor overload device being not more than 7.5 m (25 ft) long and being protected from ~~physical~~ damage.
Substantiation: Use of the word “physical” is superfluous - the purpose is obvious.,
Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every unnecessary instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of “physical” is not only poor writing–look at William Zinsser’s classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to “physical damage,” in 1959, from “mechanical injury” (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, “Is anyone claiming electrical equipment needs protection from non-physical injury?” (Substitute the snide adjective of your choice.) Let’s take care of that for good: for our purposes, “damage” means “physical damage.”
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 11-33.

11-48 Log #1730 NEC-P11 **Final Action: Reject**
(430.59 (New))

Submitter: Paul S. Hamer, Chevron Texaco Energy Research and Technology Company
Recommendation: Add a new section:
430.59 Ground-Fault Protection of Motor Branch Circuits. A motor branch circuit shall be protected from ground faults by the branch-circuit short-circuit and ground-fault protective device, or it shall be permitted to be protected by a ground-fault circuit interrupter (GFCI), a three-phase ground-fault circuit-interrupter system (GFCIS-3Ph) or by ground-fault protection of equipment.
FPN No. 1: See Article 100 for the definitions of ground-fault circuit interrupter, three-phase ground-fault circuit-interrupter system, and ground-fault protecton of equipment.
FPN No. 2: For three-phase systems rated above 150 volts to ground, the capacitive-charging current of an individual feeder or branch circuit (a current that is also sensed during a system ground fault on another feeder or branch circuit) can exceed the 6 mA current threshold of a ground-fault circuit interrupter (GFCI) and result in false trips. This may occur for circuit length of approximately 300 m (1000 ft) for a 480 V solidly-grounded system or 90 m (300 ft) for a 480 V high-resistance grounded or ungrounded system. If line-to-ground connected surge capacitors are applied at a motor, a GFCI cannot be used. The application of a three-phase ground-fault circuit-interrupter system (GFCIS-3Ph) will not be susceptible to false trips due to the capacitive effect.
Substantiation: See my companion proposals for Article 100 and section 210.8(D). If the proposals are accepted, this proposal would allow the option (using the wording “shall be permitted”) of using a ground-fault circuit interrupter (GFCI), a three-phase ground-fault circuit-interrupter system (GFCIS-3Ph), or ground-fault protection of equipment for motor branch circuit ground-fault protection.
FPN No. 1 is proposed to refer back to the definitions of the ground-fault protection techniques. FPN No. 2 is added as explanatory information to avoid misapplication of the GFCI on three-phase systems rated above 150 volts to ground (see the proposal for 210.8(D) for further explanation of the capacitive charging effect.
Panel Meeting Action: Reject
Panel Statement: The panel is encouraged by the work of the submitter but is concerned that the proposal is premature. No information is yet available as to the effectiveness of the product. In order to use the product as ground-fault protection in the Code, it should be listed. The proposed section of the Code addresses equipment protection rather than personnel protection. The panel recognizes that the application of this system is permitted to be used for motor circuits as an added technology.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-49 Log #1731 NEC-P11 **Final Action: Reject**
(430.64 (New))

Submitter: Paul S. Hamer, Chevron Texaco Energy Research and Technology Company
Recommendation: Add a new section:
430.64 Ground-Fault Protection of Motor Feeder Circuits. A motor feeder circuit shall be protected from ground faults by the feeder short-circuit and ground-fault protective device, or it shall be permitted to be protected by a ground-fault circuit interrupter (GFCI), a three-phase ground-fault circuit-interrupter system (GFCIS-3Ph), or by ground-fault protection of equipment.
FPN No. 1: See Article 100 for the definitions of ground-fault circuit interrupter, three-phase ground-fault circuit interrupter system, and ground-fault protection of equipment.
FPN No. 2: For three-phase systems rated above 150 volts to ground, the capacitive-charging current of an individual feeder or branch circuit (a current that is also sensed during a system ground fault on another feeder or branch circuit) can exceed the 6 mA current threshold of a ground-fault circuit interrupter (GFCI) and result in false trips. This may occur for circuit length of approximately 300 m (1000 ft) for a 480 V solidly-grounded system or 90 m (300 ft) for a 480V high-resistance grounded or ungrounded system. If line-to-ground connected surge capacitors are applied at a motor, a GFCI cannot be used. The application of a three-phase ground-fault circuit-interruptr system (GFCIS-3Ph) will not be susceptible to false trips due to the capacitive effect.
Substantiation: See my companion proposals for Article 100 and section 210.8(D). If the proposals are accepted, this proposal would allow the option (using the wording "shall be permitted") of using a ground-fault circuit interrupter (GFCI), a three-phase ground-fault circuit-interrupter system (GFCIS-3Ph), or ground-fault protection of equipment for motor feeder circuit ground-fault protection.
FPN No. 1 is proposed to refer back to the definitions of the ground-fault protection techniques. FPN No. 2 is added as explanatory information to avoid misapplication of the GFCI on three-phase systems rated above 150 volts to ground (see the proposal for 210.8(D) for further explanation of the capacitive charging effect.

Ballot Results: Affirmative: 15

11-50 Log #1773 NEC-P11 **Final Action: Reject**
(Table 430.72(B), Note 2)

Submitter: Joseph C. Warren, Joseph C. Warren Electrical Consulting Services
Recommendation: Notes:
2. 400 percent of value specified in Table <u>310.16</u> for 60° C conductors.
Substantiation: Note #2 of Table 430.72(B) states 400 percent of value specified in Table 310.17 for 60° C conductors. Since Table 310.17 is for <u>free air ampacities only</u> and Note #2 of Table 430.72(B) is given under column B for conductors <u>within enclosures</u> , Table 310.17 should not be used for this situation.
Panel Meeting Action: Reject
Panel Statement: The reference to Table 310.17 is correct for conductors in enclosures that are not bundled.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
FAHEY, R.: The panel action should have been to accept this proposal to revise Table 430.72(B) Note No. 2. The submitter is correct that Note No. 2 should reference Table 310.16. Most control conductors are, in fact, bundled when installed in a neat and workmanlike manner inside an enclosure, therefore, these control conductors are not installed in free air. Table 310.17 applies to conductors outside of an enclosure in free air, where the conductors are in fact cooled by free air. The conductors contained within an enclosure are not subject to the same conditions of cooling that exist in free air; therefore Table 310.16 should be applied in Note No. 2 as requested in the proposal.

11-51 Log #252 NEC-P11 **Final Action: Reject**
(430.73)

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
Where damage to a motor control circuit would constitute a hazard, all conductors of such a remote motor control circuit that are outside the control device itself shall be installed in a raceway or be otherwise suitably protected from ~~physical~~ damage.
Substantiation: Use of the word "physical" is superfluous - the purpose is obvious, especially given the section title, "Mechanical protection of conductor," used as the title of 430.73, is an unusual example of clear terminology.
Submitting proposals removing the adjective "physical" may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every unnecessary instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 11-33.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-52 Log #838 NEC-P11 **Final Action: Accept in Principle**
(430.73)

Submitter: Stephen W. Drayton, Eastern Idaho Electrical JATC
Recommendation: Assign 430.74 to the 2nd paragraph of 430.73 and title it as "ELECTRICAL ARRANGEMENT OF CONTROL CIRCUITS", and keep the paragraph as written. Renumber existing 430.74 as 430.75.
Substantiation: For the user of the NEC, this important paragraph has been "hidden" under mechanical protection for too long. This will allow the user to find the information easier.
Panel Meeting Action: Accept in Principle
Revise Section 430.73 as follows:
430.73 Mechanical Protection of Conductor.
<u>(A) Protection from Physical Damage.</u> (first paragraph of existing Section 430.73 follows)
<u>(B) Electrical Arrangement of Control Circuits.</u> (second paragraph of existing Section 430.73 follows)
Panel Statement: The revisions maintain current section numbering and provide means to identify separate conditions included under Section 430.73.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-53 Log #1503 NEC-P11 **Final Action: Accept in Principle**
(430.73)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: In second sentence, change "one side" to "one conductor".
Substantiation: Editorial.
Panel Meeting Action: Accept in Principle
Revise the second paragraph of 430.73 to read as follows:
Where the motor control circuit is intentionally grounded, the motor control circuit shall be arranged so that an accidental ground in the control circuit remote from the motor controller will (1) not start the motor and (2) not bypass manually operated shutdown devices or automatic safety shutdown devices.
Panel Statement: The wording provided by the panel more clearly states the requirement and meets the intent of the submitter.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-53a Log #CP1100 NEC-P11 **Final Action: Accept**
(430.81(A))

Submitter: Code-Making Panel 11,
Recommendation: Replace the words "protective device" in 430.81(A) with "disconnecting means".
Substantiation: The words "disconnecting means" more clearly include the types of devices that can be used as motor controllers.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
SAPORITA, V.: Replacing the words "protective device" with "disconnecting means" makes a subtle but significant change. It would preclude the application of a 1/8 HP or less stationary motor from beng installed where a Type S fuse is protecting the motor and where removal of the fuse would serve as the disconnecting means. The specific words in 430.81(A) have been in the NEC as written since at least the 1947 edition.

11-54 Log #1082 NEC-P11 **Final Action: Accept in Principle**
(430.87 Exception No. 2 (New))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Add:
Exception No. 2: A branch circuit overcurrent device serving as the controller as permitted in 430.81(B) may serve more than one motor.
Substantiation: Edit. Where more than one clock motor or similar impedance protected motor is on the same circuit, the provisions of 430.81(A) should be permitted.
Panel Meeting Action: Accept in Principle
Add Exception No. 2 to read as follows:
Exception No. 2: A branch circuit disconnecting means serving as the controller as allowed in 430.81(A) shall be permitted to serve more than one motor.
Panel Statement: The revision is made to correct the difference between the recommended text and the submitter's substantiation. In addition the panel has replaced "overcurrent device" with "disconnecting means" to correlate with the panel action on Proposal 70-53A (Log #CP1100).
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-55 Log #1956 NEC-P11 **Final Action: Accept**
(430.91)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Delete the following text:
~~430.91 Motor Controller Enclosure Types. Table 430.91 provides the basis for selecting enclosures for use in specific locations other than hazardous (classified) locations. The enclosures are not intended to protect against conditions such as condensation, icing, corrosion, or contamination that may occur within the enclosure or enter via the conduit or unsealed openings. These internal conditions shall require special consideration by the installer and user.~~
~~Table 430.91 Motor Controller Enclosure Selection.~~
Substantiation: This proposal is made as part of a suggestion for dealing with Comments that were HELD during the 2005 cycle. Four Comments (1-229, 1-230, 1-231, and 1-233) on Proposal 1-157 were held, with the Panel Statement on the other three referring back to the Panel Action and Statement on 1-231. This proposal builds upon Proposals 1-152 and 1-157 of the 2005 cycle, and is essentially the same as Comment 1-231.
Due to lack of any other guidance within the Code, Table 430.91 has been applied to enclosures for numerous kinds of equipment, even though it is stated as applying only to motor controller enclosures. This has resulted in considerable confusion. Bringing the requirements of 430.91 into a general application area of the Code and specifically stating the kinds of equipment to which they apply will add clarity. The equipment types in the list all are required, by existing industry standards, to use a Type number marking.
Therefore, a companion proposal proposes creating a new 110.20 from 430.91, and Table 430.91. 430.91 and Table 430.91 should be deleted ONLY IF proposed new 110.20 is accepted.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
CACCAMESE, J.: This proposal should be accepted pending determination of the action by Panel 1 for Article 110 regarding the relocation of the information presently located in section 430.91 and Table 430.91.

11-56 Log #2106 NEC-P11 **Final Action: Accept**
(Table 430.91)

TCC Action: The Technical Correlating Committee directs that this proposal be sent to Code-Making Panel 1 for action. This action will be considered by Code-Making Panel 1 as a Public Comment. The actions taken on Proposals 1-95 and 11-55 relocates Table 430.91 to 110.20.
Submitter: Jim Wiseman, Schneider Electric
Recommendation: Revise Table 430.91 as shown below:

[Proposal 11-56 (Log #2106)]

Second and third lines of Table 430.91 presently show the following:

	3	3R	3S	3X	3RX	3SX	4	4X	6	6P
Rain, snow, and sleet	X	X	X	X	X	X	X	X	X	X
Sleet[2]	—	—	X	—	—	X	—	—	—	—

Change those lines to read:

	3	3R	3S	3X	3RX	3SX	4	4X	6	6P
Rain, snow, and sleet	X	X	—	X	X	—	X	X	X	X
Rain, snow and sleet[2]	—	—	X	—	—	X	—	—	—	—

Substantiation: Table 430.91 does not readily show the distinction between either Type 3 and Type 3S or Type 3X and Type 3SX enclosures. A Type 3 enclosure provides a degree of protection against rain, snow, and sleet. A Type 3S enclosure also provides a degree of protection against rain, snow, and sleet, but additionally, its mechanism shall be operable when ice covered (as stated in footnote 2 .) The same relationship exists between Types 3X and 3SX. These distinctions are more readily seen with the Table information presented as proposed.
Panel Meeting Action: Accept
Panel Statement: The panel agrees with the recommendation but refers to the panel actions on Proposals 11-7 and 11-55. The panel recommends that this proposal be referred to Panel 1 for action as a public comment.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-57 Log #69 NEC-P11 **Final Action: Reject**
(430, Part VIII)

Submitter: Michael Rytelewski, Rytel Electric #8372
Recommendation: Add new text to read:
<u>All industrial control panels and motor control cubicles that are a part of the motor control center assembly, shall conform to the requirements of Article 409.</u>
Substantiation: The addition of adding Article 409 to Article 430 part VIII would ensure that all control panels would adhere to the same standard, Article 409.
Panel Meeting Action: Reject
Panel Statement: Factory built equipment is specially designed and manufactured for installation in a motor control center. These parts are intended to be installed using existing provisions within Article 430.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-58 Log #2644 NEC-P11 **Final Action: Accept**
(430.95)

Submitter: Kevin J. Lippert, Eaton Corporation
Recommendation: Revise text to read:
430.95 Service ~~Entrance~~ Equipment.
The proposal addresses only the title, the actual requirement remains unchanged.
Substantiation: The word "Entrance" should be deleted. Throughout the Code, the term "service entrance" is usually reserved for identifying the service conductors/cables. When referring to equipment, the correct term is "service equipment".
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-59 Log #251 NEC-P11 **Final Action: Reject**
(430.97(A))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
Busbars shall be protected from ~~physical~~ damage and be held firmly in place.
Substantiation: Use of the word "physical" is superfluous - the purpose is obvious.
Submitting proposals removing the adjective "physical" may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every unnecessary instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in

1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" Ballot Results: Affirmative: 15

11-60 Log #1209 NEC-P11 **Final Action: Reject**
(430.102(A))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise as follows:
430.102 Location.
(A) Controller. An individual disconnecting means shall be provided for each controller and shall disconnect the controller. The disconnecting means shall be located in sight from <u>and readily accessible from</u> the controller location.
Substantiation: There are instances that arise in the field where a window is between the controller and the disconnecting means required by this section, yet if a workman had to access it or monitor it from being closed while he or she were working on the controller, it could present a safety issue. Adding the requirement that the disconnect also be readily accessible from the controller location would give enforcement and industry clear guidelines to apply in the field.
Panel Meeting Action: Reject
Panel Statement: The disconnecting means for the controller is not always required to be readily accessible from the controller. See 430.107 for readily accessible requirements. Existing Code text requires that at least one of the disconnecting means be readily accessible.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 12 Negative: 3
Explanation of Negative:
CACCAMESE, J.: In addition to the substantiation provided by the submitter, a window as a barrier for example, there are other obstacles (elevation, fencing, and inaccessible terrain) that would prevent access even though a disconnect is "within sight". The submitter's concern is well founded, and even though section 430.107 provides the "readily accessible" requirements, further evaluation is warranted due to safety issues associated with controller disconnect accessibility.
FAHEY, R.: The panel action should have been to accept this proposal to revise Section 430.102(A). The submitter has provided adequate substantiation in that a safety issue exists in the present Code. The purpose of disconnecting means requirements is to provide a safe installation during testing and maintenance of motors and driven machinery. There have been instances where the controller was located in a locked room with a window between it and the motor and its driven machinery but still met the definition of "within sight of".
If the disconnects are important enough to be within sight of both the controller and the motor, the disconnects should then be important enough to be readily accessible, and capable of being reached quickly for operation.
CMP-11 took a bold step towards enhancing worker safety during the 2002 code cycle. If the panel chooses to reject this proposal, it would be contradictive to those panel actions based on the substantiation presented at that time. Acceptance of this proposal will give the AHJ an avenue to enforce the purpose of disconnecting means requirements and provide much needed worker safety.
TODD, L.: Disconnecting means should be readily accessible even if covered in other sections, since there seems to be confusion adding it here would make the situation safer for workers. I agree with the commens of Mr. Caccamese.

11-61 Log #1211 NEC-P11 **Final Action: Reject**
(430.102(A))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise as follows:
430.102 Location.
(A) Controller. An individual disconnecting means shall be provided for each controller and shall disconnect the controller. The disconnecting means shall be located in sight from <u>and accessible from</u> the controller location.
Substantiation: There are instances that arise in the field where a window is between the controller and the disconnecting means required by this section, yet if a workman had to access it or monitor it from being closed while he or she were working on the controller, it could present a safety issue. Adding the requirement that the disconnect also be readily accessible from the controller location would give enforcement and industry clear guidelines to apply in the field.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 11-60. In addition, the definition of "in sight from" allows up to 50 feet between the disconnecting means and the controller. The disconnecting means and the controller do not have to be accessible from each other.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 12 Negative: 3
Explanation of Negative:
CACCAMESE, J.: See my explanation of negative vote on Proposal 11-60.
COLE, T.: Having worked in industrial establishments, I have seen the condition arise which the submitter is referring to. There are many situations in which control rooms are kept locked so that only operators have access. Since this is a control room there are always windows which one can look through to see the controller. Locating a disconnect in this controlled access room and having the controller on the other side of a locked door does not enhance safety in case of an emergency. By adding the words <u>and accessible from</u> would ensure under emergency situations that the disconnect could be deactivated. Time is of the essence when someone is either hung up in the equipment or is being electrocuted.
TODD, L.: See my explanation of negative vote on Proposal 11-60.

11-62 Log #3447 NEC-P11 **Final Action: Reject**
(430.102(A) Exception No. 1)

Submitter: Louis A. Barrios, Jr., Shell Global Solutions
Recommendation: Modify existing Exception No. 1 to read:
~~For motor circuits over 600 volts, nominal, a~~ <u>A</u> controller disconnecting means capable of being locked in the open position shall be permitted to be out of sight of the controller, provided the controller is marked with a warning label giving the location of the disconnecting means.
Substantiation: Removing the restriction that this exception only applies to motor circuits over 600 volts would afford the same level of protection whether the motor circuit was 4160V or 480V. This proposal is an alternative to the proposal to add a new Exception No. 3 to 430.102(A).
Panel Meeting Action: Reject
Panel Statement: No documentation has been provided to reduce the level of safety by expanding
the exception for under 600 volt motor circuits. Allowing this exception for lower voltages may reduce worker safety. For under 600 volt equipment, the physical limitations that apply to over 600 volt equipment do not apply.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
GLOVER, W.: The action on this proposal should have been Accept.
The proposal does not reduce safety, but applies the same rules to equipment less than 600V. Current code wording sometimes requires the installation of redundant disconnects. Redundant disconnects may sometimes be convenient, but they do not improve safety and they do add cost. This is specifically the case for motor operated valves (MOVs) as discussed in Proposals 11-63 and 11-81.

11-63 Log #3446 NEC-P11 **Final Action: Reject**
(430.102(A) Exception No. 3 (New))

Submitter: Louis A. Barrios, Jr., Shell Global Solutions
Recommendation: Add a new Exception No. 3 to read:
In industrial installations with written safety procedures, where conditions of maintenance and supervision ensure that only qualified persons service the equipment, the disconnecting means shall not be required to be in sight from the motor and the driven machinery location provided the disconnecting means is individually capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed.
Substantiation: The controllers for motor operated valves installed in industrial facilities are typically integral (installed in the same enclosure) as the motor. These valves are supplied by 3-phase 480V power remotely from the valve by a feeder fused disconnect switch or circuit breaker located in a motor control center or outdoor switchrack. The proposed new exception, similar to the one already approved for the motor disconnecting means, would permit safely isolating and locking out the motor operated valve without having to install a redundant disconnecting means at the MOV.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: Upon evaluation of 430.102(B) the requested exception already exists. Reference is made to the submitter's recommendation which addresses the disconnecting means with respect to the motor and driven machinery location. The illustration in the substantiation is for a motor with an integral controller.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
GLOVER, W.: The action on this proposal should have been Accept.
The exception granted in 430.102(B) may not accommodate the situation presented in the submitter's substantiation. The submitter is specifically requesting an extension to this exception (for motors) to allow the same exception (for controllers) in the case of motor operated valves (MOVs). The question arises as a result of the controller location, which in the case of MOVs is integral with the motor. The 430.102(B) exception exempts the motor disconnecting means from being in sight of the motor if all conditions are met, it does not specifically exempt the controller disconnecting means from being

within sight of the controller.

The panel may find it preferable to implement a separate section for MOVs as suggested in Proposal 11-81 or removal of the 600V limitation as suggested in Proposal 11-62.

11-64 Log #1212 NEC-P11 **Final Action: Reject**
(430.102(B))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise as follows:

(B) Motor. A disconnecting means shall be located in sight from <u>and accessible from</u> the motor location and the driven machinery location.

Substantiation: There are instances that arise in the field where a window is between the motor and the disconnecting means required by this section, yet if a workman had to access it or monitor it from being closed while he or she were working on the motor or driven machinery, it could present a safety issue. Adding the requirement that the disconnect also be readily accessible from the motor and driven machinery location would give enforcement and industry clear guidelines to apply in the field.

Panel Meeting Action: Reject

Panel Statement: See the panel action and statement on Proposal 11-66. In addition, the definition of "in sight from" allows up to 50 feet between the disconnecting means and the motor. The disconnecting means and the motor do not have to be accessible from each other.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

CACCAMESE, J.: See my explanation of negative vote on Proposal 11-60.

COLE, T.: Having worked in industrial establishments, I have seen the condition arise which the submitter is referring to. There are many situations in which control rooms are kept locked so that only operators have access. Since this is a control room there are always windows which one can look through to see the controller. Locating a disconnect in this controlled access room and having the controller on the other side of a locked door does not enhance safety in case of an emergency. By adding the words <u>and accessible from</u> would ensure under emergency situations that the disconnect could be deactivated. Time is of the essence when someone is either hung up in the equipment or is being electrocuted.

11-65 Log #1267 NEC-P11 **Final Action: Reject**
(430.102(B))

Submitter: Mark Shapiro, Farmington Hills, MI
Recommendation: Revise to read:

"Motor. A disconnecting means shall be located in sight from the motor location ~~and the driven machinery location~~ ."

Substantiation: The requirement here, under the title "Motors" is to also have a disconnect in sight of the driven machinery. There are numerous cases where large parts of driven machinery are not in sight of their motors. This requirement became a problem, in a way that it was not before, with the revision of this section in the 2002 NEC.

Before the 2002 revision to this section, the exception to 430.120(B) was really the rule. Then, a lockable disconnect ahead of the controller took care of all of the elements mentioned in this section; the controller, the motor, and the driven machinery. Now, (B) is the default and the exception is truly secondary. In the past, this was not an issue, relative to the driven machinery, because the disconnect at the controller is generally manufactured to be lockable.

The unintended consequence of the '02 change, to require disconnects in sight of motors, was to also create a tougher rule for the driven machinery. If the machinery is a conveyer line that snakes around a warehouse, the literal reading of the rule now requires a disconnecting means at every point where the conveyer makes a turn. There must be a lot of conveyers in violation, because I have never seen this done.

For long presses and transfer lines represent other cases where the machinery could easily be out of sight of its motor and there could be the need for disconnects in sight of the driven machinery.

Keep in mind that for the purposes of this section, we are talking about a horsepower-rated disconnect, not a push-button or an E-stop cord that will signal a controller.

However, for installations where this could present a problem, there are safety standards, such as the ANSI B11 series, that do address the issue. They outline providing means to control the power without needing these multiple disconnects.

Panel Meeting Action: Reject

Panel Statement: The panel contends that the disconnecting means shall be located within sight of the motor and driven machinery location. The requirement that the disconnecting means be in sight of the driven machinery affords needed safety for personnel servicing the driven machinery. "Within sight of the driven machinery" does not necessarily mean within sight of the entire machine.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

11-66 Log #1307 NEC-P11 **Final Action: Reject**
(430.102(B))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read:

(B) Motor. A disconnecting means shall be located in sight from <u>and readily accessible from</u> the motor location and the driven machinery location.

Substantiation: There are instances that arise in the field where a window is between the motor and the disconnecting means required by this section, yet if a workman has to access it or monitor it from being closed while he or she were working on the motor or driven machinery, it could present a safety issue. Adding the requirement that the disconnect also be readily accessible from the motor and driven machinery location would give enforcement and industry clear guidelines to apply in the field.

Panel Meeting Action: Reject

Panel Statement: The disconnecting means for the motor is not always required to be readily accessible from the motor. See 430.107 for readily accessible requirements. Existing Code text requires that at least one of the disconnecting means be readily accessible.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

CACCAMESE, J.: See my explanation of negative vote on Proposal 11-60.

FAHEY, R.: The panel action should have been to accept this proposal to revise Section 430.102(B). The submitter has provided adequate substantiation in that a safety issue exists in the present Code. The purpose of disconnecting means requirements is to provide a safe installation during testing and maintenance of motors and driven machinery. There have been instances where the controller was located in a locked room with a window between it and the motor and its driven machinery but still met the definition of "within sight of".

If the disconnects are important enough to be within sight of both the controller and the motor, the disconnects should then be important enough to be readily accessible, and capable of being reached quickly for operation.

CMP-11 took a bold step towards enhancing worker safety during the 2002 code cycle. If the panel chooses to reject this proposal, it would be contradictive to those panel actions based on the substantiation presented at that time. Acceptance of this proposal will give the AHJ an avenue to enforce the purpose of disconnecting means requirements and provide much needed worker safety.

11-67 Log #2704 NEC-P11 **Final Action: Accept**
(430.102(B))

TCC Action: The Technical Correlating Committee directs the panel to review the action on Proposals 11-67 and 11-68 and revise their action to make it clear as to what part of 430.102(B) the Exception is intended to apply. This action will be considered by the Panel as a Public Comment.

Submitter: Dorothy Kellogg, American Chemistry Council
Recommendation: Revise text to read:

(B) Motor. A disconnecting means shall be located within sight from the motor location and the driven machinery location. <u>The disconnecting means required in accordance with 430.102(A) shall be permitted to serve as the disconnecting means for the motor if it is located in sight from the motor location and the driven machinery location.</u>

Exception: The disconnecting means shall not be required to be in sight from the motor and driven machinery location under either condition (a) or (b), provided the disconnecting means required in accordance with 430.102(A) is individually capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed.

(a) Where such a location of the disconnecting means is impracticable or introduces additional or increased hazards to persons or property.

(b) In industrial locations, with written safety procedures, where conditions of maintenance and supervision ensure that only qualified persons service the equipment.

FPN No. 1: Some examples of increased or additional hazard include, but are not limited to, motors rated in excess of 100 hp, multimotor equipment, submersible motors, motors associated with adjustable speed drives, and motors located in hazardous (classified) locations.

FPN No. 2: For information on lockout/tagout procedures, see NFPA-70E-2004, Standard for Electrical Safety in the Workplace.

~~The disconnecting means required in 430.102(A) shall be permitted to serve as the disconnecting means for the motor if it is located in sight from the motor location and the driven machinery location.~~

Substantiation: The last sentence of 430.102(B) is causing NEC users to question the application of the exception. This sentence location gives the impression of contradicting the exception. The last sentence is a continuation of the idea expressed in this section and should follow immediately after the first sentence. The remainder of the text expresses and explains an exception to the general rule and should follow the complete expression of the general rule to eliminate this confusion.

Panel Meeting Action: Accept

Panel Statement: The panel notes that only the changes identified by legislative text are intended and the action on Proposal 11-68 is not affected.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
GOETZ, C.: Acceptance of this proposal undoes panel action from the 2005 cycle. Additionally, when taken together with panel action on proposal 11-68, the resulting revision to 430.102(B) seems to allow both the disconnect in sight of the motor (first sentence) and the disconnect in sight of the controller (second sentence), covered by section 430.102(A), to be absent from a motor installation. This would create confusion over what is intended by Section 430.102(A) which does not include a similar exception. The submitters concerns would be addressed by revising section 430.102 (B) to individually number the two sentences as follows:
430.102(B) Motor.
(1) A disconnecting means shall be located within sight from the motor location and the driven machinery.
Exception: (text and FPN's as shown in proposal 11-68)
(2) The disconnecting means required by 430.102(A) shall be permitted to serve as the disconnecting means for the motor if it is located in sight from the motor location and the driven machinery location.

11-68 Log #1732 NEC-P11 **Final Action: Accept in Principle**
(430.102(B) Exception)

TCC Action: See Technical Correlating Committee Note on Proposal 11-67.
Submitter: Paul S. Hamer, Chevron Texaco Energy Research and Technology Company
Recommendation: Revise as follows:
(B) Motor. A disconnecting means shall be located in sight from the motor location and the driven machinery location.
Exception: The disconnecting means shall not be required to ~~be in sight from the motor and the driven machinery location~~ under either condition (a) or (b), provided the disconnecting means required in accordance with 430.102(A) is individually capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed.
(a) Where such a location of the disconnecting means is impracticable or introduces additional or increased hazards to persons or property.
(b) In industrial installations, with written safety procedures, where conditions of maintenance and supervision ensure that only qualified persons service the equipment.
FPN No. 1: Some examples of increased or additional hazards include, but are not limited to, motors rated in excess of 100 hp multimotor equipment, submersible motors, motors associated with adjustable speed drives and motors located in hazardous (classified) locations.
FPN No. 2: For information on lockout/tagout procedures, see NFPA 70E-2004, Standard for Electrical Safety in the Workplace.
The disconnecting means required in accordance with 430.102(A) shall be permitted to serve as the disconnecting means for the motor if it is located in sight from the motor location and the driven machinery location.
Substantiation: This proposal corrects an error in transcription from the 2005 NEC cycle. See Proposal 11-65 (Log #1122) from the May 2004 Report on Proposals.
Note: Supporting Material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Revise the first sentence of the exception to read as follows:
Exception: The disconnecting means shall not be required ~~to be in sight from the motor and the driven machinery location~~ under either condition (a) or (b), provided the disconnecting means required in accordance with 430.102(A) is individually capable of being locked in the open position.
Panel Statement: The panel has corrected an editorial oversight by removing the word "to".
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-69 Log #1268 NEC-P11 **Final Action: Reject**
(430.102(B) Exception)

Submitter: Mark Shapiro, Farmington Hills, MI
Recommendation: Revise the exception to broaden the permission to use "written safety procedures" beyond industrial installations.
(B) In ~~industrial~~ installations, with written safety procedures, where <u>the</u> conditions of maintenance and supervision ensure that only qualified persons service the equipment.
Substantiation: This proposal differs from a companion proposal by allowing "written safety procedures" in all types of buildings.
I occasionally consult with a major university where I have been impressed with the very professional level of their engineering and electrical departments. They have rigorous lockout tag out and safe work practices programs. And, I have more confidence that they will use those programs than I have for many an industrial plant. But, because hey are not industrial, they cannot use this exception.
Panel Meeting Action: Reject
Panel Statement: It is not the intent of Panel 11 to reduce the level of safety by expanding the
exception for other than industrial installations. Section 90.4 provides a possible solution for the submitter.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
CACCAMESE, J.: The panel reaffirms the need to maintain the language in the code that helps to protect workers involved in maintenance and repair.

11-70 Log #1269 NEC-P11 **Final Action: Reject**
(430.102(B) Exception)

Submitter: Mark Shapiro, Farmington Hills, MI
Recommendation: Revise the exception to broaden the permission to use "written safety procedures" beyond industrial installations.
(b) In industrial, <u>commercial or institutional</u> installations, with written safety procedures, where <u>the</u> conditions of maintenance and supervision ensure that only qualified persons service the equipment.
Substantiation: This proposal differs from a companion proposal by allowing "written safety procedures" only in industrial, commercial, or institutional installations. I prefer the companion proposal but include this version in case the panel does not wish to broaden the rule to allow it to apply in all types of buildings and installations.
I occasionally consult with a major university where I have been impressed with the very professional level of their engineering and electrical departments. They have rigorous lockout tagout and safe work practices programs. And, I have more confidence that they will use those programs than I have for many an industrial plant. But, because they are not industrial, they cannot use this exception.
Panel Meeting Action: Reject
Panel Statement: It is not the intent of Panel 11 to reduce the level of safety by expanding the
exception for other than industrial installations. Section 90.4 provides a possible solution for the submitter.

(430.103)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Add:
The disconnecting means shall be designed so that it cannot be closed automatically.
Substantiation: The ubiquitous time (clock) switch appears to meet the criteria for motor disconnect means and controllers in 430.104, 430.109(C), 430.110(A), 430.111(A) and (B)(1), 430.81(A) and 430.83(C). Although they have an external level operated switch mechanism, if the clock motor continues to run it can automatically return to the on position, after manually being switched off.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-72 Log #1099 NEC-P11 **Final Action: Reject**
(430.108)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Change "requirements" to "provisions."
Substantiation: Edit. The phrase "shall be permitted" through 430.109 and 430.110 do not indicate requirements, per se, but alternatives.
Panel Meeting Action: Reject
Panel Statement: The term "requirements" is used as the preferred term for clarity and is mandatory in nature and complies with 3.2.1 of the NEC Style Manual.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-73 Log #1146 NEC-P11 **Final Action: Accept in Principle**
(430.108)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:
Every disconnecting means in the motor branch circuit ~~between the point of attachment to the feeder and the point of connection to the motor~~ shall comply with the requirements of 430.109 and 430.110.
Substantiation: Edit. Branch circuit covers the superfluous description. All branch circuits do not originate from a feeder, e.g., where supplied directly from the service equipment, where the present requirement does not apply.
Panel Meeting Action: Accept in Principle
Revise 430.108 to read as follows:
430.108 Every disconnecting means in the motor circuit between the point of attachment to the feeder or branch circuit and the point of connection to the motor shall comply with the requirements of 430.109 and 430.110
Panel Statement: The panel action should meet the submitter's intent as indicated in his substantiation.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-74 Log #1015 NEC-P11 **Final Action: Reject**
(430.109(A)(1))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:
A listed motor circuit switch, rated in horsepower suitable for the current type, (ac or dc), number of phases to be disconnected, and a horsepower rating at the applicable voltage not less than the motor horsepower. For combination loads, the disconnecting means current and horsepower ratings shall be in accordance with 430.110(C).
Substantiation: Horsepower ratings are based on voltage, current type, number of phases. I have seen installations where switch ratings were based on arithmetic addition of horsepowers and currents, since many do not seem to be aware of the requirements of 430.110(C), and almost always result in lower ratings than required.
Panel Meeting Action: Reject
Panel Statement: Motor circuit switches are investigated under UL 98. The UL marking requirements under this standard should satisfy the submitter's concerns.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-75 Log #1080 NEC-P11 **Final Action: Accept in Principle in Part**
(430.110 Exception)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
Exception: A listed ~~nonfused~~ motor circuit switch without fuseholders having a horsepower rating not less than the motor horsepower, or a molded case switch shall be permitted to have an ampere rating not less than ~~115~~ 100 percent of the full-load current rating of the motor.
Substantiation: Edit. Nonfusible motor-circuit switches and molded case switches are rated for current at 100 percent of their rating. Motor nameplates do not have current, but current ratings. Molded case switches are permitted in 430.109(A). I believe the term "without fuseholders" is used by UL. A fuseholder that is jumped would be nonfused.
Panel Meeting Action: Accept in Principle in Part
Revise the exception to read:
Exception: A listed ~~nonfused~~ unfused motor circuit switch, without fuseholders, having a horsepower rating not less than the motor horsepower shall be permitted to have an ampere rating less than 115 percent of the full-load current rating of the motor.
Panel Statement: The panel rejects the change "not less than 100 percent." The exception reflects the same percentage value as does the main rule. The panel rejects the addition of the words "or a molded case switch." The remainder of the proposal is accepted to be consistent with the product standards. Molded case switches are rated in amperes. The exception does not apply to molded case switches.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-76 Log #2131 NEC-P11 **Final Action: Accept in Principle**
(430.110(C)(1))

Submitter: Russell LeBlanc, Peterson School of Engineering
Recommendation: Before the exception add these words after the last sentence:
In cases where different horsepower ratings are obtained when applying these tables, a rating at least equal to the larger of the values obtained shall be used.
Substantiation: It's unclear what to do when different values are obtained.
440.12(A)(2) has wording to explain what needs to be done.
Panel Meeting Action: Accept in Principle
Before the exception, add these words after the last sentence:
In cases where different current ratings are obtained when applying these tables, the largest value obtained shall be used.
Panel Statement: The panel changed the word "horsepower" to "current" as more appropriate to the action being performed.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-77 Log #1951 NEC-P11 **Final Action: Accept**
(430.126(A))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Revise 430.126(A) as shown:
(A) General. Adjustable Speed drive systems shall protect against motor overtemperature conditions ~~.~~ where the motor is not rated to operate at the nameplate rated current over the speed range required by the application . This ~~Overtemperature~~ protection shall be provided ~~is~~ in addition to the conductor protection required in 430.32. Protection shall be provided by one of the following means:
Change the word "controller" to "system" in 430.126 (A) (2)
(2) Adjustable speed drive system ~~controller~~ with load and speed sensitive overload protection and thermal memory retention upon shutdown or power loss.
Add the following exception to 430.126(A)(2):
Exception 1: Thermal memory retention upon shutdown or power loss is not required for continuous duty loads.
Modify 430.126 (A)(4) as indicated:
(4) Thermal sensor embedded in the motor whose communications are ~~that is~~ received and acted upon by an adjustable speed drive system .
Relocate FPN from 430.126(C) to 430.126(A), and revise as follows:
FPN: The relationship between motor current and motor temperature changes when the motor is operated by an adjustable speed drive. In certain applications, overheating of motors can occur ~~W~~ w hen operated at reduced speed, ~~overheating of motors may occur~~ even at current levels less than ~~or equal to~~ a motor's rated full load current. ~~This is~~ The overheating can be the result of reduced motor cooling when its shaft-mounted fan is operating less than rated nameplate RPM. As part of the analysis to determine whether overheating will occur, it is necessary to consider the continuous torque capability curves for the motor given the application requirements. This will assist in determining whether the motor overload protection will be able, on its own, to provide protection against overheating. These overheating protection requirements are only intended to apply to applications where an adjustable speed drive, as defined in 430.2, is used.
For motors that utilize external forced air or liquid cooling systems, overtemperature can occur if the cooling system is not operating. Although this issue is not unique to adjustable speed applications, externally cooled motors are most often encountered with such applications. In these instances, overtemperature protection using direct temperature sensing is recommended (i.e. 430.126(A)(1), (A)(3) or (A)(4)) or additional means should be provided to assure that the cooling system is operating (flow or pressure sensing, interlocking of adjustable speed drive system and cooling system, etc.).
Substantiation: Requirements for overtemperature are application dependent and are not required in all circumstances. The revision to 430.126(A) reflects conditions where such protection is needed, as given in the original substantiation for the addition of this section.
The means to provide overtemperature protection are not limited to the controller or drive and can be part of the system.
The exception recognizes that the thermal memory requirements are intended mainly for protection of short-time, intermittent, periodic or varying duty loads. The FPN is relocated and revised as it more appropriately applies to all adjustable speed drives, not to only multiple motor applications, but does not apply in all applications. The additional text in the FPN is intended to provide guidance to help AHJs in their consideration of the analysis of potential motor overheating. The additional text in the FPN is intended to provide guidance to help AHJs in their consideration of the analysis of potential motor overheating when forced air or liquid cooling systems are used to obtain the desired motor torque capability over the speed range required by the application. When the forced cooling is present and functioning, overtemperature protection is provided by the overload protection mechanism. This FPN text addition supports the NEMA proposal to remove section 430.126(B).
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
HAMER, P.: The proposed Exception No. 1 should not be included. Thermal memory is necessary to avoid damage to the motor if it is subject to repeated accidental overloads, even if the load is classified as "continuous duty."

11-78 Log #3114 NEC-P11 **Final Action: Reject**
(430.126(A)(1))

Submitter: Jeffrey Small, General Electric
Recommendation: Add text to read as follows:
A thermal protector shall not be used on constant torque applications where motor current does not decrease as motor speed decreases, unless motor is marked for conditions.
Substantiation: Motors in constant torque applications are at risk of thermal when the current is below nameplate current, unless motor is specifically designed and rated for the purpose.
Panel Meeting Action: Reject
Panel Statement: No technical information provided to substantiate a problem exists with present overtemperature requirements for constant torque motors; therefore the panel does not concur with the need to omit these types of motors from having overtemperature protection.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-79 Log #1952 NEC-P11 **Final Action: Accept**
(430.126(B))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Delete 430.126(B) and the associated FPN.
~~(B) Motors with Cooling Systems. Motors that utilize external forced air or liquid cooling systems shall be provided with protection that shall be continuously enabled or enabled automatically if the cooling system fails.~~
~~FPN: Protection against cooling system failure can take many forms. Some examples of protection against inoperative or failed cooling systems are direct sensing of the motor temperature as described in 430.32(A)(1), (A)(3), and (A)(4) or sensing of the presence or absence of the cooling media (flow or pressure sensing).~~
Renumber items (C) and (D) accordingly.
Note: This is a companion proposal to 430.126(A), see second paragraph of proposed FPN.
Substantiation: Since 430.126(A) covers all types of motors, including those with an external source of cooling, and the method of thermal protection should provide continuous protection against overheating during operation, regardless of the cause, then 430.126(B) is unnecessary. There would be no change in the requirements for continuous thermal protection of such motors if 460.126(B) is removed.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-80 Log #1948 NEC-P11 **Final Action: Accept**
(430.126(C))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Recommendation: Revise text to read as follows:
430.126(C) Multiple Motor Applications.
For multiple motor applications, individual motor overtemperature protection shall be provided as required in 430.126(A) .
Relocate FPN from 430.126(C) to 430.126(A).
Note: This is a companion proposal to 430.126(A).
Substantiation: Provides guidance to where and how overtemperature protection for multiple motors shall be provided for multiple motor applications.
Panel Meeting Action: Accept
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-81 Log #1693 NEC-P11 **Final Action: Reject**
(430.150)

Submitter: Paul E. Guidry, Fluor Enterprises, Inc.
Recommendation: Add text to read as follows:
Article 430, Part XI. Valve Actuator Motors.
430.150 General. The installation provisions of Part I through Part 1X are applicable unless modified or supplemented by Part XI.
430.151 Marking on Valve Actuator Motors
(A) Usual Valve Actuator Motor Applications. A valve actuator motor shall be marked with the following information:
(1) Manufacturer's name.
(2) Rated voltage
(3) Rated frequency and number of phases of an ac motor
(4) Rated full load speed
(5) Rated ambient temperature
(6) Time rating. The time rating shall be in seconds or minutes.
(7) Insulation class
(8) Connection diagram
(9) Enclosure type
(10) Duty
(11) Order number
(12) Serial number
Additional information regarding operation characteristics, manufacturer, and the like shall be permitted to be included on the nameplate.
430.152 Motor Branch-Circuit Short-Circuit and Ground-Fault Protection
(A) The valve actuator motor branch circuit short-circuit and ground-fault protective device rating shall be determined under engineering supervision and shall comply with Article 240.
430.153 Protection Conductors - Minimum Size and Ampacity.
(A) Branch/Feeder Circuit Conductors, 600V and less. Circuits conductors supplying valve actuator motors shall comply with Article 310.
430.154 Overload Protection.
(A) Valve actuator motors shall contain overload protection provided by the valve manufacturer as part of the actuator motor assembly.
430.155 Disconnecting Means. This section is intended to require disconnecting means for each valve actuator motor capable of disconnecting the valve actuator motor and controller from the source of supply.
(A) Minimum Size. The disconnecting means may be an integral part of the motor branch-circuit short-circuit ground-fault device. If a remote disconnecting means is used it shall have a rating not less than the branch-circuit short-circuit ground-fault protection device that is protecting the circuit.
(B) Controller. An individual disconnecting means shall be provided for each controller and shall disconnect the controller. The disconnecting means shall be located in sight of the controller location.
Exception: The disconnecting means shall not be required to be in sight from the controller under either condition (a) or (b), provided the disconnecting means is capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed.
(a) Where such location of the disconnecting means introduces additional or increased hazards to persons or property
(b) In industrial locations, with written safety procedures, where conditions of maintenance and supervision ensure that only qualified persons service the equipment.
(c) Motor. A disconnecting means shall be located within sight from the valve actuator motor location.
Exception: The disconnecting means shall not be required to be in sight from the motor under either condition (a) or (b), provided the disconnecting means is capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed.
(a) Where such location of the disconnecting means introduces additional or increased hazards to persons or property
(b) In industrial locations, with written safety procedures, where conditions of maintenance and supervision ensure that only qualified persons service the equipment.
FPN No. 1: An example of increased or additional hazard is where the motor operated valve is used for a process emergency shutdown and the failure of the disconnecting means near the motor operated valve controller would prevent the valve from operating.
FPN No. 2: For information on lockout/tagout procedures, see NFPA 70E-2004, Standard for Electrical Safety in the Workplace.
430.156 Haza rdous (Classified) Locations. Valve actuator motors located in hazardous (classified) locations shall comply with 500.8, 501.125(A)(1) and 501.125(B).
430.157 Grounding. Valve actuator motors shall be grounded in accordance with Article 250.
Substantiation: This is a companion proposal for a new addition for valve actuator motors. Companion proposal section numbers are: Figure 430.1, 430.2, and 430.6(D).
The NEC doesn't presently address valve actuator motors. Users in the industrial/petrochemical have tried for years to apply Article 430 to valve actuator motors without success. These motors do not fit into many of the present rules that are in Article 430. I believe they need their own section and special rules.
Panel Meeting Action: Reject
Panel Statement: While the scope of Article 430 does cover valve actuator motors, additional provisions may be needed to adequately address the application of this equipment. However, there are a number of issues raised by the submitter's proposal that need to be better addressed.
The panel is concerned that the proposed requirements could be applied in cases where they are not warranted such as valve modulating motors. In addition, the proposed requirements related to wire sizing overcurrent protective device sizing and the need for a disconnecting means for the motor controller are not well specified or addressed. Information from the valve actuator manufacturer is needed in order to more precisely specify requirements for this equipment.
The panel also notes that general references to other articles without providing specific sections are not permitted by the manual of style. In

addition, addressing hazardous location applications is outside the scope of this article.

The panel suggests using the current structure of Article 430 and in particular Section 430.22(E) and providing the modifications necessary to accommodate valve actuator motors within this structure.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 2

Explanation of Negative:

CACCAMESE, J.: The addition of new Part XI provides a necessary means to provide a method to protect workers performing maintenance or repair/replacement to motorized actuators. I concur with the submitter that these units provide a unique application that differs from the motor types presently listed in Article 430.

GLOVER, W.: The action on this proposal should have been Accept in Principle.

Refer to my comments on Proposals 11-62 and 11-63. Acceptance of either of these proposals would accomplish the intent of this submitter that is not covered by existing Article 430 language.

11-82 Log #365 NEC-P11 **Final Action: Accept in Principle**
(430.227)

Submitter: Michael J. Johnston, Plano, TX

Recommendation: Revise text to read:

430.227 Disconnecting Means. The controller disconnecting means shall be capable of being locked in the open position. The provisions for locking or adding a lock to the disconnecting means must remain in place at the switch or circuit breaker whether the lock is installed or not. Portable means for adding a lock to the switch or circuit breaker shall not be permitted.

Substantiation: This proposed change in wording is to provide consistency between other similar rules in the NEC that also call for disconnecting means to be capable of being locked in the open position. The phrase "capable of being locked in the open position" is used over 25 times in the NEC and the purpose is the same in every instance. Electrical safety rules for the worker should be consistent and the wording and requirements should be consistent where this phrase is used. The last sentence is being proposed because there are claims that some of the portable units available for snapping on to circuit breakers do remain with the switch or circuit breaker after they are installed on the breakers when the lock is not installed, but they are portable. The actions by CMP 11 in the 2002 cycle in 430-102(B) Exception were fairly clear that the provisions for adding a lock should be more substantial and not portable units.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and substantiation on Proposal 11-83.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

CACCAMESE, J.: The additional sentence in this proposal "Portable means for adding a lock to a switch or circuit breaker shall not be permitted" is important and should be added to 430.102(B), 440.14 and all other sections in 430 and 440 that do not have this language. Without this language, the red plastic covers that snap over operating handles and would accept a lock would met the existing language.

11-83 Log #2037 NEC-P11 **Final Action: Accept**
(430.227)

Submitter: James T. Dollard, Jr., IBEW Local 98

Recommendation: Revise text to read as follows:

430.227 Disconnecting Means

The controller disconnecting means shall be capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed.

Substantiation: The problem with the present wording of this section is that the disconnect in many motor installations over 600-volts nominal is a circuit breaker in a switchboard/starter or a switch that is not made with permanent provisions for locking the circuit breaker or switch in the open position.

This requirement for a disconnect is for the safety of the installer/maintainer of the equipment. Permanent provisions for making circuit breakers and switches capable of being locked in the open position are readily available from circuit breaker and switch manufacturers.

This proposal does not represent a large increase in the cost of an installation but will result in a dramatic increase in safety.

Where motors at over 600-volts are installed we know that maintenance will take place, we must ensure that only a lock is needed by an installer/maintainer to work safely.

The practical safeguarding of persons from electrical hazards as detailed in the scope of the NEC must not be permitted to hinge on whether or not an installer just happens to have enough different types of devices and hopefully one that that happens to fit the circuit breaker or switch in an installation.

Note that this language was accepted by CMP-11 and is a present requirement, in the 2002 NEC, when a circuit breaker or switch is used as a disconnecting means not within sight of a motor. Also included in the 2005 NEC is the same language in 422.31 for appliances. The same level of safety is needed for these disconnecting means for motors operating at over 600 volts.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

11-84 Log #2178 NEC-P11 **Final Action: Accept in Principle**
(430.227)

Submitter: Dann Strube, Strube Consulting

Recommendation: Add new sentence:

The provisions for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed.

Substantiation: To match other code rules and to comply with OSHA rules.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and substantiation on Proposal 11-83.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

11-85 Log #95 NEC-P11 **Final Action: Reject**
(430.242)

Submitter: Adam Krouse, Dewitt, MI

Recommendation: Revise as follows:

"The frames of stationary motors shall be grounded ~~under any of the following conditions:~~ where not isolated or guarded."

Delete paragraphs (1) through (4).

Retain the last sentence.

Substantiation: This section is so permissive that it is not necessary to ground most electric motors that operate from a 120/240 volt single-phase electrical system, or a 208Y/120 volt 3-phase electrical system if supplied by a nonmetallic wiring method. All that needs to be done is to make sure the motor is insulated from ground. It does not matter whether the ungrounded motor is exposed to human contact. This would explain the numerous installations I find where motor powered equipment in industrial plants have the ground wires cut off and complaints of shocks from the equipment. Apparently, it is not necessary to ground all motors exposed to human contact.

Panel Meeting Action: Reject

Panel Statement: Only the frames of stationary motors that are isolated or guarded are not required to be grounded. Most motors in fact are required to be grounded in accordance with 430.242. No evidence has been provided to support the proposed revision.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

11-86 Log #1147 NEC-P11 **Final Action: Accept**
(430.242(3))

TCC Action: The Technical Correlating Committee directs the panel to clarify the action on this proposal as to whether or not they intend to include references to the other Articles between 500 and 517. This action will be considered by the panel as a public comment.

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Revise as follows:

(3) If in a hazardous (classified) location as described in 500.5 and 517.60 ~~covered in Articles 500 through 517.~~

Substantiation: Edit. To conform to Style Manual requirements.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

11-87 Log #106 NEC-P11 **Final Action: Accept**
(430.243)

Submitter: Brian Gregory, Linwood, MI

Recommendation: Revise as follows:

The frames of portable motors supplied by a premises wiring system ~~that operate at over 150 volts to ground~~ shall be ~~guarded or~~ grounded unless guarded or isolated from contact .

Substantiation: It does not seem reasonable that portable motors operating at less than 150 volts to ground that are supplied by a premises wiring system should be permitted to be operated ungrounded with frames of the equipment can make contact with personnel. If there are cases where motors should not be grounded, then allow for those cases.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

GOETZ, C.: While it is understood that the panel is attempting to improve safety, acceptance of this proposal without modification will have an impact on manufacturers of motor operated appliances, which must comply with Article 430 as noted in Section 422.3. Motor operated appliances that do not involve water or use in wet locations may be connected by a two conductor attachment plug. The listing requirements for such appliances operating at 150V or less to ground require leakage currents available between accessible metal parts and ground to be below prescribed limits during various operating conditions including, in some cases, high humidity conditions. The requirements in Section 250.114 appropriately cover grounding for residential and non-residential applications of motor operated appliances. Suggest that the current fine print note number 1 be revised to become an exception that refers all motor operated appliances to comply with 250.114. In addition, (portable) equipment, connected by a cord and plug, can be double insulated which is neither grounded nor guarded. Another exception is needed to permit listed double insulated equipment to be utilized without need for additional means. The text in the exception to 250.114 could be added as exception no. 2.

11-87a Log #916 NEC-P11 **Final Action: Accept in Principle**
(430.245)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise text:
~~Where required~~ Grounding shall be done in the manner specified in Part VI of Article 250.
Substantiation: Edit. Where grounding is not required, but done by choice, Article 250 should apply. Where done by choice present wording does not impose requirements. Code provisions are not limited to mandatory requirements and 110.12 applies to all wiring. 250.1(1) indicates Article 250 covers installations "permitted" and the proposal would correlate this section.
Panel Meeting Action: Accept in Principle
Revise the main paragraph of 430.245 to read as follows:
430.245 Method of Grounding. Connection to the equipment grounding conductor shall be done in the manner specified in Part VI of Article 250. [Remaining subparagraphs are unchanged.]
Panel Statement: The panel has removed the words "where required," as requested, and has made changes to correlate with the action on Proposal 11-1.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-88 Log #2208 NEC-P11 **Final Action: Reject**
(430.245(B))

Submitter: Kyle Cope, Prysmian Cables and Systems
Recommendation: Revise as follows:
"... provided the leads to the meter are stranded conductors within Type AC cable, <u>Type PA cable,</u> interlocked metal tape Type MC cable...".
Substantiation: Statement of problem: Material technology advancements now allow for cable designs that provide improved mechanical damage protection. i.e., crush and impact, over standard Type MC cable without sacrificing flame performance properties. The characteristics achieved using traditional metallic components can now be realized using polymeric materials. The use of polymeric materials also provides the opportunity for lighter and smaller diameter cables.
Substantiation for Proposal: Type PA has been proposed as a new type (Article 3XX) and should be included in this list (430.245(B)) as it offers enhanced mechanical benefits as an alternate to Type MC cable. See test data provided. A UL Fact-Finding study comparing the subject cable to type MC is ongoing at the time of proposal submittal. This data will be forwarded once the study is complete.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: Type PA cable is not currently recognized in Chapter 3 as an approved wiring method.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

ARTICLE 440 — AIR-CONDITIONING AND REFRIGERATING EQUIPMENT

11-90 Log #421 NEC-P11 **Final Action: Reject**
(440.2)

Submitter: Earl W. Roberts, Reptec
Recommendation: Change the title of "Leakage Current Detection and Interruption (LCDI) Protection" to:
"Leakage Current Detector and Interrupter (LCDI)"
Substantiation: The proposed change would correct the grammar and would correlate with the definitions of "GFCI" in Article 100 and "AFCI" in Article 210.
Panel Meeting Action: Reject
Panel Statement: Leakage Current Detection and Interruption is the phrase used by product standards and is an integral component of a cord set.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-91 Log #2843 NEC-P11 **Final Action: Reject**
(440.5)

Submitter: Doug Eckelkamp, Bell Electric
Recommendation: Revise text to read as follows:
440.5 Marking on Controllers. A controller shall be marked with the manufacturer's name, trademark, or symbol: identifying designation; voltage; phase; full-load and locked-rotor current (or horsepower) rating; <u>the short-circuit current rating</u> ; and such other data as may be needed to properly indicate the motor-compressor for which it is suitable.
<u>Exception No. 1: The short-circuit current rating is not required to be marked on the controller when the short-circuit current rating of the controller is marked elsewhere on the assembly.</u>
<u>Exception No. 2: The short-circuit rating is not required to be marked on the controller when the assembly into which it is installed has a marked short-circuit current rating.</u>
Substantiation: Correlation is needed within 430.8 as far as short-circuit current ratings are concerned. Exceptions found in 430.8 for controllers for very small motors are unnecessary.
Panel Meeting Action: Reject
Panel Statement: The submitter's concerns are already addressed in 440.4(B).
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
FAHEY, R.: The panel action should have been to accept this proposal to revise Section 440.5. I do not agree with the panel statement that the concerns of the submitter are addressed in 440.4(B). Section 440.4(B) addresses multi motor and combination load equipment, and are not enforceable in Section 440.5 which deals with controllers. Therefore, the short circuit current rating should also be required for controllers in Section 440.5.
Article 430 requires the short circuit current rating to be marked on multi motor and combination load equipment in 430.7(D)(1) and for controllers in 430.8. The additional marking requirement requested in the proposal for controllers in Article 440 should be consistent with the marking requirements in Article 430. By adding the short circuit current rating to the controller it would add consistency between Article 430 and 440, but more importantly add information that would give the installer guidance as to the amount of short circuit current the controller is capable of withstanding.

11-92 Log #1069 NEC-P11 **Final Action: Accept in Principle in Part**
(440.12(A)(1) Exception and (B)(2), Exception)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
(A)(1) Exception: A listed ~~nonfusible~~ motor circuit switch <u>without fuseholders</u> having a horsepower rating not less than the equivalent horsepower rating determined in accordance with 440.12(A)(2) <u>or a molded case switch</u> shall be permitted to have an ampere rating <u>not</u> less than <u>100</u> ~~115~~ percent of the specified current.
(B)(2) Exception: A listed ~~nonfused~~ motor circuit switch <u>without fuseholders</u> having a horsepower rating not less than the equivalent horsepower determined in accordance with 444.12(B)(1) <u>or a molded case switch</u> shall be permitted to have an ampere rating not less than ~~115~~ <u>100</u> percent of the sum of all currents.
Substantiation: Edit. A switch with jumpers across the fuseholders is nonfused. UL uses the phrase "without fuseholders". Such motor circuit switches and molded case switches are listed for continuous current at their ampere rating. "Less than 100 percent" does not establish a lower limit; e.g., 50 percent is less than 115 percent.

Panel Meeting Action: Accept in Principle in Part

Revise the exceptions to read as follows:

(A)(1) Exception: A listed ~~nonfused~~ unfused motor circuit switch, without fuseholders, having a horsepower rating not less than the equivalent horsepower determined in accordance with 440.12(A)(2) shall be permitted to have an ampere rating less than 115 percent of the specified current.

(B)(2) Exception: A listed ~~nonfused~~ unfused motor circuit switch, without fuseholders, having a horsepower rating not less than the equivalent horsepower determined in accordance with 440.12(B)(1) shall be permitted to have an ampere rating less than 115 percent of the sum of all currents.

Panel Statement: The panel rejects the change "not less than 100 percent." The exception reflects the same percentage value as does the main rule. The panel rejects the addition of the words "or a molded case switch." The remainder of the proposal is accepted to be consistent with the product standards. Molded case switches are rated in amperes. The exception does not apply to molded case switches.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

11-93 Log #124 NEC-P11 **Final Action: Accept in Principle**
(440.14)

Submitter: Mark Halmo, PDM Group

Recommendation: Addendum to Article 440.14 A/C and Refrigeration Equipment: Disconnecting means shall not be mounted so as to cover machine data tag.

Substantiation: In my more than 18 years in the HVAC industry, I have found service disconnects mounted over the manufacturers' data tag, preventing safe acquisition of pertinent information such as voltage, etc.

Panel Meeting Action: Accept in Principle

Add the following at the end of the second paragraph of 440.14 to read as follows:

"or to obscure the equipment nameplate(s)."

Panel Statement: The panel has provided language that more clearly provides the intended change.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

11-94 Log #3600 NEC-P11 **Final Action: Reject**
(440.14)

Submitter: Douglas Hansen, Code Check

Recommendation: Add the following sentence to the end of the first paragraph in 440.14:

Working space about the disconnecting means shall comply with 110.26.

Substantiation: There is inconsistency in interpretation and enforcement for working space about the disconnecting means for air conditioning equipment, yet it is clearly a type of equipment that is frequently worked on while energized, and it should fall under the scope of 110.26. The wording here is the same that was added to article 480 in the 1999 cycle, clarifying the need for working space about a battery rack. This proposal is consistent with many other recent changes that promote worker safety.

Panel Meeting Action: Reject

Panel Statement: Section 110.26 already applies per 90.3.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

11-95 Log #493 NEC-P11 **Final Action: Accept in Principle**
(440.14 Exception No. 1)

Submitter: Michael J. Johnston, Plano, TX

Recommendation: Revise as follows:

Exception No. 1: Where the disconnecting means provided in accordance with 430.102(A) is capable of being locked in the open position, and the refrigerating or air-conditioning equipment is essential to an industrial process in a facility with written safety procedures, and where the conditions of maintenance and supervision ensure that only qualified persons service the equipment, a disconnecting means within sight from the equipment shall not be required. The provision for locking or adding a lock to the disconnecting means shall be installed at the switch or circuit breaker and shall remain in place with or without the lock installed. ~~shall be p ermanently installed on or at the switch or circuit breaker used as the disconnecting means.~~

Substantiation: This proposed change in wording is to provide consistency between other similar rules in the NEC that also call for disconnecting means to be capable of being locked in the open position. The phrase "capable of being locked in the open position" is used over 25 times in the NEC and the purpose is the same in every instance. Electrical safety rules for workers should be consistent. This wording and requirement should be consistent where this phrase is used. The last sentence is being proposed because there are claims that some of the portable units available for snapping on to circuit breakers do remain with the switch or circuit breaker after they are installed on the breakers when the lock is not installed, but they are portable. The actions by CMP 11 in the 2002 cycle in 430.102(B) Exception were fairly clear that the provisions for adding a lock should be more substantial and not portable units.

Panel Meeting Action: Accept in Principle

Revise the last sentence of the exception to read as follows:

The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker and shall remain in place with or without the lock installed.

Panel Statement: The words "on or" were added to be consistent with the action on Proposal 11-83.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

CACCAMESE, J.: An additional sentence, "Portable means for adding a lock to a switch or circuit breaker shall not be permitted" is important language that should be added to 440.14, Exception No. 1. This will ensure that the red plastic covers that snap over operating handles and accept a lock would not be allowed.

11-96 Log #3068 NEC-P11 **Final Action: Reject**
(440.14 Exception No. 1)

Submitter: Richard F. Van Wert, Middle Department Inspection Agency / Rep. Benjamin Franklin Chapter IAEI

Recommendation: Delete text as follows:

440.14 Location. ~~Exception No. 1~~

Substantiation: The entire Exception No. 1 should be deleted. If there are written procedures and only qualified persons service the equipment then all the more reason to go ahead and meet the intent of the safety rule as written in 440.14 and require that a disconnect be located within sight of the equipment. Safety for people is supposed to be the goal of the rules contained in the NEC as explained in 90.1(A). Since when did the NEC decide to put product ahead of people?

Panel Meeting Action: Reject

Panel Statement: The exception as written provides safeguards for qualified persons. The conditions listed in the exception specifically limit the application.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

CACCAMESE, J.: The installation and application of a disconnecting means within sight does not hinder the operation of air-conditioning equipment as applied to an industrial process when the conditions include written safety procedures, and the conditions of maintenance and supervision are only performed by qualified personnel. By placing a disconnect switch within sight, safety is assured.

11-97 Log #412 NEC-P11 **Final Action: Accept**
(440.21)

Submitter: Michael J. Johnston, Plano, TX

Recommendation: Revise text to read as follows:

III. Branch-Circuit Short-Circit and Ground-Fault Protection

440.21 General

The provisions of Part III specify devices intended to protect the branch-circuit conductors, control apparatus, and motors in circuits supplying hermetic refrigerant motor-compressors against overcurrent due to short circuits and ground fault ~~grounds~~ . They are in addition to or amendatory of the provisions of Article 240.

Substantiation: This proposal is an effort to promote consistency with the use of terms related to grounding and bonding. Ground fault is defined in 250.2 and is more appropriate to be used here because this is the type of event that the protection required in this part of Article 440 is intended to provide. This change brings the proposed text in this section consistent with the title of this section which is "Branch-circuit Short-Circuit and Ground-Fault Protection."

Note: There are also proposals to revise the current definition of the the word "ground" in Article 100 which could impact how it is currently used in this section.

Panel Meeting Action: Accept

Panel Statement: The panel notes that the word "fault" should be "faults" and directs that this change be made.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

11-98 Log #2831 NEC-P11 **Final Action: Reject**
(440.22(A))

Submitter: Nathan Goff, AMF Electric

Recommendation: Add a new last sentence to 440.22(A):

Circuit breakers that open as a result of a ground fault or short circuit at or near their maximum interrupting rating shall be tested, serviced, or replaced before reenergizing the motor circuit.

Substantiation: OSHA CFR 29 1910.334(b)(2) is so concerned about the safety of workers when it comes to reenergizing circuits after a fault that it prohibits the resetting of a circuit breaker without first checking out the circuit to make sure that the fault has been cleared. The manufacturers fully agree with this approach as can be seen in the NEMA sponsored article, written by Vince Baclawski, that appeared in the January, 1995 issue of EC&M Magazine.

"After a high level fault has occurred in equipment that is properly rated and installed, it is not always clear to investigating electricians what damage has occurred inside encased equipment. The circuit breaker may well appear virtually clean while its internal condition is unknown. For such situations, the NEMA AB4 "Guidelines for Inspection and Preventive Maintenance of MCCBs Used in Commercial and Industrial Applications" may be of help. Circuit breakers unsuitable for continued service may be identified by simple inspection under these guidelines. Testing outlined in the document is another and more definite step that will help to identify circuit breakers that are not suitable for continued service."

The addition of this material will help warn workers that they should not simply reset a circuit breaker after it has tripped. And they should be especially careful when the circuit breaker saw a short-circuit at or near its interrupting rating.

Panel Meeting Action: Reject

Panel Statement: The proposal is unenforceable as written and is not part of the electrical installation requirements of the NEC. Refer to the recommendations in NFPA 70B.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

CACCAMESE, J.: Should be accept in principle in part. Change to Fine Print Note: "Circuit breakers that open as a result of a ground fault or short circuit at or near their maximum interrupting rating should be tested, serviced or replaced before reenergizing the motor circuit. NEMA AB4 Guidelines for Inspection and Preventive Maintenance of MCCBs Used in Commercial and Industrial Applications is a source for correct procedures to follow." Comment: The submitter's substantiation shows the need for the installer/maintainer being aware of the hazard of re-energizing a breaker without clearing of a fault; however a FPN would make the qualified person performing work aware of the existence of the procedures needed for safe practices.

11-99 Log #1004 NEC-P11 **Final Action: Reject**
(440.32)

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Revise second paragraph:

For a wye-start delta-run connected motor-compressor the ~~selection~~ ampacity of the branch circuit conductors between the controller and the motor-compressor shall be ~~permitted to be based on~~ not less than 72 percent of either the motor-compressor full load current or the branch circuit selection current, whichever is greater.

Delete the FPN.

Substantiation: Edit. The proposal is a positive statement consistent with similar Code wording. The FPN is superfluous. 90.1(C) states the Code is not intended as an instruction manual. Proposal removes any implication that conductor selection is based on 125 percent of 72 percent.

Panel Meeting Action: Reject

Panel Statement: The current text in 440.32 properly and clearly provides the requirements. The existing text more clearly expresses the requirements. The proposed text does not improve clarity.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

11-100 Log #3409 NEC-P11 **Final Action: Reject**
(440.32)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: In the second paragraph, delete "selection of" and change the terminology "based on" to "sized at".

Substantiation: The NEC has always required the 72% multiplier through the terminology "based on"; start with 58% (the base number) and then apply the appropriate multiplier. This is also the approach in 430.22(C); in the latter section "based on" must be maintained because the multiplier might be any number of possibilities due to duty cycle applications covered elsewhere in that section. The current literal text in Article 440 is confusing in this context and may suggest to some, especially those familiar with the "based on" wording in 430.22(C), that 72% should be multiplied by 125%.

Panel Meeting Action: Reject

Panel Statement: The present language along with the FPN provides clarity to the 72% requirement. Removal of "selection of" and changing "based on" to "sized at" do not improve the clarity of this section.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

11-101 Log #410 NEC-P11 **Final Action: Accept**
(440.53)

Submitter: Michael J. Johnston, Plano, TX

Recommendation: Revise text to read as follows:

440.53 Overload Relays

Overload relays and other devices for motor overload protection that are not capable of opening short circuits shall be protected by fuses or inverse time circuit breakers with ratings or settings in accordance with Part III unless identified ~~approved~~ for group installation or for part-winding motors and marked to indicate the maximum size of fuse or inverse time circuit breaker by which they shall be protected.

Exception: The fuse or inverse time circuit breaker size marking shall be permitted on the nameplate of the ~~approved~~ equipment in which the overload relay or other overload device is used.

Substantiation: The change is an effort to promote consistency in how the term "approved" is being used throughout the NEC. Both words are defined in Article 100.

Approved. Acceptable to the authority having jurisdiction.

Identified (as applied to equipment). Recognizable as suitable for the specific purpose, function, use, environment, application, and so forth, where described in a particular Code requirement.

It appears as though the more appropriate word to use here is "identified" because these marks would be provided by the manufacturer and the equipment would probably be evaluated for this use and thus identified. The AHJ would generally not be doing this on this equipment.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

11-102 Log #411 NEC-P11 **Final Action: Accept**
(440.54(A))

Submitter: Michael J. Johnston, Plano, TX

Recommendation: Revise text to read as follows:

(A) Overload Protection. The motor-compressor shall be provided with overload protection selected as specified in 440.52(A). Both the controller and motor overload protective device shall be identified ~~approved~~ for installation with the short-circuit and ground-fault protective device for the branch circuit to which the equipment is connected.

Substantiation: The change is an effort to promote consistency in how the term "approved" i being used throughout the NEC. Both words are defined in Article 100.

Approved. Acceptable to the authority having jurisdiction.

Identified (as applied to equipment). Recognizable as suitable for the specific purpose, function, use, environment, application, and so forth, where described in a particular Code requirement.

It appears as though the more appropriate word to use here is "identified" because these marks would be provided by the manufacturer and the equipment would probably be evaluated for this use and thus identified. The AHJ would generally not be doing this on this equipment.

Ballot Results: Affirmative: 15

11-103 Log #408 NEC-P11 **Final Action: Accept**
(440.55(A))

Submitter: Michael J. Johnston, Plano, TX

Recommendation: Revise text to read as follows:

(A) Overload Protection. The motor-compressor shall be provided with overload protection as specified in 440.52(A). Both the controller and the motor overload protective device shall be identified ~~approved~~ for installation with the short-circuit ground-fault protective device for the branch circuit to which the equipment is connected.

Substantiation: The change is an effort to promote consistency in how the term "approved" is being used throughout the NEC. Both words are defined in Article 100.

Approved. Acceptable to the authority having jurisdiction.

Identified (as applied to equipment). Recognizable as suitable for the specific purpose, function, use, environment, application, and so forth, where described in a particular Code requirement.

It appears as though the more appropriate word to use here is "identified" because these marks would be provided by the manufacturer and the equipment would probably be evaluated for this use and thus identified. The AHJ would generally not be doing this on this equipment.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

11-104 Log #2350 NEC-P11 **Final Action: Reject**
(440.55(B))

Submitter: Andre R. Cartal, Princeton Borough Building Dept.

Recommendation: Increase voltage to 277.

Substantiation: 277 volts is a commonly utilized voltage, to restrict the receptacle rating to 250 volts requires 277v AC units to "hard wired". It is much safer to be able to replace this AC unit when one simply has to plug it in. Maintenance people may not be qualified to hard wire this equipment but that will not stop them. Note that there is no restriction on 277V receptacles installed for luminaries.

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided any proposed text to implement the change. The increased shock hazard at 277 volts to ground versus 120 volts to ground does not warrant this increase. The submitter's comparison of "phase to phase" voltage (250 volts) to "phase to ground"

voltage (277 volts) is inappropriate.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14 Negative: 1
Explanation of Negative:
COLE, T.: Although I agree with the panel that the proposal should be stated in a way that reflects the change being requested, I also agree with the concept of the submitter. There are many applications in which installers and maintenance people work on 480V and higher systems that have greater potential of being shocked. Why is unplugging a motor any more dangerous? If there is such a concern, why do we allow it in lighting systems? Refer to 210.6(C)1 through 6. It does seem that we are being consistent.
Comment on Affirmative:
CACCAMESE, J.: An unskilled maintenance worker should not work on a 277-volt hard-wired appliance. The danger of injury would increase greatly if the voltage to ground were increased to 277-volts as recommended in the proposal.

11-105 Log #2341 NEC-P11 **Final Action: Reject**
(440.60)

Submitter: Andre R. Cartal, Princeton Borough Building Dept.
Recommendation: Increase voltage to 277V in the first paragraph.
Delete the second paragraph.
Substantiation: 277 volts is a commonly utilized voltage, to restrict the receptacle rating to 250 volts requires 277v AC units to "hard wired". It is much safer to be able to replace this AC unit when one simply has to plug it in. Maintenance people may not be qualified to hard wire this equipment but that will not stop them. (440.65)

Submitter: Jim M. Schmer, Boise, ID
Recommendation: In 440.65 Leakage Current Detection (LCDI), or Arc Fault Circuit Interrupter (AFCI).
Substantiation: There seems to be a miss print in the heading of 440.65 where "and" should have been "or".
Panel Meeting Action: Reject
Panel Statement: The word "and" is appropriate because both devices are addressed in 440.65. The requirements clearly indicate that only one device must be provided.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

(Note: The sequence 11-108 was not used)

ARTICLE 445 — GENERATORS

13-4 Log #2270 NEC-P13 **Final Action: Reject**
(445.3 (New))

Submitter: H. Brooke Stauffer, National Electrical Contractors Assn. (NECA)
Recommendation: Add new text to read:
455.xx Generators shall be installed in a neat and workmanlike manner.
FPN: Accepted industry practices are described in ANSI/EGSA/NECA 404-2000, Recommended Practice for Installing Generator Sets, ANSI/NECA 406-2003, Recommended Practice for Installing Residential Generator Sets, and other ANSI-approved installation standards.
Substantiation: The general workmanship requirement of 110.12 applies to electrical equipment covered by Article 445. However, safety would be improved by offering more detailed installation guidance for generators.
Panel Meeting Action: Reject
Panel Statement: Repetitive information concerning installation standards is covered in Article 110.12 of the NEC.
The Code is not intended as a design specification or an instruction manual.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14
Ballot Not Returned: 1 Gustafson, R.

13-5 Log #3598 NEC-P13 **Final Action: Reject**
(445.8 (New))

Submitter: Joe McCann, City of Coral Springs
Recommendation: Add new text to read:
445.8 Application of Other Articles. Chapters One through four shall apply generally per 90.3 and 110.3(b). Equipment shall be installed and used in accordance with instructions included in the listing and labeling.
Substantiation: Generators should comply to the manufacturers instructions according to 110.3(B) (Installation and Use) and be capable of carrying any load applied automatically. Small generators are being permanently installed that cannot pickup automatically the connected load of the residence or business.
Panel Meeting Action: Reject
Panel Statement: NEC Chapters 1 through 4 apply to the installation of generators, including 90.3 and 110.3(B). The proposal duplicates existing NEC text.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 14
Ballot Not Returned: 1 Gustafson, R.

13-6 Log #1598 NEC-P13 **Final Action: Accept**
(445.12(D))

TCC Action: The Technical Correlating Committee understands that the Panel Action replaces the word "neutrals" with "neutral points".
Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Make the following change in 445.12(D):
Change "neutral" to "neutral point."
The revised text would appear as follows:
(D) Balancer Sets. Two-wire, dc generators used in conjunction with balancer sets to obtain neutral~~s~~ points for 3-wire systems shall be equipped with overcurrent devices that disconnect the 3-wire system in case of excessive unbalancing of voltages or currents.
Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).
The Task Group has proposed the following definitions to be added to Article 100:
- **Neutral conductor.** A circuit conductor connected to the neutral point of a system.
- **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals
- The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.

● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.

Additional information is available in the Task Group report.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 1

Ballot Not Returned: 1 Gustafson, R.

Explanation of Negative:

STAFFORD, T.: Based on comments made by Task Group members it doesn't look like this proposal was completed at the TG level. Based upon supporting material submitted to the Panel it appears that the work on the Task Group was not complete, nor in agreement. Supporting materials submitted also specified that the entire list of proposals created and submitted by the task group should be rejected.

13-7 Log #2891 NEC-P13 **Final Action: Accept**
(445.13)

TCC Action: The Technical Correlating Committee understands that the Panel also accepted the addition of the word "that" in the last phrase of the third sentence.

Submitter: Mark R. Hilbert, Wolfeboro, NH

Recommendation: Revise text to read:

445.13 Ampacity of Conductors. The ampacity of the conductors from the generator terminals to the first distribution device(s) containing overcurrent protection shall not be less than 115 percent of the nameplate current rating of the generator. It shall be permitted to size the neutral conductors in accordance with 220.61. Conductors that must carry ground-fault currents shall not be smaller than that required by ~~250.24(C)~~ 250.30(A) . Neutral conductors of dc generators that must carry ground-fault currents shall not be smaller than the minimum required size of the largest conductor.

Substantiation: Accepting the revised text will identify that the conductors in question are part of a "system" as opposed to a service which is supplied by a utility. 250.30(A)(2) and (8) contain the proper sizing requirements and are a more appropriate reference for the systems which are the subject of 445.13.

Panel Meeting Action: Accept

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 1

Ballot Not Returned: 1 Gustafson, R.

Explanation of Negative:

SWAYNE, R.: The reference 250.30(A), is too general since it includes grounding electrode conductors which are not intended to carry ground fault currents, 250.30(A)(8) is the correct reference for the grounded circuit conductor and 250.122 in total is the correct reference for the equipment grounding conductor. Using the proposed reference would leave the wrong impression that grounding electrode conductors carry ground fault current.

13-8 Log #832 NEC-P13 **Final Action: Accept in Principle**
(445.18)

Submitter: Thomas H. Wood, Cecil B. Wood Inc.

Recommendation: Revise Section 445.18 to read as follows:

445.18 Disconnecting Means Required for Generators.

<u>(A)</u> Generators shall be equipped with disconnect(s) by means of which the generator and all protective devices and control apparatus are able to be disconnected entirely form the circuits supplied by the generator except where both of the following conditions apply:

(1) The driving means for the generator can be readily shut down.

(2) The generator is not arranged to operate in parallel with another generator or other source of voltage.

<u>(B) A single generator supplying more than one load, or multiple generators operating in parallel, shall be permitted to supply:</u>

<u>(1) A vertical switchboard with separate sections, or</u>

<u>(2) Individual enclosures with overcurrent protection tapped from a single feeder for load separation and distribution.</u>

Substantiation: The supply tap box on generators equipped with disconnecting means with or without overcurrent protection is not generally designed or manufactured for installation of multiple devices to serve separate circuits for emergency loads, fire pumps, legally required standby loads, and optional standby loads, although some AHJs have interpreted the mandated separation of wiring for emergency and standby loads in other Articles of the Code to require just that. The recommended addition clarifies that the disconnect(s), that also provide separation of the emergency and standby circuits, may be provided using a single feeder from the generator set to separately mounted enclosed disconnects with overcurrent protection or a distribution switchboard that separates emergency and standby load disconnects in different vertical sections. Multiple generators operating in parallel are treated similarly downstream of the paralleling switchboard. (Separately enclosed overcurrent devices or overcurrent devices mounted in separate vertical sections of a distribution switchboard can provide physical separation of the different systems or branches of distribution and define that the origin of the emergency, legally required standby, and optional standby systems is at the feeder overcurrent protection device, not the generator terminals. A related proposal has been submitted for 700.9).

This proposal was developed by the Task Group directed by the TCC to consider comments 13-6 and 13-71 and if appropriate to develop proposals for the 2008 NEC. The task group consisted of the following: Thomas H. Wood; Chair (Chair NFPA-70, panel 13), Hugh O. Nash; (Chair NFPA 99), Douglas S. Erickson; (Chair NFPA 110), James Costley; and Herb Whittall.

Panel Meeting Action: Accept in Principle

Relocate the proposed revision to a new 445.19 to read as follows:

445.19 Generators Supplying Multiple Loads.

<u>A single generator supplying more than one load, or multiple generators operating in parallel, shall be permitted to supply:</u>

<u>(1) A vertical switchboard with separate sections, or</u>

<u>(2) Individual enclosures with overcurrent protection tapped from a single feeder for load separation and distribution.</u>

Panel Statement: While the panel supported this change, it did not believe this change belonged under 445.18 but more appropriately as a new section 445.19.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 13 Negative: 1

Ballot Not Returned: 1 Gustafson, R.

Explanation of Negative:

SWAYNE, R.: This change would permit multiple generators with no disconnect for each generator connected to a common bus. It is necessary to separate the requirements for disconnecting devices for each generator from the requirements for supplying multiple loads. The proposed wording does not do that.

13-9 Log #2121 NEC-P13 **Final Action: Accept in Principle**
(445.18)

Submitter: Bud Swathwood, Bud Swathwood Consulting

Recommendation: Insert after "generator" and before "except" the words... and <u>locked in the open position</u> except where both the following conditions apply:

Substantiation: This is a proposal for a safety factor for someone working on the generator or the equipment connected to the system.

Panel Meeting Action: Accept in Principle

Revise 445.18, first sentence, to read as follows:

Generators shall be equipped with disconnect(s), <u>lockable in the open position</u> , by means of which the generator and all protective devices and control apparatus are able to be disconnected entirely from the circuits supplied by the generator except where both of the following conditions apply:

Panel Statement: The revised wording clarifies the submitter's intent.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14

Ballot Not Returned: 1 Gustafson, R.

Comment on Affirmative:

STAFFORD, T.: While the panel action is agreed with, it is desired that the action taken by Panel 13 provide additional safety features. By using wording as written in 430.102(B) exception and as accepted by Panel 12 in this code cycle in ROP 12-9: "The provisions for locking or adding a lock to the disconnecting means must remain in place at the switch or circuit breaker whether the lock is installed or not. Portable means for adding a lock to the switch or circuit breaker shall not be permitted." would provide additional safety requirements, meet the intent of the submitter, and standardize wording for all applicable portions of the NEC.

13-10 Log #810 NEC-P13 **Final Action: Reject**
(Table 445.19 (New))

Submitter: Mark Stahley, Facilities Management Partners

Recommendation: A table is needed for calculating minimum dedicated generator loads (nonlinear). As a Stratford Career Institute student, I can only make a proposal, not test it.

Substantiation: A table is needed for calculating minimum generator capacity reserved for nonlinear loads. It seems to me that even though nonlinear lighting loads gain mechanical advantage through the electrical equivalent of "ropes and pulleys" the "fatigue" factor remains the same, so that the capacity for an X watt incandescent bulb putting out 1 footcandle should be the same or greater than a fluorescent of Y watts putting out 1 footcandle.

Panel Meeting Action: Reject

Panel Statement: No specific text was proposed. The proposal does not meet the requirements of Section 4.3.3. of the NFPA Regulations Governing Committee Projects.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14

Ballot Not Returned: 1 Gustafson, R.

13-11 Log #1716 NEC-P13 **Final Action: Accept in Principle**
(445.19)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 3 for information since there was a similar proposal for 590.6(A).
Submitter: Ray Stanko, Underwriters Laboratories, Inc.
Recommendation: Add text to read as follows:
Ground-Fault Circuit Interrupter Protection for Receptacles on Portable Generators. All 125-volt, single-phase, 15- 20-, and 30 ampere receptacle outlets that are a part of a portable generator shall have ground-fault circuit interrupter protection for personnel.
Substantiation: By requiring GFCI protection for personnel for these receptacle outlets on portable generators, this new section will meet the intent of providing GFCI protection as covered in 590.6, where these portable generators are often used as temporary power. Electrical equipment, such as table saws, pressure washer, and hand-held tools should have adequate GFCI protection for personnel on construction sites and similar locations. There are many hazards associated with temporary installations, such as cut and abraded wire, wet locations, and similar hazardous applications requiring GFCI protection no matter the power source. This new section will ensure that portable generators will have adequate personnel protection for these receptacles whether the generators are on a construction site or used elsewhere. During power outages from storms and other natural disasters, persons who may not be familiar with adequate safety procedures frequently use these generators to supply power in less than optimal conditions.
Panel Meeting Action: Accept in Principle
Add a new 445.20, to read as follows:
Ground-Fault Circuit Interrupter Protection for Receptacles on Portable Generators. All 120 and 120/240 volt, single-phase, 15-, 20-, and 30 ampere receptacle outlets that are a part of a portable generator shall have <u>listed</u> ground-fault circuit interrupter protection for personnel.
Panel Statement: The panel clarified that this requirement applies to 120 volt and 120/240 Volt receptacles, and added the word "listed" to avoid unreliable ground fault protection.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 12 Negative: 2
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:
ELKINS, D.: This proposal should be rejected or accepted in principle with an industrial exception. The proposal ignores industrial applications of portable generators in which loss of power can have safety consequences. Examples might include: refrigeration compressors for cryogenic storage of flammable materials, flood lighting for workers on elevated structures, magnetically held cutting/welding tools or ventilation/pressurization for enclosures in a hazardous location. This proposal could be supported if an exception is added as follows: "In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified personnel are involved, portable generators without GFCI receptacles may be applied when serving loads whose loss are judged by the AHJ to have safety consequences."
SWAYNE, R.: The need for ground fault protection for receptacles on portable generators, if necessary, should be in 250.34. The need for ground fault protection should be determined by CMP 5 which has the expertise for grounding requirements.
Comment on Affirmative:
NASBY, J.: NEMA is concerned is with the application of this requirement to all generators, in particular where these generators supply power to fixed wiring systems that may not be compatible with GFCI protection.

ARTICLE 450 — TRANSFORMERS AND TRANSFORMER VAULTS

9-129 Log #1480 NEC-P09 **Final Action: Reject**
(450.3)

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise as follows:
<u>(A)</u> Transformers 600 Volts, Nominal, or Less. Overcurrent protetion shall be provided in accordance with Table 450.3 <u>(A).</u>
<u>(B)</u> Transformers Over 600 Volts, Nominal. Overcurrent protection shall be provided in accordance with Table 450.3 <u>(B)</u> .
Exception: Code language to remain unchanged for the exception.
The existing tables should remain unchanged, other than changing their locations and names to (A) for less than 600 volts and (B) for over 600 volts.
Substantiation: Throughout the rest of the Code, the provisions for systems operating over 600 volts appear after the requirements of those operating below 600 volts. This makes perfect sense, considering the fact that there are many more systems that operate at less than 600 volts than those operating over 600 volts.
A companion proposal to 450.7 will be submitted to provide correlation.
Panel Meeting Action: Reject
Panel Statement: Most transformers within the scope of the NEC are step down transformers. It is more logical to cover these transformers in Article 450 in the direction of power flow, first the higher voltage and then the lower voltage.
Such a change may lead to confusion for persons already familiar with the Code.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-130 Log #3526 NEC-P09 **Final Action: Reject**
(450.3(A) Note 6 and Table 450.3(B), Note 4 (New))

Submitter: Steven R. Musial, II, CJL Engineering
Recommendation: Article 450 does not address a method of sizing primary and secondary transformer conductors. Add Note 6 to Table 450.3(A) and add Note 4 to Table 450.3(B) which states:
"Transformer primary conductors shall be capable of carrying at least 1.25 times the transformer primary load amps. Transformer secondary conductors shall be capable of carrying at least 1.25 times the transformer secondary full load amps."
Substantiation: Transformer primary and secondary conductors should be capable of carrying <u>continuous</u> primary full load amps and <u>continuous</u> secondary full load amps.
Panel Meeting Action: Reject
Panel Statement: Conductor protection is beyond the scope of the article. See 450.3 FPN No. 1.
Number Eligible to Vote: 11

9-131 Log #432 NEC-P09 **Final Action: Accept**
(Table 450.3(B) Note 2)

Submitter: Brian Dolan, IBEW/NECA Technical Institute
Recommendation: Delete the last sentence of Note 2 as follows:
~~If both breakers and fuses are utilized as the overcurrent device, the total of the device ratings shall not exceed that allowed for fuses.~~
Substantiation: Since the "secondary protection" portion of Table 450.3(B) does not distinguish between fuses and circuit breakers, the last sentence is unnecessary.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-132 Log #1273 NEC-P09 **Final Action: Accept**
(Table 450.3(B) Note 2)

Submitter: Jim Davis, Electrical Education Services, LLC
Recommendation: Revise as follows:
2. Where secondary overcurrent protection is required, the secondary overcurrent device shall be permitted to consist of not more than six circuit breakers or six sets of fuses grouped in one location. Where multiple overcurrent devices are utilized, the total of all device ratings shall not exceed the allowed value of a single overcurrent device. ~~If both breakers and fuses are utilized as the overcurrent device, the total of the device ratings shall not exceed that allowed for fuses.~~
Substantiation: Unlike Table 450.3(A), Table 450.3(B) is not organized to differentiate between circuit breakers and fuses, and the text of the proposed deleted sentence is irrelevant and potentially confusing.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-133 Log #1599 NEC-P09 **Final Action: Accept**
(450.5)

Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Make the following change in 450.5:
Change "neutral reference" to "neutral point."
The revised text would appear as follows:
Grounding autotransformers covered in this section are zigzag or T-connected transformers connected to 3-phase, 3-wire ungrounded systems for the purpose of creating a 3-phase, 4-wire distribution system or providing a neutral ~~reference~~ <u>point</u> for grounding purposes. Such transformers shall have a continuous per-phase current rating and a continuous neutral current rating. Zig-zag connected transformers shall not be installed on the load side of any system grounding connection, including those made in accordance with 250.24(B), 250.30(A)(1), or 250.32(B)(2).

Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).

The Task Group has proposed the following definitions to be added to Article 100:

● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.

● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals

● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.

● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.

In this section, the terms "neutral point" should be used instead of "neutral reference" since "neutral point" is being defined by the proposed definitions.

Additional information is available in the Task Group report.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept

Panel Statement: Note to the Technical Correlating Committee is that acceptance is strictly conditional on the definition of terms in the substantiation being accepted by CMP-5.

9-135 Log #492 NEC-P09 **Final Action: Accept in Principle**
(450.5(B)(2))

Submitter: David Murray, IPC Resistors Inc.

Recommendation: Insert the following wording at the beginning of paragraph 450.2(B)(2):

<u>Where provision is made to automatically de-energize all ungrounded conductors upon the detection of a ground fault,</u> an overcurrent protective device of adequate short-circuit rating...

Add the following sentence at the end of the paragraph 450.2(B)(2):

"... or any series connected devices in the neutral connection thereto. <u>For high-resistance grounded systems where provision is not made to de-energize all ungrounded conductors upon the detection of a ground fault, and where the maximum ground fault current is controlled at 10A or less, and where the electrical system rated voltage is 600V or less, and where the zig-zag grounding auto transformer and the neutral grounding resistor are rated for continuous duty, an overcurrent protective device of adequate short circuit rating that will open simultaneously all ungrounded conductors when it operates shall be applied in the zig-zag grounding auto transformer branch circuit and shall be rated or set at a currant not exceeding 20 amperes.</u>

Optionally, the following additional wording could be added because it represents good engineering practice:

"The overcurrent protective device shall have auxiliary contacts for provision for remote alarming whenever the overcurrent protective decive is open."

Substantiation: 450.5(B)(2) requires an overcurrent protective device (OCD) set not higher than 125 percent of the grounding autotransformer's rated per-phase current, and furthermore that all three phases must be simultaneously opened when the OCD operates.

This works well for low-resistance grounded systems, which typically operate with a ground fault current in the neutral grounding resistor of between 50-400A, which corresponds to 17-133A of per-phase current for the zig-zag grounding autotransformer. It's no problem to find a circuit breaker to protect devices rated in the range of 17-133A. It is also very necessary to protect the grounding autotransformer (always a "zig-zag" transformer that passes only zero sequence ground fault current) in low-resistance grounding applications because the transformer and resistor are normally noncontinuous rated, for only 10 seconds of operation. In low-resistance grounded applications, the purpose of the grounding zig-zag autotransformer is to develop a ground reference voltage for a ground fault protective device to sense and trip the faulted feeder within a second or less.

This code rule is not entirely practical for high-resistance grounded systems, which are typically 480V delta with a 5A (sometimes up to 10A) neutral grounding resistor and zig-zag grounding autotransformer. In this application, the grounding autotransformer is not used to generate a ground reference voltage for a ground fault protective device, but rather for a ground fault alarm device only. The faulted circuit is not de-energized, but is allowed to remain energized until the fault is located and repaired, because the ground fault current is so small. In this case, the grounding transformer and associated neutral grounding resistor are always continuously rated. The neutral grounding resistor prevents the ground fault current from being higher than 5A (10A), which corresponds to 1.67A (3.3A) per phase in the zig-zag grounding autotransformer. It is impossible for the transformer to become overloaded because the 5A (10A) resistor limits the current to 1.67A (3.3A) per phase. The resistor and transformer are rated to carry this current continuously.

The code requirement of an overcurrent device that simultaneously trips all three phases at once, and which is set to 125 percent of 1.67A per phase, or 2.1A, is impractical - there is no 480V, 100 kAIC, 3-pole breaker on the market that is rated smaller than 15A, that trips all three phases simultaneously (ruling out a fused disconnect switch). 100 kAIC is often required due to the high available fault current on the secondary bus of a main power transformer. The best that can be done is to supply a current-limiting molded case breaker, rated 15-20A, 3-pole, 100 kAIC at 600 V, for short circuit protection and disconnecting means. Overload protection should not be required because the neutral grounding resistor limits the current to 1.67A per phase. Breaker examples include Square D model FIL36020 (rated 20A),Siemens model CED63B015 (rated 15A),Cutler-Hammer model FB3015PL (rated 15A), and others. The breaker should also have auxiliary contacts which are remotely monitored to provide alarm if the breakers are inadvertently left open because an open breaker means the grounding system has been disconnected.

IEEE Std. 142-1991, "Recommended Practice for Grounding of Industrial and Commercial Power Systems," paragraph 1.4.7, page 30, states, "...It is generally desirable to connect a grounding transformer directly to the main bus of a power system, without intervening circuit breaker or fuses, to prevent the transformer from being inadvertently taken out of service by the operation of the intervening devices. (In this case, the transformer is considered part of the bus and is protected by the relaying applied for bus protection). Alternatively, the grounding transformer should be served by a dedicated feeder circuit breaker, as shown in fig. 5(a), or connected between the main transformer and the main switchgear...".

My Recommendation:

The NFPA requirement for 125 percent overcurrent protection of continuous-rated zig-zag grounding autotransformers on high resistance grounded systems (where the resistor current is in the range of 1-10A max., and hence the corresponding transformer per phase current is in range of 0.3-3A max.), is neither practical nor possible. Hence, the 125 percent rating rule should be amended to permit up to 20A rated circuit breaker for high-resistance grounded, continuously rated, zig-zag grounding autotransformers, where the neutral ground fault current is 10A or less, where the system voltage is 600V or less, and where the ungrounded conductors are not de-energized by a protective device upon a first ground fault. The reason I say 20A instead of 15A is that Square D's smallest current-limiting 480V molded case circuit breaker is rated 20A. Siemens, Cutler-Hammer and GE all make 15A current-limiting 480V molded case circuit breakers.

By comparison, the Canadian Electrical Code requires overcurrent protection only for noncontinuous rated neutral grounding devices, which are found only on low-resistance grounded systems. See CSA Standard C22.1-2002, Rule 10-1104(3).

Panel Meeting Action: Accept in Principle

Revise 450.5(B) to read as follows:

(B) Ground Reference for Fault Protection Devices. A grounding autotransformer used to make available a specified magnitude of ground-fault current for operation of a ground-responsive protective device on a 3-phase, 3-wire ungrounded system shall conform to 450.5(B)(1) and (B)(2).

(1) Rating. The autotransformer shall have a continuous neutral-current rating sufficient for the specified ground-fault current.

(2) Overcurrent Protection. Overcurrent protection shall comply with (a) and (b).

(a) Operation and Interrupting Rating. An overcurrent protective device having an interrupting rating in compliance with 110.9 and that will open simultaneously all ungrounded conductors when it operates shall be applied in the grounding autotransformer branch circuit.

(b) Ampere Rating. The overcurrent protection shall be rated or set at a current not exceeding 125 percent of the autotransformer continuous per-phase current rating or 42 percent of the continuous-current rating of any series connected devices in the autotransformer neutral connection. Delayed tripping for temporary overcurrents to permit the proper operation of ground-responsive tripping devices on the main system shall be permitted but shall not exceed values that would be more than the short-time current rating of the grounding autotransformer or any series connected devices in the neutral connection thereto.

Exception: For high impedance-grounded systems covered in 250.36, where the maximum ground-fault current is designed to be not more than 10 amperes, and where the grounding autotransformer and the grounding impedance are rated for continuous duty, an overcurrent device rated not more than 20 amperes that will simultaneously open all ungrounded conductors shall be permitted to be installed on the line side of the grounding autotransformer.

Panel Statement: The revisions are editorial in nature. Not all impedances are resistors. The material is an exception to the general procedure that applies only to high-impedance grounded systems covered in 250.36, and is therefore more clearly stated as an exception to the general rule.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10

Ballot Not Returned: 1 de Vega, H.

9-136 Log #1479 NEC-P09 **Final Action: Reject**

(450.7)

Submitter: Ryan Jackson, West Valley City, UT

Recommendation: Revise as follows:

450.7 Parallel Operation. Transformers shall be permitted to be operated in parallel and switched as a unit, provided the overcurrent protection for each transformer meets the requirements of 450.3(A) for primary and secondary protective ~~over 600 volts~~ devices 600 volts or less , or 450.3(B) for primary and secondary protective devices ~~600 volts or~~ ~~less~~ over 600 volts .

Substantiation: Please refer to my proposal to change the section and table of 450.3

Throughout the rest of the Code, the provisions for systems operating over 600 volts appear after the requirements of those operating below 600 volts. This makes perfect sense, considering the fact that there are many more systems that operate at less than 600 volts than those operating over 600 volts.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Proposal 9-29.

Ballot Not Returned: 1 de Vega, H.

9-137 Log #250 NEC-P09 **Final Action: Reject**

(450.8(A))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education

Recommendation: Revise as follows:

Appropriate provisions shall be made to minimize the possibility of damage to transformers from external causes where the transformers are exposed to ~~physical damage~~ blows or abrasion.

Substantiation: Use of the word “physical” is superfluous - the intention is obvious. In some instances, one could argue for the use of “mechanical” to differentiate that from e.g., “thermal” damage, but context makes the intended sense quite clear, rendering this unnecessary.

The proposed rewording is an attempt at precision. If you retain the repeat of the word “damage, I would then have to fall back to arguing that in that case the term “physical” should be eliminated.

Submitting proposals removing the adjective “physical” may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every unnecessary instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.

Second, the use of “physical” is not only poor writing–look at William Zinsser’s classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to “physical damage,” in 1959, from “mechanical injury” (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, “Is anyone claiming electrical equipment needs protection from non-physical injury?” (Substitute the snide adjective of your choice.)

Panel Meeting Action: Reject

Panel Statement: The use in CMP-9’s articles is consistent with the rest of the Code. CMP-9 understands that this is a global proposal and if this terminology changes, it must be evaluated by the Technical Correlating Committee and guidance provided to code making panels so the results will be consistent.

(450.13(B))

Submitter: Jeffrey A. Fecteau, City of Peoria, Arizona

Recommendation: Revise text to read:

(B) Hollow Space Installations. Dry-type transformers 600 volts, nominal, or less and not exceeding 50 kVA shall be permitted in hollow spaces of buildings not permanently closed in by structure or used as a plenum or other air handling spaces as identified in 300.22 , provided they meet ventilation requirements of 450.9 and separation from combustible materials requirements of 450.21(A). Transformers so installed shall not be required to be readily accessible.

Exception: Totally enclosed nonventilated transformers or transformers listed and identified for specific use may be used in other air handling spaces identified by 300.22(C)(2).

Substantiation: This will clarify that transformers with ventilation openings that contain plastics, varnish coated windings and other components that may produce smoke and toxic vapors that could escape through the ventilation openings and contaminate this space used for environmental air shall not be installed in this space unless listed for such installation

See the Exception to 300.22(C)(2) that will only allow an integral fan “where specifically identified for such use.”

This will also mirror the requirements in 300.22(C)(1) “...for totally enclosed, nonventilated, insulated busway..., surface metal raceway or metal wireway with metal covers or solid bottom metal cable tray with solid metal covers.”

Note: Supporting material is available for review at NFPA headquarters.

Panel Meeting Action: Reject

Panel Statement: Transformers have been used in these applications for years. There has been no technical substantiation submitted that indicates problems are encountered with existing installations. The language in the other referenced sections in the substantiation is intended to prohibit devices that may produce an arc in this area such as plug-in connection or motors. Transformers do not exhibit this concern.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10

Ballot Not Returned: 1 de Vega, H.

Comment on Affirmative:

BELISLE, R.: The submitter proposal to eliminate mounting of transformers above plenum ceilings is a concept worthy of thought. The panel statement of CMP-9 relates to a concern over items that may produce an arc, stating that transformers do not present such a hazard. The submitter is concerned about the lack of an enclosure that would contain any toxic vapor or smoke during a fault or failure. The introduction of either smoke or toxic vapor in a plenum area should raise concern. My notes indicate that there wasn’t adequate documentation to support such claims of any hazard. We would be interested in any fact finding data that may be available to base future decisions on.

9-140 Log #565 NEC-P09 **Final Action: Reject**
(450.13(B))

9-141 Log #1270 NEC-P09 **Final Action: Reject**
(450.13(B))

Submitter: Mark Shapiro, Farmington Hills, MI
Recommendation: Revise the first sentence to permit 75 kVA transformers in hollow spaces.
“Dry-type transformers 600 volts, nominal, or less and not exceeding ~~50 kVA~~ <u>75 kVA</u> shall be permitted in hollow spaces of buildings not permanently closed in by structure, provided they meet the ventilation requirements of 450.9 and separation from combustible materials requirements of 450.21(A).”
Substantiation: It has been over 30 years since the 1971 NEC first permitted 50 kVA transformers to be exempt from being readily accessible. Since then, innumerable 75 kVA transformers have been installed (unknowingly in violation of the code) in suspended ceiling areas, above 200 amp panelboards, without any apparent incidents.
Let’s notch the permission up to a level that is still safe and removes unnecessary difficulty and uncertainty.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided adequate technical substantiation.
In order to make this change, CMP-9 would require documentation of the basis for the present 50 kVA limitation and why that limitation is no longer valid.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-142 Log #2402 NEC-P09 **Final Action: Reject**
(450.15 (New))

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Add new text to read:
<u>450.xx Disconnecting Means. An individual disconnecting means shall be provided for each transformer rated 75 kVA or greater, and shall disconnect the primary conductors from the transformer. The disconnecting means shall be located in sight from the transformer.</u>
<u>Exception No. 1: Where the disconnecting means is capable of being locked in the open position, and the transformer is essential to an industrial process in a facility with written safety procedures, and where the conditions of maintenance and supervision ensure that only qualified persons service the equipment, a disconnecting means within sight from the transformer shall not be required. The provision for locking or adding a lock to the disconnecting means shall be permanently installed on or at the switch or circuit breaker used as the disconnecting means.</u>
Substantiation: Nearly every piece of equipment in the National Electrical Code requires a local means of disconnect for the purposes of protecting our workforce. The exception to this is transformers, which are, in fact, more dangerous than other pieces of equipment in many ways.
The secondary conductors are typically considered unprotected by the primary device.
Many inspectors and designers do not believe the working space rules of 110.26(A) apply to transformers, resulting in less than ideal working conditions.
The internal components of a transformer (including field wiring) make the transformer very difficult to work on safely, and many times require the disconnection of conductors while troubleshooting, testing or maintaining the transformer.
Panel Meeting Action: Reject
Panel Statement: The principal application of in-sight disconnecting means generally involves motor-operated equipment in some form that is capable of sudden mechanical movement. This does not apply to a transformer. If this rule is eventually accepted in any form, it would need to allow for remote disconnects that are capable of being locked open.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 9 Negative: 1
Ballot Not Returned: 1 de Vega, H.
Explanation of Negative:
BELISLE, R.: The proposal to require a disconnecting means within sight of a transformer would eliminate many unsafe situations that occur regularly in the construction and maintenance industry.
The ability to lock out a transformer in the immediate area provides a safer workplace.
Current code does not require a locking means for transformers disconnect at this time. The installation requirement should mirror that of motors and other equipment requiring disconnecting. We would recommend this proposal be accepted in principle and add the requirement for “ <u>The provisions for locking shall remain in place with or without the lock installed</u> .” therefore not allowing a portable locking means that is not always available when needed.

(450.23(A)(1)(c))

Submitter: Jonathan Piel, Roger Bengston, Cooper Power System
Recommendation: Delete requirement (c):
A liquid containment area is required.
Substantiation: 1) The requirement has proven unnecessary for the purpose of practical fire protection hazards for indoor installations of less-flammable liquid-filled transformers.
2) History: Since 1978 the NEC has recognized significantly less installation safeguards required for less-flammable fluid-filled transformers compared to mineral oil filled transformers. From 1978 to 1981 containment was not a requirement in 450.23. The push for the 1981 NEC Article 450 to add the requirements for a containment-area and heat-release-rates was based on the concept of having a pool fire.
3) History: By 1984, the NEC heat release rate requirements were removed.
4) History: The pool fire scenario for less-flammable liquid-filled transformers was never incorporated by Underwriters Laboratories in their listing (Classification) requirements.
5) Science: High temperature, high fault current, high voltage “worse case scenario” tests performed under Underwriters Laboratories witnessing resulted in no ignition of a pool of any listed less flammable dielectric liquid tested. [1]
6) Science: High temperature, sustained high current, low voltage tests “worse case scenario” designed and performed under FM Global witnessing resulted in no ignition of a pool of any listed less-flammable dielectric liquid. [2, 3, 4]
7) Experience: Field case histories of less-flammable liquid-filled transformers that have experienced severe internal arcing faults are consistent with the sustained high current laboratory testing outlined above. Even when the arcing has been so severe as to burn through the tank walls, no ignition of the liquid has occurred. [5]
8) Experience: There has never been a pool fire reported involving less-flammable-dielectric fluids since their introduction in 1975, with over two hundred-thousand transformers in service. [6]
9) Current Situation: NEC 450-23(a)(1)(d) states, “The installation complies with all restrictions provided for in the listing of the liquid.” The two NRTL listing agencies for less-flammable liquid are Underwriters Laboratories (UL) and FM Global (FM). UL and FM have also evaluated the history, science, and experience of fire risk. Since 1999 both UL and FM have been unified in not considering potential heat release rates for less-flammable fluids but rather focusing on tank rupture and fire prevention. [7, 8] Both UL and FM less-flammable transformer fluid listings have very stringent listing requirements to prevent eventful failures. [9, 10, 11, 12, 13] The key prevention safeguards include (not limited to):

- Limiting fault currents to safe levels
- Limiting internal pressures to safe levels
- Requiring the use of dielectric fluids that essentially cannot ignite to prevent pool fires

These combined requirements have contributed to the 30-year, ~250,000 transformer flawless safety record; there have been no pool fires involving less-flammable fluids with over 4,000,000 unit service years.
10) Conclusion: The 1981 perceived need to add containment of less-flammable fluids to the existing 1978 requirements has not been bourne out, consistent with science, experience, and NRTL requirements. Fluid containment is not required for practical safeguarding of persons and property from hazards arising from the use of transformers with less-flammable fluids.

Panel Meeting Action: Reject
Panel Statement: The scope of Section 90-1, states: “ The purpose of this code is the practical safeguarding of persons and property from hazards arising from the use of electricity.” If the installation of liquid filled electrical equipment can result in damage to property or hazards to individuals by the release of liquid, then the requirement for containing liquid electrical insulating materials should stand.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-148 Log #536 NEC-P09 **Final Action: Reject**
(450.45(C))

Submitter: Elliot Miller, Thoridon Electric
Recommendation: Revise text to read:
For a vault vented by natural circulation of air to an outdoor area, the combined net area of all ventilated openings, ~~after deducting the area occupied by screens, gratings or louvers,~~ after deducting the area consisting of material within the screens, gratings, or louvers, shall not be less than 1900 mm 2 (3 in. 2) per kVA of transformer capacity in service, and in no case shall the net area be less than 0.1 m 2 (1 ft 2) for any capacity under 50 kVA.
Substantiation: There needs to be clarification as to whether the entire area occupied by the means of ventilation needs to be deducted or just the area where the air can’t flow through needs to be deducted.
Panel Meeting Action: Reject
Panel Statement: The measurement is a nominal one, capable of hard conversion (i.e., inexact) into metric values (as done in the present NEC). This is clear enough without adding additional text to the Code.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

ARTICLE 455 — GENERATORS

13-12 Log #1022 NEC-P13 **Final Action: Accept in Principle**
(455.3)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Change “requirements” to “provisions.”
Substantiation: Applicable provisions which are not requirements per se, should also apply. “Applicable provisions” is used in 400.2. Similar wording should be used where referring to the same thing. To avoid confusion.
Panel Meeting Action: Accept in Principle
Revise to 455.3 to read as follows:
Phase converters shall comply with this article and with the applicable provisions of other articles of this Code.

Panel Statement: The panel agreed with the proposal but placed the wording in the same order as in 400.2.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

13-13 Log #3552 NEC-P13 **Final Action: Reject**
(455.7(C) (New))

Submitter: Patrick Gaffney, Ronk Electrical Industries, Inc.
Recommendation: Add a new section 455.7(C) or Exception #1:
Where a power loss hazard exists, 240.4(A) shall apply and conductor overload protection shall not be required. Short circuit protection shall be provided.
Substantiation: Clarifies that 240.4(A) shall supersede 455.7 in applications where a loss of power could endanger safety, i.e. fire pumps, emergency sirens, valve actuators on pipelines (for emergency shut downs), etc.
Panel Meeting Action: Reject
Panel Statement: The submitter has not substantiated that a phase converter can supply sufficient short circuit to operate "short circuit protection". Phase converters must be sized to provide the maximum continuous current, such as motor locked rotor current. Therefore, the overcurrent protection sizing requirements in 445.7 (A) and (B) are adequate.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Gustafson, R.

ARTICLE 460 — CAPACITORS

11-109 Log #1497 NEC-P11 **Final Action: Accept in Principle**
(460.10)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Delete:
"... in accordance with Article 250".
Substantiation: Edit. 250.1 indicates Article 250 covers (1) required grounding; (2) permitted grounding: (3) not permitted grounding; and (4) substitution for grounding. Apparent intent is to apply (1) required grounding, which is clarified by the proposal. Some sections requiring grounding do not refer to Article 250, e.g. 490.36. Article 250 already applies, per 90.3.
Panel Meeting Action: Accept in Principle
Revise 460.10 to read as follows:
460.10 Grounding. Capacitor cases shall be connected to the equipment grounding conductor.
Exception: Capacitor cases shall not be connected to the equipment grounding conductor where the capacitor units are supported on a structure designed to operate at other than ground potential.
Panel Statement: The panel removed the words "in accordance with Article 250" and included direction for connection to the equipment grounding conductor to clarify the requirement and to correlate with the action on Proposal 11-1.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15
Comment on Affirmative:
BUNCH, R.: Need to review the final proposed 460.10 to be sure that capacitors which are plastic cases do not end up being interpreted as requiring to have the case grounded.

11-110 Log #1498 NEC-P11 **Final Action: Accept in Principle**
(460.27)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Delete:
"... in accordance with Article 250".
Substantiation: Edit. 250.1 indicates Article 250 covers (1) required grounding; (2) permitted grounding: (3) not permitted grounding; and (4) substitution for grounding. Apparent intent is to apply (1) required grounding, which is clarified by the proposal. Some sections requiring grounding do not refer to Article 250, e.g. 490.36. Article 250 already applies, per 90.3.
Panel Meeting Action: Accept in Principle
Revise 460.27 to read as follows:
460.27 Grounding. Capacitor cases shall be connected to the equipment grounding conductor. If the capacitor neutral point is connected to a grounding electrode conductor, the connection shall be made in accordance with Part III of Article 250.
Exception: Capacitor cases shall not be connected to the equipment grounding conductor where the capacitor units are supported on a structure designed to operate at other than ground potential.
Panel Statement: The panel agrees that a general reference to Article 250 is not appropriate but instead of removing the reference has added more specific direction as to the intended part of Article 250 to be used. In addition, the panel has included direction for connection to the equipment grounding conductor to clarify the requirement and to correlate with the action on Proposal 11-1. The panel also changed "neutral" to "neutral point" to correlate with the TCC Task group definition identified in the substantiation of Proposal 11-38.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

ARTICLE 470 — RESISTORS AND REACTORS

11-111 Log #249 NEC-P11 **Final Action: Reject**
(470.2)

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
Resistors and reactors shall not be placed where exposed to ~~physical~~ damage.
Substantiation: Use of the word "physical" is superfluous - the purpose is obvious.
Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every unnecessary instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on. Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 11-33.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-112 Log #299 NEC-P11 **Final Action: Reject**
(470.18(A))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
Protected Against ~~Physical~~ Damage. Resistors and reactors shall be protected against ~~physical~~ damage.
Substantiation: Use of the word "physical" is superfluous– the purpose is obvious.
Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, maybe a quarter-page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on. Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 11-33.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 15

11-113 Log #1499 NEC-P11 **Final Action: Accept**
(470.19)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Delete:
"... in accordance with Article 250".
Substantiation: Edit. 250.1 indicates Article 250 covers (1) required grounding; (2) permitted grounding: (3) not permitted grounding; and (4) substitution for grounding. Apparent intent is to apply (1) required grounding, which is clarified by the proposal. Some sections requiring grounding do not refer to Article 250, e.g. 490.36. Article 250 already applies, per 90.3.
Panel Meeting Action: Accept
Panel Statement: The panel refers to the panel action on Proposal 11-1 and advises that the action on Proposal 11-113 removes the words "in accordance with Article 250" from the action on Proposal 11-1. The result will read as follows:

470.19 Grounding. Resistor and reactor cases or enclosures shall be connected to the equipment grounding conductor.

Exception: Resistor or reactor cases or enclosures supported on a structure designed to operate at other than ground potential shall not be connected to the equipment grounding conductor.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 15

ARTICLE 480 — STORAGE BATTERIES

13-14 Log #3128 NEC-P13 **Final Action: Reject**
(480)

Submitter: Jeremy Enders, East Lansing, MI

Recommendation: Add a new title Part I Battery Installation ahead of 480.3, and add a new Part II Equipment and Wiring to follow 480.10 with the text of the sections in the new Part II as follow:

Part II Equipment and Wiring

480.41 System Grounding. For a power source, one conductor of a two-wire system with a voltage over 50 volts and the reference (center tap) conductor of a bipolar system shall be solidly grounded or shall use other methods that accomplish equivalent system protection in accordance with 250.4(A) and that utilize equipment listed and identified for the use.

Exception: Systems complying with 690.35.

480.71 Installation.

(A) General. The interconnected battery cells shall be considered grounded where the power source is installed in accordance with 480.41.

(B) Dwellings.

(1) Operating Voltage. Storage batteries for dwellings shall have the cells connected so as to operate at less than 50 volts nominal. Lead-acid storage batteries for dwellings shall have no more than twenty-four 2-volt cells connected in series (48 volts nominal).

Exception: Where live parts are not accessible during routine battery maintenance, a battery system voltage in accordance with 609.7 shall be permitted.

(2) Guarding of Live Parts. Live parts of battery systems for dwellings shall be guarded to prevent accidental contact by persons or objects, regardless of voltage or battery type.

FPN: Batteries in renewable energy production systems are subject to extensive charge-discharge cycles and typically require frequent maintenance, such as checking electrolyte and cleaning connections.

(C) Current Limiting. A listed, current-limiting, overcurrent device shall be installed in each circuit adjacent to the batteries where the available short-circuit current from a battery or battery bank exceed the interrupting or withstand rating of other equipment in that circuit.

FPN: See 690.16 for installation of current-limiting fuses in photovoltaic power systems.

(D) Battery Nonconductive Cases and Conductive Racks. Flooded, vented, lead-acid batteries with more than twenty-four 2-volt cells connected in series (48 volts, nominal) shall not use conductive cases or shall not be installed in conductive cases. Conductive racks used to support the nonconductive cases shall be permitted where no rack material is located within 150 mm (6 in.) of the tops of the nonconductive cases.

This requirement shall not apply to any type of valve-regulated lead-acid (VRLA) battery or any other types of sealed batteries that may require steel cases for proper operation.

(E) Disconnection of Series Battery Circuits. Battery circuits subject to field servicing, where more than twenty-four 2-volt cells are connected in series (48 volts nominal), shall have provisions to disconnect the series-connected strings into segments of 24 cells or less for maintenance by qualified persons. Non-load-break bolted or plug-in disconnects shall be permitted.

(F) Battery Maintenance Disconnecting Means. Battery installations, where there are more than twenty-four 2-volt cells connected in series (48 volts, nominal), shall have a disconnecting means, accessible only to qualified persons, that disconnects the grounded circuit conductor(s) in the battery electrical system for maintenance. This disconnecting means shall not disconnect the grounded circuit conductor(s) for the remainder of the photovoltaic electrical system. A non-load-break-rated switch shall be permitted to be used as the disconnecting means.

(G) Battery Systems of More Than 48 Volts. On systems where the battery system consists of more than twenty-four 2-volt cells connected in series (more than 48 volts, nominal), the battery system shall be permitted to operate with ungrounded conductors, provided the following conditions are met:

(1) The source and output circuit shall comply with 480.41.

(2) The dc and ac load circuits shall be solidly grounded.

(3) All main ungrounded battery input/output circuit conductors shall be provided with switched disconnects and overcurrent protection.

(4) A ground-fault detector and indicator shall be installed to monitor for ground faults in the battery bank.

480.72 Charge Control.

(A) General. Equipment shall be provided to control the charging process of the battery. Charge control shall not be required where the design of the source is matched to the voltage rating and charge current requirements of the interconnected battery cells and the maximum charging current multiplied by 1 hour is less than 3 percent of the rated battery capacity expressed in ampere-hours or as recommended by the battery manufacturer. All adjusting means for control of the charging process shall be accessible only to qualified persons.

FPN: Certain battery types such as valve-regulated lead acid or nickel cadmium can experience thermal failure when overcharged.

(B) Diversion Charge Controller.

(1) Sole Means of Regulating Charging. A power system employing a diversion charge controller as the sole means of regulating the charging of a battery shall be equipped with a second independent means to prevent overcharging of the battery.

(2) Circuits with Direct-Current Diversion Charge Controller and Diversion Load. Circuits containing a dc diversion charge controller and a dc diversion load shall comply with the following:

(1) The current rating of the diversion load shall be less than or equal to the current rating of the diversion load charge controller. The voltage rating of the division load shall be greater than the maximum battery voltage. The power rating of the diversion load shall be at least 150 percent of the power rating of the power source.

(2) The conductor ampacity and the rating of the overcurrent device for this circuit shall be at least 150 percent of the maximum current rating of the diversion charge controller.

(3) Systems Using Utility-Interactive Inverters. Power systems using utility-interactive inverters to control battery state-of-charge by diverting excess power into the utility system shall comply with (1) and (2):

(1) These systems shall not be required to comply with 480.72(B)(2). The charge regulation circuits used shall comply with the requirements of 690.8

(2) The conductor ampacity and the rating of the overcurrent device for this circuit shall be at least 150 percent of the maximum current rating of the diversion charge controller.

480.74 Battery Interconnections. Flexible cables, as identified in Article 400, in sizes 2/0 AWG and larger shall be permitted within the battery enclosure from battery terminals to a nearby junction box where they shall be connected to an approved wiring method. Flexible battery cables shall also be permitted between batteries and cells within the battery enclosure. Such cables shall be listed for hard-service use and identified as moisture resistant.

Substantiation: Battery systems are being installed as a part of renewable energy systems, especially in dwelling occupancies, and there are no rules for installing these systems. There is a good set of rules in Part VIII of Article 690, but those rules only apply to photovoltaic systems. Battery systems are being installed as a part of renewable energy systems that have nothing to do with photovoltaics.

Panel Meeting Action: Reject

Panel Statement: This proposal was extracted from Article 690 and still contains those references in it. It needs to be written and substantiated for general application of battery installations in dwellings.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14

Ballot Not Returned: 1 Gustafson, R.

13-15 Log #1093 NEC-P13 **Final Action: Accept in Part**
(480.3)

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Change “requirements” to “applicable provisions” or alternatively, delete this section.

Substantiation: Edit. Some code provisions are not requirements. Per 90.5(B), some rules are permissive. 430.5 uses the term “applicable provisions”. This section is already covered by 90.3.

Panel Meeting Action: Accept in Part

Change “requirements” to “applicable provisions”

Panel Statement: The submitter offered the panel two alternativ,es and the panel accepted the first one as reflected in this change.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14

Ballot Not Returned: 1 Gustafson, R.

13-16 Log #1947 NEC-P13 **Final Action: Reject**
(480.5 (New))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Recommendation: Add text to read as follows:

480.5 Disconnecting Means. A disconnecting means shall be provided for all ungrounded conductors derived from a stationary battery system. A disconnecting means shall be readily accessible and located within sight of the battery system.

Substantiation: All batteries systems require maintenance if they are to remain functional. In some cases, such as in 700.3(C) and (D), the NEC requires battery system maintenance, and requires documentation of the maintenance. To safely perform maintenance on a stationary battery system, a disconnect means should be provided within sight of the battery system.

Panel Meeting Action: Reject
Panel Statement: There was no substantiation provided for requiring a disconnect for batteries of all voltage and current levels. Additionally there are no requirements specified in the proposal for the disconnect construction and ratings.
Number Eligible to Vote: 15
Ballot Results: Affirmative: 11 Negative: 3
Ballot Not Returned: 1 Gustafson, R.
Explanation of Negative:

NASBY, J.: The NEMA Proposal Substantiation reads: All batteries systems require maintenance if they are to remain functional. In some cases, such as in 700.3(C) and (D), the NEC requires battery system maintenance, and requires documentation of the maintenance. To safely perform maintenance on a stationary battery system, a disconnect means should be provided within sight of the battery system.

The substantiation identified means for isolating the battery for periodic maintenance as needed. The type and construction details are best developed in product standards. The Code is not intended as a design specification.

Further, these batteries will typically be capable of large short circuit currents, and since these batteries will normally contain an explosive mixture of hydrogen and oxygen from charging, that a disconnecting provision is vital. This is regardless of whether the battery voltage is a shock hazard or not. Moreover, a bank of six or 12 volt batteries may pose a shock hazard in situ (connected in series) even though each individual battery does not.

STAFFORD, T.: This panel member feels that it is necessary for all stationary battery systems to be required to have a readily accessible disconnecting means. It is understood by those performing work on such stationary battery systems that potentially hazardous conditions could occur regardless of the size or number of batteries in the stationary battery system. In addition a second paragraph stating: The provisions for locking or adding a lock to the disconnecting means must remain in place at the switch or circuit breaker whether the lock is installed or not. Portable means for adding a lock to the switch or circuit breaker shall not be permitted. See additional comments on proposal 13-9.

SWAYNE, R.: The proposal should be accepted. A disconnect is necessary to insure that there is no current flow. Lifting a battery interconnection strap under load would result in arcing and a potentially hazardous condition for personnel and property.

ARTICLE 490 — EQUIPMENT, OVER 600 VOLTS, NOMINAL

9-149 Log #2326 NEC-P09 **Final Action: Reject**
(490.2.Arc Resistant Switchgear (New))

Submitter: Daleep C. Mohla, DCM Electrical Consulting Services, Inc.
Recommendation: Add the following definition:

Arc Resistant Switchgear. Switchgear in an enclosure that is capable of withstanding the effects of an internal arcing fault.

FPN: See IEEE Standard C37.20.7 for performance and testing requirements.
Substantiation: Arc resistant switchgear is being utilized in the industry. This term is not recognized or defined in the NEC. Inclusion of this definition will provide users a consistent definition.
Panel Meeting Action: Reject
Panel Statement: This definition is not needed.

CMP-9 changed the text of the definition; See panel action and statement of Proposal 9-5 for the definition of “Metal-Enclosed Power Switchgear”.

Additional information should be a product standards issue.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-150 Log #2327 NEC-P09 **Final Action: Reject**
(490.21(A)(1)(a))

Submitter: Daleep C. Mohla, DCM Electrical Consulting Services, Inc.
Recommendation: Revise text as follows:

Circuit breakers ~~installed indoors~~ shall be mounted in metal-enclosed units <u>of listed arc resistant construction</u> or fire-resistant cell-mounted units. ~~or they shall be permitted to be open-mounted in locations accessible to qualified persons only.~~
Substantiation: An arc flash within the equipment, even with the door closed, can cause thermal, sound, pressure; shrapnel, and blast hazards resulting in injuries to the operating personnel even when wearing personal protective equipment. Personal protective equipment is tested for protection against thermal hazards only. A non arc resistant switchgear is tested to withstand bolted fault only. A listed arc resistant switchgear is designed and tested to withstand effects of internal faults as well as bolted fault and will provide protection against thermal, pressure, blast, and shrapnel hazards. Arc resistant switchgear is tested as per IEEE C37.20.7 and is available from multiple equipment suppliers. Open mounted circuit breakers are not available in industry any longer and present a safety hazard to personnel.

Panel Meeting Action: Reject
Panel Statement: All MV switchgear may not need to be of the arc resistant type as many existing installations have been applied for years without incident. This decision should be left to the designer of a particular facility and the installation requirements. The designer of a facility may choose other methods to ensure personnel safety when working around switchgear therefore forgoing the additional cost, bulkiness and installation issues associated with arc resistant switchgear.

Supporting notes:

(1)Arc resistant switchgear is offered by most manufacturers but is not necessarily offered in all lines of gear. Typically metal-clad gear is built in an arc resistant version but many metal-enclosed lines are not offered with this option. This is because switchgear can be applied safely with appropriate installations and work practices.

(2)Arc resistant switchgear may require larger spaces both from a footprint and a height standpoint to accomplish the installation and is not needed in all instances.

(3)As written, this proposal would require a single section added to an existing 50 section line-up to be arc resistant. Having only one section arc resistant does little to increase safety plus may create impossible installation challenges.

(4)This proposal as written would require a MV starter installed in a remote site such as an oil well or irrigation pump to be arc resistant. The designer of this type facility may deem this unnecessary due to restricted access and appropriate work practices of maintenance personnel.

In summary, the decision of whether to utilize an arc resistant design of switchgear should lie with the designer of a facility and depend on specifications and working conditions. Arc resistant switchgear should not be mandated by the Code in all applications.

The submitter has not provided adequate substantiation for deleting open-mounted circuit breakers or deletion of “installed indoors”.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-151 Log #3523 NEC-P09 **Final Action: Reject**
(490.21(A)(1)a.)

Submitter: James R. White, Shermco Industries, Inc.
Recommendation: Revise text as follows:

Circuit breakers installed indoors shall be mounted in metal-enclosed units of listed arc resistant construction, or fire-resistant cell-mounted units, ~~or they shall be permitted to be open mounted~~ in locations accessible to qualified persons only.

Other text remains unchanged.
Substantiation: Open-mounted circuit breakers are no longer available and present a safety hazard to personnel. Arc flash and arc blast are recognized hazards by OSHA and the NFPA 70E. Metal-enclosed switchgear is not currently constructed to withstand the pressures of an internal arcing fault. Even with the door closed and latched an arc can cause thermal, sound, pressure; shrapnel, and blast hazards resulting in injuries to the operating personnel, even when wearing PPE. Although PPE is available to protect personnel from incident energies created by an arc, there is no protective equipment rated for the arc blast hazard. Listed arc resistant switchgear is designed and tested to withstand effects of internal faults, as well as bolted faults and will provide protection against the above hazards. Arc resistant switchgear that is tested in accordance with IEEE C37.20.7 is averrable from multiple equipment suppliers.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 9-150.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-152 Log #3069 NEC-P09 **Final Action: Reject**
(490.21(A)(4)(2))

Submitter: Eric Gesualdi, Lyondell Chemical Company
Recommendation: Article 490 Equipment Over 600 Volts, Nominal

490.21(A)(4) Circuit Breaker Rating

(2) The Interrupting rating of a circuit breaker shall not be less than the maximum fault current the circuit breaker will be required to interrupt, including contributions from all connected sources of energy.

Recommendation: Add a FPN as follows:

FPN: For supervised locations, circuit breakers may not need to be rated based on the contributions from all connected sources of energy if the circuit breaker is part of a secondary selective system that operates with the tie breaker open when both main breakers are closed and has a transfer scheme that limits the time the sources can be operated in parallel during source transfers and alarms when time is exceeded.
Substantiation: Adherence to “490.21(A)(4) Circuit Breaker Rating” increase both equipment cost and equipment complexity. Adding the FPN, allows under supervision and specific conditions, the option to reduce circuit breaker ratings.

Panel Meeting Action: Reject
Panel Statement: During the period of time when the tie breaker is closed, CMP-9 concludes that the interrupting rating of the circuit breaker must be evaluated on the basis of contribution from all connected sources.
In addition, the proposed text has mandatory applicability and would be more properly expressed as an exception.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 9 Negative: 1
Ballot Not Returned: 1 de Vega, H.
Explanation of Negative:
YOUNG, R.: The panel should have voted to Accept this proposal. This proposal recognizes a system to provide reliable power to loads in large manufacturing facilities. These secondary selective systems are common in double ended substations where maintaining power to loads is critical for operation or system safety such as continuous manufacturing facilities and generating stations. These schemes utilize automatic transfer logic that parallels sources only momentarily and prohibit continuous paralleling. IEEE 666, “Design Guide for Electric Power Service Systems for Generating Stations”, specifically allows this arrangement.
Transformer impedances required to continuously parallel the sources would limit the ability to start very large motors common in these facilities when operating on a single source. Also, the probability of a fault during the very brief transfer period is much lower than the risk of fault or misoperation of a system with a reactor and paralleled breaker to limit the fault current during the transition.

9-153 Log #3522 NEC-P09 **Final Action: Reject**
(490.21(B) (New))

Submitter: James R. White, Shermco Industries, Inc.
Recommendation: Add new Section B. Renumber/reidentify existing section B and other sections.
Load interrupting switches shall be mounted in metal-enclosed units of listed arc resistant construction and in locations accessible to qualified persons only.
FPN: See IEEE Standard C37.20.7 for testing requirements of arc resistant switchgear.
Other text remains unchanged.
Substantiation: Arc flash and arc blast are recognized hazards by OSHA and the NFPA 70E. Standard-construction metal-enclosed switchgear cannot withstand the pressures of an internal arcing fault. Even with the door closed and latched an arc can cause thermal, sound, pressure, shrapnel, and blast hazards resulting in injuries to the operating personnel, even when wearing PPE. Although PPE is available to protect personnel from incident energies created by an arc, there is no protective equipment rated for the arc blast hazard. Listed arc resistant switchgear is designed and tested to withstand the effects of internal faults, as well as bolted faults and will provide protection against the above hazards. Arc resistant switchgear that is tested in accordance with IEEE C37.20.7 is available from multiple equipment suppliers.
Panel Meeting Action: Reject
Panel Statement: See panel actions and statements on Proposals 9-149 and 9-150.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-154 Log #2328 NEC-P09 **Final Action: Reject**
(490.21(B)(7) and 490.21(B)(7), FPN (New))

Submitter: Daleep C. Mohla, DCM Electrical Consulting Services, Inc.
Recommendation: Add the following to the end of 490.21(B)(7) and a new FPN to 490.21(B)(7) to read:
The switch shall be mounted in metal-enclosed unit(s) of listed arc resistant construction.
FPN: See IEEE/ANSI Standard C37.20.7 for testing requirements of arc resistant switchgear.
Other text remains unchanged.
Substantiation: An arc flash within the equipment, even with the door closed, can cause thermal, sound, pressure; shrapnel, and blast hazards resulting in injuries to the operating personnel even when wearing personal protective equipment. Personal protective equipment is tested for protection against thermal hazards only. A non arc resistant switchgear is tested to withstand bolted fault only. A listed arc resistant switchgear is designed and tested to withstand effects of internal faults as well as bolted fault and will provide protection against thermal, pressure, blast, and shrapnel hazards. Arc resistant switchgear is tested as per IEEE/ANSI C37.20.7 and is available from multiple equipment suppliers. This is not intended to apply to motor starters with fuses and contactors typically known as NEMA E2 contactors.
Panel Meeting Action: Reject
Panel Statement: See panel actions and statements on Proposals 9-149 and 9-150.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-155 Log #2038 NEC-P09 **Final Action: Accept in Principle**
(490.44(C))

Submitter: James T. Dollard, Jr., IBEW Local 98
Recommendation: Revise text to read as follows:
490.44 (C) Switching Mechanism The switching mechanism shall be arranged to be operated from a location outside the enclosure where the operator is not exposed to energized parts and shall be arranged to open all ungrounded conductors of the circuit simultaneously with one operation. Switches shall be capable of being locked in the open position. <u>The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed.</u>
Substantiation: This requirement for a disconnect is for the safety of the installer/maintainer of the equipment. Permanent provisions for making circuit breakers and switches capable of being locked in the open position are readily available from circuit breaker and switch manufacturers.
This proposal does not represent a large increase in the cost of an installation but will result in a dramatic increase in safety.
The practical safeguarding of persons from electrical hazards as detailed in the scope of the NEC must not be permitted to hinge on whether or not an installer just happens to have enough different types of devices and hopefully one that that happens to fit the circuit breaker or switch in an installation.
Note that this language was accepted by CMP-11 and is a present requirement, in the 2002 NEC, when a circuit breaker or switch is used as a disconnecting means not within sight of a motor. Also included in the 2005 NEC is the same language in 422.31 for appliances
The same level of safety is needed for these disconnecting means for all equipment operating at over 600-volts nominal.
Panel Meeting Action: Accept in Principle
Add a last sentence to existing text that reads as follows:
The provisions for locking shall remain in place with or without the lock installed.
Panel Statement: The proposal as written is not appropriate for a section addressing a fused interrupter switch.
The statement was editorially modified for reader clarity and understandability. The additional words in the submitter’s language would do nothing to clarify the issue. The existing language already requires locking provisions, the only concept added is to ensure permanent rather than portable means for lockout.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.
Comment on Affirmative:
BELISLE, R.: We feel that the addition of the following language would clarify the provisions for locking requirements and assist in enforcement interpretation.
Add the following after the last sentence:
“Portable means for adding a lock shall not be permitted.”

9-156 Log #2039 NEC-P09 **Final Action: Accept in Principle**
(490.45(A))

Submitter: James T. Dollard, Jr., IBEW Local 98
Recommendation: Revise text to read as follows:
490.45 (A) Circuit Breakers Circuit breakers equipped with stored energy mechanisms shall be designed to prevent the release of the stored energy unless the mechanism has been fully charged. <u>Circuit breakers shall be capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed.</u>
Substantiation: This proposed requirement for a disconnect is for the safety of the installer/maintainer of the equipment. Permanent provisions for making circuit breakers and switches capable of being locked in the open position are readily available from circuit breaker and switch manufacturers.
This proposal does not represent a large increase in the cost of an installation but will result in a dramatic increase in safety.
The practical safeguarding of persons from electrical hazards as detailed in the scope of the NEC must not be permitted to hinge on whether or not an installer just happens to have enough different types of devices and hopefully one that that happens to fit the circuit breaker or switch in an installation.
Note that this language was accepted by CMP-11 and is a present requirement, in the 2002 NEC, when a circuit breaker or switch is used as a disconnecting means not within sight of a motor. Also included in the 2005 NEC is the same language in 422.31 for appliances
The same level of safety is needed for these disconnecting means for all equipment operating at over 600-volts nominal.
Panel Meeting Action: Accept in Principle
Renumber existing 490.46 to 490.47. 490.47 to remain in Part III.
Create new section 490.46
490.46 Circuit Breaker Locking. Circuit breakers shall be capable of being locked in the open position or, if they are installed in a drawout mechanism,

that mechanism shall be capable of being locked in such a position that the mechanism cannot be moved into the connected position. In either case, the provision for locking shall remain in place with or without the lock.

Panel Statement: The proposal as written is not appropriate for a section addressing a circuit breaker interlock.

CMP-9 created a new section that addresses the concern of the submitter.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10

Ballot Not Returned: 1 de Vega, H.

Ballot Results: Affirmative: 10

Ballot Not Returned: 1 de Vega, H.

9-158 Log #3410 NEC-P09 **Final Action: Accept in Principle**
(490.46)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: Revise to read as follows:

490.46 Metal Enclosed and Metalclad Service Equipment.

(A) General. Metal-enclosed and metalclad switchgear installed as high voltage service equipment shall consist of a substantial metal structure and a sheet metal enclosure. Where installed over a combustible floor, suitable protection thereto shall be provided. The metal enclosed and metalclad switchgear shall include a service conductor termination compartment that separates the service conductors and service conductor terminations from an isolating switch or linkages, if present, the service disconnecting means, and all wiring and equipment on the load side of the service disconnecting means.

FPN: Local serving utilities may have additional requirements for high-voltage service equipment. See ANSI/IEEE C2-2002 Sections 18 and 38 for further information.

(B) Service Conductor Termination Compartment. The service cables shall terminate in a separate compartment. The compartment shall comply with 490.46(B)(1) through (B)(6):

(1) Door. The compartment shall include a hinged door with provision for applying a separate lock in the field.

(2) Marking. The compartment shall be equipped with a label identifying its function and the service voltage.

(3) Busbars. Where service conductor termination compartments contain exposed busbars the compartment shall include:

(1) A removable or hinged inner barrier marked with the nominal voltage(s) present

(2) A bare bus bar extension on each phase for voltage testing and application of safety grounds

(4) Separable Connectors. Where service conductor termination compartments incorporate the use of high voltage insulated separable connectors without exposed, bare or insulated bus within the compartment, the compartment shall include either:

(1) Provisions to disconnect and isolate the service cable connector from the service equipment; or

(2) Provisions to facilitate the application of safety grounds to the service conductors

(5) Ground Bus. A ground bus shall be extended into the compartment for connection of service cable termination shields and to facilitate the attachment of safety grounds for personnel protection.

(6) Included Equipment. The service conductor termination compartment shall be dedicated to this use and shall be reserved for the equipment in 490.46(B)(6)(1) through 490.46(B)(6)(6).

(1) Service conductors and terminations

(2) Surge arresters

(3) Metering transformers

(4) Busbars and their supports, insulators, associated components

(5) Line-side components of the service disconnecting means

(6) Current transformers and associated wiring for protective relaying.

(C) Service Overcurrent Protective Devices. High voltage service overcurrent devices shall be designed or installed so they are de-energized while being replaced or maintained. Access to these devices shall not expose personnel to live parts connected to the service conductors.

FPN: Barriers, rack-out mechanisms, and interlocks with load break or isolating switches are recognized safeguards to provide this isolation.

Substantiation: The submitter has no strong technical position on the merits of this proposal, but is concerned that it will end up being around for a long time with no effective response from the NEC Committee. See, for example, Proposal 13-28 and Comment 13-8 in the 2002 code cycle, which means that an underlying proposal must have been generated before the first Friday in November, 1999. This proposal is a placeholder to allow CMP 9 to pursue action on its own in the event there has been no consensus on the technical issues reached by the affected industry interests. A companion proposal has been submitted to correlate 230.211 with this action. This language was previously published as the submitter's comment on affirmative vote in the 2005 NEC ROP, Proposal 9-141, but the wording is slightly modified to incorporate the current wording of 490.46.

Panel Meeting Action: Accept in Principle

Change the submitter's text to read as follows:

490.46 Metal Enclosed and Metalclad Service Equipment.

(A) General. Metal-enclosed and metalclad switchgear installed as high voltage service equipment shall consist of a substantial metal structure and a sheet metal enclosure. Where installed over a combustible floor, suitable protection thereto shall be provided. The metal enclosed and metalclad switchgear shall include a service conductor termination compartment that separates the service conductors and service conductor terminations from an isolating switch or linkages, if present, the service disconnecting means, and all wiring and equipment on the load side of the service disconnecting means.

FPN: Local serving utilities may have additional requirements for high-voltage service equipment. See ANSI/IEEE C2-2002 Sections 18 and 38 for further information.

(B) Service Conductor Termination Compartment. The service cables shall terminate in a separate compartment. The compartment shall comply with 490.46(B)(1) through (B)(6):

(1) Door or Cover . The compartment shall include a bolted cover or a hinged door with provision for applying a separate lock in the field.

(2) Marking. The compartment shall be equipped with a label identifying its function and the service voltage.

(3) ~~Busbars.~~ Testing ~~Where service conductor termination compartments contain exposed busbars the compartment shall include:~~

~~(1) A removable or hinged inner barrier marked with the nominal voltage(s) present~~

~~(2) A bare bus bar extension on each phase for voltage testing and application of safety grounds.~~

Provisions shall be supplied on the line terminals or connecting bus in the compartment shall include provisions for voltage testing and application of safety grounds.

(4) Ground Bus. A ground bus shall be extended into the compartment for connection of service cable termination shields and to facilitate the attachment of safety grounds for personnel protection.

(5) Separable Connectors. Where service conductor termination compartments incorporate the use of high voltage insulated separable connectors without exposed, bare or insulated bus within the compartment, the compartment shall include either:

(1) Provisions to disconnect and isolate the service cable connector from the service equipment; or

(2) Provisions to facilitate the application of safety grounds to the service conductors

~~(5) Ground Bus. A ground bus shall be extended into the compartment for connection of service cable termination shields and to facilitate the attachment of safety grounds for personnel protection.~~

~~(6)~~ (6) Included Equipment. The service conductor termination compartment shall be dedicated to this use and shall be reserved for the equipment in 490.46(B)(6)(1) through 490.46(B)(6)(7).

(1) Service conductors and terminations

(2) Surge arresters

(3) Metering transformers

(4) Busbars and their supports, insulators, associated components

(5) Line-side components of the service disconnecting means

(6) Current transformers and associated wiring for protective relaying.

(7) devicesAdditional equipment that facilitates metering, grounding, or other service-entrance related functions.

(C) Service Overcurrent Protective Devices. High voltage service overcurrent devices shall be designed or installed so they are de-energized while being replaced or maintained. Access to these devices shall not expose personnel to live parts connected to the service conductors.

FPN: Barriers, rack-out mechanisms, and interlocks with load break or isolating switches are recognized safeguards to provide this isolation.

Panel Statement: This text should replace the existing text in 490.46 contained in the 2005 NEC.

The change in (B)(1) provides for an alternatively safe installation utilized bolted covers to provide the compartment's isolation.

The modified language in (B)(3) retains the important concept of providing for the connection of ground and test devices but revised to avoid overly prescriptive language, permitting multiple design solutions that may be acceptable to the user. Additionally the language proposed for (B)(5) has been moved next to this section to consolidate all ground and test requirements.

An item (7) is added to (B)(6) to ensure the list is not overly limiting. There are many devices that may need to be included in this compartment depending on the user needs and requirements.

Number Eligible to Vote: 11
Ballot Results: Affirmative: 8 Negative: 2
Ballot Not Returned: 1 de Vega, H.
Explanation of Negative:

SENGUPTA, S.: The submitter's substantiation does not address the safety benefits of the proposal over existing practices. The proposal looks like a design specification, and the code is not intended to be such unless all safety related installations are covered.

I believe that this article needs attention by the code. I recommend that the TCC coordinate this issue, based on the actions of CMP 9 of 2005 NEC.

YOUNG, R.: The Panel should have voted to Reject this proposal. The submitter provided no substantiation as to the safety benefits to be added by these new requirements over existing practices. These are design specifications.

Comment on Affirmative:

HARTWELL, F.: The action on Proposal 9-156 creates an inadvertent numbering conflict with this section. The panel intent was to place the action on Proposal 9-156 directly after the existing code text on circuit breakers. This section should be assigned a higher number in Part III, presumably 490.57.

9-159 Log #3521 NEC-P09 **Final Action: Reject**
(490.46)

Submitter: James R. White, Shermco Industries, Inc.
Recommendation: Revise text as follows:

Metal enclosed and metal clad switchgear installed as high-voltage service equipment <u>shall be of arc resistant construction, and</u> include a ground bus for the connection of service cable shields and to facilitate the attachment of safety grounds, for personnel protection.

Other text remains unchanged.

Substantiation: Arc flash and arc blast are recognized hazards by OSHA and the NFPA 70E. Standard-construction metal-enclosed switchgear cannot withstand the pressures of an internal arcing fault. Even with the door closed and latched an arc can cause thermal, sound, pressure, shrapnel, and blast hazards resulting in injuries to the operating personnel, even when wearing PPE. Although PPE is available to protect personnel from incident energies created by an arc, there is no protective equipment rated for the arc blast hazard. Listed arc resistant switchgear is designed and tested to withstand the effects of internal faults, as well as bolted faults and will provide protection against the above hazards. Arc resistant switchgear that is tested in accordance with IEEE C37.20.7 is available from multiple equipment suppliers.

Ballot Not Returned: 1 de Vega, H.

9-161 Log #298 NEC-P09 **Final Action: Reject**
(490.51(C))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:

Protection. Adequate enclosures or guarding, or both, shall be provided to protect portable and mobile equipment from ~~physical~~ damage.

Substantiation: Use of the word "physical" is superfluous– the purpose is obvious.

Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, maybe a quarter-page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on. Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."
Panel Meeting Action: Reject
Panel Statement: The use in CMP-9's articles is consistent with the rest of the Code. CMP-9 understands that this is a global proposal and if this terminology changes, it must be evaluated by the Technical Correlating Committee and guidance provided to code making panels so the results will be consistent.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 de Vega, H.

9-162 Log #1543 NEC-P09 **Final Action: Accept**
(490.53)

Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Delete the term "effectively" from the terms "effectively grounded" and "effectively bonded" from Articles 490 and revise text as shown for the affected NEC sections.

490.53: All energized switching and control parts shall be enclosed in ~~effectively~~ grounded metal cabinets or enclosures. These cabinets or enclosures shall be marked "DANGER — HIGH VOLTAGE — KEEP OUT" and shall be locked so that only authorized and qualified persons can enter. Circuit breakers and protective equipment shall have the operating means projecting through the metal cabinet or enclosure so these units can be reset without opening locked doors. With doors closed, reasonable safe access for normal operation of these units shall be provided.

Substantiation: 490.53: The definition is ambiguous and very subjective without any defined values or parameters for one to judge as either "effective" or "ineffective." This section is revised to be more prescriptive.

This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to delete the term "grounded, effectively" and its definition from Article 100 and other companion proposals throughout the NEC relative to this Task Group's recommendations. The substantiation of this proposal is as follows.

The term "Effectively Grounded" is used 29 times in the NEC. It appears as though in the majority of the locations where it is used, the word "grounded" or phrase "connected to an equipment grounding conductor" could be used. Other proposals are submitted to make those changes.

The 1996 NEC in Section 250.51 used the term "effective grounding path," and those concepts were incorporated in 250.2 (1999 NEC) and then expanded in 250.4(A) and (B) in the 2002 NEC. The performance criteria of grounding and bonding are currently provided in Section 250.4 and include the concepts contained in the vague definition of the term "effectively grounded."

The definition "Effectively Grounded" is very subjective and without any defined values or parameters for one to judge grounding as either "effective" or "ineffective." "Effective" is described in Section 250.4(A) and (B), but it relates to the effective ground-fault current path as a performance criteria. Deleting the term in the NEC and the definition is logical because there are no definitive parameters for Code users to make a determination on what constitutes "effectively grounded." Systems are solidly grounded, grounded through a resistor or impedance, or ungrounded. Equipment (normally noncurrent-carrying metal parts are grounded where connected to an equipment grounding conductor.

This proposal is to change the term "Effectively Bonded" to just "Bonded" in each of the section where it is used. The term "Effectively Bonded" is currently not defined in the NEC.

The term "effectively bonded" is also used a few times in the NEC and is undefined. The same situation exists. There are no defined parameters for Code users to judges what the difference between "Effectively Bonded" and "Bonded" really is. Where the term appears in the NEC, it is revised to just "bonded" and still has the same meaning in each rule.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10

Ballot Not Returned: 1 de Vega, H.

9-163 Log #1600 NEC-P09 **Final Action: Accept in Principle**
(490.72(D))

TCC Action: The Technical Correlating Committee directs that the action on this proposal be sent to the Technical Correlating Committee Task Group on the definition of "Neutral Conductor" for review and comment

Submitter: Technical Correlating Committee on National Electrical Code®,

Recommendation: Make the following change in 490.72(D):

Change "neutral" to "neutral conductor currents."

The revised text would appear as follows:

(D) Ground Current Detection. Means shall be provided for detection of the sum of the neutral conductor currents and ground currents and shall trip the circuit-interrupting device if the sum of those currents exceeds the greater of 5 amperes or 7 percent of the boiler full-load current for 10 seconds or exceeds an instantaneous value of 25 percent of the boiler full-load current.

Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).

The Task Group has proposed the following definitions to be added to Article 100:

● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.

● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals

● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.

● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.

Additional information is available in the Task Group report.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle

Panel Statement: The change meets the submitter's intent.

ARTICLE 500 — HAZARDOUS (CLASSIFIED) LOCATIONS, CLASSES I, II, AND III, DIVISIONS 1 AND 2

14-1a Log #CP1400 NEC-P14 **Final Action: Accept**
(Articles 500, 503, 504, 506)

TCC Action: The Technical Correlating Committee advises that Article Scope Statements and Article Titles are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee Accepts the Panel Action on 500.1, 503.1, and the revised title of Article 506.

Submitter: Code-Making Panel 14,

Recommendation: Revise the following parts of the identified sections in the 2005 NEC to read:

1) 500.1 Scope Articles 500 Through 504: Articles 500 through 504 cover the requirements for electrical and electronic equipment and wiring for all voltages in Class I, Divisions 1 and 2; Class II, Divisions 1 and 2; and Class III, Divisions 1 and 2 locations where fire or explosion hazards may exist due to flammable gases, flammable liquid-produced vapors, combustible liquid-produced vapors, combustible dusts, or ignitible fibers/flyings.

FPN No. 1: The unique hazards associated with explosives, pyrotechnics, and blasting agents are not addressed in this article.

FPN No. 2: For the requirements for electrical and electronic equipment and wiring for all voltages in Class I, Zone 0, Zone 1, and Zone 2 hazardous (classified) locations where fire or explosion hazards may exist due to flammable gases or vapors or flammable liquids, refer to Article 505.

FPN No. 3: For the requirements for electrical and electronic equipment and wiring for all voltages in Zone 20, Zone 21, and Zone 22 hazardous (classified) locations where fire or explosion hazards may exist due to combustible dusts or ignitible fibers/flyings, refer to Article 506.

2) 500.5(A) Classifications of Locations. Locations shall be classified depending on the properties of the flammable gas, flammable liquid-produced vapor, combustible-liquid produced vapors, combustible dusts, or fibers/flyings that may be present, and the likelihood that a flammable or combustible concentration or quantity is present. Where pyrophoric materials are the only materials used or handled, these locations shall not be classified. Each room, section, or area shall be considered individually in determining its classification.

3) 500.5(B) Class I Locations. Class I locations are those in which flammable gases, flammable liquid–produced vapors, or combustible liquid-produced vapors are or may be present in the air in quantities sufficient to produce explosive or ignitible mixtures. Class I locations shall include those specified in 500.5(B)(1) and (B)(2).

4) 500.5(B)(1) Class I, Division 1. A Class I, Division 1 location is a location

(1) In which ignitible concentrations of flammable gases, flammable liquid–produced vapors, or combustible liquid- produced vapors can exist under normal operating conditions, or

(2) In which ignitible concentrations of such flammable gases, flammable liquid–produced vapors, or combustible liquids above their flashpoints may exist frequently because of repair or maintenance operations or because of leakage, or

(3) In which breakdown or faulty operation of equipment or processes might release ignitible concentrations of flammable gases, flammable liquid–produced vapors, or combustible liquid-produced vapors and might also cause simultaneous failure of electrical equipment in such a way as to directly cause the electrical equipment to become a source of ignition.

5) 500.5(B)(2) Class I, Division 2. A Class I, Division 2 location is a location

(1) In which volatile flammable gases, flammable liquid–produced vapors, or combustible liquid-produced vapors are handled, processed, or used, but in which the liquids, vapors, or gases will normally be confined within closed containers or closed systems from which they can escape only in case of accidental rupture or breakdown of such containers or systems or in case of abnormal operation of equipment, or

(2) In which ignitible concentrations of flammable gases, flammable liquid– produced vapors, or combustible liquid-produced vapors are normally prevented by positive mechanical ventilation and which might become hazardous through failure or abnormal operation of the ventilating equipment, or

(3) That is adjacent to a Class I, Division 1 location, and to which ignitible concentrations of flammable gases, flammable liquid–produced vapors, or combustible liquid-produced vapors above their flashpoints might occasionally be communicated unless such communication is prevented by adequate positive-pressure ventilation from a source of clean air and effective safeguards against ventilation failure are provided.

6) 500.5(D) Class III Locations. Class III locations are those that are hazardous because of the presence of easily ignitible fibers or materials producing combustible flyings are handled, manufactured, or used, but in which such fibers/flyings are not likely to be in suspension in the air in quantities sufficient to produce ignitible mixtures. Class III locations shall include those specified in 500.5(D)(1) and (D)(2).

7) 500.5(D)(1) Class III, Division 1. A Class III, Division 1 location is a location in which easily ignitible fibers/flyings are handled, manufactured, or used.

FPN No. 1: Such locations usually include some parts of rayon, cotton, and other textile mills; combustible fibers/flyings manufacturing and processing plants; cotton gins and cotton-seed mills; flax-processing plants; clothing manufacturing plants; woodworking plants; and establishments and industries involving similar hazardous processes or conditions.

FPN No. 2: Easily ignitible fibers/flyings include rayon, cotton (including cotton linters and cotton waste), sisal or henequen, istle, jute, hemp, tow, cocoa fiber, oakum, baled waste kapok, Spanish moss, excelsior, and other materials of similar nature.

8) 500.5(D)(2) Class III, Division 2. A Class III, Division 2 location is a location in which easily ignitible fibers/flyings are stored or handled other than in the process of manufacture.

9) 500.8(A)(6) Where flammable gases, flammable liquid–produced vapors, combustible liquid-produced vapors, or combustible dusts are or may be present at the same time, the simultaneous presence of both shall be considered when determining the safe operating temperature of the electrical equipment.

10) 500.8(A)(1) Equipment shall be identified not only for the class of location but also for the explosive, combustible, or ignitible properties of the specific gas, vapor, dust, fibers/flyings that will be present. In addition, Class I equipment shall not have any exposed surface that operates at a temperature in excess of the ignition temperature of the specific gas or vapor. Class II equipment shall not have an external temperature higher than that specified in 500.8(C)(2). Class III equipment shall not exceed the maximum surface temperatures specified in 503.5.

11) 503.1 Scope. Article 503 covers the requirements for electrical and electronic equipment and wiring for all voltages in Class III, Division 1 and 2 locations where fire or explosion hazards may exist due to ignitible fibers/flyings.

12) 503.5 General. (second paragraph): Equipment installed in Class III locations shall be able to function at full rating without developing surface temperatures high enough to cause excessive dehydration or gradual carbonization of accumulated fibers/flyings. Organic material that is carbonized or excessively dry is highly susceptible to spontaneous ignition. The maximum surface temperatures under operating conditions shall not exceed 165°C (329°F) for equipment that is not subject to overloading, and 120°C (248°F) for equipment (such as motors or power transformers) that may be overloaded.

13) 503.128 Ventilating Piping — Class III, Divisions 1 and 2. (second paragraph)

Ventilating pipes shall be sufficiently tight, including their connections, to prevent the entrance of appreciable quantities of fibers/flyings into the ventilated equipment or enclosure and to prevent the escape of sparks, flame, or burning material that might ignite accumulations of fibers/flyings or combustible material in the vicinity. For metal pipes, lock seams and riveted or welded joints shall be permitted; and tight-fitting slip joints shall be permitted where some flexibility is necessary, as at connections to motors.

14) 503.130(A) Fixed Lighting. Luminaires (lighting fixtures) for fixed lighting shall provide enclosures for lamps and lampholders that are designed to minimize entrance of fibers/flyings and to prevent the escape of sparks, burning material, or hot metal. Each luminaire (fixture) shall be clearly marked to show the maximum wattage of the lamps that shall be permitted without exceeding an exposed surface temperature of 165°C (329°F) under normal conditions of use.

15) 503.140 Flexible Cords — Class III, Divisions 1 and 2.

Flexible cords shall comply with the following:

(5) Be provided with suitable means to prevent the entrance of fibers/flyings where the cord enters boxes or fittings

16) 503.145 Receptacles and Attachment Plugs — Class III, Divisions 1 and 2.

Receptacles and attachment plugs shall be of the grounding type and shall be designed so as to minimize the accumulation or the entry of fibers/flyings, and shall prevent the escape of sparks or molten particles.

Exception: In locations where, in the judgment of the authority having jurisdiction, only moderate accumulations of lint or flyings will be likely to collect in the vicinity of a receptacle, and where such receptacle is readily accessible for routine cleaning, general-purpose grounding-type receptacles mounted so as to minimize the entry of fibers/flyings shall be permitted.

17) 504.10(B) Location. (second paragraph, first sentence)

Simple apparatus shall be permitted to be installed in any hazardous (classified) location in which the maximum surface temperature of the simple apparatus does not exceed the ignition temperature of the flammable gases or vapors, flammable liquids, combustible dusts, or ignitible fibers/flyings present.

18) Article 506 Title: Zone 20, 21, and 22 Locations for Combustible Dusts or Ignitible Fibers/Flyings

19) 506.2 Definitions

Zone 20 Hazardous (Classified) Location. An area where combustible dust or ignitible fibers/flyings are present continuously or for long periods of time in quantities sufficient to be hazardous, as classified by 506.5(B)(1).

Zone 21 Hazardous (Classified) Location. An area where combustible dust or ignitible fibers/flyings are likely to exist occasionally under normal operation in quantities sufficient to be hazardous, as classified by 506.5(B)(2).

Zone 22 Hazardous (Classified) Location. An area where combustible dust or ignitible fibers/flyings are not likely to occur under normal operation in quantities sufficient to be hazardous, as classified by 506.5(B)(3).

20) 506.5 Classification of Locations.

(A) Classifications of Locations. Locations shall be classified on the basis of the properties of the combustible dust, ignitible fibers/flyings that may be present, and the likelihood that a combustible or combustible concentration or quantity is present. Each room, section, or area shall be considered individually in determining its classification. Where pyrophoric materials are the only materials used or handled, these locations are outside of the scope of this article.

(B) Zone 20, Zone 21, and Zone 22 Locations. Zone 20, Zone 21, and Zone 22 locations are those in which combustible dust, or ignitible fibers/flyings are or may be present in the air or in layers, in quantities sufficient to produce explosive or ignitible mixtures. Zone 20, Zone 21, and Zone 22 locations shall include those specified in 506.5(B)(1), (B)(2), and (B)(3).

21) 506.5(B)(1) Zone 20. A Zone 20 location is a location in which

(a) Ignitible concentrations of combustible dust or ignitible fibers/flyings are present continuously.

(b) Ignitible concentrations of combustible dust or ignitible fibers/flyings are present for long periods of time.

22) 506.5(B)(2) Zone 21. A Zone 21 location is a location

(a) In which ignitible concentrations of combustible dust or ignitible fibers/flyings are likely to exist occasionally under normal operating conditions; or

(b) In which ignitible concentrations of combustible dust or ignitible fibers/flyings may exist frequently because of repair or maintenance operations or because of leakage; or

(c) In which equipment is operated or processes are carried on, of such a nature that equipment breakdown or faulty operations could result in the release of ignitible concentrations of combustible dust, or ignitible fibers/flyings and also cause simultaneous failure of electrical equipment in a mode to cause the electrical equipment to become a source of ignition; or

(d) That is adjacent to a Zone 20 location from which ignitible concentrations of dust or ignitible fibers/flyings could be communicated, unless communication is prevented by adequate positive pressure ventilation from a source of clean air and effective safeguards against ventilation failure are provided.

23) 506.5(B)(3) Zone 22. A Zone 22 location is a location

(a) In which ignitible concentrations of combustible dust or ignitible fibers/flyings are not likely to occur in normal operation, and if they do occur, will only persist for a short period; or

(b) In which combustible dust, or fibers/flyings are handled, processed, or used but in which the dust, fibers, or flyings are normally confined within closed containers of closed systems from which they can escape only as a result of the abnormal operation of the equipment with which the dust, or fibers, or flyings are handled, processed, or used; or

(c) That is adjacent to a Zone 21 location, from which ignitible concentrations of dust or fibers/flyings could be communicated, unless such communication is prevented by adequate positive pressure ventilation from a source of clean air and effective safeguards against ventilation failure are provided.

24) 506.6(C) Reclassification Permitted. A Class II or Class III, Division 1 or Division 2 location shall be permitted to be reclassified as a Zone 20, Zone 21, or Zone 22 location, provided that all of the space that is classified because of a single combustible dust or ignitible fiber/flying source is reclassified under the requirements of this article.

25) 506.6(D) Simultaneous Presence of Flammable Gases and Combustible Dusts, Fibers/Flyings. Where flammable gases, combustible dusts, or fibers/flyings are or may be present at the same time, the simultaneous presence shall be considered during the selection and installation of the electrical equipment and the wiring methods, including the determination of the safe operating temperature of the electrical equipment.

26) 506.9(B) Listing

(1) Equipment that is listed for Zone 20 shall be permitted in a Zone 21 or Zone 22 location of the same dust, or ignitible fiber/flying. Equipment that is listed for Zone 21 may be used in a Zone 22 location of the same dust, fiber/flying.

(2) Equipment shall be permitted to be listed for a specific dust, or ignitible fiber/flying, or any specific combination of dusts, fibers/flyings.

27) 506.16 Sealing.

Where necessary to protect the ingress of combustible dust, or ignitible fibers/flyings, or to maintain the type of protection, seals shall be provided. The seal shall be identified as capable of preventing the ingress of combustible dust or ignitible fibers/flyings and maintaining the type of protection but need not be explosionproof or flameproof.

28) 506.17(5) Be provided with suitable seals to prevent the entrance of combustible dust, or ignitible fibers/flyings where the flexible cord enters boxes or fittings

29) 506.20(E)(2) Equipment Installation.

(2) For ignitible fibers/flyings, less than 165°C (329°F) for equipment that is not subject to overloading, or 120°C (248°F) for equipment (such as motors or power transformers) that may be overloaded.

Substantiation: The term “flammable” is not limited by the NFPA 30 definition and for purposes of Articles 500-506, classification does need to consider the vapor component of both flammable and combustible liquids and it is not just a NFPA 30 defined “flammable” material. The CMP proposal correctly reflects that the combustible liquid-produced vapor correctly defines this condition which is expressed differently in the other two proposals. Additionally, the change from ignitible “flyings or fibers” to “flyings/fibers” is being made globally including within Article 503 for improved grammatical reasons to eliminate the redundant use of “or”.

Panel Meeting Action: Accept

Panel Statement:

Number Eligible to Vote: 14

14-2 Log #209 NEC-P14 **Final Action: Accept in Principle**
(500.1, FPN 2)

NOTE: The following proposal consists of Comment 14-3 on Proposal 14-5 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 14-5 was:

Add text to read as follows:

FPN No. 2: The unique hazards associated with propellant, explosives, pyrotechnics, and blasting agents are not addressed in this Article.

The Technical Correlating Committee directs that the Panel Action on Comment 14-3 be reported as “Hold “ consistent with Section 4-4.6.2.2 of the NFPA Regulations Governing Committee Projects. See Technical Correlating Committee Note on Comment 14-5.

Submitter: David Wechsler, The Dow Chemical Company

Recommendation: Within Article 500, where the context of the single term used, such as “flammable gas” or “flammable vapor” of “flammable liquid” and the meaning is more universal to include both flammable and combustible materials that can form ignitible mixtures in air and burn, replace these terms with <u>“gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode...”.</u>

Specific texts to be changed include the following:

500.1 Scope - Article 500 through 504.

Articles 500 through 504 cover the requirements for electrical and electronic equipment and wiring for all voltages in Class I, Divisions 1 and 2; Class II Divisions 1 and 2; and Class III, Divisions 1 and 2 locations where fire or explosion hazards may exist due to ~~flammable gases or vapors,~~ flammable liquids, flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode, combustible dust, or ignitible fibers or flyings.

505.5 Classifications of Locations.

(A) Classifications of Locations. Locations shall be classified depending on the properties of the ~~flammable vapors, liquids, or gases~~ flammable gas, flammable liquid-produced vapor mixed with air that may burn or explode, or combustible dusts or fibers that may be present, and the likelihood that a flammable or combustible concentration or quantity is present.

(B) Class I Locations. Class I locations are those in which ~~flammable gases~~ or vapors flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air are or may be present in the air in quantities sufficient to produce explosive or ignitible mixtures.

(1) Class I, Division 1. A Class I, Division 1 location is a location

(1) In which ignitible concentrations of ~~flammable gases or vapors~~ flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode can exist under normal operating conditions, or

(2) In which ignitable concentrations of ~~such gases or vapors~~ flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode may exist frequently because of repair or maintenance operations or because of leakage, or

(3) In which breakdown or faulty operation of equipment or processes might release ignitible concentrations of ~~flammable gases or vapors~~ flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air may burn or explode and might also cause simultaneous failure of electrical equipment in such a way as to directly cause the electrical equipment to become a source of ignition.

(2) Class I, Division 2. A Class I, Division 2 location is a location

(1) In which volatile ~~flammable liquids or flammable gases~~ flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode are handled, processed, or used, but in which the liquids, vapors, or gases will normally be confined within closed containers or closed systems from which they can escape only in case of accidental rupture or breakdown of such containers or systems or in case of abnormal operation of equipment, or

(2) In which ignitible concentrations of ~~gases or vapors gases~~ flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air are normally prevented by positive mechanical ventilation, and which might occasionally be communicated unless such communication is prevented by adequate positive-pressure ventilation from a source of clean air and effective safeguards against ventilation failure are provided.

(3) That is adjacent to a Class I, Division 1 location, and to which ignitible concentrations of ~~gases or vapors gases~~ flammable gas, flammmaable liquid-produced vapor, or combustible liquid-produced vapor mixed with air might occasionally be communicated unless such communication is prevented by adequate positive-presssure ventilation from a source of clean air and effective sareguards against ventilation failure are provided.

500.8(A)(6) Where ~~flammable gases~~ flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode, or combustible dusts are or may be present at the same time, the simultaneous presence of both shall be considered when determining the safe operating temperature of the electrical equipment.

Substantiation: Within Article 500, where the context of the single term used, such as "flammable gas" or "flammable vapor" of "flammable liquid" and the meaning is more universal to include both flammable and combustible materials that can form ignitible mixtures in air and burn, replace these terms with "gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode...".

Specific texts to be changed include the following:

500.1 Scope - Article 500 through 504.

Articles 500 through 504 cover the requirements for electrical and electronic equipment and wiring for all voltages in Class I, Divisions 1 and 2; Class II Divisions 1 and 2; and Class III, Divisions 1 and 2 locations where fire or explosion hazards may exist due to ~~flammable gases or vapors,~~ flammable liquids, flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode, combustible dust, or ignitible fibers or flyings.

505.5 Classifications of Locations.

(A) Classifications of Locations. Locations shall be classified depending on the properties of the ~~flammable vapors, liquids, or gases~~ flammable gas, flammable liquid-produced vapor mixed with air that may burn or explode, or combustible dusts or fibers that may be present, and the likelihood that a flammable or combustible concentration or quantity is present.

(B) Class I Locations. Class I locations are those in which ~~flammable gases~~ or vapors flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air are or may be present in the air in quantities sufficient to produce explosive or ignitible mixtures.

(1) Class I, Division 1. A Class I, Division 1 location is a location

(1) In which ignitible concentrations of ~~flammable gases or vapors~~ flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode can exist under normal operating conditions, or

(2) In which ignitable concentrations of ~~such gases or vapors~~ flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode may exist frequently because of repair or maintenance operations or because of leakage, or

(3) In which breakdown or faulty operation of equipment or processes might release ignitible concentrations of ~~flammable gases or vapors~~ flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air may burn or explode and might also cause simultaneous failure of electrical equipment in such a way as to directly cause the electrical equipment to become a source of ignition.

(2) Class I, Division 2. A Class I, Division 2 location is a location

(1) In which volatile ~~flammable liquids or flammable gases~~ flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode are handled, processed, or used, but in which the liquids, vapors, or gases will normally be confined within closed containers or closed systems from which they can escape only in case of accidental rupture or breakdown of such containers or systems or in case of abnormal operation of equipment, or

(2) In which ignitible concentrations of ~~gases or vapors gases~~ flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air are normally prevented by positive mechanical ventilation, and which might occasionally be communicated unless such communication is prevented by adequate positive-pressure ventilation from a source of clean air and effective safeguards against ventilation failure are provided.

(3) That is adjacent to a Class I, Division 1 location, and to which ignitible concentrations of ~~gases or vapors gases~~ flammable gas, flammmaable liquid-produced vapor, or combustible liquid-produced vapor mixed with air might occasionally be communicated unless such communication is prevented by adequate positive-presssure ventilation from a source of clean air and effective sareguards against ventilation failure are provided.

500.8(A)(6) Where ~~flammable gases~~ flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode, or combustible dusts are or may be present at the same time, the simultaneous presence of both shall be considered when determining the safe operating temperature of the electrical equipment.

Panel Meeting Action: Accept in Principle

Panel Statement: The recommended action is accomplished through the panel action on Panel Proposal 14-1a (Log #CP1400). The panel accepts the principle that the term "flammable" is not limited by the NFPA 30 definition and, for purposes of Articles 500-506, classification does need to consider the vapor component of both flammable and combustible liquids and it is not just a NFPA 30 defined "flammable" material. The CMP proposal correctly reflects that the combustible liquid-produced vapor correctly defines this condition which is expressed differently in the other two proposals.

Additionally, the change from ignitible "flyings or fibers" to "flyings/fibers" is being made globally including within Article 503, for improved grammatical reasons to eliminate the redundant use of "or".

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-3 Log #210 NEC-P14 **Final Action: Accept in Principle**
(500.1, FPN 2)

NOTE: The following proposal consists of Comment 14-5 on Proposal 14-5 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 14-5 was:

Add text to read as follows:

FPN No. 2: The unique hazards associated with propellant, explosives, pyrotechnics, and blasting agents are not addressed in this Article.

The Technical Correlating Committee directs that the Panel Action on Comment 14-5 be reported as "Hold " consistent with Section 4-4.6.2.2 of the NFPA Regulations Governing Committee Projects. The comment introduces a new concept that has not had public review. In addtion, the Technical Correlating Committee notes that the language in the FPN is inappropriate in that it contains an implied requirement.

Submitter: David Wechsler, The Dow Chemical Company

Recommendation: Revise text to read as follows:

Within Article 500, where the context of the single term used, such as "flammable gas" or "flammable vapor" or "flammable liquid" and the meaning is more universal to include both flammable and combustible materials that can form ignitable mixtures in air and burn, replace these terms with "flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode...".

Specific texts to be changed include the following:

500.1 Scope - Articles 500 through 504.

Articles 500 through 504 cover the requirements for electrical and electronic equipment and wiring for all voltages in Class 1, Division 1 and 2; Class II, Divisions 1 and 2; and Class III, Divisions 1 and 2 locations where fire or explosion hazards may exist due to ~~flammable gases or vapors~~ , flammable liquids, flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode , combustible dust, or ignitable fibers or flyings.

500.5 Classifications of Locations.

(A) Classifications of Locations. Locations shall be classified depending on the properties of the ~~flammable vapors, liquids, or gases~~ flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode, or combustible dusts or fibers that may be present , and the likelihood that a flammable or combustible concentration or quantity is present.

(B) Class I Locations. Class I locations are those in which ~~flammable gases~~ or vapors flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air are or may be present in the air in quantities sufficient to produce explosive or ignitable mixtures.

(1) Class I, Division 1. A Class I, Division 1 location is a location

(1) In which ignitable concentrations of ~~flammable gases or vapors~~ flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode can exist under normal operating conditions, or

(2) In which ignitable concentrations of ~~such gases or vapors~~ flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode may exist frequently because of repair or maintenance operations or because of leakage, or

(3) In which breakdown or faulty operation of equipment or processes might release ignitable concentrations of ~~flammable gases or vapors~~ flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode and might also cause simultaneous failure of electrical equipment in such a way as to directly cause the electrical equipment to become a source of ignition.

(2) Class I, Division 2. A Class I, Division 2 location is a location

(1) In which volatile ~~flammable liquids or flammable gases~~ flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode are handled, processed, or used, but in which the liquids, vapors, or gases will normally be confined within closed containers or closed systems from which they can escape only in case of accidental rupture or breakdown of such containers or systems or in case of abnormal operation of equipment, or

(2) In which ignitable concentration of ~~gases or vapors gases~~ flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air are normally prevented by positive mechanical ventilation, and which might become hazardous through failure or abnormal operation of the ventilating equipment, or

(3) That is adjacent to a Class I, Division 1 location, and to which ignitable concentrations of ~~gases or vapors gases~~ flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air might occasionally be communicated unless such communication is prevented by adequate positive-pressure ventilation from a source of clean air and effective safeguards against ventilation failure are provided.

500.8(A)(6) Where ~~flammable gases~~ flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode, or combustible dusts are or may be present at the same time, the simultaneous presence of both shall be considered when determining the safe operating temperature of the electrical equipment.

Substantiation: The actions taken by the Committee on this proposal, while valid in this writer's opinion, have inadvertently raised a more fundamental and serious problem. When the NEC is used in conjunction with other references, such as NFPA 497 and NFPA 30, and only the NEC term "flammable" is used, there is an opinion being raised that there is indeed no requirement to classify areas containing "combustible liquids". Restating this concern, it appears that only those areas or locations addressed within the NEC, such as in Class I locations in which materials having flash points below 100F, must be classified at all. One might even be under the misimpression that only Class I, Division 1 locations contain flammable gases or vapors. Neither of these, I believe, are positions that are supported by CMP-14, but if allowed to go unchecked could result in loss of life, serious property damage, or an unsafe electrical installation within an intended hazardous (classified) location.

The recommended corrective action is for the text to be consistent when addressing Class I materials so as to agree with the Class I defined Groups. This would require the modification where "flammable vapor" is used, the following replacement text: "...flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode...".

In the quest for having the words in the various standards/codes agree with the Committee's intents, it would seem that there is yet another interesting paradox to consider. This issue seems critical as to what "Flammable" means and upon this understanding rests the entire basis for the need to classify a Class I location. For instance, refer to 500.5(B)(1) FPN No. 1 and examine the listing - only "flammable" conditions are presented.

Classification, or the need to do it, stems from NEC Article 500, 500.5(A).

"Locations shall be classified depending on the properties of the flammable vapors, liquids, or gases, or combustible dusts or fibers that may be present, and the likelihood that a flammable or combustible concentration or quantity is present."

Reference is made to NFPA 497 and the material table which contain groups. These groups contain flammable gases, flammable liquids (NFPA Class I's), and combustible gases, liquids and vapors (NFPA Class II, III's).

Further within NFPA 497, the "generic" term "Combustible Material" is used, in addition to the extracted definitions for the terms "flammable liquid" and "combustible liquid". This "combustible material" term includes the flammable gas, flammable liquid, etc. [literal definition from NFPA 497 - Combustible Material.* A generic term used to describe a flammable gas, flammable liquid produced vapor, or combustible liquid produced vapor mixed with air that may burn or explode] but aside from using this term within some of the 497 text, it does not enter into the NEC classification aspects, as does the term "flammable". The Group definitions however, also use the terms "flammable gas", "flammable liquid", and "combustible liquid". Table 2-1 in NFPA 497 containing the Grouped materials, list only "Selected" and not "ALL" chemicals. Referring to the NEC 500.5A, the text does not contain specific language requiring the classification of only those location(s) that contain one or more of the chemicals found in the NFPA 497 list, but rather based upon 500-5A "Locations shall be classified depending on the properties of the flammable vapors, liquids, or gases, or combustible dusts...".

"Flammable" is defined within the NEC only as "Volatile Flammable Liquid. A flammable liquid having a flash point below 38 degree C (100 degree F), or a flammable liquid whose temperature is above its flash point, or a Class II combustible liquid that has a vapor pressure not exceeding 276 kPa (40 psia) at 38 degree C (100 degree F) and whose temperature is above its flash point."

The NEC also uses the term "flammable" in other areas. One such example is "450.24 Nonflammable Fluid-Insulated Transformers. For the purposes of this section, a nonflammable dielectric fluid is one that does not have a flash point or fire point and is not flammable in air."

In conclusion, applying the text of the NEC, there is an opinion being raised due to the actions taken on this proposal that there is indeed no requirement to classify areas containing "combustible liquids", or rather put another way, only those areas or locations addressed in the NEC definition above, such as in locations in which materials having flash points below 100F, must be classified.

Panel Meeting Action: Accept in Principle

Panel Statement: The recommended action is accomplished through the panel action on Panel Proposal 14-1a (Log #CP1400). The panel accepts the principle that the term "flammable" is not limited by the NFPA 30 definition and, for purposes of Articles 500 to 506, classification does need to consider the vapor component of both flammable and combustible liquids and it is not just a NFPA 30 defined "flammable" material. The CMP proposal correctly reflects that the combustible liquid-produced vapor correctly defines this condition, which is expressed differently in the other two proposals.

Additionally, the change from ignitible "flyings or fibers" to "flyings/fibers" is being made globally, including within Article 503, for improved grammatical reasons to eliminate the redundant use of "or".

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-4 Log #2179 NEC-P14 **Final Action: Accept in Principle**
(500.2)

Submitter: Dann Strube, Strube Consulting

Recommendation: Revise text to read as follows:

"...Class III Division 2; Zone 20; Zone 21; Zone 22; or any...".

Substantiation: Editorial only.

Panel Meeting Action: Accept in Principle

Panel Statement: The recommended action is accomplished through the panel action on Proposal 14-9.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-8 Log #2502 NEC-P14 **Final Action: Accept**
(500.2.Dusttight)

TCC Action: The Technical Correlating Committee understands that the reference to the standard will be shown as "ANSI/ISA-12.12.01-2000" to correlate with the panel action on
Proposal 14-5.

Submitter: Edward M. Briesch, Underwriters Laboratories, Inc.

Recommendation: Dusttight. Enclosures constructed so that dust will not enter under specified test conditions.

FPN: See ANSI/ISA 12.12.01-2000, Nonincendive ElectricalEquipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations ~~, and UL 1604-1994, Electrical Equipment for Use in Class I and II, Division 2 and Class III Hazardous (Classified)Locations.~~

Substantiation: UL 1604 has been withdrawn.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-5 Log #2449 NEC-P14 **Final Action: Accept**
(500.2. Dusttight, FPN, Hermetically Sealed, FPN, Nonincendive Circuit, FPN, Nonincendive Equipment, FPN, Nonincendive Field Wiring Apparatus, FPN)

Submitter: Eliana Beattie, ISA
Recommendation: 500.2 - Dusttight - FPN
Change ANSI/ISA 12.12.01-2000 to ANSI/ISA-12.12.01-2000
500.2 - Hermetically Sealed - FPN
Change ANSI/ISA 12.12.01-2000 to ANSI/ISA-12.12.01-2000
500.2 - Nonincendive Circuit - FPN
Change ANSI/ISA 12.12.01-2000 to ANSI/ISA-12.12.01-2000
500.2 - Nonincendive Equipment - FPN
Change ANSI/ISA 12.12.01-2000 to ANSI/ISA-12.12.01-2000
500.2 - Nonincendive Field Wiring Apparatus - FPN
Change ANSI/ISA 12.12.01-2000 to ANSI/ISA-12.12.01-2000
Substantiation: Change format to match actual ISA standards numbering.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-6 Log #2462 NEC-P14 **Final Action: Reject**
(500.2.FSICO and FNICO)

Submitter: Eliana Beattie, ISA
Recommendation: 500.2 Definitions
Add the following to the end of the section:
FISCO . Fieldbus Intrinsically Safe Concept. An intrinsic safety protection method specifically designed for systems using two wire high speed digital field communications protocols (also known as Fieldbus).
FNICO . Fieldbus Nonincendive Concept. A nonincendive protection method specifically designed for systems using two wire high speed digital field communications protocols (also known as Fieldbus).
Substantiation: The FISCO (**F** ieldbus **I** ntrinsically **S** afe **CO** ncept) and FNICO (**F** ieldbus **N** on **I** ncendive **CO** ncept) protection concepts take advantage of functional requirements of Fieldbus systems to significantly simplify i.s. installation. These requirements include wire type and quality, supply voltage and current levels, and limitation of stored energy at the terminals of field devices. The objective of these concepts is to simplify the i.s. installation to the point where a safe installation may be effected by simply selecting devices labeled as FISCO (or FNICO) and observing basic wiring type and length restrictions. The NRTL evaluation of all devices ensures that they will be compatible with all other similarly labeled devices without further analysis on the part of the installer.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: Because there is no definition of intrinsic safety in Article 500, the panel concludes that it is not appropritate to include a definition of "FISCO". The panel rejects the addition of a new definition "FNICO" because there are numerous nonincendive field wiring methods that are acceptable and a new definition could imply that "FNICO" is the only method available. If "FISCO" and "FNICO" wiring systems are installed in accordance with the control drawings, this practice would not be prohibited by the present NEC.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
SCHNAARE, T.: Generally speaking, the code serves its primary users base best when it includes information about the various techniques that are allowed for installation. While I agree that the panel does not want to imply that FISCO and FNICO are the only techniques available, I also belive that the code is made stronger and easier to understand and apply when information such as this is included. If there are other deficiencies in the current code (as implied by the panel statement) then these should be addressed as well.

14-10 Log #1851 NEC-P14 **Final Action: Reject**
(500.2.General Purpose (New))

Submitter: Robert Lau, Hoffman Enclosure Inc.
Recommendation: Add a new definition:
General Purpose. Apparatus components, devices, enclosures, and equipment listed for use only in nonclassified (ordinary) locations.
Substantiation: I found several instances of the term general purpose in the 2005 NEC. My understanding of this term, when applied to enclosures, has always been any listed nonhazardous type rated enclosure. However, the NEC does not define this term. Nor does NEMA 250, UL 50, or UL 508. It should be defined in a US National Standard.
Panel Meeting Action: Reject

Panel Statement: The term "general-purpose" as it relates to enclosures is well understood in the industry and is used throughout the NEC. Defining the term in Article 500 may have the unintended consequence of impacting current listing requirements and other requirements in the NEC covering "general-purpose" enclosures.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
COOK, D.: The substantiation provided by the submitter is correct. While I do not agree with the proposed text, I understand the submitters concern. The last part of the proposed text states "equipment listed for use only in nonclassified (ordinary) locations". I am not aware of any equipment that is listed for use "only" in those locations. At least two certification laboratories list products for use in "ordinary" locations. I am not sure if that is a defined and specific term any more than "general purpose". I agree that "general purpose" is an understood term, but for code users that are applying requirements from all articles of the NEC, it does not seem to have the same meaning in every use. I believe that defined terms should be used when possible.

14-7 Log #2499 NEC-P14 **Final Action: Accept**
(500.2.Nonincendive Component)

TCC Action: The Technical Correlating Committee understands that the reference to the standard will be shown as "ANSI/ISA-12.12.01-2000" to correlate with the panel action on Proposal 14-5.
Submitter: Edward M. Briesch, Underwriters Laboratories, Inc.
Recommendation: Revise text to read as follows:
Nonincendive Component. A component having contacts for making or breaking an incendive circuit and the contacting mechanism is constructed so that the component is incapable of igniting the specified flammable gas–air or vapor–air mixture. The housing of a nonincendive component is not intended to exclude the flammable atmosphere or contain an explosion.
FPN: For further information, see ANSI/ISA 12.12.01-2000, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations* ~~, UL 1604-1994, *Electrical Equipment for Use in Class I and II, Division 2, and* Class III Hazardous (Classified) Locations .~~
Substantiation: UL 1604 has been withdrawn.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-9 Log #2971 NEC-P14 **Final Action: Accept in Principle**
(500.2.Unclassified Locations)

Submitter: Nicholas P. Ludlam, FM Approvals
Recommendation: Revise text to read as follows:
Unclassified Locations. Locations determined to be neither Class I, Division 1; Class I, Division 2; Class I, Zone 0; Class I, Zone 1; Class I, Zone 2; Class II, Division 2; Class III, Division 1; Class III, Division 2; Zone 20; Zone 21; Zone 22 ; or any combination thereof.
Substantiation: Zones 20, 21 and 22 where added into the 2005 NEC as part of the new section 506. Zones 20, 21 and 22 are considered as Hazardous (Classified) Locations. Therefore, an area which is not classified as Zone 20, 21, or 22 should also be considered to be an Unclassified location.
Panel Meeting Action: Accept in Principle
Revise the recommended definition to read: Unclassified Locations. Locations determined to be neither Class I, Division 1; Class I, Division 2; Class I, Zone 0; Class I, Zone 1; Class I, Zone 2; Class II, Division 1; Class II, Division 2; Class III, Division 1; Class III, Division 2; Zone 20; Zone 21; Zone 22; or any combination thereof.
Panel Statement: The panel assumes that the submitter inadvertently omitted the Class II, Division 1 location when the 2005 text was copied to revise. Otherwise panel accepts the recommended text.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
LAWRENCE, JR., W.: The original proposal submitted included the text "Class II, Division 1" that the panel comment indicates was omitted. I assume that this omission occurred during the NFPA transcription of the comment. The text, as modified by the Panel, is correct.

14-11 Log #1003 NEC-P14 **Final Action: Reject**
(500.3)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Change "rules" to "provisions" or alternatively, delete this section.
Substantiation: Edit. Some Code provisions are not requirements. Per 90.5(B) some rules are permissive. Sec. 430.5 uses the term "applicable provisions". This section is already covered by 90.3.
Panel Meeting Action: Reject
Panel Statement: Section 90.5 covers the use of the term "rules" in regard to mandatory and permissive requirements in this Code.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-12 Log #2458 NEC-P14 **Final Action: Reject**
(500.4(A) & 500.8 (B))

Submitter: Eliana Beattie, ISA
Recommendation: Add underlined text under 500.4(A) as follows:
500.4 General.
(A) Documentation.
<u>(1) Area Classification</u> . All areas designated as hazardous (classified) locations shall be properly documented. This documentation shall be available to those authorized to design, install, inspect, maintain, or operate electrical equipment at the location.
<u>(2) Certificate of Conformity. The documentation for electrical equipment marked in accordance with 500.8(B) shall be permitted to include a Certificate of Conformity showing compliance with the applicable standards.</u>
<u>(a) Where the Certificate number includes an "X" suffix, the electrical equipment Listing includes Special Condition for Safe Use which shall be observed.</u>
<u>(b) Where the Certificate number includes a "U" suffix, the equipment is an incomplete component and is not suitable for installation without further evaluation.</u>
Provide a new marking 500.8(B)
Marking. Equipment shall be marked to show the environment for which it has been evaluated <u>and shall also be permitted to be marked with a certificate reference, see 500.4(A).</u> Unless otherwise specified or allowed in (B)(6), the marking shall include the information specified in (B)(1) through (B)(5).
Substantiation: While listing and labeling are marks to indicate equipment meets specific standards, Certificates offer an extremely important long term benefit of providing documentation that will enable users to understand the Models certified, the applicable standards, the effective date and any special conditions for safe use, long after the normal life of most other product literature. Certificates are this important documentation that provides vital information to users to better assure that equipment will be properly installed within a hazardous (classified) location.
Examples of certificates, selected at random from public sources, are provided for improved understanding.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: This proposal would add permission to permit a certificate that is not prohibited by the current requirements. The additional text serves no purpose. The panel rejection of the proposal in no way prohibits the manufacturer and/or the certification body from providing a certificate if it is needed or desired for other reasons.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-13 Log #2448 NEC-P14 **Final Action: Accept**
(500.4(B))

Submitter: Eliana Beattie, ISA
Recommendation: 500.4(B) - FPN 2
Change ISA 12.10-1988 to ISA-12.10-1998
Substantiation: Change format to match actual ISA standards numbering.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-14 Log #2506 NEC-P14 **Final Action: Accept in Part**
(500.6(A), FPN 3)

TCC Action: The Technical Correlating Committee directs the panel to reconsider the action on this proposal and include the farenheit temperature in order to maintain consistency with the balance of the code. This action will be considered by the panel as a public comment.
Submitter: Edward M. Briesch, Underwriters Laboratories, Inc.
Recommendation: Revise text to read as follows:
(A) Class I Group Classifications. Class I groups shall be according to 500.6(A)(1) through (A)(4).
FPN No. 1: FPN Nos. 2 and 3 apply to 500.6(A).
FPN No. 2: The explosion characteristics of air mixtures of gases or vapors vary with the specific material involved. For Class I locations, Groups A, B, C, and D, the classifi-
cation involves determinations of maximum explosion pressure and maximum safe clearance between parts of a clamped joint in an enclosure. It is necessary, therefore, that
equipment be identified not only for class but also for the specific group of the gas or vapor that will be present.
FPN No. 3: Certain chemical atmospheres may have characteristics that require safeguards beyond those required for any of the Class I groups. Carbon disulfide is one of these chemicals because of its low ignition temperature [~~100°C (212°F)~~ <u>90°C (194°F)</u>] and the small joint clearance permitted to arrest its flame.
Substantiation: The stated value is incorrect.The ignition temperature of carbon disulphide is 90C. See Table 4.4.2 of *NFPA 497, Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas 2004 Edition.*
Panel Meeting Action: Accept in Part
Revise the recommendation for current FPN No. 3 to read: FPN No. 3: Certain chemical atmospheres may have characteristics that require safeguards beyond those required for any of the Class I groups. Carbon disulfide is one of these chemicals because of its low ignition temperature [~~100°C (212°F)~~ (<u>90°C)</u> ~~(194°F)]~~ and the small joint clearance permitted to arrest its flame.
Panel Statement: The panel rejects the inclusion of the Farenheit temperature, to be consistent with the data contained in Table 4.4.2 of NFPA 497.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-15 Log #1296 NEC-P14 **Final Action: Reject**
(500.7(K))

Submitter: Jon Miller, Detector Electronics Corp.
Recommendation: Revise text to read:
500.7 Protection Techniques. Section <u>500.7(A)</u> through <u>500.7(L)</u> shall be acceptable protection techniques for electrical and electronic equipment in hazardous (classified) locations.
(A)...
(K) Combustible Gas Detection System. A combustible gas detection system shall be permitted as a means of protection in industrial establishments with restricted public access and where the conditions of maintenance and supervision ensure that only qualified persons service the installation. Gas detection equipment shall be listed for detection of the specific gas or vapor to be encountered. Where such a system is installed, equipment specified in 500.7(K)(1), (K)(2), or (K)((3) shall be permitted.
The type of detection equipment, its listing, installation location(s), alarm and shutdown criteria, and calibration frequency shall be documented <u>and in conformance with ISA-TR12.13.03, Guide for Combustible Gas Detection as a Method of Protection,</u> when combustible gas detectors are used as a protection technique.
FPN No. 1: For further information, see ANSI/ISA-12.13.01, Performance Requirements, Combustible Gas Detectors.
FPN No. 2: For further information, see ANSI/API RP 500, Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Division 1, or Division 2.
FPN No. 3: For further information, see ISA-RP12.13.02, Installation, Operation, and Maintenance of Combustible Gas Detection Instruments.
(1) Inadequate Ventilation. In a Class I, Division 1 location that is so classified due to inadequate ventilation, electrical equipment suitable for Class I, Division 2 locations shall be permitted.
(2) Interior of a Building. In a building located in, or with an opening into, a Class I, Division 2 location where the interior does not contain a source of flammable gas or vapor, electrical equipment for unclassified locations shall be permitted.
(3) Interior of a Control Panel. In the interior of a control panel containing instrumentation utilizing or measuring flammable liquids, gases, or vapors, electrical equipment suitable for Class I, Division 2 locations shall be permitted.
Substantiation: There is currently no guidance on recommended practices for the use of combustible gas detection equipment as a method of protection. It is recommended that a reference to ISA-TR12.13.03 be provided within the text for such recommended practice. The ISA-TR12.13.03 is directly based upon API practices that have been applied for 30+ years in the petroleum industry.
Panel Meeting Action: Reject
Panel Statement: The proposed text cannot be included as a mandatory requirement for the application of combustible gas detectors because mandatory references to other standards are not permitted by the NEC Style Manual. Acceptance of information regarding the referenced standard in a fine print note is premature because the document is not currently available. The panel is seeking information on the availability date of the referenced standard.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-16 Log #2447 NEC-P14 **Final Action: Accept**
(500.7(K))

TCC Action: The Technical Correlating Committee assumes, based on previous actions, that the intended reference in FPN No. 3 is "ANSI/ISA-RP12.13.02-2003".
Submitter: Eliana Beattie, ISA
Recommendation: 500.7(K) - FPN 1
Change ANSI/ISA 12.13.01 to ANSI/ISA-12.13.01-2003 (IEC 61779-1 through - 5 Mod)
500.7(K) - FPN 3
Change ANSI/ISA 12.13.02 t to ANSI/ISA-RP12.13.2003 (IEC 61779-6 Mod)
Substantiation: Change format to match actual ISA standards numbering.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-17 Log #2495 NEC-P14 **Final Action: Accept in Principle**
(500.7(K))

Submitter: Edward M. Briesch, Underwriters Laboratories, Inc.
Recommendation: Revise text to read as follows:
(K) Combustible Gas Detection System. A combustible gas detection system shall be permitted as a means of protection in industrial establishments with restricted public
access and where the conditions of maintenance and supervision ensure that only qualified persons service the installation. Gas detection equipment shall be listed for both the location in which it is installed and for detection of the specific gas or vapor to be encountered. Where such a system is installed, equipment, other than the gas detection equipment, specified in 500.7(K)(1), (K)(2), or (K)(3) shall be permitted. The type of detection equipment, its listing, installation location(s), alarm and shutdown criteria, and calibration frequency shall be documented when combustible gas detectors are used as a protection technique.
Substantiation: The current text is unclear with respect to the suitability of the gas detection equipment and the location in which it is installed. While the use of this technique permits equipment for Division 2 or unclassified locations in a Division 1 or 2 location respectively, the detection equipment itself should be suitable for the actual classified location in which it is installed.
Panel Meeting Action: Accept in Principle
Revise the current text of 500.7(K) to read:
(K) Combustible Gas Detection System. A combustible gas detection system shall be permitted as a means of protection in industrial establishments with restricted public access and where the conditions of maintenance and supervision ensure that only qualified persons service the installation. ~~Gas detection equipment shall be listed for both the location in which it is installed and for detection of the specific gas or vapor to be encountered.~~ Where such a system is installed, equipment specified in 500.7(K)(1), (K)(2), or (K)(3) shall be permitted.
The type of combustible detection equipment, its listing, installation location(s), alarm and shutdown criteria, and calibration frequency shall be documented when combustible gas detectors are used as a protection technique.
(1) Inadequate Ventilation. In a Class I, Division 1 location that is so classified due to inadequate ventilation, electrical equipment suitable for Class I, Division 2 locations shall be permitted. Combustible gas detection equipment shall be listed for Class I, Division 1, the appropriate material group, and for the detection of the specific gas or vapor to be encountered.
(2) Interior of a Building. In a building located in, or with an opening into, a Class I, Division 2 location where the interior does not contain a source of flammable gas or vapor, electrical equipment for unclassified locations shall be permitted. Combustible gas detection equipment shall be listed for Class I, Division 1 or Class I, Division 2, the appropriate material group, and for the detection of the specific gas or vapor to be encountered.
(3) Interior of a Control Panel. In the interior of a control panel containing instrumentation utilizing or measuring flammable liquids, gases, or vapors, electrical equipment suitable for Class I, Division 2 locations shall be permitted. Combustible gas detection equipment shall be listed for Class I, Division 1, the appropriate material group, and for the detection of the specific gas or vapor to be encountered.
Panel Statement: The panel action accomplishes the intent of the submitter.

Ballot Results: Affirmative: 14

14-18a Log #CP1406 NEC-P14 **Final Action: Accept**
(500.8, 505.9(A), & 506.9(A))

Submitter: Code-Making Panel 14,
Recommendation: Revise 500.8 as follows:
1) Add the following text after existing FPN No. 3 as new 500.8(A):
(A) Suitability. Suitability of identified equipment shall be determined by one of the following:
(1) Equipment listing or labeling
(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation
(3) Evidence acceptable to the authority having jurisdiction such as a manufacturer's self-evaluation or an owner's engineering judgment.
FPN: Additional documentation for equipment may include certificates demonstrating compliance with applicable equipment standards, indicating special conditions of use, and other pertinent information.
2) Re-identify existing 500.8(A),(B),(C),(D), and (E) as 500.8(B),(C),(D),(E), and (F)
3) Delete the current text regarding suitability from existing 500.8(A)(1) (located in the second paragraph following the fine print note that reads: Luminaires (lighting fixtures) and other heat-producing apparatus...)
4) Add a new fine print note following 505.9(A)(3) to read:
FPN: Additional documentation for equipment may include certificates demonstrating compliance with applicable equipment standards, indicating special conditions of use, and other pertinent information.
5) Add a new fine print note following 506.9(A)(3) to read:
FPN: Additional documentation for equipment may include certificates demonstrating compliance with applicable equipment standards, indicating special conditions of use, and other pertinent information.
Substantiation: The revision to 500.8 provides consistency with the same requirements in 505.9(A) and 506.9(A). The new fine print note has been added to acknowledge the current practice of providing certificates as part of the required documentation.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-19 Log #654 NEC-P14 **Final Action: Accept**
(500.8(B)(5))

Submitter: William G. Lawrence, Jr., S. Yarmouth, MA
Recommendation: Add new text as follows:
(5) Ambient Temperature Range. For equipment rated for a temperature range other than -25°C to +40°C, the marking shall specify the special range of ambient temperatures in degrees Celsius . The marking shall include either the symbol "Ta" or "Tamb."
FPN: As an example, such a marking might be "-30°C ≤ Ta ≤ +40°C."
Substantiation: Even though the standard ambient range is specified in degrees Celsius, this section does not specify that any special ambient temperature is also to be expressed in degrees Celsius. It is also worth noting that the remainder of the Article, e.g., 501.105(B)(2) Exception 501.115(B)(1)(4), 501.20(B)(3), etc., it specifies temperatures in degrees Celsius. If the ambient temperature range is expressed in degrees Fahrenheit, the potential exists for misapplication of the equipment.
Panel Meeting Action: Accept
Panel Statement: The panel notes that the correct reference is 500.8(B)(5).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-20 Log #607 NEC-P14 **Final Action: Reject**
(500.8(B)(5))

Submitter: Douglas Dura, Rockwell Automation
Recommendation: Revise text to read:
~~For~~ ~~e~~ E quipment rated for a temperature range other than -25°C to +40°C, ~~the marking shall specify~~ shall either be marked with the special range of ambient temperatures or, the special range shall be specified in the literature that accompanies the equipment . When used ~~T~~ t he marking shall include either the symbol "Ta" or "Tamb".
FPN: As an example, such a marking might be "-30°C ≤ Ta ≤ +40°C".
Substantiation: Several ANSI/UL standards dealing with electrical equipment for use in hazardous locations have been reviewed and found to not require the marking of ambient temperature on the equipment. Examples of these are: ANSI/UL 698a, ANSI/UL 913, ANSI/UL 1002, ANSI/UL 1604, ANSI/UL 60079-0, ANSI/UL 60079-1, ANSI/UL 60079-5, ANSI/UL 60079-6, ANSI/UL 60079-7, ANSI/UL 60079-11, ANSI/UL 60079-18.
Panel Meeting Action: Reject
Panel Statement: This information needs to be provided on the product marking, not just in the literature. The substantiation is not correct, because those product standards currently require this marking.

Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-21 Log #2572 NEC-P14 **Final Action: Reject**
(500.8(B)(7))

Submitter: Daniel McKinney, Kingsport, TN
Recommendation: Proposal to add new Subsection/text:
500.8(B)(7) External Conduit Seal(s). Equipment that contains an ignition source as indicated in 501.15(A)(1)(*1*), shall be marked as requiring an external conduit seal. Equipment that does not contain an ignition source during normal operation shall be marked as not requiring an external conduit seal. Marking according to this section shall not be required when the equipment complies with any of the exceptions to 501.15(A)(1)(*1*).
Substantiation: The National Electrical Code requires an external conduit seal for equipment in hazardous locations when the apparatus produces arcs, sparks or high temperatures that are considered to be an ignition source during normal operation (Ref. 501.15(A)(1)(*1*)). In many instances, where the apparatus contained is a simple relay or a circuit breaker, the determination on whether or not an external seal is required is straight forward. In other cases though, where the apparatus is more complex, the determination on the need for an external seal is not quite as obvious. In these cases the assistance by the manufacturer and the information they have received from the Nationally Recognized Testing Laboratory agency would be very helpful to engineers, electricians and inspectors in the field. Marking that indicates whether or not an external conduit seal is required would reduce much confusion and cost, not to mention helping to ensure a safe installation.
Panel Meeting Action: Reject
Panel Statement: Section 500.8 includes general equipment requirements for all types of equipment used for electrical installations related to hazardous (classified) locations. The (B) part of that section includes marking requirements for that equipment. Sealing requirements are addressed in 501.15, 502.15, 503.15, 504.70, 511.9, 513.9, 514.9, and 515.9. The same sealing requirements would not be applicable on a specific piece of equipment located in a different application and therefore are not considered to be equipment marking requirements. In some cases the seals are provided to complete an explosionproof enclosure, while in other cases the seals are provided to minimize the passage of hazardous materials from one location to another. In either application the seal could be external or provided within the equipment (factory sealed).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 501 — CLASS I LOCATIONS

14-22 Log #1525 NEC-P14 **Final Action: Accept in Principle in Part**
(501, 502, 503, 504, 506, 511, and 516)

TCC Action: The Technical Correlating Committee directs that the action on this proposal be sent to the Technical Correlating Committee Grounding and Bonding task group for review and comment.
Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Revise Articles 501, 502, 503, 504, 506, 511, and 516 as described in the following, relative to the terms bonding and grounding.
501.10(A)(1)(c): Revise 501.10(A)(1)(c) as follows:
(c) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type MC-HL cable, listed for use in Class I, Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, separate equipment grounding conductors in accordance with 250.122, and provided with termination fittings listed for the application.
501.10(B)(2)(5): Revise 501.10(B)(2)(5) as follows:
(5) Flexible cord listed for extra-hard usage and provided with listed bushed fittings. An additional conductor for use as an equipment grounding conductor shall be included in the flexible cord.
501.15(A)(4) Exception No. 2: Revise 501.15(A)(4) Exception No. 2 as follows:
Exception No. 2: For underground conduit installed in accordance with 300.5 where the boundary is beneath the earth ~~ground~~ , the sealing fitting shall be permitted to be installed after the conduit leaves the earth ~~ground~~ , but there shall be no union, coupling, box, or fitting, other than listed explosionproof reducers at the sealing fitting, in the conduit between the sealing fitting and the point at which the conduit leaves the earth ~~ground~~ .
501.140(B)(2): Revise 501.140(B)(2) as follows:
(2) Contain, in addition to the conductors of the circuit, ~~a~~ an equipment grounding conductor complying with 400.23.
501.145 Receptacles and Attachment Plugs, Class I, Divisions 1 and 2 Receptacles and attachment plugs shall be of the type providing for connection to the equipment grounding conductor of a flexible cord and shall be identified for the location.
502.10(A)(1)(3): Revise 502.10(A)(1)(3) as follows:
(3) In industrial establishments with limited public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type MC cable, listed for use in Class II, Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, separate equipment grounding conductors in accordance with 250.122, and provided with termination fittings listed for the application, shall be permitted.
502.140(2): Revise 502.140(2) as follows:
(2) Contain, in addition to the conductors of the circuit, ~~a~~ an equipment grounding conductor complying with 400.23.
502.145 (A)Revise 502.145(A) as follows:
(A) Class II, Division 1 In Class II, Division 1 locations, receptacles and attachment plugs shall be of the type providing for connection to the equipment grounding conductor of the flexible cord and shall be identified for Class II locations.
502.145(B): Revise 502.145(B) as follows:
(B) Class II, Division 2 In Class II, Division 2 locations, receptacles and attachment plugs shall be of the type that provides for connection to the equipment grounding conductor of the flexible cord and shall be designed so that connection to the supply circuit cannot be made or broken while live parts are exposed.
503.140: Revise 503.140 as follows:
(2) Contain, in addition to the conductors of the circuit, ~~a~~ an equipment grounding conductor complying with 400.23.
504.50(A): Revise 504.50(A) as follows:
(A) Intrinsically Safe Apparatus, Associated Apparatus, and Raceways Intrinsically safe apparatus, associated apparatus, cable shields, enclosures, and raceways, if of metal, shall be connected to the equipment grounding conductor ~~grounded~~ .
505.15(B)(1)(b): Revise 505.15(B)(1)(b) as follows:
(b) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, and where the cable is not subject to physical damage, Type MC-HL cable listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, separate equipment grounding conductors in accordance with 250.122, and provided with termination fittings listed for the application.
505.17(2): Revise 505.17(2) as follows:
(2) Contain, in addition to the conductors of the circuit, ~~a~~ an equipment grounding conductor complying with 400.23.
506.15(A)(3): Revise 506.15(A)(3) as follows:
(3) In industrial establishments with limited public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type MC cable, listed for continuous use in Zone 20 locations, with a gas/vaportight continuous corrugated metallic sheath, and overall jacket of suitable polymeric material, separate equipment grounding conductors in accordance with 250.122, and provided with termination fittings listed for the application, shall be permitted.
506.17(2): Revise 506.17(2) as follows:
(2) Contain, in addition to the conductors of the circuit, ~~a~~ an equipment grounding conductor in complying with 400.23.
511.16(B)(2): Revise 511.16(B)(2) as follows:
(2) Approved Means Approved means shall be provided for maintaining continuity of the equipment grounding conductor between the fixed wiring system and the non–current-carrying metal portions of pendant luminaires (fixtures), portable lamps, and portable utilization equipment.
516.10(A)(6): Revise 516.10(A)(6) as follows:
(6) Grounding All electrically conductive objects in the spray area, except those objects required by the process to be at high voltage, shall be ~~adequately~~ grounded. This requirement shall apply to paint containers, wash cans, guards, hose connectors, brackets, and any other electrically conductive objects or devices in the area.
516.10(B)(4): Revise 516.10(B)(4) as follows:
(4) Electrostatic Equipment All electrically conductive objects in the spraying area shall be ~~adequately~~ grounded. This requirement shall apply to paint containers, wash cans, and any other electrical conductive objects or devices in the area. The equipment shall carry a prominent, permanently installed warning regarding the necessity for this grounding feature.
516.10(C)(1): Revise 516.10(C)(1) as follows:
(1) Electric Equipment and Sources of Ignition Electric equipment and other sources of ignition shall comply with the requirements of Article 502. Portable electric lamps and other utilization equipment shall not be used within a Class II location during operation of the finishing processes. Where such lamps or utilization equipment are used during cleaning or repairing operations, they shall be of a type identified for Class II, Division 1 locations, and all exposed metal parts shall be ~~effectively~~ grounded.
516.10(C)(4)(b): Revise 516.10(C)(4)(b) as follows:
(b) All electrically conductive objects within the powder-coating area shall be ~~adequately~~ grounded. The powder-coating equipment shall carry a prominent, permanently installed warning regarding the necessity for grounding these objects.

Substantiation: 501.10(A)(1)(c): Added the word equipment to be more specific about the conductor being described.

501.10(B)(2)(5): Added words to be more specific about the conductor being described.

501.15(A)(4) Exception No. 2: The definition of ground has been revised. The more appropriate word to use in this exception is "earth" since this exception deals with earth or grade levels.

501.140(B)(2): Modified wording to be more specific about the conductor being described.

501.145: Modified wording to be more specific about the conductor being described.

501.10(A)(1)(3): Modified wording to be more specific about the conductor being described.

502.140(2): Modified wording to be more specific about the conductor being described.

502.145(A): Modified wording to be more specific about the conductor being described

502.145(B): Modified wording to be more specific about the conductor being described

503.140: Modified wording to be more specific about the conductor being described

504.50(A): These changes clarify the present requirement in more prescriptive language.

505.15(B)(1)(b): Modified wording to be more specific about the conductor being described.

505.17(2): Modified wording to be more specific about the conductor being described.

506.15(A)(3): Modified wording to be more specific about the conductor being described.

506.17(2): Modified wording to be more specific about the conductor being described.

511.16(B)(2): Modified wording to be more specific about the conductor being described.

516.10(A)(6): There are no definitive parameters for Code users to make a determination on what constitutes "adequately grounded."

516.10(B)(4): There are no definitive parameters for Code users to make a determination on what constitutes "adequately grounded."

516.10(C)(1): There are no definitive parameters for Code users to make a determination on what constitutes "effectively grounded."

516.10(C)(4)(b): There are no definitive parameters for Code users to make a determination on what constitutes "adequately grounded."

This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to the proposed revision to the terms "bonded", "grounded", and "equipment grounding conductor" in Article 100 relative to this Task Group's recommendations. These changes clarify the present requirement in more prescriptive language.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle in Part

The panel takes the following actions on the recommended text.

1) Accept the recommended text for 501.10(A) (1) (c) and in addition change "conductors" to "conductor(s)".

2) Revise recommended text of 501.10(B) (2) (5) to read: " Flexible cord listed for extra-hard usage and provided with listed bushed fittings. A ~~n additional~~ conductor for use as an equipment grounding conductor shall be included in the flexible cord. .."

3) Revise the recommendation for 501.15(A) (4), Exception No. 2, by adding "below grade" instead of "earth" in the first occurrence and by adding "emerges from below grade" instead of "earth" in the second two occurrences.

4) Accept recommended change to 501.140(B) (2).

5) Accept recommended change to 501.145.

6) Accept the recommended text for 502.10(A) (1) (c) and in addition change "conductors" to "conductor(s)".

7) Accept the recommended change to 502.140(2).

8) Accept the recommended change to 502.145(A).

9) Accept the recommended change to 502.145(B).

10) Accept the recommended change to 503.140.

11) Reject the recommended change to 504.50(A)

12) Accept the recommended text for 505.15(B) (1) (b) and in addition change "conductors" to "conductor(s)".

13) Accept the recommended change to 505.17(2).

14) Accept the recommended text for 506.15(A)(3) and in addition change "conductors" to "conductor(s)".

15) Accept the recommended change to 506.17(2).

16) Accept the recommended change to 511.16(B)(2).

17) Reject the recommended change to 516.10(A)(6).

18) Reject the recommended change to 516.10(B)(4).

19) Reject the recommended change to 516.10(C)(1).

20) Reject the recommended change to 516.10(C)(4)(b).

Panel Statement: The panel has accepted this proposal in principle in part for the following reasons:

1) The revision to 501.10(A)(1)(c) allows for single or multiple equipment grounding conductors in Type MC-HL cable.

2) The revision to 501.10(B)(2)(5) clarifies that the equipment grounding conductor required by this section is that required by Article 250 and is not in addition to the required equipment grounding conductor.

3) The panel rejects the recommendation to revise 501.15(A)(4), Exeception No. 2, and has added text to clarify that this text relates to below-grade installations.

4) The revision to 502.10(A)(1)(c) allows for single or multiple equipment grounding conductors in Type MC-HL cable.

5) The panel rejects the recommendation to revise 504.50(A) because connection to an equipment grounding conductor is not always the appropriate method to accomplish the requirement of 504.50(A).

6) The revision to 505.15(B)(1)(b) allows for a single or multiple equipment grounding conductors in Type MC-HL cable.

7) The revision to 506.15(A)(3) allows for a single or multiple equipment grounding conductors in Type MC-HL cable.

8) The panel rejects the recommendation for 516.10(A)(6) and 516.10(B)(4) because grounding requirements included in these sections are related to elimination of static electricity. Although "adequately grounded" is not a very specific term, the recommendation to delete "adequately" does not necessarily clarify the necessary effectiveness of the grounding connection. Any paint can, wash can, bracket, etc. that was sitting on a grounded concrete floor would be considered grounded but would not likely be adequately grounded.

9) The panel rejects the recommendation to revise the text in 516.10(C) (1) because this section is describing an equipment grounding path. See the panel action to accept Proposal 14-191 which recommends the text be revised to read: " Where such lamps or utilization equipment are used during cleaning or repairing operations, they shall be of a type identified for Class II, Division 1 locations, and all exposed metal parts shall be ~~effectively~~ connected to an equipment grounding conductor ~~grounded~~ ."

9) The panel rejects the recommendation to revise the text in 516.10(C)(4)(b) because the grounding requirements in 516.10(C) (4) (b) are related to elimination of static electricity. These electrically conductive objects may not be required to have an equipment grounding conductor based on the requirements in Article 250. When these objects are bonded together to eliminate static charges, they also need to be adequately grounded. They could be in contact with ground by sitting on the floor, but not be adequately grounded.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

Comment on Affirmative:

O'MEARA, M.: Although I agree with this proposal in principal in part, I do not agree with all of the panel actions taken. Specifically, in 516.10(A)(6), 516.10(B)(4), and 516.10(C)(4)(b) the task force recommendation to eliminate the term "adequately" from "adequately grounded" should have been accepted. Likewise, the task force recommendation to eliminate the term "effectively" from "effectively grounded" should have been accepted by replacing the text with the phrase "connected to an equipment grounding conductor" similar to the action taken on Proposal 14-191. By not making these changes, CMP 14 has created a correlation issue with the task force recommendations and the actions taken by other code panels.

14-24 Log #3194 NEC-P14 **Final Action: Accept in Principle**
(501.5 and Exception)

Submitter: Donald Cook, Shelby County Development Services

Recommendation: Delete the first paragraph and the exception.

Substantiation: If we believe that use the all of the parties involved in the development of the NEC, users, designers, installers, manufacturers, labor, research & testing, and enforcement are capable of working in hazardous (classified), we should assume they are capable of looking at 90.3 and understanding that the requirements in Chapter 5 modify the general rules in Chapters 1-4. If they are not capable of understanding that, adding the information again in 501.5 will not change their ability to understand the requirements.

This change does not impact the requirements at all.

Panel Meeting Action: Accept in Principle

The panel accepts the recommendation and in addition revises the title of the section from "General" to "Zone Equipment".

Panel Statement: The revised title better captures the remaining requirements of this section now that the first paragraph and exception have been deleted.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-25 Log #2463 NEC-P14 **Final Action: Reject**
(501.10)

Submitter: Eliana Beattie, ISA

Recommendation: 501.10 Wiring Methods

Revise 501.10(B)(3) as follows:

(3) Nonincendive Field Wiring & FNICO . Nonincendive field wiring and FNICO shall be permitted using any of the wiring methods permitted for unclassified locations. Nonincendive field wiring and FNICO systems shall be installed in accordance with the control drawing(s). Simple apparatus, not shown on the control drawing, shall be permitted in a nonincendive field

wiring <u>or FNICO</u> circuit, provided the simple apparatus does not interconnect the nonincendive field wiring <u>or FNICO</u> circuit to any other circuit.
Substantiation: The FISCO (**F** ieldbus **I** ntrinsically **S** afe **CO** ncept) and FNICO (**F** ieldbus **N** on **I** ncendive **CO** ncept) protection concepts take advantage of functional requirements of Fieldbus systems to significantly simplify i.s. installation. These requirements include wire type and quality, supply voltage and current levels, and limitation of stored energy at the terminals of field devices. The objective of these concepts is to simplify the i.s. installation to the point where a safe installation may be effected by simply selecting devices labeled as FISCO (or FNICO) and observing basic wiring type and length restrictions. The NRTL evaluation of all devices ensures that they will be compatible with all other similarly labeled devices without further analysis on the part of the installer.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject
Panel Statement: The panel rejects the addition of "FNICO" because there are numerous nonincendive field wiring methods that are acceptable and the inclusion of the acronym in this section would imply that "FNICO" is the only method available. If "FNICO" wiring systems are installed in accordance with the control drawings, this practice would not be prohibited by the present NEC. See the panel action and statement on Proposal 14-6.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:

SCHNAARE, T.: Generally speaking, the code serves its primary users base best when it includes information about the various techniques that are allowed for installation. While I agree that the panel does not want to imply that FISCO and FNICO are the only techniques available, I also belive that the code is made stronger and easier to understand and apply when information such as this is included. If there are other deficiencies in the current code (as implied by the panel statement) then these should be addressed as well.

14-23 Log #2333 NEC-P14 **Final Action: Reject**
(501.10(A)(1)(C))

Submitter: Lee Perry, Service Wire Company
Recommendation: Revise existing text to read:

In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type MC-HL cable, listed for use in Class I, Division 1 locations, with a gas/vaportight continuous ~~corrugated metallic sheath, an~~ overall jacket of suitable polymeric material, separate grounding conductors in accordance with 250.122, and provided with termination fittings listed for the application.
Substantiation: Requirement of restricting construction to one specific type-corrugated metallic sheath is precluding testing and listing of interlocked metal tape-type MC cable as MC-HL cable to determine compliance with mechanical strength requirements as well as gas/vaportight requirements, interlocked metal tape type cables, such as TECK-90 construction, can pass the required mechanical and gas/vaportight requirements and is allowed in Canadian Electrical Code for use in Class I, Division 1 areas in industrial installations for the last 20 years. The NEC should specify performance requirements instead of mandating one type of construction. US manufacturers are manufacturing and selling TECK cable for the Canadian market, but are precluded from selling in US markets, thereby, restricting their ability to market their product. Replacing prescriptive construction requirements with performance requirements will allow manufactures of interlocked metal tape-type MC cable to request listing agencies to test and list cables as MC-HL if they successfully pass the mechanical and gas vaportight requirements in compliance with the NEC.
Panel Meeting Action: Reject
Panel Statement: In previous NEC revision cycles, action by CMP-14 to accept Type MC-HL cable for use in Class I, Division 1 locations was achieved through considerable discussion. There was great concern related to the gas/vapor tight integrity, to the mechanical strength of the metallic cable sheath, and to the mechanical strength of the polymeric jacket both during the testing and duration of the life of the cable. Under fault conditions, turn to turn arcing cannot be tolerated in an interlocked sheath construction in a Division 1 location. The continuous corrugated metallic sheath provides excellent gas/vapor tight characteristics and an effective ground-fault current return path in accordance with 250.118(10).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:

COSPOLICH, J.: We agree with the panel's action to reject Proposal 14-23. The IEEE seeks a performance and not a construction feature to achieve the sealed gas/vapor-tight protection and a metallic armor sheath plus any other performance requirements as appropriate for the listing.

14-26 Log #2474 NEC-P14 **Final Action: Accept in Principle**
(501.10(A)(1)(c) and (d))

TCC Action: The Technical Correlating Committee directs that the panel reconsider the action on this Proposal. The requirement in the main text is for the cable in question to be listed. The FPNs add a reference to the product standard. Annex A of the NEC was specifically added to handle these types of references. The panel should delete the new FPNs and add a reference to UL 2225 into Annex A. This will make the text consistent with how standards for listing are treated elsewhere in the code. This action will be considered by the panel as a public comment.
Submitter: Donald W. Ankele, Underwriters Laboratories Inc.
Recommendation: Revise text to read as follows:

(c) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type MC-HL cable, listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, separate grounding conductors in accordance with 250.122, and provided with termination fittings listed for the application.

FPN <u>1</u> : See 330.12 for restrictions on use of Type MC cable.

<u>FPN 2: For further information on construction, testing and marking requirements for Type MC-HL cable and Type MC-HL cable sealing fittings, see ANSI/UL 2225, Cables and Cable Fittings for Use in Hazardous (Classified) Locations.</u>

(d) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type ITC-HL cable, listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material and provided with termination fittings listed for the application.

<u>FPN 1: See 727.4 and 727.5 for restrictions on use of Type ITC cable.</u>

<u>FPN 2: For further information on construction, testing and marking requirements for Type MC-HL cable and Type MC-HL cable sealing fittings, see ANSI/UL 2225, Cables and Cable Fittings for Use in Hazardous (Classified) Locations.</u>
Substantiation: Add FPN 2 to reference the ANSI standard for Type MC-HL cable and Type ITC-HL cables and cable fittings to aid approval of the installation for the location involved.

Add FPN 1 to reference Article 727 for Type ITC cable.
Panel Meeting Action: Accept in Principle
Revise the recommended fine print note to 501.10(A)(1)(d) to read: <u>FPN No. 2: For further information on construction, testing and marking requirements for Type ITC-HL cable and Type ITC-HL cable sealing fittings, see ANSI/UL 2225, Cables and Cable Fittings for Use in Hazardous (Classified) Locations.</u>
Panel Statement: The panel accepts the recommendation and corrects the type of cable covered by the new fine print note to 501.10(A)(1)(d).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-27 Log #1928 NEC-P14 **Final Action: Reject**
(501.10(A)(1) Exception)

TCC Action: The Technical Correlating Committee directs the panel to reconsider the action on this proposal and remove the redundant reference to Article 352 since this is already covered by 90.3. This action will be considered by the panel as a public comment. The Technical Correlating Committee also refers this proposal to Code-Making Panel 8 for comment as it relates to the action taken on Proposal 8-53.
Submitter: William Wagner, Certification Solutions
Recommendation: Revise the first sentence of the exception to 501.10(A)(1) as follows:

Exception: Rigid nonmetallic conduit ~~complying with Article 352~~ shall be permitted where encased in a concrete envelope a minimum of 50 mm (2 in.) thick and provided with not less than 600 mm (24 in.) of cover measured from the top of the conduit to grade.
Substantiation: 4.1.1 of the NEC Style Manual does not permit references to be made to an entire article unless additional conditions are specified. Therefore, the reference to Article 352 should be deleted.
Panel Meeting Action: Reject
Panel Statement: The use of rigid nonmetallic conduit in this section is conditional because this requirement specifies a minimum 2 inches of concrete encasement. Under this condition, the NEC Style Manual permits a reference to an entire article.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:

COOK, D.: Based on the information in 90.3, the text "complying with Article 352" adds nothing to the requirement.

14-28 Log #629 NEC-P14 **Final Action: Reject**
(501.10(A)(3))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read as follows:
(3) Boxes and Fittings. All boxes and fittings shall be listed and identified ~~approved~~ for Class I, Division 1.
Substantiation: It appears that the more appropriate words to use in this section are "listed" and "identified". Approved is defined as "acceptable to the authority having jurisdiction". This proposed revision is an effort to promote consistent use of words and terms in the NEC. The proposal is for clarification purposes.
Panel Meeting Action: Reject
Panel Statement: Some fittings, such as listed conduit couplings, are not identified specifically for use in hazardous locations. In regard to boxes, based on the recommendation there would have to be a listing mark plus some form of identification.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
COOK, D.: While I agree that certain items like conduit couplings are not "listed" specifically for use in Class I, Division 1 locations, the use of the term "identified" as described in 500.8 would cover those fittings and any boxes that would be permitted. "Approved" is defined as acceptable to the authority having jurisdiction (AHJ) and the AHJ will need some basis for that approval. My vote for this proposal would be to accept in part.

14-29 Log #630 NEC-P14 **Final Action: Accept**
(501.10(B)(1)(1))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read as follows:
(B) Class I, Division 2
(1) General. In Class I, Division 2 locations, the following wiring methods shall be permitted:
(1) All wiring methods permitted in ~~Article~~ 501.10(A).
Substantiation: This is an editorial change. 501.10(B)(1)(1) should refer to 501.10(A), not Article 501.10(A).
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-30 Log #2707 NEC-P14 **Final Action: Accept in Principle**
(501.10(B)(1)(3) (New))

Submitter: Dorothy Kellogg, American Chemistry Council
Recommendation: Under (1) General add: new (3) as follows and renumber the existing items beginning with the current (3) accordingly:
(3) In industrial establishments with restricted public access where the conditions of maintenance and supervision ensure that only qualified persons service the installation and where added corrosion resistance is necessary, rigid nonmetallic conduit with appropriate fittings and seals, identified for use in a Class I, Division 2 location and run with an appropriately sized equipment grounding conductor shall be permitted.
Substantiation: There are industrial establishments having Class I, Division 2 locations where added corrosion resistance is needed. Traditional metal conduit and even metal conduit with coatings, does not offer the needed corrosion protection. Permission within the code for a rigid nonmetallic conduit product would offer a solution to this problem and at the same time better assure protection offered by a conduit system.
Clearly, users with intrinsic safe, nonincendive systems, or areas containing corrosive atmospheres would welcome opportunity to use an identified rigid nonmetallic conduit that could safely be used in a Division 2 location. Often times, if the opportunity door is shut for an application, there is little chance that a product will be developed for that application. In this case, action to support this proposal will enable the development of both the product and the testing standard to proceed, as there definitely is a need for this product.
The panel action should not rule out the use of a rigid nonmetallic conduit application on the basis that it has not been tested or that such a variety could not be manufactured. As an example, Type "Schedule 80" pc rigid nonmetallic already is considered by its product standard as being suitable for use in areas where subject to physical damage. There is no certainty that metallic conduit will not be bent, damaged, corroded, or be otherwise compromised to question its ability to perform as it was originally intended.
Lastly, since this is a Division 2 application, there is no reason that a solvent made connection would be less secure than a threaded connection. Further, while it is common and good practice to use threaded conduit even in Division 2 locations, there is not an NEC requirement that this be done. Additionally, since a separate equipment ground is required with this rigid nonmetallic conduit, the issues associated with continuity afforded by the conduit system would not be an issue. So again, the nonmetallic connection only needs to be secure, and tight for integrity reasons.
In summary, under this proposal, a product standard could be developed to address such additional considerations as bonding of sections of rigid nonmetallic conduit, provision of appropriate seals, and perhaps even interconnection of metallic with nonmetallic conduits.
Panel Meeting Action: Accept in Principle
Panel Statement: The recommended action is accomplished through the panel action on Proposal 14-33a (Log #CP1402).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
BERNSEN, M.: The substantiation for this proposal does not resolve all the issues and concerns I have with the installation of Schedule 80 PVC and RTRC in Division 2 locations. The substantiation indicates, in item 1 that poor installations are a general problem which is addressed by limiting the installations to industrial facilities with qualified personnel.
I don't believe that poor installations are a general problem nor do I feel that limiting installations to industrial facilities will automatically translate into better installations. The definition of a "qualified person" in Article 100 is very loose and leaves a lot to the interpretation of the AHJ. Applying the definition does not guarantee that a person who is labeled a "qualified person" completely understands the NEC or how to install electrical equipment. Placing this "qualified person" in an industrial facility does not insure a proper, code-compliant installation. The truth is that poor installations are the product of lack of maintenance as much as they are the problems with the original installation and they can occur just as easily in an industrial facility as they can in a local gasoline station. During my 15 years of conducting electrical inspections for the City of Fort Lauderdale, I had the occasion to issue "not approved notices" on every type of job from small residential to complex commercial and industrial installations.
Item 3 of the substantiation indicates that fitting concerns are addressed by specific reference to Article 352. Nothing in Section 352.10 Uses Permitted indicates that rigid nonmetallic conduit is approved for use in hazardous locations. Furthermore, Section 500.8(A) of the 2005 NEC states that "Equipment shall be identified not only for the class of location, but also for the explosive, combustible, or ignitable properties of the specific gas vapor, dust, fiber, or flyings that will be present." The Article 100 definition of "Equipment" includes "fittings". The FPN under the Article 100 definition of "Identified (applies to equipment)" suggests that "listing and labeling" is a method to identify equipment as being suitable for the use. I am concerned that the proposal would allow the installation of fittings such as male and female adapters, expansion fittings, couplings and other fittings in a hazardous area without investigating their suitability as required by 500.8(A). To my knowledge, RTRC and Schedule 80 PVC have not been evaluated and identified for use in any hazardous location.
The substantiation in item 4 states that "Risk of physical damage has been minimized by use of RTRC or Schedule 80 PVC". I checked RTRC in the UL "white book" (DZKT) and noted the following statement: "Conduit marked "Above Ground" (or "AG") has been investigated for use aboveground, underground and for direct burial with or without encasement in concrete. This conduit has been investigated for concealed or exposed work where not subject to physical damage." The same statement appears in UL 1684. UL 1684A supplements this information by allowing the use of RTRC above ground Type XW in locations subject to physical damage. I couldn't find anything on the UL web page to indicate that this product has been tested.
Furthermore, UL 1684 in its scope states: "This Standard specifies the requirements for halogen-free reinforced thermosetting resin conduit (RTRC), and associated fittings for installation and use in accordance with the Rules of the Canadian Electrical Code, (CEC) Part I, and the National Electrical Code (NEC) for non-hazardous locations."
In researching the Champion Fiberglass catalogue for Fiberglass Conduit (RTRC), I noted that there are four methods for joining the conduit. Two of the methods do not appear to use any cement or epoxy. The other two methods use a two part epoxy which, according to the catalogue takes one hour to cure at the rated temperature. The epoxy is available in three different curing temperatures.
I don't believe, based on the facts presented in the three previous paragraphs that RTRC should be permitted to be installed in a hazardous location without further evaluation and investigation. The substantiation does not show that the product has been investigated for use in hazardous locations. There are too many unanswered questions pertaining to the suitability of the product for use in a hazardous area. Installation details are complex and should be included or referenced in any code rule which would allow its installation.
Item 5 of the substantiation discusses "materials that might attack RTRC or Schedule 80 PVC" and indicates the problem is addressed by Section 110.11. If this is the case, then the same could be said for coated rigid metal conduit

which is approved for use in Division 2 locations. The coating should provide the corrosion protection while the rigid conduit underneath would provide the physical protection. The substantiation for proposal 14-34 indicates that the rigid corrodes under the coating. I question whether the corrosion took place due to the improper installation of the product. I have seen this product used in hazardous locations and have not observed the deterioration of the metal conduit when the product is properly installed and maintained. If the breakdown is due to improper installation and maintenance, then I would refer back to my comment under item 1 concerning industrial locations and "qualified persons".

Item 9 states that "ingress of vapors is assumed as is the case for all other installations and, thus, is not different for RTRC or PVC." The substantiation does not provide any data to support this statement. Does a PVC male adapter or a RTRC connector provide the same connection characteristics as rigid metal conduit threads when connected to an enclosure? Are PVC and RTRC expansion fittings suitable for use in a Division 2 location? I don't have the answers to these questions and I don't feel comfortable with making an assumption that these fittings can be used in the Division 2 location without creating a safety hazard.

The substantiation in item 10 states the "UL 1684 indicates that this material (RTRC) is tested and must be stronger than the equipment it is connected to. Therefore, it is considered acceptable." If the substantiation is addressing physical damage, I would agree but if the substantiation is addressing acceptable for use in Division 2 locations, I don't see the correlation. The substantiation does not provide information that supports the statement.

Item 11 states that "Generation of static electricity is not an issue that is specific to RTRC or PVC conduits, since these materials are used for enclosures, flexible connections, etc. which are already permitted." The substantiation does not provide any facts to substantiate that claim. Looking on the web, I found numerous articles addressing static electricity associated with PVC and other plastics. PVC food grade material handling hoses contain embedded copper grounding wires to prevent the build up of static electricity. While the energy level may not be high enough to cause problems in a hazardous location, that determination should be made based on controlled tests and not conjecture.

In my attempt to give this proposal a fair evaluation, I contacted some friends at Crouse-Hinds who have dealt with hazardous locations for years and asked for some feedback on the proposal.

Note: Supporting material is available for review at NFPA Headquarters.

14-31 Log #2209 NEC-P14 **Final Action: Reject**
(501.10(B)(1)(6))

Submitter: Kyle Cope, Prysmian Cables and Systems
Recommendation: Revise as follows:

Type MI, MC, MV, PA or TC cable with termination fittings, or in cable tray system and installed in a manner to avoid tensile stress at the termination fittings. Single Conductor Type MV cables shall be shielded or metallic armored.

Substantiation: Statement of problem: Material technology advancements now allow for cable designs that provide improved mechanical damage protection. i.e., crush and impact, over standard Type MC cable without sacrificing flame performance properties. The characteristics achieved using traditional metallic components can now be realized using polymeric materials. The use of polymeric materials also provides the opportunity for lighter and smaller diameter cables.

Substantiation for Proposal: Type PA has been proposed as a new type (Article 3XX) and should be included in this list (501.10(B)(1)(6)) as it offers enhanced mechanical benefits as an alternate to Type MC cable. See test data provided. A UL Fact-Finding study comparing the subject cable to type MC is ongoing at the time of proposal submittal. This data will be forwarded once the study is complete.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: This cable is not currently recognized as a Chapter 3 wiring method. CMP-14 notes that CMP-7 rejected a proposal to include this type of cable in Chapter 3.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

Comment on Affirmative:

COOK, D.: I would also add that acceptance of the cable as a Chapter 3 wiring method would not answer all the questions related to use in hazardous (classified) locations.

14-32 Log #2727 NEC-P14 **Final Action: Accept**
(501.10(B)(1)6.)

Submitter: Dorothy Kellogg, American Chemistry Council
Recommendation: Revise text to read:

(6) Type MI, MC, MV, or TC cable with termination fittings, or in cable tray systems and installed in a manner to avoid tensile stress at the termination fittings. ~~Single conductor Type MV cables shall be shielded or metallic armored.~~

Substantiation: Action taken under proposal 14-47 Log #2299 NEC-P14 (501.4(B)(1)(6)) in the 2005 Code cycle was to accept the addition of the new sentence "Single conductor Type MV cables must be shielded or metallic armored". However, there is no adverse experience to indicate that Type MV single conductor cables installed within a Class I, Division 2 location are or have been a problem. The original submitter further stated in the substantiation that by providing a metallic armor or shield to provide a ground plane, that an "alleged" external electrical discharge would eliminate the ignition source and preclude any possibility of creating an explosion. Such a statement is not factual.

Panel Meeting Action: Accept

Panel Statement:

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

Comment on Affirmative:

BERNSEN, M.: My vote to accept this proposal is based on the 2005 NEC change to 310.63 that limits the voltage on single conductor non-shielded cable to 2400 volts. The original proposal did not provide substantiation to prove that a metallic armor or shield will eliminate ignition sources associated with these cable.

COOK, D.: My position to delete the 2005 NEC text that requires single conductor Type MV cable to be shielded or armored is based on the 2005 NEC changes in Table 310.63 limiting those cables to 2400 volts. Nothing in the substantiation for proposal 14-32 has convinced me that single conductor, nonshielded cable, operating at 4160 volts is not capable of external discharge that could become an ignition source. I do not agree with the substantiation provided with the proposal.

COSPOLICH, J.: By accepting Proposal 14-32, the 2008 NEC will now allow single conductor non-shielded and non-armored 2400 volt MV cables in Class I, Division 2 locations which was previously not allowed. My position on Proposal 14-32 to accept the deletion of the 2005 NEC text that requires single conductor Type MV cable to be shielded or armored is based on the NEC 2005 changes to 310.6 Exception and Table 310.63 that limit single conductor nonshielded cables to 2400 volts. My position is contingent upon Code Panel 6 not reversing the changes made to 310.6 Exception and Table 310.63 in the NEC 2005 which reduced the voltage allowed from 8000 volts to 2400 volts. Furthermore, it is strongly recommended that the insulation be limited to the thicknesses of the "Wet or Dry Locations" section of NEC 2005 Table 310.63. I do not agree with the submitter's substantiation that there has been no adverse experience to indicate that Type MV single conductor cables installed within a Class I, Division 2 location are or have been a problem or that has convinced me that single conductor, nonshielded cable operating at 4160 volts or 8000 volts is not capable of external discharge that could become an ignition source. I do not agree with the substantiation provided with the proposal.

14-33 Log #3629 NEC-P14 **Final Action: Accept in Principle**
(501.10(B)(1)7.)

Submitter: Goran Haag, Champion Fiberglass, Inc.
Recommendation: Add new item (7) as follows:

(7) Rigid nonmetallic conduit, type RNC, per article 352 installed with an equipment grounding conduction.

Substantiation: Addition of rigid nonmetallic conduit to Class I, Division 2 wiring methods. This proposal provides the option of using a conduit system that is corrosion resistant and safe for Class I, Division 2 locations. Chemical plants, refineries, off shore drilling facilities and other similar processes are highly corrosive and also have classified areas. Nonmetallic conduit provides a critical option on these locations. The NEC requirements for rigid nonmetallic conduit are found in Article 352. Rigid nonmetallic conduit is listed in the UL Information Directory, which describes the types of rigid nonmetallic conduit, and also in UL standard 1684. Rigid nonmetallic conduit is permitted in Class III, Division 1 locations; a s buried raceway in Class I location in commercial Garages, Article 511; in Bulk Storage Plants, Article 515, and in Class I, Division 1 locations when enclosed in concrete. This proposal also requires an equipment grounding conductor with the nonmetallic conduit in Class I, Division 2 locations. Rigid nonmetallic conduit, not other cabling or conduit systems, is not permitted where subject to physical damage unless identified for such use.

A second proposal to permit RNC in Class I, Division 2 locations is being submitted to section 352.12 (A)

Panel Meeting Action: Accept in Principle

Panel Statement: The recommended action is accomplished through the panel action on Proposal Proposal 14-33a (Log #CP1402).

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

BERNSEN, M.: See my Explanation of Negative on Proposal 14-30.

14-33a Log #CP1402 NEC-P14 **Final Action: Accept**
(501.10(B)(1)(7))

TCC Action: The Technical Correlating Committee directs the panel to reconsider this proposal and remove the redundant references to Articles 352 and 355. Both of these articles already require that RTRC and RNMC be listed wherever they are used in the NEC. The Technical Correlating Committee is concerned that the references specifically to the xxx.6 sections imply that there are other applications where the listing requirement does not apply. This action will be considered by the panel as a public comment.
Submitter: Code-Making Panel 14,
Recommendation: Add a new 501.10(B)(1)(7) to read: In industrial establishments with restricted public access where the conditions of maintenance and supervision ensure that only qualified persons service the installation and where metallic conduit does not provide sufficient corrosion resistance, Reinforced Thermosetting Resin Conduit (RTRC), factory elbows, and associated fittings in accordance with 355.x, and Schedule 80 PVC Conduit, factory elbows, and associated fittings, in accordance with 352.6, shall be permitted.
Where seals are required for boundary conditions as defined in 501.15 (A) (4), the Division 1 wiring method shall extend into the Division 2 area to the explosionproof seal which shall be located on the Division 2 side of the Division 1 - Division 2 boundary.
Substantiation: Technical issues considered within this proposal include the following:
1) Installation concerns about poor installation are a general problem for installations and these are addressed by limiting the installations to industrial facilities with qualified personnel.
2) Boundary sealing requirements have been addressed by the new text for the Division 1 to Division 2 installation and existing texts already covers Division 2 to unclassified installations.
3) Fittings concerns are addressed by specific reference to Article 352.
4) Risk of physical damage has been minimized by use of RTRC or Schedule 80 PVC.
5) The question about materials that might “attack” RTRC or PVC were considered, but this was considered to be addressed by 110.11 and it was not felt that this was a greater hazard potential than other material currently used.
6) Panel note to CMP8; Article 355 and 352.12 (A) (2) needs to be revised to reflect this permissive installation in 510.10 (B) (1) (7).
7) Rigid nonmetallic has been redefined by actions of CMP-8. Article 352 is now the rigid nonmetallic article and it has been re-titled PVC; addressing schedule 40 and 80. CMP-14 has accepted only schedule 80 for Division 2 installations as provided in the text above. Article 353 is HDPE as Type HDPE Conduit is not a metallic material and there has been no proposal offered for considering this. Types A-PVC and EB-PVC are addressed in UL 651a and are for installations in concrete only.
8) Weather, sunlight, UV exposure, ambient temperatures, etc. are addressed within the product ANSI standards.
9) Ingress of vapors is assumed as is the case for all other installations and thus is not different for RTRC or PVC conduit installations.
10) Fiberglass is addressed in proposed Article 355 as Reinforced Thermosetting Resin Conduit (RTRC). The ANSI RTRC standard (UL-1684) indicates that this material is tested and must be stronger than the equipment it is connected too. Therefore it is considered acceptable.
11) Generation of static electricity is not an issue that is specific to RTRC or PVC conduits, since these materials are used for enclosures, flexible connections, etc. which are already permitted
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
BERNSEN, M.: See my Explanation of Negative on Proposal 14-30.
Comment on Affirmative:
BRIESCH, E.: In order to address the Panel’s concern to minimize the risk of physical damage, the requirement for Reinforced Thermosetting Resin Conduit (RTRC) needs to specify RTRC marked with suffix –XW to specify RTRC with the equivalent mechanical strength of Schedule 80 PVC. In addition, since Zone 2 locations as defined in Article 505 and Division 2 locations are technically the same, consideration should be given to adding these wiring methods to 505.15 (C)(1) as well.
WECHSLER, D.: There is a strong need in Industrial applications when corrosion is a problem for having an alternative to metallic conduit. The Panel should continue to support this proposal.

14-34 Log #2626 NEC-P14 **Final Action: Accept in Principle**
(501.10(B)(5) (New))

Submitter: David H. Kendall, Carlon
Recommendation: Add new text to read as follows:
<u>(5) Corrosive Atmospheres. Schedule 80 PVC Rigid Nonmetallic Conduit with an equipment grounding conductor shall be permitted in corrosive atmospheres when installed in accordance with Article 352 and shall be under conditions of continuous maintenance and supervision by only qualified persons that monitor and supervise the systems.</u>
Substantiation: Corrosion is a serious safety problem on offshore drilling rigs and in chemical plants. Metal conduit will corrode away even when it has been galvanized or coated with PVC. When metal conduit corrodes it will no longer maintain its physical ability to protect the conductors or cables nor be able to act as an equipment grounding conductor.
PVC Coated Metal Conduit can corrode underneath the PVC coating. This corrosion can go undetermined for a period of time. There will be a minimum to no protection of electrical conductors in these areas in addition to the loss of grounding.
Schedule 80 PVC Rigid Nonmetallic Conduit is a heavy duty conduit that has been evaluated and listed for areas of physical damage. Schedule 80 PVC RNC when installed in accordance with Article 352 will not bend and provide the physical strength and integrity in areas prone to damage due to corrosive atmospheres. The proposed language adopts text found throughout the code and lists the use of Schedule 80 PVC Conduit to those areas that are monitored by qualified persons (As defined in Article 100.)
Panel Meeting Action: Accept in Principle
Panel Statement: The recommended action is accomplished through the panel action on Proposal 14-33a (Log #CP1402).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
BERNSEN, M.: See my Explanation of Negative on Proposal 14-30.

14-35 Log #2475 NEC-P14 **Final Action: Accept**
(501.15 FPN No. 3 & No. 4)

TCC Action: The Technical Correlating Committee directs the panel to reconsider the action on this proposal and relocate the product standards references to Annex A. The Technical Correlating Committee intends that the use of Annex A be consistent throughout the NEC. This action will be considered by the panel as a public comment.
Submitter: Donald W. Ankele, Underwriters Laboratories Inc.
Recommendation: Revise text to read as follows:
5011.15 Sealing and Drainage. Seals in conduit and cable systems shall comply with 501.15(A) through 501.15(F). Sealing compound shall be used in Type MI cable termination fittings to exclude moisture and other fluids from the cable insulation.
FPN No. 1: Seals are provided in conduit and cable systems to minimize the passage of gases and vapors and prevent the passage of flames from one portion of the electrical installation to another through the conduit. Such communication through Type MI cable is inherently prevented by construction of the cable. Unless specifically designed and tested for the purpose, conduit and cable seals are not intended to prevent the passage of liquids, gases, or vapors at a continuous pressure differential across the seal. Even at differences in pressure across the seal equivalent to a few inches of water, there may be a slow passage of gas or vapor through a seal and through conductors passing through the seal. See 501.15(E)(2). Temperature extremes and highly corrosive liquids and vapors can affect the ability of seals to perform their intended function. See 501.15(C)(2).
FPN No. 2: Gas or vapor leakage and propagation of flames may occur through the interstices between the stranded conductors larger than 2 AWG. Special conductor constructions, for example, compacted strands or sealing of the individual strands, are means of reducing leakage and preventing the propagation of flames.
<u>FPN No. 3: For further information on construction, testing and marking requirements for conduit sealing fittings, see ANSI/UL 1203, Explosionproof and Dust-Ignition-Proof Electrical Equipment for Use in Hazardous (Classified) Locations.</u>
<u>FPN No. 4: For further information on construction, testing and marking requirements for Type MC-HL cable and Type MC-HL cable sealing fittings, see ANSI/UL 2225, Cables and Cable Fittings for Use in Hazardous (Classified) Locations</u> .
Additionally, revise FPN No. 1 following 501.15(E)(2) as follows:
FPN No. 1: See ~~ANSI/UL 886 1994, Outlet Boxes and Fittings for Use in Hazardous (Classified) Locations.~~ <u>ANSI/UL 1203, Explosionproof and Dust-Ingition-Proof Electrical Equipment for Use in Hazardous (Classified) Locations.</u>

Substantiation: Add FPN No. 3 and FPN No. 4 to reference the ANSI standards for conduit sealing fittings and cable sealing fittings to aid approval of the installation for the location involved. Replace the reference to UL 886, in 501.15(E)(2), with ANSI/UL 1203 because UL 886 is no longer published.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-36 Log #2802 NEC-P14 **Final Action: Reject**
(501.15(A)(4))

Submitter: Stephen V. Norako, EGS Electrical Group
Recommendation: Delete the following text:
~~...of such location within 3.05 m (10 ft) of the boundary...~~
Substantiation: Conduit (ridgid metal) is available in 20 ft lengths. This will address these longer lengths and allow seals to be installed as far as 20 ft from a boundary.
Panel Meeting Action: Reject
Panel Statement: The panel established this requirement based on the standard length for conduit as specified in the product standard. Non-standard lengths are available; however, the submitter provided no technical substantiation to support moving the seal farther than 10 feet from the boundary.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-37 Log #3559 NEC-P14 **Final Action: Reject**
(501.15(B)(2))

Submitter: Robert Alexander, Laguna Hills, CA
Recommendation: Delete the current 501.15(B)(2) and replace with the following:
501.15(B)(2) Between Class I, Division 2 and Unclassified Locations.
(A) Aboveground. In each aboveground raceway between a Class I, Division 2 location and an unclassified location where, under normal conditions, there is a differential air pressure that may cause fluid flow from the Division 2 location to the unclassified location.
(1) Where a physical barrier, such as a wall or dike, creates the classified location boundary, and the raceway penetrates such barrier,
(A) The sealing fitting shall be permitted on either side of the boundary within 3.05 m (10 ft) of the boundary,
(B) A threaded connection shall be used at the sealing fitting,
(C) Except for listed explosionproof reduces, there shall be no union, coupling, box, or fitting between the conduit seal and the boundary.
(2) Where the classified location boundary is in open air and the raceway continues to an unclassified location and penetrates a physical barrier, such as a wall or dike into the unclassified location.
(A) The sealing fitting shall be within 3.05 m (10 ft) of the physical barrier.
(B) A threaded connection shall be used at the sealing fitting.
(C) Except for listed explosionproof reducers, there shall be no union, coupling, box, or fitting between the conduit seal and the boundary.
(b) At grade. In each raceway where the Class I, Division 2 location boundary is created by grade and the material or materials that create the classified location have a vapor density greater than 0.6.
(1) The sealing fitting shall be aboveground within 3.05 m (10 ft) of grade.
(2) A threaded connection shall be used at the sealing fitting.
(3) Except for listed explosionproof reducers, there shall be no union, coupling, box, or fitting between the conduit seal and grade.
Substantiation: Since the 1990 cycle, there have been several proposals accepted that relax the requirements for seals between Class I, Division 2 and unclassified locations - almost to the point that such seals have become unnecessary. Under most conditions, this is well justified since there is not supposed to be ignitible materials present in Division 2 under normal conditions.
A significant relaxation in the last cycle permits boundary seals to be nonexplosionproof. I have come to the conclusion that they should be explosionproof- that is, if they are needed at all. Unlike the intrinsically safe circuits used to partially justify the relaxation, common circuits still have the ability to ignite flammable materials under abnormal conditions.
I have reduced 501.15(B)(2) to the few conditions I believe seals between Division 2 and unclassified locations ARE necessary and they should be explosionproof.
Notes:
1) 501.15(B)(2)(a)(1) and (2) do not apply unless the main rules applies; i.e., a differential air pressure exists under normal conditions.
2) I have used the term “fluid flow” rather than “gasses” to emphasize the means of migration rather than the material that migrates.
Panel Meeting Action: Reject
Panel Statement: The goal of the NEC is to provide safe electrical installations in both normal and abnormal conditions. The proposed relaxation or modifications have no technical substantiation and provide no equivalency to the existing requirement. The proposed text does not improve the clarity of this section. The differentiation between the condition described in proposed 501.15(B)(2)(A)(1) and 501.15(B)(2)(A)(2) is not clear and would lead to great difficulty in enforcement.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-38 Log #100 NEC-P14 **Final Action: Reject**
(501.15(C)(6))

Submitter: Ian Eckstein, March Electric
Recommendation: Add a new last sentence to the section and a new table as follows:
<u>“The cross-sectional area of the conductors shall not exceed the values given in Table 501.15(C)(6).”</u>

Table 501.15(C)(6) Allowable Conductor Fill Permitted for Conduit Seals Installed in Class I Division 1 Locations

Metric Designator	Trade Size	Maximum Cross-Sectional Area mm²	in.²
16	½	51	0.079
21	¾	88	0.137
27	1 ¼	143	0.222
35	1 ½	246	0.328
41	1	333	0.518
53	2	550	0.852
63	2 ½	784	1.217
78	3	1210	1.875
91	3 ½	1615	2.503
103	4	2079	3.221
129	5	3263	5.053
155	6	4705	7.290

Substantiation: Since the number of conductors permitted to be run through a Class I seal (25% fill) is usually less than for the conduit (40% fill), time is lost making calculations in the field where the size of the seal for a particular run is in question. Since the maximum fill is 25% of the cross-sectional area of RMC, a simple fill table in Article 501 would be easy to provide. I saw Proposals 14-38 and 14-39 from the last revision and was disappointed when they were rejected. I copied one of the tables from the proposal and put it in the back of my 2005 NEC. Electricians and inspectors should know about the 25% fill requirement, but the reality is they are often not aware. Such a table would help make this requirement obvious and the sizing of seals faster to determine. If the feeling is that this table is not necessary, then perhaps the 31%, 40%, 53% and 60% columns of Tables 4 should be deleted. As an electrician, I feel adding this new table to Article 501 will definitely make the NEC more user friendly.
Panel Meeting Action: Reject
Panel Statement: Seals are required to be provided with an accompanying table that specifies the allowable fill which may be other than 25%.

Ballot Results: Affirmative: 14

14-39 Log #2446 NEC-P14 **Final Action: Accept**
(501.15(F)(3))

TCC Action: The Technical Correlating Committee directs the panel to reconsider this proposal and to relocate the reference into Annex A to be consistent with other parts of the Code. This action will be considered by the panel as a public comment.
Submitter: Eliana Beattie, ISA
Recommendation: 501.15(F)(3) - 2nd FPN
Change ISA 12.27.01 to ANSI/ISA-12.27.01-2003
Substantiation: Change format to match actual ISA standards numbering.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-40 Log #973 NEC-P14 **Final Action: Reject**
(501.30)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:
Wiring and equipment in Class I Division 1 and 2 locations shall be grounded ~~as specified in Article 250~~ and in accordance with the requirements in 502.30(A) and 501.30(B).
Substantiation: Edit. To comply with Style Manual.
Panel Meeting Action: Reject
Panel Statement: The grounding requirement in this section is conditional because of the additional requirements specified in 501.30. Under this condition, the NEC Style Manual permits a reference to an entire article.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
COOK, D.: While I am not opposed to the panel action, I will offer alternate wording for 510.30 if it is determined the current text does not comply with the NEC Style Manual.
"In addition to the general grounding requirements, wiring and equipment in Class I, Division 1 and 2 locations shall also comply with 501.30 (A) and (B)."

14-41 Log #1452 NEC-P14 **Final Action: Reject**
(501.30(A))

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise as follows:
501.30 Grounding and Bonding. Class, Divisions 1 and 2. Wiring and equipment in Class I, Division 1 and 2 locations shall be grounded <u>and bonded</u> as specified in Article 250 and with the requirements in 501.30(A) and 501.30(B).
(A) Bonding. <u>Bonding in Class I locations shall comply with 250.100.</u> ~~The locknut bushing and double-locknut types of contacts shall not be depended on for bonding purposes, but bonding jumpers with proper fittings or other approved means of bonding shall be used.~~ Such means of bonding shall apply to all ~~intervening raceways, fittings, boxes enclosures, and so forth~~ <u>equipment</u> between Class I locations and the point of grounding for service equipment or point of grounding of a separately derived system.
Exception: The specific bonding means shall be required only to the nearest point where the grounded circuit conductor and the grounding electrode are connected together on the line side of the building or structure disconnecting means as specified in 250.32(A), (B), and (C), provided the branch-circuit overcurrent protection is located on the load side of the disconnecting means.
~~FPN: See 250.100 for additional bonding requirements in hazardous (classified) locations.~~
(B) Types of Equipment Grounding Conductors. Remain unchanged.
Substantiation: This section is not written in language that is consistent with the rest of the code. For example, what is "so forth"? Also, there is no need to include the sentence that I propose to delete, when it is already found in 250.92, which hazardous (classified) locations are already required to comply with.
Companion proposals are being made to 502.30 and 503.30 for the purposes of correlation.
Panel Meeting Action: Reject
Panel Statement: Because the requirements for grounding and bonding equipment located in, and intervening into, hazardous locations are critical to safe installations, CMP-14 affirms that this requirement should be expressed explicitly in this section and a cross-reference to 250.100 does not improve usability.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
COOK, D.: I agree with the submitter's substantiation and agree in principle with the proposed text for 501.30(A) and the proposal to delete the FPN. I will offer the following alternate wording for public comment:
(A) Bonding. Bonding in Class I locations shall comply with 250.100. Such means shall apply to all metal equipment between Class I locations and the point of grounding for service equipment or point of grounding of a separately derived system.
[No change to exception]
[Delete the FPN.]

14-42 Log #2762 NEC-P14 **Final Action: Reject**
(501.30(A))

Submitter: Truman C. Surbrook, Michigan State University
Recommendation: Add a new last sentence to 501.30(A) to read as follows:
<u>When a bonding jumper is used, it shall be sized in accordance with 250.102(D).</u>
Substantiation: There is no clear statement specifying the minimum size required when a bonding jumper is used for bonding back to the service for a circuit serving a classified hazardous location.
Panel Meeting Action: Reject
Panel Statement: Since 90.3 states the general requirements apply unless modified by the special requirements in Chapters 5, 6, and 7, the requirements in 250.102(D) are applicable without reference. This section does not modify the sizing requirement.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-43 Log #2403 NEC-P14 **Final Action: Reject**
(501.30(A) Exception)

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reconsidered and correlated with the action on Proposal 5-119. This action will be considered by the panel as a public comment.
Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Revise text to read:
501.30 Grounding and Bonding. Class I, Divisions 1 and 2. Wiring and equipment in Class I, Division 1 and 2 locations shall be grounded as specified in Article 250 and with the requirements in 501.30(A) and 501.30(B).
(A) Bonding. The locknut-bushing and double-locknut types of contacts shall not be depended on for bonding purposes, but bonding jumpers with proper fittings or other approved means of bonding shall be used. Such means of bonding shall apply to all intervening raceways, fittings, boxes, enclosures, and so forth, between Class I locations and the point of grounding for service equipment or point of grounding of a separately derived system.
~~Exception: The specific bonding means shall be required only to the nearest point where the grounded circuit conductor and the grounding electrode are connected together on the line side of the building or structure disconnecting means as specified in 250.32(A), (B), and (C), provided the branch circuit overcurrent protection is located on the load side of the disconnecting means.~~
Substantiation: This is a companion proposal to my proposal to delete 250.32(B)(2). If 250.32(B)(2) is deleted as I am requesting, this section will need to be revised as well.
Panel Meeting Action: Reject
Panel Statement: The panel rejects this proposal based on the fact that the sole substantiation is acceptance of a companion proposal by CMP-5. Without current knowledge of CMP-5's actions on these companion proposals, CMP-14 has no alternative other than to reject and await any necessary correlating action recommended by the TCC.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
BERNSEN, M.: I agree with the change being proposed in Proposal 5-119. The use of an equipment grounding conductor in the feeder or branch circuit supplying a separate building should not be optional. The current rule is an exception to the general requirement found in 250.24(A)(5), stating that a "grounding connection shall not be made to the grounded conductor on the load side of the service disconnecting means." It took the code making process a long time to rectify the exception to the rule for ranges and clothes dryers. Proposal 14-43 would remove another unnecessary exception to the rule.
My vote to Reject proposal 14-43 concurs with the substantiation provided by Code-Making Panel 14. My vote, however, would be to Accept this proposal if Code-Making Panel 5 makes a wise decision and votes to Accept Proposal 5-119.

14-44 Log #1504 NEC-P14 **Final Action: Accept in Principle**
(501.30(B))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Delete:
"...and is to be relied on to complete a sole equipment grounding path".
Substantiation: Edit. These raceways cannot be used as the sole grounding path. This wording is not used in 502.30(B) or 503.30(B).
Panel Meeting Action: Accept in Principle
Revise 501.30(B) to read:
Flexible metal conduit and liquidtight flexible metal conduit shall not be used as the sole ground-fault current path. Where equipment bonding jumpers are installed, they shall comply with 250.102.
Retain the exisiting exception.
Panel Statement: The panel concurs that flexible metal conduit and liquidtight flexible metal conduit cannot be used in Class I, Division 2 location as the sole ground-fault current path and has revised the current text for clarity.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-45 Log #2600 NEC-P14 **Final Action: Reject**
(501.35 and 502.35)

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reconsidered and correlated with the action on Proposal 5-349. This action will be considered by the panel as a public comment.
Submitter: Joseph P. DeGregoria, Underwriters Laboratories Inc.
Recommendation: Revise text to read:

501.35 Surge Protection.

(A) Class I, Division 1. Surge arresters, surge protective devices ~~transient voltage surge suppressors (TVSS)~~ , and capacitors shall be installed in enclosures identified for Class I, Division 1 locations. Surge-protective capacitors shall be of a type designed for specific duty.

(B) Class I, Division 2. Surge arresters and surge protective devices ~~TVSS~~ shall be nonarcing, such as metal-oxide varistor (MOV) sealed type, and surge-protective capacitors shall be of a type designed for specific duty. Enclosures shall be permitted to be of the general-purpose type. Surge protection of types other than described in this paragraph shall be installed in enclosures identified for Class I, Division 1 locations.

502.35 Surge Protection — Class II, Divisions 1 and 2. Surge arresters and surge protective devices ~~transient voltage surge suppressors (TVSS)~~ installed in a Class II, Division 1 location shall be in suitable enclosures. Surge-protective capacitors shall be of a type designed for specific duty.

Substantiation: 1) UL intends to combine the categories of Surge Arresters (Article 280) and Transient Voltage Surge Suppressors (Article 285) into one category and Standard, UL 1449, renamed Surge Protective Devices(SPDs).

UL 1449 will include SPD designations Type 1 and Type 2 for permanently connected devices for use on circuits not exceeding 600 V.

The technology of both low voltage Surge Arresters and TVSSs are now basically the same, thereby justifying coverage under one Standard, UL 1449, and one test program with consideration given to the installation location on the line side (Type 1) or load side (Type 2) of the service disconnect overcurrent protection.

2) The Surge Arrester designation will only be retained for devices used in circuits of 1 kV and over and evaluated to IEEE C62.11-1999.

Panel Meeting Action: Reject
Panel Statement: Transient voltage surge suppressors (TVSS) are currently defined in Article 285. Acceptance of this proposal introduces a term (surge protective devices) that is not defined and may result in confusion. The panel understands that there is action on CMP-5's agenda that may clarify this issue and encourages the submitter of this proposal to comment accordingly.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:

BRIESCH, E.: I agree with the Panel Action to Reject and the reasons for doing so as documented in the Panel Statement. However it is my understanding that, subsequent to the meeting of Panel 14, Panel 5 accepted these changes in their actions on Proposals 5-335, 5-340 and 5-349.

14-46 Log #550 NEC-P14 **Final Action: Accept**
(501.100(A)(2))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read:

(2) Not Containing Liquid That Will Burn. Transformers and capacitors that do not contain a liquid that will burn shall be installed in vaults complying with 501.100(A)(1) or be identified ~~approved~~ for Class I locations.

Substantiation: It appears that the more appropriate word to use in this section is "identified." Approved is defined as "acceptable to the authority having jurisdiction." This proposed revision is an effort to promote consistent use of words and terms in the NEC. Also, comparison with 502.100(A)(2) reveals that the word "identified" is used rather than the word "approved" in Class II locations for a requirement that parallels the same requirement in Class I locations for transformers.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-47 Log #622 NEC-P14 **Final Action: Accept**
(501.100(A)(2))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read as follows:

(2) Not Containing Liquid That Will Burn. Transformers and capacitors that do not contain a liquid that will burn shall be installed in vaults complying with 501.100(A)(1) or be identified ~~approved~~ for Class I locations.

Substantiation: Approved is defined as "acceptable to the authority having jurisdiction". It appears that the more appropriate word to use would be "identified" in this requirement. This would promote more consistency in how the terms "approved", "listed", and "identified" are used in the articles dealing with hazardous (classified) locations. In 502.100(A)(2), the word "identified" is used in a requirement that is similar. This proposal is for clarification purposes.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-48 Log #2801 NEC-P14 **Final Action: Reject**
(501.100(B))

Submitter: Stephen V. Norako, EGS Electrical Group
Recommendation: Add text to read as follows:

Dry type transformer operating temperature shall not exceed the ignition temperature of the specific gas or vapor encountered. Operating temperature is determined by transformer temperature rise, ambient temperature (40°C) and hot spot temperature (30°C).

FPN: Example for a 150°C rise transformer, operating temperature is 220°C (150°C rise and 40°C ambient and 30°C hot spot)

Substantiation: Dry type transformer operating temperature has been overlooked when installed in Class 1, Division 2 locations, and can result in a transformer operating temperature that may exceed the vapor or gas ignition temperature. This can easily be addressed by using the formula in the proposal.
Panel Meeting Action: Reject
Panel Statement: The general requirements for the operating temperature of all equipment in hazardous (classified) locations are specified in 500.8(A)(1).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-49 Log #2482 NEC-P14 **Final Action: Reject**
(501.125, FPN 3)

Submitter: Frederick Bried, Spring, TX
Recommendation: Revise text to read as follows:

For further information on the application of electric motors in Class I, Division 2 hazardous (classified) locations, see IEEE std. 1349-200 6 ~~1~~ , IEEE Guide for the Application of Electric Motors in Class I, Division 2, and Class I, Zone 2 Hazardous (Classified) Locations.

Substantiation: IEEE 1349-2001 is being revised and will be completed in 2006. The standard will include information related to application of electric motors in Class I, Division 2 and Class I, Zone 2 hazardous (classified) locations.
Panel Meeting Action: Reject
Panel Statement: The document referenced in the recommendation has not been approved by the IEEE Standards Board.

Ballot Results: Affirmative: 14

14-50 Log #297 NEC-P14 **Final Action: Reject**
(501.130(2))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:

~~Physical~~ Damage. Each luminaire (fixture) shall be protected against ~~physical~~ damage by a ~~suitable~~ guard acceptable to the Authority Having Jurisdiction or by location.

Substantiation: Use of the word "physical" is superfluous– the purpose is obvious. "Suitable" is not clean Code language, so unless someone has specs to suggest I propose substituting the AHJ, who has to be satisfied anyway.

Submitting proposals removing the adjective "physical" may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, maybe a quarter-page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on. Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."

Panel Meeting Action: Reject

Panel Statement: CMP-14 disagrees with the submitter's substantiation which indicates that all damage to electrical equipment is physical damage. Electrical equipment can be damaged by overheating. This could occur from ambient, from overload, from the equipment being located in direct sunlight, from lack of adequate ventilation, from proximity to other heat producing equipment, or other situations. The suitable guards required by this section would not protect the electrical equipment from damage in an overheating condition. Other sections of the NEC address that protection. Electrical equipment can be damaged by electrical faults; short circuits, ground faults, etc. The suitable guards required by this section would not protect the electrical equipment from damage in an electrical fault condition. Other sections of the NEC address that protection. Damage to electrical equipment can occur from lightning or other transient voltage sources, under-voltage, misapplication of electrical ratings, and a variety of other sources. The damage addressed by this requirement is physical damage. This requirement will be applied in a variety of different applications, occupancies, and environments, with each having its own unique set of conditions. CMP-14 concedes that "physical damage" has a variety of meanings to a variety of code users, but believes most experienced code users know physical damage when they see it. Panel also believes "suitable" is an accurate description of the guard. A guard that is protecting a luminaire where the lamp that might be broken from vibration and a guard that protecting a luminaire that might be subject to vehicular traffic might both be "suitable", but be very different. Suitability will be determined by the conditions of the installation. It should also be noted that based on 110.2, all equipment required or permitted by this code shall be acceptable only if approved. Including the text "acceptable to the authority having jurisdiction" in this location would only duplicate the requirement in 110.2 and only fatten the document.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-51 Log #2799 NEC-P14 **Final Action: Reject**
(501.130(B)(1))

Submitter: Stephen V. Norako, EGS Electrical Group

Recommendation: Revise text to read as follows:

~~Where lamps are of a size or type that may, under normal operating conditions, reach surface temperatures exceeding a percent of the ignition temperature in degrees Celsius of the gas or vapor involved,~~ fixtures shall comply with 501.130(A)(1) or shall be of a type that has been tested in order to determine the marked operating temperature or temperature class (T code).

Substantiation: This is a point of much confusion causing the unnecessary derating of the temperature class (T code) of identified (UL listed) Class 1, Divison 2 luminaires. The misinterpretation is that tests must be taken at 80 percent instead of 100 percent. Also, in reality it can't be used as intended. Lamp manufacturers do not provide operating surface temperatures of their lamps in open conditions so that this temperature can be derated to 80 percent when lamp is placed in an enclosure (luminaire).

Panel Meeting Action: Reject

Panel Statement: The substantiation shows no basis for the reason for confusion nor does the suggested text make any improvement. For example, in an area with a T1 temperature classification, testing of fluorescent lamps is not necessary because it is evident that they will not exceed 80% of the autoignition temperature.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-52 Log #296 NEC-P14 **Final Action: Reject**
(501.130(B)(2))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education

Recommendation: Revise as follows:

~~Physical~~ Damage. Luminaire (lighting fixtures) shall be protected from ~~physical~~ damage by ~~suitable~~ guards <u>acceptable to the Authority Having Jurisdiction</u> or by location.

Substantiation: Use of the word "physical" is superfluous– the purpose is obvious. "Suitable" is not clean Code language, so unless someone has specs to suggest I propose substituting the AHJ, who has to be satisfied anyway.

Submitting proposals removing the adjective "physical" may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every unnecessary instance, as I am attempting to do, we actually cut the NEC down by up to oh, maybe a quarter-page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.

Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."

Panel Meeting Action: Reject

Panel Statement: See the panel statement on Proposal 14-50 which provides a thorough explanation for the rejection of this proposal and others recommending the elimination of "physical".

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-53 Log #2798 NEC-P14 **Final Action: Reject**
(501.140(A)(3))

Submitter: Stephen V. Norako, EGS Electrical Group

Recommendation: Add text to read as follows:

The wireway shall be sealed to minimize the gas or vapor in the well-pit from being communicated to the location of the power source. Such seals shall not be required to be explosion proof.

Substantiation: Typically, the raceway used is ridgid metal conduit or nonmetallic conduit and is directly connected to a switch or disconnect located in an unclassified location. Since the conduit is open at the well-pit, it must be sealed to limit well-pit gases from entering the switch in the unclassified locations in quantity sufficient to ignite.

Panel Meeting Action: Reject

Panel Statement: The requirements for boundary seals are located in 501.15 and vary depending on the area classification of the wet pit and other factors associated with the specific installation.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-54 Log #978 NEC-P14 **Final Action: Reject**
(501.140(B)(3))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Revise text to read as follows:

(3) Be connected to terminals in ~~an approved manner~~ <u>accordance with 110.14 and 501.45</u> .

Substantiation: Edit. Proposal is more specific.

Panel Meeting Action: Reject

Panel Statement: The reference to 110.14 is not necessary because it is a general rule that applies throughout the Code and there is not a 501.45.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

COOK, D.: I agree with the submitter's substantiation that current text is not specific. The current text requires terminations of supply conductors of a flexible cord to be connected to terminals in an "approved manner". "Approved" is defined as acceptable to the authority having jurisdiction (AHJ). Nothing in the current text or in Chapter 5 of the NEC would provide a basis for the AHJ to accept anything other than a termination that complies with the requirements in 110.14 unless those terminations were permitted to be uninsulated by 501.25. The panel statement indicates the reference to 110.14 is not necessary because it is a general rule. The requirement for supply conductors to be connected to terminals in an approved manner is not necessary either since the general rule in 110.2 requires all conductors and equipment to be approved. I will offer the following alternate wording for public comment:

501.140(B) (3) is connected to terminals in accordance with 110.14 and 501.25.

ARTICLE 502 — CLASS II LOCATIONS

14-54a Log #CP1401 NEC-P14 **Final Action: Accept**
(502.5)

Submitter: Code-Making Panel 14,
Recommendation: Delete the second paragraph and associated fine print note in 502.5 Retitle the remaining paragraph as "Explosionproof Equipment".
Substantiation: The temperature requirements in this paragraph are explicitly covered in 500.8(C)(2).
Panel Meeting Action: Accept
Panel Statement:
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-55 Log #3197 NEC-P14 **Final Action: Accept**
(502.5 and Exception)

Submitter: Donald Cook, Shelby County Development Services
Recommendation: Delete the first paragraph and the exception.
Substantiation: A review of 90.2 (A) and (B), the Article 100 definition of service point, the complete NEC text and specifically the text in Articles 225, and 230 leads one to believe that electrical wiring and equipment located on the load side of the service point is under the scope of the NEC. This FPN, which based on the text in 90.5(C) is not enforceable, provides no value to the NEC user.

If industry believes information in the NESC is necessary for installations on the load side of the service point, that information should included as requirements of the NEC, not as a FPN. As an FPN, it only adds to the confusion of designers, installers, and AHJ's working on installations working on premises wiring.

The FPN also appears to include a requirement, which is not permitted to be located in a FPN.
Panel Meeting Action: Accept
Panel Statement: The panel understands that the same substantiation provided with Proposal 14-24 was intended for this proposal.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-56 Log #2476 NEC-P14 **Final Action: Accept**
(502.10)

TCC Action: The Technical Committee Committee directs the panel to reconsider this proposal and to relocate the reference into Annex A to be consistent with other parts of the Code. This action will be considered by the panel as a public comment.
Submitter: Donald W. Ankele, Underwriters Laboratories Inc.
Recommendation: Revise text to read as follows:

502.10 Wiring Methods. Wiring methods shall comply with 502.10(A) or 502.10(B).

(A) Class II, Division 1.

(1) General. In Class II, Division 1 locations, the wiring methods in (1) through (4) shall be permitted.

(1) Threaded rigid metal conduit, or threaded steel intermediate metal conduit.

(2) Type MI cable with termination fittings listed for the location. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.

(3) In industrial establishments with limited public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type MC- HL cable, listed for use in Class II, Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, separate grounding conductors in accordance with 250.122, and provided with termination fittings listed for the application, shall be permitted.

FPN: For further information on construction, testing and marking requirements for Type MC-HL cable and Type MC-HL cable sealing fittings, see ANSI/UL 2225, Cables and Cable Fittings for Use in Hazardous (Classified) Locations.
Substantiation: Type MC cable listed specifically for hazardous locations carries the HL marking. This is consistent with similar portions of Chapter 5.

Add FPN to reference the ANSI standard for cables and cable fittings to aid approval of the installation for the location involved.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-57 Log #2709 NEC-P14 **Final Action: Reject**
(502.10(B)(1))

Submitter: Dorothy Kellogg, American Chemistry Council
Recommendation: Replace the entire existing text with the following:

Revise this section with the underlined and striken portions as shown:

(1) General. In Class II, Division 2 locations, the following wiring methods shall be permitted:

(1) All wiring methods permitted in 502.10(A).

(2) Rigid metal conduit, intermediate metal conduit, electrical metallic tubing, dusttight wireways.

(3) Type PLTC cable in accordance with the provisions of Article 725, or in cable tray systems. PLTC shall be installed in a manner to avoid tensile stress at the termination fittings.

(4) Type ITC cable as permitted in 727.4.

~~(3) Type MC or MI cable with listed termination fittings.~~

~~(4) Type PLTC in cable trays.~~

~~(5) Type ITC in cable trays.~~

(5) Type MI, MC, MV, or TC cable with listed termination fittings or in cable tray systems, and installed in a manner to avoid tensile stress at the termination fittings. Where ~~Type MC, MI, or TC cable~~ installed in ladder, ventilated trough, or ventilated channel cable trays in a single layer, Type MI, MV, or TC cables, or a nonlisted for use Class II, Division 1 Type MC cable shall be in ~~with~~ a space not less than the larger cable diameter between the two adjacent cables, ~~shall be the wiring method employed.~~

Exception to (5): Type MC cable listed for use in Class II, Division 1 locations shall be permitted to be installed without the spacings required by (5).
Substantiation: The revised wording aligns the wording and requirements closer to that of 501.10. This will reduce confusion in the field and will aid in more consistent installations.
Panel Meeting Action: Reject
Panel Statement: The proposed revision does not improve the clarity of this section and also introduces technical changes without adequate substantiation.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-58 Log #2464 NEC-P14 **Final Action: Reject**
(502.10(B)(3))

Submitter: Eliana Beattie, ISA
Recommendation: 502.10 Wiring Methods.

Revise 502.10(B)(3) as follows:

(3) Nonincendive Field Wiring & FNICO . Nonincendive field wiring and FNICO shall be permitted using any of the wiring methods permitted for unclassified locations. Nonincendive field wiring and FNICO systems shall be installed in accordance with the control drawing(s). Simple apparatus, not shown on the control drawing, shall be permitted in a nonincendive field wiring or FNICO circuit, provided the simple apparatus does not interconnect the nonincendive field wiring or FNICO circuit to any other circuit.
Substantiation: The FISCO (**F** ieldbus **I** ntrinsically **S** afe **CO** ncept) and FNICO (**F** ieldbus **N** on **I** ncendive **CO** ncept) protection concepts take advantage of functional requirements of Fieldbus systems to significantly simplify i.s. installation. These requirements include wire type and quality, supply voltage and current levels, and limitation of stored energy at the terminals of field devices. The objective of these concepts is to simplify the i.s. installation to the point where a safe installation may be effected by simply selecting devices labeled as FISCO (or FNICO) and observing basic wiring type and length restrictions. The NRTL evaluation of all devices ensures that they will be compatible with all other similarly labeled devices without further analysis on the part of the installer.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The panel rejects the addition of "FNICO" because there are numerous nonincendive field wiring methods that are acceptable and the inclusion of the acronym in this section would imply that "FNICO" is the only method available. If "FNICO" wiring systems are installed in accordance with the control drawings, this practice would not be prohibited by the current requirements in the NEC.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:

SCHNAARE, T.: Generally speaking, the code serves its primary users base best when it includes information about the various techniques that are allowed for installation. While I agree that the panel does not want to imply that FISCO and FNICO are the only techniques available, I also belive that the code is made stronger and easier to understand and apply when information such as this is included. If there are other deficiencies in the current code (as implied by the panel statement) then these should be addressed as well.

14-59 Log #919 NEC-P14 **Final Action: Reject**
(502.30)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise last sentence:
Such means of bonding shall apply to intervening raceways, cables , fittings, boxes, enclosures, and so forth between Class II locations and the point of grounding for service equipment or building or structure disconnecting means, or point of grounding of separately derived systems.
Substantiation: Edit. Cables permitted in these locations should be included. If the Class II location is in a building served by overhead conductors, there will be space where there is no intervening equipment to be bonded. It doesn't seem necessary to bond on the line side of a building disconnecting means.
Panel Meeting Action: Reject
Panel Statement: The bonding of a cable wiring method to the boxes, enclosures or equipment occurs through the termination fitting. Fittings are currently included in the list of items required to meet this requirement. The building or structure disconnecting means may, or may not, include a point of grounding (see 250.32). The bonding requirements in this section apply to metal equipment. They apply within a single building or structure, or in installations that involve multiple buildings or structures. If the equipment or the wiring method is nonmetallic, there is nothing to bond. Wiring could include both metal and nonmetallic methods and the metal sections are required to meet the requirement.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-60 Log #1453 NEC-P14 **Final Action: Reject**
(502.30)

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise as follows:
502.30 Grounding and Bonding, Class II, Divisions 1 and 2. Wiring and equipment in Class II, Division 1 and 2 locations shall be grounded and bonded as specified in Article 250 and with the requirements in 502.30(A0 and 502.30(B).
(A) Bonding. Bonding in Class II locations shall comply with 250.100 . ~~The locknut bushing and double locknut types of contacts shall not be depended on for bonding purposes, but bonding jumpers with proper fittings or other approved means of bonding shall be used.~~ Such means of bonding shall apply to all ~~intervening raceways, fittings, boxes, enclosures, and so forth~~ equipment being Class II locations and the point of grounding for service equipment or point of grounding of a separately derived system.
Exception: The specific bonding means shall be required only to the nearest point where the grounded circuit conductor and the grounding electrode are connected together on the line side of the building or structure disconnecting means as specified in 250.32(A), (B), and (C), provided the branch-circuit overcurrent protection is located on the load side of the disconnecting means.
(B) Types of Equipment Grounding Conductors. Remain unchanged.
Substantiation: This section is not written in language that is consistent with the rest of the code. For example, what is "so forth"? Also, there is no need to include the sentence that I propose to delete, when it is already found in 250.92, which hazardous (classified) locations are already required to comply with. Companion proposals are being made to 501.30 and 503.30, for the purposes of correlation.
Panel Meeting Action: Reject
Panel Statement: Because the requirements for grounding and bonding equipment located in, and intervening into, hazardous locations are critical to safe installations, CMP-14 affirms that this requirement should be expressed explicitly in this section and a cross-reference to 250.100 does not improve usability.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
COOK, D.: I agree with the submitter's substantiation and agree in principle with the proposed text for 502.30(A) and the proposal to delete the FPN. I will offer the following alternate wording for public comment:
(A) Bonding. Bonding in Class I locations shall comply with 250.100. Such means shall apply to all metal equipment between Class I locations and the point of grounding for service equipment or point of grounding of a separately derived system.
[No change to exception]

14-61 Log #2763 NEC-P14 **Final Action: Reject**
(502.30(A))

Submitter: Truman C. Surbrook, Michigan State University
Recommendation: Add a new last sentence to 502.30(A) to read as follows:
When a bonding jumper is used, it shall be sized in accordance with 250.102(D).
Substantiation: There is no clear statement specifying the minimum size required when a bonding jumper is used for bonding back to the service for a circuit serving a classified hazardous location.
Panel Meeting Action: Reject
Panel Statement: Since 90.3 states the general requirements apply unless modified by the special requirements in Chapters 5, 6, and 7, the requirements in 250.102(D) are applicable without reference. This section does not modify the sizing requirement.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-62 Log #2404 NEC-P14 **Final Action: Reject**
(502.30(A) Exception)

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reconsidered and correlated with the action on Proposal 5-119. This action will be considered by the panel as a public comment.
Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Revise text to read:
502.30 Grounding and Bonding. Class II, Divisions 1 and 2. Wiring and equipment in Class II, Division 1 and 2 locations shall be grounded as specified in Article 250 and with the requirements in 502.30(A) and 502.30(B).
(A) Bonding. The locknut-bushing and double-locknut types of contacts shall not be depended on for bonding purposes, but bonding jumpers with proper fittings or other approved means of bonding shall be used. Such means of bonding shall apply to all intervening raceways, fittings, boxes, enclosures, and so forth, between Class II locations and the point of grounding for service equipment or point of grounding of a separately derived system.
~~Exception: The specific bonding means shall only be required to the nearest point where the grounded circuit conductor and the grounding electrode conductor are connected together on the line side of the building or structure disconnecting means as specified in 250.32(A), (B), and (C), if the branch circuit overcurrent protection is located on the load side of the disconnecting means.~~
Substantiation: This is a companion proposal to my proposal to delete 250.32(B)(2). If 250.32(B)(2) is deleted as I am requesting, this section will need to be revised as well.
Panel Meeting Action: Reject
Panel Statement: The panel rejects this proposal based on the fact that the sole substantiation is acceptance of a companion proposal by CMP-5. Without current knowledge of CMP-5's actions on these companion proposals, CMP-14 has no alternative other than to reject and await any necessary correlating action recommended by the TCC.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
BERNSEN, M.: I agree with the change being proposed in Proposal 5-119. The use of an equipment grounding conductor in the feeder or branch circuit supplying a separate building should not be optional. The current rule is an exception to the general requirement found in 250.24(A)(5), stating that a "grounding connection shall not be made to the grounded conductor on the load side of the service disconnecting means." It took the code making process a long time to rectify the exception to the rule for ranges and clothes dryers. Proposal 14-43 would remove another unnecessary exception to the rule.
My vote to Reject proposal 14-43 concurs with the substantiation provided by Code-Making Panel 14. My vote, however, would be to Accept this proposal if Code-Making Panel 5 makes a wise decision and votes to Accept Proposal 5-119.

14-52a Log #CP1404 NEC-P14 **Final Action: Accept**
(502.30(B))

Submitter: Code-Making Panel 14,
Recommendation: Revise 502.30(B) to read:
Liquidtight flexible metal conduit shall not be used as the sole ground-fault current path. Where equipment bonding jumpers are installed, they shall comply with 250.102.
Retain the exisiting exception.
Substantiation: The revised wording clarifies the requirement and is parallel language to the same requirements in Articles 501, 503, 505 and 506.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-63 Log #2501 NEC-P14 **Final Action: Accept**
(502.115(A))

Submitter: Edward M. Briesch, Underwriters Laboratories, Inc.
Recommendation: Revise text to read as follows:
502.115 Switches, Circuit Breakers, Motor Controllers, and Fuses.
(A) Class II, Division 1. In Class II, Division 1 locations, switches, circuit breakers, motor controllers, and fuses shall comply with 502.115(A)(1) and ~~through~~ (A)(2 ~~3~~).
(1) Type Required. Switches, circuit breakers, motor controllers, and fuses, including pushbuttons, relays, and similar devices ~~that are intended to interrupt current during normal operation or that are installed where combustible dusts of an electrically conductive nature may be present,~~ shall be provided with identified dust-ignitionproof enclosures.

~~(2) Isolating Switches. Disconnecting and isolating switchescontaining no fuses and not intended to interrupt current and not installed where dusts may be of an electrically conductive nature shall be provided with tight metal enclosures that shall be designed to minimize the entrance of dust and that shall (1) be equipped with telescoping or close-fitting covers or with other effective means to prevent the escape of sparks or burning material and (2) have no openings (such as holes for attachment screws) through which, after installation, sparks or burning material might escape or through which exterior accumulations of dust or adjacent combustible material might be ignited.~~

(2)(~~3~~) Metal Dusts. In locations where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present, fuses, switches, motor controllers, and circuit breakers shall have enclosures identified for such locations.

(B) Class II, Division 2. In Class II, Division 2 locations, enclosures for fuses, switches, circuit breakers, and motor controllers, including pushbuttons, relays, and similar devices, shall be dusttight.

Substantiation: Current requirement permits a construction in Division 1 which would not even be permitted by 502.115(B) in Division 2.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 12 Negative: 2

Explanation of Negative:

WECHSLER, D.: The action should have been to Reject due to a lack of technical substantiation.

The current text under (1) is as follows:

(1) Type Required Switches, circuit breakers, motor controllers, and fuses, including pushbuttons, relays, and similar devices that are intended to interrupt current during normal operation or that are installed where combustible dusts of an electrically conductive nature may be present, shall be provided with identified dust-ignitionproof enclosures.

This text addresses two conditions: Condition 1 being that for switches, circuit breakers, etc. installed where combustible dusts of an electrically conductive nature are installed and these shall be provided with an identified dust-ignitionproof enclosures. Condition 2 is for switches, circuit breakers, etc. that are intended to interrupt current during normal operations shall be provided with identified dust-ignitionproof enclosures.

With the proposed change, the requirement loses the valuable requirement dealing with combustible dusts of an electrically conductive nature. Additionally the requirement has been expanded to include both normal operations and abnormal operations requiring dust-ignitionproof enclosures. There is no technical substantiation to support this change or to demonstrate that the current wording has resulted in an unsafe condition.

Striking of the current (2) eliminates the historic permitted installation practice of isolating switches which contain no fuses and are not intended to interrupt current, housed in a tight metal enclosure designed to minimize the entrance of dust. No substantiation has been offered to reflect that this practice is unsafe.

WIRFS, M.: I agree with the comments expressed in Mr. Wechsler's explanation of negative vote.

14-64 Log #2500 NEC-P14 **Final Action: Accept**
(502.120(B)(2))

Submitter: Edward M. Briesch, Underwriters Laboratories, Inc.

Recommendation: Revise text to read as follows:

(B) Class II, Division 2. . In Class II, Division 2 locations, transformers and resistors shall comply with 502.120(B)(1) through (B)(3).

(1) Switching Mechanisms. Switching mechanisms (including overcurrent devices) associated with control transformers, solenoids, impedance coils, and resistors shall be
provided with dusttight enclosures.

(2) Coils and Windings. Where not located in the same enclosure with switching mechanisms, control transformers, solenoids, and impedance coils shall be provided with dusttight enclosures. ~~tight metal housings without ventilating openings.~~

(3) Resistors. Resistors and resistance devices shall have dust-ignitionproof enclosures identified for Class II locations.

Exception: Where the maximum normal operating temperature of the resistor will not exceed 120°C (248°F),nonadjustable resistors or resistors that are part of an automatically timed starting sequence shall be permitted to have enclosures complying with 502.120(B)(2).

Substantiation: 502.10(B)(4) requires all boxes and fittings in a Class II, Division 2 location to be dusttight. It should not require less for a coil or winding.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 11 Negative: 3

Explanation of Negative:

GOODMAN, M.: The specific term of "dusttight" is not applicable to the enclosures for this type of equipment and would, in essence, require that a new type of equipment be created and approved which is not necessary to enhance safety.

WECHSLER, D.: Article 502.120 is dealing with a specific installation with Control Transformers and Resistors and within a Class II, Division 2 location has provided that installation of coils and windings (Article 502.120 (B)(2)) follow some different rules when coils and resistors are not located in the same enclosure with switching mechanisms, control transformers, etc. This rule was that they could be installed in tight metal housings without ventilating openings. While a dust-tight enclosure would also be acceptable, there is no basis for excluding a current practice which has not been demonstrated as being unsafe. Justification that something should not require less, when there is no evidence suggested that the current application is unsafe, is not a sufficient justification for eliminating a long existing requirement.

The action by the panel could have been to "Accept in Part" and add to the text permission to locate coils and resistors in a dusttight enclosure, but this is already permitted under 502.10(B)(4).

WIRFS, M.: I agree with the comments expressed in Mr. Wechsler's explanation of negative vote.

14-65 Log #2497 NEC-P14 **Final Action: Reject**
(502.125(B))

TCC Action: Based on the action to "Reject" the Technical Correlating Committee understands there is no change to the existing text.

Submitter: Edward M. Briesch, Underwriters Laboratories, Inc.

Recommendation: Revise text to read as follows:

(B) Class II, Division 2. In Class II, Division 2 locations, motors, generators, and other rotating electrical equipment shall be provided with dusttight enclosures. ~~totally enclosed nonventilated, totally enclosed pipeventilated, totally enclosed water-air-cooled, totally enclosed fan-cooled or dust-ignitionproof for which~~ The maximum full-load external temperature shall be in accordance with 500.8(C)(2) for normal operation when operating in free air (not dust blanketed). ~~and shall have no external openings.~~

~~Exception: If the authority having jurisdiction believes accumulations of nonconductive, nonabrasive dust will be moderate and if machines can be easily reached for routine~~
~~cleaning and maintenance, the following shall be permitted to be installed:~~

~~(1) Standard open-type machines without sliding contacts, centrifugal or other types of switching mechanism (including motor overcurrent, overloading, and overtemperature~~
~~devices), or integral resistance devices~~

~~(2) Standard open-type machines with such contacts, switching mechanisms, or resistance devices enclosed within dusttight housings without ventilating or other openings~~

~~(3) Self-cleaning textile motors of the squirrel-cage type to have enclosures complying with 502.120(B)(2).~~

Substantiation: 502.10(B)(4) requires all boxes and fittings in a Class II, Division 2 location to be dusttight. Motors and other rotating equipment should not be permitted to be less than that.

Panel Meeting Action: Reject

The panel accepts the deletion of the existing exception and rejects the revisions to the current text of 502.125(B).

Panel Statement: The submitter did not convince the panel that the current requirement and exception do not adequately cover rotating equipment in Class II, Division 2 locations.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 11 Negative: 3

Explanation of Negative:

BRIESCH, E.: The Panel Action should be to Accept. It makes no sense to require dusttight boxes, fittings and wiring systems and permit dust entrance into a motor or generator. There is a greater likelihood of an ignition source being present in the motor enclosure than in a raceway, conduit fitting or junction box. Furthermore, the Exception is vague, unenforceable and permits a construction in a Class II location that appears to be suitable only for a Class III location. The Panel Statement, fails to address the basic issue of why boxes, fittings and wiring systems need to be capable of excluding dust but motors and generators do not. The ANSI standard for Class II, Division 2 equipment, ANSI/ISA-12.12.01, requires all equipment intended for that location to have a dusttight enclosure. The requirement for dustight enclosures was accepted on other types of equipment by the Panel in the actions taken on Proposals 14-63, -64, -69 and –73.

COOK, D.: This proposal should be accepted. Rejecting this proposal sends a message to users of the NEC that it is acceptable to permit dust into equipment that is obviously ignition capable. If the panel believes the ANSI product standard for dusttight equipment is overly restrictive, we should work to amend the product standard rather than simply permitting the installation of equipment that can not meet the requirements of that standard. The current requirement places the responsibility of evaluating a motor enclosure on the designer, the installer and the AHJ. They are responsible for determining that the motor enclosure will be sufficiently tight to prevent the entrance of appreciable quantities of dust and to determine that the enclosure will prevent the escape of sparks, flame or burning material that might ignite dust accumulations or combustible material in the vicinity. As an AHJ that believes I am relatively competent, I am not sure that I can make that determination in the field.

LAWRENCE, JR., W.: The panel action should have been to "accept in principle". The panel confirmed that junction boxes must be dusttight, but did not confirm that motors are also required to be dusttight. This results in a situation where the terminal box for a motor is required to exclude the entry of dust, but the stator housing of the motor is not. There is a far greater likelihood of an ignition source being present in the stator housing than in the terminal compartment, so the panel's logic appears inverted. The panel's concerns with the prescriptive nature of the definition of "Dusttight" could have been addressed with a revision to that definition.

"Dusttight. Enclosures constructed to provide a degree of protection against the entrance of dust."

Comment on Affirmative:

NEAGLE, J.: The statement "The panel accepts the deletion of the existing exception and rejects the revisions to the current text of 502.125(B)." is incorrect and does not reflect the panel action to reject the proposal.

WECHSLER, D.: 1) The action by the Panel to "Reject" the proposal but accepts deletion of the existing exception does not make sense. The panel action should reflect a complete rejection of this proposal.

2) The panel should continue to reject this proposal. The installation defined under the current 502.125 (B) has existed for many years and no evidence has been provided to the Panel that this installation is unsafe. The current wording does not prohibit the use of dusttight enclosures. There is no technical substantiation to support any change.

14-66 Log #295 NEC-P14 **Final Action: Reject**
(502.128(3))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education

Recommendation: Revise as follows:

(3) Be protected against ~~physical damage~~ <u>blows or abrasion</u> and against rusting or other corrosive influences.

Substantiation: The proposed rewording is an attempt at precision. Rusting and corrosion technically are physical damage. If you retain "damage," I could argue that the term "physical" should be eliminated.

Submitting proposals removing the adjective "physical" may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, maybe a quarter-page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on. Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?

Panel Meeting Action: Reject

Panel Statement: See the panel statement on Proposal 14-50 which provides a thorough explanation for the rejection of this proposal and others recommending the elimination of "physical".

14-71 Log #1250 NEC-P14 **Final Action: Reject**
(502.140(3))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Revise: Be connected to terminals or supply conductors in ~~an approved manner~~ accordance 110.14 except as provided in 502.145.

Substantiation: Edit. Proposal is more specific.

Panel Meeting Action: Reject

Panel Statement: The reference to 110.14 is not necessary because it is a general rule that applies throughout the Code and 502.145 is not applicable to this requirement.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

COOK, D.: I agree with the submitter's substantiation that current text is not specific. The current text requires terminations of supply conductors of a flexible cord to be connected to terminals in an "approved manner". "Approved" is defined as acceptable to the authority having jurisdiction (AHJ). Nothing in the current text or in Chapter 5 of the NEC would provide a basis for the AHJ to accept anything other than a termination that complies with the requirements in 110.14 unless those terminations were permitted to be uninsulated by 502.25. The panel statement indicates the reference to 110.14 is not necessary because it is a general rule. The requirement for supply conductors to be connected to terminals in an approved manner is not necessary either since the general rule in 110.2 requires all conductors and equipment to be approved. I will offer the following alternate wording for public comment:

502.140(3) is connected to terminals in accordance with 110.14 and 502.25.

14-72 Log #2493 NEC-P14 **Final Action: Accept**
(502.150(A))

Submitter: Edward M. Briesch, Underwriters Laboratories, Inc.

Recommendation: Revise text to read as follows:

502.150 Signaling, Alarm, Remote-Control, and Communications Systems; and Meters, Instruments, and Relays.

FPN: See Article 800 for rules governing the installation of communications circuits.

(A) Class II, Division 1. In Class II, Division 1 locations, signaling, alarm, remote-control, and communications systems; and meters, instruments, and relays shall comply with 502.150(A)(1) through (A)(56).

~~**(1) Wiring Methods.** The wiring method shall comply with 502.100(A).~~

(1 ~~2~~) Contacts. Switches, circuit breakers, relays, contactors, fuses and current-breaking contacts for bells, horns, howlers, sirens, and other devices in which sparks or arcs maybe produced shall be provided with enclosures identified for a Class II location.

Exception: Where current-breaking contacts are immersed in oil or where the interruption of current occurs within a chamber sealed against the entrance of dust, enclosures shall be permitted to be of the general-purpose type.

(2 ~~3~~) Resistors and Similar Equipment. Resistors, transformers, choke coils, rectifiers, thermionic tubes, and other heat-generating equipment shall be provided with enclosures identified for Class II locations.

Exception: Where resistors or similar equipment are immersed in oil or enclosed in a chamber sealed against the entrance of dust, enclosures shall be permitted to be of the general-purpose type.

(3 ~~4~~) Rotating Machinery. Motors, generators, and other rotating electric machinery shall comply with 502.125(A).

(4 ~~5~~) Combustible, Electrically Conductive Dusts. Where dusts are of a combustible, electrically conductive nature, all wiring and equipment shall be identified for Class II locations.

(56) Metal Dusts. Where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present, all apparatus and equipment shall be identified for the specific conditions.

Substantiation: 502.150(A)(1) is redundant as it is already required by 502.10(A.)

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-73 Log #2503 NEC-P14 **Final Action: Accept**
(502.150(B))

Submitter: Edward M. Briesch, Underwriters Laboratories, Inc.

Recommendation: Revise text to read as follows:

(B) Class II, Division 2. In Class II, Division 2 locations, signaling, alarm, remote-control, and communications systems; and meters, instruments, and relays shall comply with 502.150(B)(1) through (B)(5).

(1) Contacts. Contacts shall be provided in dusttight ~~E~~ e nclosures . ~~shall comply with 502.150(A)(2), or contacts shall have tight metal enclosures designed to minimize the entrance of dust and shall have telescoping or tight-fitting covers and no openings through which, after installation, sparks or burning material might escape.~~

Exception: In nonincendive circuits, enclosures shall be permitted to be of the general-purpose type.

(2) Transformers and Similar Equipment. The windings and terminal connections of transformers, choke coils, and similar equipment shall be provided with dust tight ~~metal~~ enclosures . ~~without ventilating openings.~~

(3) Resistors and Similar Equipment. Resistors, resistance devices, thermionic tubes, rectifiers, and similar equipment shall comply with 502.1 2 ~~3~~ 0(B ~~A~~)(3).

~~Exception: Enclosures for thermionic tubes, nonadjustable resistors, or rectifiers for which maximum operating temperature will not exceed 120°C (248°F) shall be permitted to be of the general-purpose type.~~

(4) Rotating Machinery. Motors, generators, and other rotating electric machinery shall comply with 502.125(B).

(5) Wiring Methods. The wiring method shall comply with 502.10(B).

Substantiation: 502.10(B)(4) requires all boxes and fittings in a Class II, Division 2 location to be dusttight. Equipment covered by this section should be required to meet the same requirement.

Also, the reference to 502.130(A)(3) in 502.150(B)(3) should be 502.120(B)(3)

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

GOODMAN, M.: The submitter's substantiation is insufficient to warrant the extent of the changes proposed. The specific term of "dusttight" is not applicable to the enclosures for (2) Transformers and Similar Equipment and would, in essence, require that a new type of equipment be created and approved. There is no substantiation for the removal of the Exception to (3) Resistors and Similar Equipment which presently allows general purpose enclosure types under specific conditions.

14-74 Log #2505 NEC-P14 **Final Action: Accept**
(502.150(B)(5))

Submitter: Edward M. Briesch, Underwriters Laboratories, Inc.

Recommendation: Revise text to read as follows:

(B) Class II, Division 2. In Class II, Division 2 locations, signaling, alarm, remote-control, and communications systems; and meters, instruments, and relays shall comply with 502.150(B)(1) through (B)(4 ~~5~~).

(1) Contacts. Enclosures shall comply with 502.150(A)(2), or contacts shall have tight metal enclosures designed to minimize the entrance of dust and shall have telescoping or tight- fitting covers and no openings through which, after installation, sparks or burning material might escape.

Exception: In nonincendive circuits, enclosures shall be permitted to be of the general-purpose type.

(2) Transformers and Similar Equipment. The windings and terminal connections of transformers, choke coils, and similar equipment shall be provided with tight metal enclosures without ventilating openings.

(3) Resistors and Similar Equipment. Resistors, resistance devices, thermionic tubes, rectifiers, and similar equipment shall comply with 502.130(A)(3).

Exception: Enclosures for thermionic tubes, nonadjustable resistors, or rectifiers for which maximum operating temperature will not exceed 120°C (248°F) shall be permitted to be of the general-purpose type.

(4) Rotating Machinery. Motors, generators, and other rotating electric machinery shall comply with 502.125(B).

~~(5) Wiring Methods. The wiring method shall comply with 502.10(B).~~

Substantiation: 502.150(B)(5) is redundant as it is already required by 502.10(B)

ARTICLE 503 — CLASS III LOCATIONS

14-75 Log #3198 NEC-P14 **Final Action: Accept**
(503.5 and Exception)

Submitter: Donald Cook, Shelby County Development Services
Recommendation: Delete the first paragraph and the exception.
Substantiation: A review of 90.2 (A) and (B), the Article 100 definition of service point, the complete NEC text and specifically the text in Articles 225, and 230 leads one to believe that electrical wiring and equipment located on the load side of the service point is under the scope of the NEC. This FPN, which based on the text in 90.5(C) is not enforceable, provides no value to the NEC user.

If industry believes information in the NESC is necessary for installations on the load side of the service point, that information should included as requirements of the NEC, not as a FPN. As an FPN, it only adds to the confusion of designers, installers, and AHJ's working on installations working on premises wiring.

The FPN also appears to include a requirement, which is not permitted to be located in a FPN.
Panel Meeting Action: Accept
Panel Statement: The panel understands that the same substantiation provided with Proposal 14-24 was intended for this proposal.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-76 Log #2465 NEC-P14 **Final Action: Reject**
(503.10(A)(3))

Submitter: Eliana Beattie, ISA
Recommendation: 503.10 Wiring Methods.
Revise 503.10(A)(3) as follows:
(3) Nonincendive Field Wiring <u>& FNICO</u> . Nonincendive field wiring <u>and FNICO</u> shall be permitted using any of the wiring methods permitted for unclassified locations. Nonincendive field wiring <u>and FNICO</u> systems shall be installed in accordance with the control drawing(s). Simple apparatus, not shown on the control drawing, shall be permitted in a nonincendive field wiring <u>or FNICO</u> circuit, provided the simple apparatus does not interconnect the nonincendive field wiring <u>or FNICO</u> circuit to any other circuit.
Substantiation: The FISCO (**F** ieldbus **I** ntrinsically **S** afe **CO** ncept) and FNICO (**F** ieldbus **N** on **I** ncendive **CO** ncept) protection concepts take advantage of functional requirements of Fieldbus systems to significantly simplify i.s. installation. These requirements include wire type and quality, supply voltage and current levels, and limitation of stored energy at the terminals of field devices. The objective of these concepts is to simplify the i.s. installation to the point where a safe installation may be effected by simply selecting devices labeled as FISCO (or FNICO) and observing basic wiring type and length restrictions. The NRTL evaluation of all devices ensures that they will be compatible with all other similarly labeled devices without further analysis on the part of the installer.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The panel rejects the addition of "FNICO" because there are numerous nonincendive field wiring methods that are acceptable and the inclusion of the acronym in this section would imply that "FNICO" is the only method available. If "FNICO" wiring systems are installed in accordance with the control drawings, this practice would not be prohibited by the current requirements in the NEC.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:

SCHNAARE, T.: Generally speaking, the code serves its primary users base best when it includes information about the various techniques that are allowed for installation. While I agree that the panel does not want to imply that FISCO and FNICO are the only techniques available, I also belive that the code is made stronger and easier to understand and apply when information such as this is included. If there are other deficiencies in the current code (as implied by the panel statement) then these should be addressed as well.

14-77 Log #292 NEC-P14 **Final Action: Reject**
(503.10(B))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:

"...on condition that protection as required by 320.15(C) be provided where conductors are not run in roof spaces and are well out of reach of sources of ~~physical~~ damage."
Substantiation: Use of the word "physical" is superfluous– the purpose is obvious from the context.

Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every unnecessary instance, as I am attempting to do, we actually cut the NEC down by up to oh, quarter-page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on. Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 14-50 which provides a thorough explanation for the rejection of this proposal and others recommending the elimination of "physical".
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-78 Log #920 NEC-P14 **Final Action: Reject**
(503.30)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise last sentence:

Such means of bonding shall apply to intervening raceways, <u>cables</u> , fittings, boxes, enclosures, and so forth between Class II locations and the point of grounding for service equipment <u>or building or structure disconnecting means</u> , or point of grounding of separately derived systems.
Substantiation: Edit. Cables permitted in these locations should be included. If the Class II location is in a building served by overhead conductors there will be space where there is no intervening equipment to be bonded. It doesn't seem necessary to bond on the line side of a building disconnecting means.
Panel Meeting Action: Reject
Panel Statement: The bonding of a cable wiring method to the boxes, enclosures or equipment occurs through the termination fitting. Fittings are currently included in the list of items required to meet this requirement. The building or structure disconnecting means may, or may not, include a point of grounding (see 250.32). The bonding requirements in this section apply to metal equipment. They apply within a single building or structure, or in installations that involve multiple buildings or structures. If the equipment or the wiring method is nonmetallic, there is nothing to bond. Wiring could include both metal and nonmetallic methods and the metal sections are required to meet the requirement.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-79 Log #1454 NEC-P14 **Final Action: Reject**
(503.30)

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise as follows:

503.30 Grounding and Bonding, Class III, Divisions 1 and 2.

Wiring and equipment in Class II, Division 1 and 2 locations shall be grounded <u>and bonded</u> as specified in Article 250 and with the requirements in 503.30(A) and 502.30(B).

(A) Bonding. <u>Bonding in class III locations shall comply with 250.100.</u> ~~The locknut bushing and double locknut types of contacts shall not be depended on for bonding purposes, but bonding jumpers with proper fittings or other approved means of bonding shall be used.~~ Such means of bonding shall apply to all ~~intervening raceways, fittings, boxes, enclosures and so forth~~ <u>equipment</u> between Class III locations and the point of grounding for service equipment or point of grounding of a separately derived system.

Exception: The specific bonding means shall be required only to the nearest point where the grounded circuit conductor and the grounding electrode are connected together on the line side of the building or structure disconnecting means as specified in 250.32(A), (B), and (C), provided the branch-circuit ovecurrent protection is located on the load side of the disconnecting means.

(B) Types of Equipment Grounding Conductors. Remain unchanged.
Substantiation: This section is not written in language that is consistent with the rest of the code. For example, what is "so forth"? Also, there is no need to include the sentence that I propose to delete, when it is already found in 250.92, which hazardous (classified) locations are already required to comply with.

Companion proposals are being made to 501.30 and 503.30, for the purposes of correlation.
Panel Meeting Action: Reject
Panel Statement: Because the requirements for grounding and bonding equipment located in, and intervening into, hazardous locations are critical to safe installations, CMP-14 affirms that this requirement should be expressed explicitly in this section and a cross-reference to 250.100 does not improve usability.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-80 Log #2764 NEC-P14 **Final Action: Reject**
(503.30(A))

Submitter: Truman C. Surbrook, Michigan State University
Recommendation: Add a new last sentence to 503.30(A) to read as follows:
When a bonding jumper is used, it shall be sized in accordance with 250.102(D).
Substantiation: There is no clear statement specifying the minimum size required when a bonding jumper is used for bonding back to the service for a circuit serving a classified hazardous location.
Panel Meeting Action: Reject
Panel Statement: Since 90.3 states the general requirements apply unless modified by the special requirements in Chapters 5, 6, and 7, the requirements in 250.102(D) are applicable without reference. This section does not modify the sizing requirement.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-81 Log #2405 NEC-P14 **Final Action: Reject**
(503.30(A) Exception)

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reconsidered and correlated with the action on Proposal 5-119. This action will be considered by the panel as a public comment.
Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Revise text to read:
503.30 Grounding and Bonding. Class III, Divisions 1 and 2. Wiring and equipment in Class III, Division 1 and 2 locations shall be grounded as specified in Article 250 and with the following additional requirements in 503.30(A) and 503.30(B).
(A) Bonding. The locknut-bushing and double-locknut types of contacts shall not be depended on for bonding purposes, but bonding jumpers with proper fittings or other approved means of bonding shall be used. Such means of bonding shall apply to all intervening raceways, fittings, boxes, enclosures, and so forth, between Class III locations and the point of grounding for service equipment or point of grounding of a separately derived system.
~~Exception: The specific bonding means shall only be required to the nearest point where the grounded circuit conductor and the grounding electrode conductor are connected together on the line side of the building or structure disconnecting means as specified in 250.32(A), (B), and (C), if the branch circuit overcurrent protection is located on the load side of the disconnecting means.~~
Substantiation: This is a companion proposal to my proposal to delete 250.32(B)(2). If 250.32(B)(2) is deleted as I am requesting, this section will need to be revised as well.
Panel Meeting Action: Reject
Panel Statement: The panel rejects this proposal based on the fact that the sole substantiation is acceptance of a companion proposal by CMP-5. Without current knowledge of CMP-5's actions on these companion proposals, CMP-14 has no alternative other than to reject and await any necessary correlating action recommended by the TCC.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
BERNSEN, M.: I agree with the change being proposed in Proposal 5-119. The use of an equipment grounding conductor in the feeder or branch circuit supplying a separate building should not be optional. The current rule is an exception to the general requirement found in 250.24(A)(5), stating that a "grounding connection shall not be made to the grounded conductor on the load side of the service disconnecting means." It took the code making process a long time to rectify the exception to the rule for ranges and clothes dryers. Proposal 14-43 would remove another unnecessary exception to the rule.
My vote to Reject proposal 14-43 concurs with the substantiation provided by Code-Making Panel 14. My vote, however, would be to Accept this proposal if Code-Making Panel 5 makes a wise decision and votes to Accept Proposal 5-119.

14-81a Log #CP1405 NEC-P14 **Final Action: Accept**
(503.30(B))

Submitter: Code-Making Panel 14,
Recommendation: Revise 503.30(B) to read:
Liquidtight flexible metal conduit shall not be used as the sole ground-fault current path. Where equipment bonding jumpers are installed, they shall comply with 250.102.
Retain the exisiting exception.
Substantiation: The revised wording clarifies the requirement and is parallel language to the same requirements in Articles 501, 502, 505 and 506.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-82 Log #291 NEC-P14 **Final Action: Reject**
(503.128(3))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
(3) Be protected against ~~physical damage~~ blows or abrasion and against rusting or other corrosive influences.
Substantiation: The proposed rewording is an attempt at precision. Rusting and corrosion technically are physical damage. If you retain "damage," I could argue that the term "physical" should be eliminated.
Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every instance, as I am attempting to do, we actually cut the NEC down by up to oh, a quarter- to half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on. Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?"
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 14-50 which provides a thorough explanation for the rejection of this proposal and others recommending the elimination of "physical".
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-83 Log #1031 NEC-P14 **Final Action: Reject**
(503.130(B))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:
A luminaire (fixture) ~~that may be~~ is exposed to physical damage shall be protected by a suitable guard.
Substantiation: Edit. "may be" is "iffy" and encompasses conditions that may prevail in the future. Proposal allows assessment to be made with prevailing conditions, including location.
Panel Meeting Action: Reject
Panel Statement: The current text covers luminaires that are subject to damage on an intermittent basis or due to different conditions. A change to "is" would require the damage to be present continuously for the protection to be required. The position of CMP-14 is that suitable guards are required for luminaires that may be exposed to physical damage.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-84 Log #1249 NEC-P14 **Final Action: Reject**
(503.140(3))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise: Be connected to terminals or supply conductors in ~~an approved manner~~ accordance 110.14 except as provided in 503.145.
Substantiation: Edit. Proposal is more specific.
Panel Meeting Action: Reject
Panel Statement: The reference to 110.14 is not necessary because it is a general rule that applies throughout the Code and 503.145 is not applicable to this requirement.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
COOK, D.: I agree with the submitter's substantiation that current text is not specific. The current text requires terminations of supply conductors of a flexible cord to be connected to terminals in an "approved manner". "Approved" is defined as acceptable to the authority having jurisdiction (AHJ). Nothing in the current text or in Chapter 5 of the NEC would provide a basis for the AHJ to accept anything other than a termination that complies with the requirements in 110.14 unless those terminations were permitted to be uninsulated by 503.25. The panel statement indicates the reference to 110.14 is not necessary because it is a general rule. The requirement for supply conductors to be connected to terminals in an approved manner is not necessary either since the general rule in 110.2 requires all conductors and equipment to be approved. I will offer the following alternate wording for public comment:
503.140(3) is connected to terminals in accordance with 110.14 and 503.25.

ARTICLE 504 — INTRINSICALLY SAFE SYSTEMS

14-85 Log #2445 NEC-P14 **Final Action: Accept**
(504.1)

Submitter: Eliana Beattie, ISA
Recommendation: 504.1 - FPN
Change ANSI/ISA RP 12.06.01-2002 to ANSI/ISA-RP12.06.01-2003
Substantiation: Change format to match actual ISA standards numbering.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-86 Log #2457 NEC-P14 **Final Action: Accept**
(504.2.Simple Apparatus)

TCC Action: The Technical Correlating Committee directs the panel to reconsider the proposal and revise the Fine Print Note so that it does not contain mandatory text. This action will be considered by the Panel as a Public Comment.
Submitter: Eliana Beattie, ISA
Recommendation: Modify text as follows:
Simple Apparatus. An electrical component or combination of components of simple construction with well-defined electrical parameters that does not generate more than 1.5 volts, 100 milliamps, and 25 milliwatts, or a passive component that does not dissipate more than 1.3 watts and is compatible with the intrinsic safety of the circuit in which it is used.
FPN: The following apparatus are examples of simple apparatus:
(a) Passive components, for example, switches, junction boxes, resistance temperature devices, and simple semiconductor devices such as LEDs
(b) sources of stored energy consisting of single components in simple circuits with well-defined parameters, for example, capacitors or inductors, whose values are be considered when determining the overall safety of the system;
(c) Sources of generated energy, for example, thermocouples and photocells, which do not generate more than 1.5 V, 100 mA, and 25 mW.
Substantiation: The addition of item c) is to permit the user to install items such as filter capacitors without having to submit the system to an NRTL for re-listing as was originally intended by the intrinsic safety standards. Aligns simple apparatus with the definition used in the international arena.
Panel Meeting Action: Accept
Panel Statement: The panel notes that the word “to” after “are” and before “be” is needed.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
COOK, D.: In the 1996 NEC, CMP-14 first defined a SIMPLE APPARATUS as a device that will neither generate nor store more than 1.2 volts,.1 ampere, 25 milliwatts or 20 microjoules. At the same time CMP-14 determined that this SIMPLE APPARATUS as defined on a control drawing shall not be required to be approved. Since NEC 110.2 requires all equipment to be approved, I am not sure if SIMPLE APPARATUS were outside the scope of the NEC at that time? A FPN was included with examples of SIMPLE APPARATUS.
In the 2002 NEC, CMP-14 expanded the definition of SIMPLE APPARATUS to: an electrical component or combination of components of simple construction with well defined electrical parameters that does not generate more than 1.5 volts, 100 milliamps, and 25 milliwatts, or a passive component that does not dissipate more than 1.3 watts and is compatible with the intrinsically safety of the circuit in which it is used. CMP-14 also determined at that time that this SIMPLE APPARATUS shall not be required to be listed. I must assume that since the devices shall not be listed, that CMP-14 assumes that installers and AHJ’s all have metering equipment in the field which they can evaluate these products to determine they are within these well defined parameters. A second part was added to the FPN to provide additional examples of qualifying devices.
The proposed text in this proposal is included to permit users to install additional SIMPLE APPARATUS without additional evaluation of certification agencies. The additional text, which the substantiation indicates will accomplish this goal, is being added to a FPN. While I trust that CMP-14 would not include text that would compromise the safety of an installation, I am not certain how a requirement can be expanded by adding text to a FPN. NEC 90.5(C) indicates that a FPN is informational only and not enforceable.

14-87 Log #2973 NEC-P14 **Final Action: Accept in Principle**
(504.10(B), FPN (New))

Submitter: Nicholas P. Ludlam, FM Approvals
Recommendation: Add text to read as follows:
Associated apparatus shall be permitted to be installed in any hazardous (classified) location for which it has been identified or, if protected by other means, permitted by Articles 501 through 503 and Article 505.
FPN: Associated intrinsically safe apparatus with a marked Um of less than 250V may require additional over-voltage protection at the inputs to limit any possible fault voltages to less than the Um marked on the product.
Simple apparatus shall be permitted to be installed in any hazardous (classified) location in which the maximum surface temperature of the simple apparatus does not exceed the ignition temperature of the flammable gases or vapors, flammable liquids, combustible dusts, or ignitible fibers or flyings present.
Substantiation: Changes in the intrinsically safe product standards have led to the removal of the requirement for the Um to be at least 250V. The added FPN is intended to draw attention to users of this fact.
Panel Meeting Action: Accept in Principle
The panel accepts the recommended text as a new fine print note #2 to 504.10(A) with the following revision:
FPN: Associated ~~intrinsically safe~~ apparatus with a marked Um of less than 250V may require additional over-voltage protection at the inputs to limit any possible fault voltages to less than the Um marked on the product.
Panel Statement: The panel has deleted “intrinsically safe” to align with the defined term and believes the information should be associated with 504.10(A).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
COOK, D.: While I do not disagree with the technical accuracy of the added FPN, it would seem that this information would be included in the Control Drawings and probably considered in the product evaluation rather than a field installation issue.

14-88 Log #2466 NEC-P14 **Final Action: Accept in Part**
(504.20)

Submitter: Eliana Beattie, ISA
Recommendation: 504.20 Wiring Methods.
Revise as indicated:
Any of the wiring methods suitable for unclassified locations, including Chapter 7 and Chapter 8, shall be permitted for installing intrinsically safe apparatus and FISCO apparatus. ~~Intrinsically safe apparatus and wiring shall be permitted to be installed using any of the wiring methods suitable for unclassified locations, including Chapter 7 and Chapter 8.~~ Sealing shall be as provided in 504.70, and separation shall be as provided in 504.30.
Substantiation: The FISCO (**F** ieldbus **I** ntrinsically **S** afe **CO** ncept) and FNICO (**F** ieldbus **N** on **I** ncendive **CO** ncept) protection concepts take advantage of functional requirements of Fieldbus systems to significantly simplify i.s. installation. These requirements include wire type and quality, supply voltage and current levels, and limitation of stored energy at the terminals of field devices. The objective of these concepts is to simplify the i.s. installation to the point where a safe installation may be effected by simply selecting devices labeled as FISCO (or FNICO) and observing basic wiring type and length restrictions. The NRTL evaluation of all devices ensures that they will be compatible with all other similarly labeled devices without further analysis on the part of the installer.
Panel Meeting Action: Accept in Part
The panel accepts the revised wording of this section but rejects the inclusion of “and FISCO apparatus.”
Panel Statement: The panel rejects the addition of “FISCO” because there are numerous intinsically safe field wiring methods that are acceptable and the inclusion of the acronym in this section would imply that “FISCO” is the only method available. If “FISCO” wiring systems are installed in accordance with the control drawings, this practice would not be prohibited by the present NEC. The panel concurs that the revised wording is grammatically correct and accepts only that part of the recommendation.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
SCHNAARE, T.: Generally speaking, the code serves its primary users base best when it includes information about the various techniques that are allowed for installation. While I agree that the panel does not want to imply that FISCO and FNICO are the only techniques available, I also belive that the code is made stronger and easier to understand and apply when information such as this is included. If there are other deficiencies in the current code (as implied by the panel statement) then these should be addressed as well.

14-88a Log #CP1407 NEC-P14 **Final Action: Accept**
(504.30(A)(1) Exception No. 3 (New))

TCC Action: The Technical Correlating Committee directs the panel to reconsider the proposal relative to the comments expressed in the voting that the Exception, as worded, covers requirements outside the Scope of Article 504. This action will be considered by the panel as a public comment.
Submitter: Code-Making Panel 14,
Recommendation: Add a new Exception No. 3 to read:
Exception No. 3 : Where equipment in a Division 2 or Zone 2 location is supplied by intrinsically safe circuits or nonincendive field wiring circuits, the circuit conductors shall be permitted to be installed in the same raceway, cable tray or cable in accordance with 504.30(B).

Substantiation: The current wording of the code prevents a user from utilizing nonincendive field wiring in a retrofitted/reclassified plant. In a situation where a user initially classified a location as Division 1 and installed intrinsically safe systems, but where it has now been reclassified as a Division 2 or Zone 2, nonincendive field wiring could only be used if the whole cable was replaced to separate intrinsically safe circuits and nonincendive field wiring circuits. Circuits that were previously acceptable for Division 1 would now be unacceptable for Division 2 or Zone 2 even though the voltage/current combination in the individual cables is non-ignition capable.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 2
Explanation of Negative:
BRIESCH, E.: The Panel Action should be Accept in Part. Article 504 does not cover nonincendive field wiring circuits. The action should be to accept all the text except the words "or nonincendive field wiring circuits".
COOK, D.: This proposal seems to permit a compromise of the separation requirements for IS wiring based on reclassification of an area and the chance that part of the circuit is now located in an area that is Division 2. This exception to the separation could allow a compromise the intrinsic safety of a circuit that is still supplying devices located in Division 1 areas and depend on the intrinsic safety of the circuit to provide protection.
Comment on Affirmative:
LAWRENCE, JR., W.: The proposed Exception No. 3 is not clearly worded. Revised text for Exception 3 is proposed.
Also, the panel action does not fully address the situation of the mixing of circuits. Where an intrinsically safe circuit passes through a Division 2 location in a cable or raceway also containing nonincendive field wiring circuits, but is connected to apparatus in a Division 1 location, separation requirements are also needed. An additional Exception 4 is proposed to address this.
" Exception No. 3 : Intrinsically safe circuits in a Division 2 or Zone 2 location shall be permitted to be installed in a raceway, cable tray or cable along with nonincendive field wiring circuits when installed in accordance with 504.30(B)."
" Exception No. 4: Intrinsically safe circuits passing through a Division 2 or Zone 2 location to supply apparatus which is located in a Division 1, Zone 0, or Zone 1 location, shall be permitted to be installed in a raceway, cable tray or cable along with nonincendive field wiring circuits when installed in accordance with 504.30(B)."
SCHNAARE, T.: The proposed Exception no. 3 should be rewritten as follows to more accurately reflect the intent of the panel.
Exception No. 3: Intrinsically safe circuits located in Division 2 or Zone 2 supplying apparatus located in a Division 2 or Zone 2 location shall be permitted to be installed in a raceway, cable tray or cable along with nonincendive field wiring circuits when installed in accorance with 504.30(B).

14-89 Log #2975 NEC-P14 **Final Action: Accept**
(504.30(A)(2))

TCC Action: The Technical Correlating Committee directs the panel to reconsider the proposal and revise both the new FPN to (1) and the existing FPN No. 1 to item (5) to comply with the NEC Style Manual. Both FPNs contain recommendations and interpretations in the form of a "preferred method" and the text "generally considered acceptable". FPNs shall only contain explanatory information. This action will be considered by the panel as a public comment.
Submitter: Nicholas P. Ludlam, FM Approvals
Recommendation: Revise text to read as follows:
(2) Within Enclosures.
~~(1)~~ Conductors of intrinsically safe circuits shall be separated from conductors of nonintrinsically safe circuits by one of the following means:
(1) ~~Separated~~ Separation by at least 50 mm (2 in.) from conductors of any nonintrinsically safe circuits ~~or as specified in 504.30(A)(2).~~
(2) Separation from conductors of nonintrinsically safe circuits by use of a grounded metal partition.
FPN: 20 gauge sheet metal partitions 0.91 mm (0.0359 in.) or thicker are generally considered acceptable.
(3) Separation from conductors of nonintrinsically safe circuits by use of an approved insulating partition.
(4) Where either (1) all of the intrinsically safe circuit conductors or (2) all of the nonintrinsically safe circuit conductors are in grounded metal-sheathed or metal-clad cables where the sheathing or cladding is capable of carrying fault current to ground.
FPN: Cables meeting the requirements of Articles 330 and 332 are typical of those considered acceptable.
~~(2)~~ (5) All conductors shall be secured so that any conductor that might come loose from a terminal cannot come in contact with another terminal.
FPN No. 1: The use of separate wiring compartments for the intrinsically safe and nonintrinsically safe terminals is the preferred method of complying with this requirement.
FPN No. 2: Physical barriers such as grounded metal partitions or approved insulating partitions or approved restricted access wiring ducts separated from other such ducts by at least 19 mm (3/4 in.) can be used to help ensure the required separation of the wiring.
Substantiation: Rearrangement of the existing requirements for clarity and to remove the circular reference in the published NEC for 504.30(A)(2).
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-90 Log #238 NEC-P14 **Final Action: Reject**
(504.30(A)(2), FPN 2)

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
" ~~Physical b~~ B arriers such as...".
Substantiation: Use of the word "physical" is superfluous - the intent is obvious given the context.
Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every unnecessary instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 14-50 which provides a thorough explanation for the rejection of this proposal and others recommending the elimination of "physical".
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-91 Log #518 NEC-P14 **Final Action: Accept**
(504.50, FPN)

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read:
FPN: In addition to an equipment grounding conductor connection, a connection to a ~~Supplementary bonding to the~~ grounding electrode may be needed for some associated apparatus, for example, zener diode barriers, if specified in the control drawing. See ANSI/ISA RP 12.06.01-2002, Wiring Methods for Hazardous (Classified) Locations Instrumentation Part 1: Intrinsic Safety.
Substantiation: Supplementary bonding is not a term that is defined in the NEC. This revision is an effort to more clearly indicate what may be required in addition to the equipment grounding conductor of the branch circuit that supplies this equipment. Supplementary grounding electrodes are addressed in 250.54, but generally if a connection to a grounding electrode is required by the control drawing, it is required to be one of those as specified in 504.50(B). These are usually not supplementary electrodes. This proposed revision is intended to provide additional clarity in the FPN.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-92 Log #2444 NEC-P14 **Final Action: Accept**
(504.50(A))

Submitter: Eliana Beattie, ISA
Recommendation: 504.50(A) - FPN
Change ANSI/ISA RP 12.06.01-2002 to ANSI/ISA-RP12.06.01-2003
Substantiation: Change format to match actual ISA standards numbering.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-93 Log #623 NEC-P14 **Final Action: Accept in Principle**
(504.50(B))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read as follows:
(B) Connection to Grounding Electrodes. Where connection to a grounding electrode is required, the grounding electrode shall be as specified in 250.52(A)(1), (A)(2), (A)(3), and (A)(4) and shall comply with 250.30(A)(7). 250.52(A)(5), (A)(6), and (A)(7) shall not be used if any of the electrodes specified in 250.52(A)(1), (A)(2), (A)(3), or (A)(4) are present for use ~~available~~ .

Substantiation: The word “available” is identified by the NEC Style Manual as a word to avoid in Code rules. It is vague and unenforceable. This proposed revision is an effort to provide a correlation with the language in 250.50. Similar revisions were made to 250.50 during the 2005 NEC development process to replace the word “available” with the concept of the electrodes being used where present. This revision should provide improved consistency.
Panel Meeting Action: Accept in Principle
Revise the recommended text as follows: (B) Connection to Grounding Electrodes. Where connection to a grounding electrode is required, the grounding electrode shall be as specified in 250.52(A)(1), (A)(2), (A)(3), and (A)(4) and shall comply with 250.30(A)(7). Section 250.52(A)(5), (A)(6), and (A)(7) shall not be used if any of the electrodes specified in 250.52(A)(1), (A)(2), (A)(3), or (A)(4) are present ~~for use available.~~
Panel Statement: The words “for use” were removed because “are present” clearly describes the requirement and aligns with 250.50. The panel notes that the word “Section” needs to be inserted at the beginning of the second sentence in the recommendation.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
COOK, D.: This proposal should be accepted as submitted. By changing “present for use” to “present”, concrete encased electrodes would be required to be exposed in retrofit applications. By using “present for use” the concrete encased electrode would only be required to be connected in applications where it is present for use.

14-94 Log #2576 NEC-P14 **Final Action: Accept**
(504.60(B))

Submitter: Nicholas P. Ludlam, FM Approvals
Recommendation: Revise text to read as follows:
(B) Unclassified. In unclassified ~~or nonhazardous~~ locations, where metal raceways are used for intrinsically safe system wiring in hazardous (classified) locations, associated apparatus shall be bonded in accordance with 501.30(A), 502.30(A), 503.30(A), or 505.25, as applicable.
Substantiation: The term nonhazardous was replaced by unclassified in the rest of the Code, but was left here.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-95 Log #2765 NEC-P14 **Final Action: Accept**
(504.60(B))

Submitter: Truman C. Surbrook, Michigan State University
Recommendation: Add 506.25 to the list at the end of the paragraph as follows:
(B) Unclassified. In unclassified or nonhazardous locations, where metal raceways are used for intrinsically safe system wiring in hazardous (classified) locations, associated apparatus shall be bonded in accordance with 501.30(A), 502.30(A), 503.30(A), ~~or~~ 505.25, or 506.25, as applicable.
Substantiation: The same bonding requirement should apply to Zone 20, 21, and 22 locations.
Panel Meeting Action: Accept
Panel Statement: The panel notes the recommended action is only to add the reference to 506.25.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-97 Log #2504 NEC-P14 **Final Action: Accept in Principle**
(504.70)

Submitter: Edward M. Briesch, Underwriters Laboratories, Inc.
Recommendation: Revise text to read as follows:
504.70 Sealing. Conduits and cables that are required to be sealed by 501.15, 502.15, and 505.16 shall be sealed to minimize the passage of gases, vapors, or dusts. Such seals shall not be required to be explosionproof or flameproof but shall be identified for the purpose of minimizing passage of gases under normal operating conditions and shall be accessible.
Exception: Seals shall not be required for enclosures that contain only intrinsically safe apparatus, except as required by 501.15(F)(3).
Substantiation: Current text is not consistent with the same sealing requirement found in 501.15(B)(2) which addresses the same issue.
Panel Meeting Action: Accept in Principle
Revise the recommended text to include a reference to 506.16 and by adding “vapors or dusts” in the second sentence. With this action the section reads:
504.70 Sealing. Conduits and cables that are required to be sealed by 501.15, 502.15, ~~and~~ 505.16 , and 506.16 shall be sealed to minimize the passage of gases, vapors, or dusts. Such seals shall not be required to be explosionproof or flameproof but shall be identified for the purpose of minimizing passage of gases, vapors, or dusts under normal operating conditions and shall be accessible.
Exception: Seals shall not be required for enclosures that contain only intrinsically safe apparatus, except as required by 501.15(F)(3).
Panel Statement: The panel has added the reference to 506.16 to include the sealing requirements from that article and has added “vapors or dusts” in the second sentence to align with the requirement expressed in the first sentence.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-98 Log #90 NEC-P14 **Final Action: Reject**
(504.70 Exception)

Submitter: David Bredhold, Eaton Corp./Cutler-Hammer Products
Recommendation: Delete the following:
~~Exception: Seals shall not be required for enclosures that contain only intrinsicaly safe apparatus, except as required by 501.15(F)(3).~~
Substantiation: Quoting from NEC 2005, Section 501.15 Sealing and Drainage. FPN No. 1: “Seals are provided in conduit and cable systems to minimize the passage of gases and vapors and prevent the passage of flames from one portion of the electrical installation to another through the conduit.”
An enclosure containing intrinsically safe apparatus can allow the intrusion of hazardous gases and vapors as well as can any other enclosure. The conduit connecting that enclosure to a safe area can allow the passage of the gases or vapors to the safe area where they could be ignited by arc- or spark-producing components. The flame front could then pass back through the conduit to the hazardous area igniting the atmosphere.
Panel Meeting Action: Reject
Panel Statement: The concern expressed in the substantiation is already addressed by the requirements in 501.15(A)(4) and 505.16(A)(1). In addition, it is necessary to retain the reference to the process seal required by 501.15(F)(3).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 505 — CLASS I, ZONE 0, 1 AND 2 LOCATIONS

14-99 Log #3136 NEC-P14 **Final Action: Reject**
(505)

Submitter: Eric Stromberg, Stromberg Engineering, Inc.
Recommendation: Delete “Class I” throughout article 505.
Substantiation: Zone 0, Zone 1, and Zone 2 are already defined as liquid or gas, thereby making the “Class I” designation redundant. Article 506 is titled “Zone 20, 21, and 22 Locations for Combustible Dusts, Fibers, and Flyings.” Deleting “Class I” from article 505 would bring it in alignment with both IEC standards and with article 506.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided specific guidance on where to remove “Class I” in Article 505. There is concern on the part of CMP-14 that a global removal of “Class I” is not necessarily the right approach and may result in confusion to the user.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-100 Log #3524 NEC-P14 **Final Action: Accept in Principle**
(505.2)

Submitter: Sandra McCloskey, Newark, DE
Recommendation: Revise as follows:
Purged and Pressurized. ~~Type of protection for electrical equipment that uses the technique of guarding against the ingress of the external atmosphere, which may be explosive, into an enclosure by maintaining a protective gas therein at a pressure above that of the external atmosphere.~~ The process of (1) purging, supplying an enclosure with a protective gas at a sufficient flow and positive pressure to reduce the concentration of the flammable gas or vapor initially present to an acceptable level; and (2) pressurization, supplying an enclosure with a protective gas with or without continuous flow at sufficient pressure to prevent the entrance of a flammable gas or vapor, a combustible dust, or an ignitable fiber. [2005 NFPA 70, 500.2]
Substantiation: As currently written, the definition of pressurized is provided without defining purged.
Panel Meeting Action: Accept in Principle
The panel accepts the recommendation in principle with the following revisions:
1) Revise the exisiting 505.2 definition to read:
Pressurization “p”. Type of protection for electrical equipment that uses the technique of guarding against the ingress of the external atmosphere, which may be explosive, into an enclosure by maintaining a protective gas therein at a pressure above that of the external atmosphere.
2) Delete the existing FPN No. 1
3) Revise the second fine print note to read:
FPN: See ANSI/ISA 60079-2 (12.04.01)-2004 Electrical Apparatus for Explosive Gas Atmospheres -Part 2 Pressurized Enclosures “p” and IEC 60079-13-1982, Electrical Apparatus for Explosive Gas Atmospheres — Part 13: Construction and Use of Rooms or Buildings Protected by Pressurization.

Panel Statement: The panel has addressed the concern of the submitter by revising the title of this section. Pressurization "p" always requires pressurizing, but does not require purging under all circumstances. The requirements in Article 500 are more comprehensive in scope and are different from those in Article 505.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
COOK, D.: I agree with all of the panel action except the inclusion of the reference to IEC 60079-13-1982. That is not an ANSI Standard. It was not developed through a consensus process. I have not seen the document.

14-101 Log #211 NEC-P14 **Final Action: Accept in Principle**
(505.2. Encapsulation "m")

NOTE: The following proposal consists of Comment 14-70 on Proposal 14-73 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 14-73 was:

Revise text as follows:

505.2 Definitions. For purposes of this article, the following definitions apply.

Combustible Gas Detection System. A protection technique utilizing stationary gas detectors in industrial establishments.

Electrical and Electronic Equipment. Materials, fittings, devices, appliances, and the like that are part of, or in connection with, an electrical installation.

FPN: Portable or transportable equipment having self-contained power supplies, such as battery-operated equipment, could potentially become an ignition source in hazardous (classified) locations.

Encapsulation "m". Type of protection where electrical parts that could ignite an explosive atmosphere by either sparking or heating are enclosed in a compound in such a way that this explosive atmosphere cannot be ignited.

FPN: See ISA 12.23.01-1998, *Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations, Type of Protection - Encapsulation "m";* IEC 60079-18-1992, *Electrical Apparatus for Explosive Gas Atmospheres - Part 18: Encapsulation "m";* and ANSI/UL 2279-1997 (Part 18), *Electrical Equipment for Use in Class I, Zone 0, 1, and 2 Hazardous (Classified) Locations* <u>ANSI/UL 60079-18, *Electrical apparatus for explosive gas atmospheres - Part 18: Encapsulation "m".*</u>

Flameproof "d". Type of protection where the enclosure will withstand an internal explosion of a flammable mixture that has penetrated into the interior, without suffering damage and without causing ignition through any joints or structural openings in the enclosure, of an external explosive gas atmosphere consisting of one or more of the gases or vapors for which it is designed.

FPN: See ISA 12.22.01-1998, *Electrical Apparatus for Use in Class I, Zone 1 and 2 Hazardous (Classified) Locations, Type of Protection - Flameproof "d";* IEC 60079-1-2000, *Electrical Apparatus for Explosive Gas Atmospheres, Part 1 - Construction and Verification Test of Flameproof Enclosures of Electrical Apparatus;* ANSI/UL 2279-1997, (Part 1), *Electrical Equipment for Use in Class I, Zone 0, 1, and 2 Hazardous (Classified) Locations* <u>ANSI/UL 60079-1, *Electrical apparatus for explosive gas atmospheres - Part 1: Flameproof enclosures "d".*</u>

Increased Safety "e". Type of protection applied to electrical equipment that does not produce arcs or sparks in normal service and under specified abnormal conditions, in which additional measures are applied so as to give increased security against the possibility of excessive temperatures and of the occurrence of arcs and sparks.

FPN: See ISA - 12.16.01-1998, *Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations, Type of Protection - Increased Safety "e",* IEC 60079-7-1990, *Electrical Apparatus for Explosive Gas Atmospheres, Part 7: - Increased Safety "e",* Amendment No. 1 (1991) and Amendment No. 2 (1993); and ANSI/UL 2279-1997 (Part 7), *Electrical Equipment for Use in Class I, Zone 0, 1, and 2 Hazardous (Classified) Locations* <u>ANSI/UL 60079-7, *Electrical apparatus for explosive gas atmospheres - Part 7: Increased Safety "e".*</u>

Intrinsic Safety "i". Type of protection where any spark or thermal effect is incapable of causing ignition of a mixture of flammable or combustible material in air under prescribed test conditions.

FPN No. 1: See ANSI/UL 913-1997, *Intrinsically Safe Apparatus and Associated Apparatus for Use in Class I, II, and III, Hazardous Locations;* ISA- 12.02.01-1999, *Electrical Apparatus for Use in Class I, Zones 0, 1 and 2 Hazardous (Classified) Locations - Intrinsic Safety "i";* IEC 60079-11-1999, *Electrical Apparatus for Explosive Gas Atmospheres - Part II; Intrinsic Safety "i"'* and ANSI/UL 2279-1997 (Part II). *Electrical Equipment for Use in Class I, Zone 0, 1, and 2 Hazardous (Classified) Locations* <u>ANSI/UL 60079-11, *Electrical apparatus for explosive gas atmospheres - Part II: Intrinsic safety "i".*</u>

FPN No. 2: Intrinsic safety is designated type of protection "ia" for use in Zone 0 locations. Intrinsic safety is designated type of protection "ib" for use in Zone 1 locations.

FPN No. 3: Intrinsically safe associated apparatus, designated by [ia] or [ib], is connected to intrinsically safe apparatus ("ia" or "ib," respectively) but is located outside the hazardous (classified) locations unless also protected by another type of protection (such as flameproof).

Oil Immersion "o". Type of protection where electrical equipment is immersed in a protective liquid in such as way that an explosive atmosphere that may be above the liquid or outside the enclosure cannot be ignited.

FPN: See ISA 12.26.01-1998, *Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations, Type of Protection - Oil-Immersion "o";* IEC 60079-6-1995, *Electrical Apparatus for Explosive Gas Atmospheres, Part 6 - Oil-Immersion "o";* and ANSI/UL 2279-1997 (Part 6), *Electrical Equipment for Use in Class I, Zone 0, 1, and 2 Hazardous (Classified) Locations* <u>ANSI/UL 60079-6, *Electrical apparatus for explosive gas atmospheres - Part 6: Oil-immersion "o".*</u>

Powder Filling "q". Type of protection where electrical parts capable of igniting an explosive atmosphere are fixed in position and completely surrounded by filling material (glass or quartz powder) to prevent the ignition of an external explosive atmosphere.

FPN: See ISA-12.25.01-1996, *Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations Type of Protection - Powder Filling "q";* IEC 60079-5-1996, *Electrical Apparatus for Explosive Gas Atmospheres - Part 5: Powder Filling, Type of Protection "q";* and ANSI/UL 2279-1997 (Part 5), *Electrical Equipment for Use in Class I, Zone 0, 1, and 2 Hazardous (Classified) Locations* <u>ANSI/UL 60079-5, *Electrical apparatus for explosive gas atmospheres - Part 5: Powder filling "q".*</u>

Purged and Pressurized. Type of protection for electrical equipment that uses the technique of guarding against the ingress of the external atmosphere, which may be explosive, into an enclosure by maintaining a protective gas therein at a pressure above that of the external atmosphere.

FPN No. 1: See NFPA 496-1998, *Standard for Purged and Pressurized Enclosures for Electrical Equipment.*

FPN No. 2: See IEC 60079-2-2000, *Electrical Apparatus for Explosive Gas Atmospheres - Part 2: Electrical Apparatus, Type of Protection "p";* and IEC 60079-13-1982, *Electrical Apparatus for Explosive Gas Atmospheres - Part 13: Construction and Use of Rooms or Buildings Protected by Pressurization.*

Type of Protection "n". Type of protection where electrical equipment, in normal operation, is not capable of igniting a surrounding explosive gas atmosphere and a fault capable of causing ignition is not likely to occur.

FPN: See IEC 60079-15-2000, *Electrical Apparatus for Explosive Gas Atmospheres, Part 15 - Electrical Apparatus with Type of Protection "n";* and ANSI/UL 2279-1997 (Part 15), *Electrical Equipment for Use in Class I, Zone 0, 1, and 2 Hazardous (Classified) Locations* <u>ANSI/UL 60079-15, *Electrical apparatus for explosive gas atmospheres- Part 15: Type of protection "n".*</u>

Unclassified Locations. Locations determined to be neither Class I, Division 1; Class I, Division 2: Class I, Zone 0; Class I, Zone 1; Class 1, Zone 2; Class II, Division 1; Class II, Division 2; Class III, Division 1; Class III, Division 2; or any combination thereof.

Submitter: Jeremy Neagle, Intertek ETL SEMKO
Recommendation: Revise text as follows:

Encapsulation "m". Type of protection where electrical parts that could ignite an explosive atmosphere by either sparking or heating are enclosed in a compound in such a way that this explosive atmosphere cannot be ignited.

FPN <u>No. 1:</u> See ANSI/ISA 12.23.01-2002, Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations, Type of Protection - Encapsulation "m", IEC 60079-18-1992, Electrical Apparatus for Explosive Gas Atmospheres - Part 18: Encapsulation "m"; and ANSI/UL 60079-18, Electrical apparatus for explosive gas atmospheres - Part 18: Encapsulation "m".

<u>FPN No. 2: Type of protection "m" may be further subdivided into ma or mb.</u>

Substantiation: Standards are currently in preparation which include two levels of protection, 'ma' and 'mb' which are suitable for Zone 0 and Zone 1 locations respectively. IEC 60079-18, 2nd edition is in the final stages of publication, and adoption of this standard as ISA 12.23.01, 2nd edition is currently in process with publication expected in 2005. The necessary measures are not yet in place to allow for use of 'ma' in Zone 0 locations. However, it provides a greater level of safety than the current practice, while 'mb' provides an equivalent level of safety as the current practice. Adding this FPN clarifies the fact that both levels of protection 'ma' and 'mb' are both suitable for use in Class I Zone 1 locations. US standards will likely be published, and listed equipment available throughout the life span of this code edition, this FPN clarifies that apparatus marked 'm' as required, which is additionally marked to indicate level of protection 'a' or 'b' is still suitable for use in Class I, Zone 1 locations.

Panel Meeting Action: Accept in Principle

Revise the text of the recommended fine print note #2 to read:

FPN No. 2: Encapsulation is designated type of protection "ma" for use in Zone 0 locations. Encapsulation is designated type of protection "m" or "mb" for use in Zone 1 locations.

Panel Statement: The revision of the new fine print note correlates with the action taken on Proposal 14-116.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

Change ISA 12.02.01-1999 to ANSI/ISA-60079-11 (12.02.01)-2002
505.2 - Oil Immersion - FPN
Change ISA 12.26.01-1998 to ANSI/ISA-60079-6 (12.26.01)-1998
505.2 - Powder Filling - FPN
Change ANSI/ISA 12.25.01-2002 to ANSI/ISA-60079-5 (12.25.01)-1998
505-2 - Type of Protection n - FPN
Change ANSI/ISA 12.25.02-2003 to ANSI/ISA-60079-15 (12.12.02)-2003
Substantiation: Change format to match actual ISA standards numbering.
Panel Meeting Action: Accept in Principle
Revise the recommended text (last referenced standard) to read:
ANSI/ISA 12.12.02-2003 to ANSI/ISA-60079-15 (12.12.02)-2003
Panel Statement: The panel action corrects the number of the referenced standard.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-103 Log #2460 NEC-P14 **Final Action: Reject**
(505.2.Various)

Submitter: Eliana Beattie, ISA
Recommendation: Modify text as follows:
Type of Protection "n." Type of protection where electrical equipment, in normal operation, is not capable of igniting a surrounding explosive gas atmosphere and a fault capable of causing ignition is not likely to occur.
FPN: See ANSI/UL 60079-15-2002, Electrical apparatus for explosive gas atmospheres — Part 15: Type of protection "n"; and ANSI/ISA -60079-15 (12.12.02)-2003, Electrical apparatus for use in Class I, Zone 2 Hazardous (Classified) Locations: Type of protection "n."
Type of protection "n" is further subdivided as follows:
non-sparking "nA"
equipment constructed to minimize the risk of occurrence of arcs or sparks capable of creating an ignition hazard during conditions of normal operation.
encapsulated "nC"
equipment, which may or may not contain voids, which is so constructed that it is totally immersed in an encapsulating compound so that it is sealed to prevent entry of an external atmosphere.
enclosed-break "nC"
equipment incorporating electrical contacts that are made and broken and that will withstand an internal explosion of the flammable gas or vapor which may enter it without suffering damage and without communicating the internal explosion to the external flammable gas or vapor.
hermetically-sealed "nC"
equipment which is so constructed that the external atmosphere cannot gain access to the interior and in which the seal is made by fusion, for example, by soldering, brazing, welding or the fusion of glass to metal.
non-incendive component "nC"
components having contacts for making or breaking a specified ignition capable circuit but in which the contacting mechanism is constructed so that the component is not capable of causing ignition of the specified explosive gas atmosphere.
FPN The enclosure of the non-incendive component is not intended to either exclude the explosive gas atmosphere or contain an explosion.
sealed "nC"
equipment which is so constructed that it cannot be opened during normal service and is sealed effectively to prevent entry of an external atmosphere.
energy-limited apparatus "nL"
electrical apparatus in which the circuits and components are constructed according to the concept of energy limitation
FPN: energy-limited apparatus "nL" may sometimes be referred to as intrinsically safe apparatus level of protection "ic".
associated energy-limited apparatus "[nL]" or "[AEx nL]"
electrical apparatus which contains both energy-limited and non-energy-limited circuits and is constructed so that the non-energy-limited circuits cannot adversely affect the energy-limited circuits. Associated energy-limited apparatus may be either:
a) electrical apparatus which has an alternative method of protection included in this standard for use in the appropriate explosive gas atmosphere [nL];
b) electrical apparatus which has an alternative type of protection listed in 505.8 for use in the appropriate explosive gas atmosphere [nL];
c) electrical apparatus not so protected and which therefore shall not be used within an explosive gas atmosphere, for example, a recorder which is not of itself in an explosive gas atmosphere but is connected to a thermocouple situated within an explosive gas atmosphere where only the recorder input circuit is energy-limited [AEx nL].
self protected energy-limited apparatus "nA nL"
apparatus which contains energy-limited sparking contacts, the circuits supplying energy-limited power to these contacts, as well as the non-energy limited source of supply to the circuit.
restricted-breathing enclosure "nR"
enclosure that is designed to restrict the entry of gases, vapors and mists.

Substantiation: Type of protection "n" is subdivided into a number of categories which are determined by the method of protection of the electrical apparatus. This is only partially covered by Table 505.9(C)(2)(4) – Types of protection designation, and complicated in the product standard by the use of two terms for one of the concepts, self-protected energy-limited apparatus.
Panel Meeting Action: Reject
Panel Statement: The standard covering the protection technique specified in the recommendation is not currently published.

Ballot Results: Affirmative: 14

14-106 Log #2454 NEC-P14 **Final Action: Reject**
(505.4(A) & 505.9(C)(2))

Submitter: Eliana Beattie, ISA
Recommendation: 1) Revise 505.4(A) with the underlined as follows:
505.4 General.
(A) Documentation for Industrial Occupancies.
(1) Area Classification. All areas in industrial occupancies designated as hazardous (classified) locations shall be properly documented. This documentation shall be available to those authorized to design, install, inspect, maintain, or operate electrical equipment at the location.
FPN: For examples of area classification drawings, see ANSI/API RP 505-1997, Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Zone 0, Zone 1, or Zone 2; ANSI/ ISA -TR ~~RP~~ 12.24.01-1998 (IEC 60079-10 Mod) , Recommended Practice for Classification of Locations for Electrical Installations Classified as Class I, Zone 0, Zone 1, or Zone 2; IEC 60079-10-1995, Electrical Apparatus for Explosive Gas Atmospheres, Classification of Hazardous Areas; and Model Code of Safe Practice in the Petroleum Industry, Part 15: Area Classification Code for Petroleum Installations, IP 15, The Institute of Petroleum, London.
(2) Certificate of Conformity. The documentation for electrical equipment marked in accordance with 505.9(C)(2) shall be permitted to include a Certificate of Conformity showing compliance with the applicable standards.
(a) Where the Certificate number includes an "X" suffix, the electrical equipment Listing includes Special Condition for Safe Use which shall be observed.
(b) Where the Certificate number includes a "U" suffix, the equipment is an incomplete component and is not suitable for installation without further evaluation.
2) Provide a new marking 505.9(C)(2) on "Marking" with the following underlined additional text:
(2) Zone Equipment.
Equipment shall be permitted to be marked with a certificate reference, see 505.4(A).
Equipment meeting one or more of the protection techniques described in 505.8 shall be marked with all of the following in the order shown:

Substantiation: While listing and labeling are marks to indicate equipment meets specific standards, Certificates offer an extremely important long term benefit of providing documentation that will enable users to understand the Models certified, the applicable standards, the effective date and any special conditions for safe use, long after the normal life of most other product literature. Certificates are this important documentation that provides vital information to users to better assure that equipment will be properly installed within a hazardous (classified) location.

Examples of certificates, selected at random from public sources, are provided for improved understanding.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: This proposal would add permission to permit a certificate that is not prohibited by the current requirements. The additional text serves no purpose. The panel rejection of the proposal in no way prohibits the manufacturer and/or the certification body from providing a certificate if it is needed or desired for other reasons.

14-109 Log #2714 NEC-P14 **Final Action: Accept**

(505.7(A))

Submitter: Dorothy Kellogg, American Chemistry Council

Recommendation: Replace the entire existing text with the following:

~~(A) Supervision of Work. Classification of areas and selection of equipment and wiring methods shall be under the supervision of a qualified Registered Professional Engineer.~~

(A) Implementation of Zone Classification System. Classification of areas, engineering and design, selection of equipment and wiring methods, installation, and inspection shall be performed by qualified persons.

Substantiation: Since the introduction of the zone methodology into the NEC, there has been the issue of the qualified registered professional engineer as the "gatekeeper" to the zone implementation. Code Panel 14 in considering action for combustible dusts (Article 506), examined this problem text and arrived at a preferred wording to address this need. The text proposed follows this lead.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 10 Negative: 4

Explanation of Negative:

BERNSEN, M.: The substantiation for this proposal does not provide any documentation to show why the requirement for having a professional engineer supervise zone installations should be removed. Discussion in the ROP meeting stated that the zone system had been around for a while now and that the electrical community should have a better understanding of installation requirements of Articles 505 and 506 of the NEC. Neither the ROP discussion nor the substantiation provided any idea of how many installations in the United States have been made using the requirements of the two code articles or how our familiarity with the zone system had increased.

The mere fact that the articles have been in the NEC for several code cycles does not mean that the electrical community has a better understanding of either article. It seems we are removing a rule without a clear understanding of the implications of doing so. The requirement to have a professional engineer supervise the installation of equipment in a hazardous area insures the safety of the installation where knowledge of the electrical code is not the only factor involved. In order to provide a safe installation, knowledge of the hazardous products that will be encountered and the fire/explosion hazards associated with the products is necessary.

The proposed change would allow a "qualified person" to classify the hazardous areas, engineer and design the installation, select equipment and wiring methods, install the equipment and inspect the installation. The Article 100 definition of a "qualified person" does not, in my opinion enable the AHJ to make educated or consistent decisions as to who is qualified to "classify" hazardous areas and to "engineer and design" the installation. Installation and inspection of the installations is in most areas of the country covered by local or state licensing requirements.

My vote to reject this proposal is based on a lack of substantiation and my concern that the proposed change will adversely affect the safety of zone installations.

COOK, D.: I agree and support strengthening the implementation of the Zone System by requiring installation and inspection of these systems by qualified persons. I do not believe anything has changed that substantiates removal of the requirement for area classification, selection of equipment and wiring methods to be under the supervision of a qualified Registered Professional Engineer. The safety of every electrical project, and certainly those involving "special occupancies", especially those special occupancies that implement the "Zone System", should be a team effort that includes the most qualified persons in every aspect of the project. Since the implementation of Article 505 in 1996, and Article 506 in 2005, CMP-14 has been made aware of one project that was based completely on Article 505. We are not aware of a single project that utilized Article 506. That limited use of these systems by the majority of the persons using the NEC is one reason to require additional oversight by the most qualified persons that we can involve in the implementation of the Zone System. Rather than deleting the requirement for this new technology, we should be expanding the requirement to all hazardous location projects.

While engineers, contractors, electricians, inspectors and operators typically have minimum education and training opportunities and requirements, the registration laws and requirements for engineers normally impose a higher level of responsibility on the PE for understanding and limiting the individual to practicing engineering services within their specific discipline. Unlike general electrical installations, the safety of electrical installations in hazardous locations requires significant, nonelectrical analysis of the property to determine the likelihood that the electrical system could become an ignition source. That might include a contribution from chemical engineers, process engineers, mechanical engineers, and fire protection engineers prior to any of the electrical design taking place. I believe the most qualified individual to supervise that activity would be a "Qualified, Registered, PE". I do not believe that makes any of the other parties less qualified to make their contribution or any less important to the overall safety of the installation. I believe the elimination of any of individuals involved in the safety of these installations is a bad decision. Without the NEC requirement, the decision to eliminate the supervision component of the safety team could become financially driven.

O'MEARA, M.: Although I agree that all individuals involved with Zone concepts need to be trained and qualified for the portion of the work being performed, I feel that relaxing the requirement for a qualified registered engineer leaves these areas vulnerable to misapplication of equipment and a false sense of security in an environment that will not tolerate mistakes in design or installation. The panel statement on Proposal 14-148 states that the installation and design "should not rely exclusively on the qualifications or certification of a single individual or entity." I fear that the wording proposed in Proposal 14-109 not only allows the installation to rely on a single person or entity, but it relaxes the requirement without providing any methods of assuring the person designing and implementing the Zone system really is qualified. The term "qualified" is too generic and would allow anyone that has attended a class to claim that they are now "qualified". I feel that the requirement for the person designing the system to be a registered engineer provides the necessary added level of assurance that the design and installation was not taken lightly, and that all proper precautions have been taken. In addition, maintaining engineering oversight does not remove the requirement for qualified persons to participate in all aspects of the design, installation and inspection of the Zone system. The requirement for a "qualified" individual is understood and applies equally throughout the NEC.

WIRFS, M.: The substantiation that similar language was fully considered for Article 506 is insufficient. I personally feel that it was NOT properly or fully addressed during the previous code cycle when Article 506 was introduced and the panel was inconsistent in not including similar language. A companion proposal for the 2008 NEC (14-148) has addressed this oversight. During panel discussion, it was suggested that some compromise had been struck within the panel to include this provision in return for consideration of passage of the new Article 505 when it was first introduced and that some "time limit" applied. Again, I believe that principles have no time limit and I am disappointed that any panel member would compromise those opinions or principles based on this premise. There is no "time limit" on my opinion or my original voting on this subject and I still maintain that this provision has the same validity that it did when it was first introduced with Article 505. This is a step forward to a higher standard of responsibility and certification of the most important issue with the application of this article. The submitter did not provide any technical or convincing argument to remove or modify this provision.

Comment on Affirmative:

WECHSLER, D.: After much discussion this Panel has finally been able to accept that the complete implementation of hazardous classified locational aspects includes more than just the assessment of the area, but selection of equipment, wiring methods, an appropriate installation, and inspection. Each must be done by persons that a qualified for the tasks. The text proposed, is the same text agreed upon for 506, also a zone methodology. For these reasons, this proposal should continued to be supported.

14-110 Log #2962 NEC-P14 **Final Action: Accept in Principle**
(505.7(A))

Submitter: Robert L. Seitz, Artech Engineering

Recommendation: Revise text to read as follows:

~~Supervision of Work~~ Implementation of Zone Classification System.

Classification of areas, engineering and design , selection of equipment and wiring methods , installation and inspection shall be ~~under the supervision of a qualified Registered Professional Engineer~~ performed by qualified persons .

Substantiation: ● Paragraph as currently written is not consistent with 506.6(A).

● No other Section requires specifically a Registered Professional Engineer.

● Presence of this paragraph actually hinders the application of Zone Classified areas as there may be qualified personnel who are not registered professional engineers, but who are qualified to perform some or all of the tasks listed.

Panel Meeting Action: Accept in Principle

Panel Statement: The recommended action is accomplished through the panel action on Proposal 14-109.

Recommendation: ***Article 505***

505.8 Protection Techniques.

Rewrite sections (C) and (D) as shown:

(C) Intrinsic Safety & FISCO . ~~This~~ These protection technique s shall be permitted for apparatus and associated apparatus in Class I, Zone 0, Zone 1, or Zone 2 locations for which it is listed.

(D) Type of Protection "n" & FNICO . ~~This~~ These protection technique s shall be permitted for equipment in Class I, Zone 2 locations. Type of protection "n" is further subdivided into nA, nC, and nR.

FPN: See Table 505.9(C)(2)(4) for the descriptions of subdivisions for type of protection "n".

505.9 (C)

Add exception Nos. 3 and 4 to end of section:

(2) Zone Equipment. Equipment meeting one or more of the protection techniques described in 505.8 shall be marked with all of the following in the order shown:

(1) Class
(2) Zone
(3) Symbol "AEx"
(4) Protection technique(s) in accordance with Table 505.9(C)(2)(4)
(5) Applicable gas classification group(s) in accordance with Table 505.9(C)
(6) Temperature classification in accordance with 505.9(D)(1)

Exception No. 1: Associated apparatus NOT suitable for installation in a hazardous (classified) locations shall be required to be marked only with (3), (4), and (5), but BOTH the symbol AEx (3) and the symbol for the type of protection (4) shall be enclosed within the same square brackets, for example, [AEx ia] IIC.

Exception No. 2: Simple apparatus as defined in 504.2 shall not be required to have a marked operating temperature or temperature class.

Exception No. 3: FISCO apparatus shall be marked as above and shall also include the term "FISCO" followed by an indication of its function, i.e. power supply, field device or terminator. This marking shall precede the markings shown above in (1) through (6).

Exception No. 4: FNICO apparatus shall be marked as above and shall also include the term "FNICO" followed by an indication of its function, i.e. power supply, field device or terminator. This marking shall precede the markings shown above in (1) through (6).

505.15 Wiring Methods.

Revise (A) as follows:

(A) Class I, Zone 0 . In Class I, Zone 0 locations, only intrinsically safe and FISCO wiring methods in accordance with Article 504 shall be permitted.

Revise (C)(1)(g) as follows:

(g) Nonincendive field wiring and FNICO shall be permitted using any of the wiring methods permitted for unclassified locations. Nonincendive field wiring and FNICO systems shall be installed in accordance with the control drawing(s). Simple apparatus, not shown on the control drawing, shall be permitted in a nonincendive field wiring or FNICO circuit, provided the simple apparatus does not interconnect the nonincendive field wiring or FNICO circuit to any other circuit.

Substantiation: The FISCO (Fieldbus Intrinsically Safe COncept) and FNICO (Fieldbus NonIncendive COncept) protection concepts take advantage of functional requirements of Fieldbus systems to significantly simplify i.s. installation. These requirements include wire type and quality, supply voltage and current levels, and limitation of stored energy at the terminals of field devices. The objective of these concepts is to simplify the i.s. installation to the point where a safe installation may be effected by simply selecting devices labeled as FISCO (or FNICO) and observing basic wiring type and length restrictions. The NRTL evaluation of all devices ensures that they will be compatible with all other similarly labeled devices without further analysis on the part of the installer.

Note: Supporting Material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The panel rejects the addition of "FISCO" and "FNICO" because there are numerous intrinsically safe and nonincendive field wiring methods that are acceptable and the inclusion of these acronyms in this section would imply that "FISCO" and "FNICO" are the only methods available.
If "FISCO" and "FNICO" wiring systems are installed in accordance with the control drawings, this practice would not be prohibited by the current requirements of the NEC.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

SCHNAARE, T.: Generally speaking, the code serves its primary users base best when it includes information about the various techniques that are allowed for installation. While I agree that the panel does not want to imply that FISCO and FNICO are the only techniques available, I also belive that the code is made stronger and easier to understand and apply when information such as this is included. If there are other deficiencies in the current code (as implied by the panel statement) then these should be addressed as well.

14-114 Log #2451 NEC-P14 **Final Action: Reject**
(505.8(D))

Submitter: Eliana Beattie, ISA

Recommendation: Revise text to read as follows:

(D) Type of protection "n". This protection technique shall be permitted for equipment to be used in Class I, Zone 2 locations. Type of protection "n" is further subdivided into nA, nC, nL and nR.

FPN...".

Substantiation: Add protection type "nL" to align with 505.2.

Panel Meeting Action: Reject

Panel Statement: The standard covering the protection technique specified in the recommendation is not currently published.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-115 Log #212 NEC-P14 **Final Action: Accept in Principle**
(505.8(G))

NOTE: The following proposal consists of Comment 14-77 on Proposal 14-80 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 14-80 was:
Revise text as follows:
505.8 Protection Techniques. Acceptable protection techniques for electrical and electronic equipment in hazardous (classified) locations shall be as described in 505.8(A) through (I).
FPN: For additional information, see ISA 12.00.01-1999, *Electrical Apparatus for Use in Class I, Zones 0 and 1 Hazardous (Classified) Locations, General Requirements;* ISA 12.01.01-1999, *Definitions and Information Pertaining to Electrical Apparatus in Hazardous (Classified) Locations;* ~~ANSI/UL 2279, 1997, *Electrical Equipment for Use in Class I, Zone 0, 1, and 2 Hazardous (Classified) Locations*~~ ANSI/UL 60079-0, *Electrical apparatus for explosive gas atmospheres - Part 0: General requirements;* and IEC 60079-0-1998, *Electrical Apparatus for Explosive Gas Atmospheres - Part 0: General Requirements.*
Submitter: Jeremy Neagle, Intertek ETL SEMKO
Recommendation: Add text as follows:
(G) Encapsulation “m”. This protection technique shall be permitted for equipment in Class I, Zone 1 or Zone 2 locations.
FPN: Type of protection “m” may be further subdivided into ma or mb.
Substantiation: Standards are currently in preparation which include two levels of protection, ‘ma’ and ‘mb’ which are suitable for Zone 0 and Zone 1 locations respectively. IEC 60079-18, 2nd edition is in the final stages of publication, and adoption of this standard as ISA 12.23.01, 2nd edition is currently in process with publication expected in 2005. The necessary measures are not yet in place to allow for use of ‘ma’ in Zone 0 locations. However, it provides a greater level of safety than the current practice, while ‘mb’ provides an equivalent level of safety as the current practice. Adding this FPN clarifies the fact that both levels of protection ‘ma’ and ‘mb’ are both suitable for use in Class I Zone 1 locations. US standards will likely be published, and listed equipment available throughout the life span of this code edition, this FPN clarifies that apparatus marked ‘m’ as required, which is additionally marked to indicate level of protection ‘a’ or ‘b’ is still suitable for use in Class I, Zone 1 locations.
Panel Meeting Action: Accept in Principle
Panel Statement: The recommended action is accomplished through the panel action on Proposal 14-116.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-116 Log #2456 NEC-P14 **Final Action: Accept**
(505.8(G))

Submitter: Eliana Beattie, ISA
Recommendation: Add text as follows:
(G) Encapsulation “m.” This protection technique shall be permitted for equipment in Class I, Zone 1 or Zone 2 locations.
(H) Encapsulation “ma.” This protection technique shall be permitted for equipment in Class I, Zone 0, Zone 1, or Zone 2 locations.
(I) Encapsulation “mb.” This protection technique shall be permitted for equipment in Class I, Zone 1 or Zone 2 locations.
(J) Powder Filling “q”…”
(K) Combustible Gas Detection System…
Substantiation: Items (H) and (I) are inserted; subsequent items are re-lettered. This clarifies that there are now multiple levels of protection for encapsulated equipment. The current edition of ANSI/ISA 60079-18 includes requirements for two levels of protection for encapsulated equipment, “ma” which is suitable for Class I, Zone 0 locations, and “mb” which is suitable for Class I, Zone 1 locations. As the NEC currently does not permit the use of “ma” or “mb” encapsulated equipment, ANSI/ISA 60079-18 currently requires both levels of protection to be marked “m” (suitable for Class I, Zone 1 locations only). Once the NEC has adopted levels of protection “ma” and “mb”, ANSI/ISA 60079-18 will be revised to permit marking of the individual levels of protection.
Panel Meeting Action: Accept

Recommendation: Revise text to read:
505.8 Protection Techniques. Acceptable protection techniques for electrical and electronic equipment in hazardous (classified) locations shall be as described in 505.8(A) through 505.8(I) .
FPN: For additional information, see ANSI/ISA 12.00.01-2002, Electrical Apparatus for Use in Class I, Zones 0 and 1 Hazardous (Classified) locations, General Requirements; ANSI/ISA 12.01.01-2002, Definitions and Information Pertaining to Electrical Apparatus in Hazardous (Classified) Locations; and ANSI/UL 60079-0, Electrical apparatus for explosive gas atmospheres—Part 0: General Requirements.
(A)...
(I) Combustible Gas Detection System. A combustible gas detection system shall be permitted as a means of protection in industrial establishments with restricted public access and where the conditions of maintenance and supervision ensure that only qualified persons service the installation. Gas detection equipment shall be listed for detection of the specific gas or vapor to be encountered. Where such a system is installed, equipment specified in 505.8(I)(1), I(2), or I(3) shall be permitted. The type of detection equipment, its listing, installation location(s), alarm and shutdown criteria, and calibration frequency shall be documented and in conformance with ISA-TR12.13.03, Guide for Combustible Gas Detection as a Method of Protection, when combustible gas detectors are used as a protection technique.
FPN No. 1: For further information, see ANSI/ISA-12.13.01, Performance Requirements, Combustible Gas Detectors.
FPN No. 2: For further information, see ANSI/API RP 505, Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Zone 0, Zone 1, and Zone 2.
FPN No. 3: For further information, see ISA-RP12.13.02, Installation, Operation, and Maintenance of Combustible Gas Detection Instruments.
(1) Inadequate Ventilation. In a Class I, Zone 1 location that is so classified due to inadequate ventilation, electrical equipment suitable for Class I, Zone 2 locations shall be permitted.
(2) Interior of a Building. In a building located in, or with an opening into, a Class I, Zone 2 location where the interior does not contain a source of flammable gas or vapor, electrical equipment for unclassified locations shall be permitted.
(3) Interior of a Control Panel. In the interior of a control panel containing instrumentation utilizing or measuring flammable liquids, gases, or vapors, electrical equipment suitable for Class I, Zone 2 locations shall be permitted.
Substantiation: There is currently no guidance on recommended practices for the use of combustible gas detection equipment as a method of protection. It is recommended that a reference to ISA-TR12.13.03 be provided within the text for such recommended practice. The ISA-TR12.13.03 is directly based upon API practices that have been applied for 30+ years in the petroleum industry.
Panel Meeting Action: Reject
Panel Statement: The proposed text cannot be included as a mandatory requirement for the application of combustible gas detectors because mandatory references to other standards are not permitted by the NEC Style Manual. Acceptance of information regarding the referenced standard in a fine print note is premature because the document is not currently available. The panel is seeking information on the availability date of the referenced standard.

(505.8(I))

Submitter: Eliana Beattie, ISA
Recommendation: 505.8(I) - FPN 1
Change ANSI/ISA-12.13.01 to ANSI/ISA-12.13.01-2003 (IEC 61779-1 through -5 Mod)
505.8(I) - FPN 3
Change ISA-RP12.13.02 to ISA-RP12.13.02-2003 (IEC 61779-6 Mod)
Substantiation: Change format to match actual ISA standards numbering.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-119 Log #2492 NEC-P14 **Final Action: Accept**
(505.8(I))

TCC Action: The Technical Correlating Committee directs the panel to reconsider this proposal and to relocate the reference into Annex A to be consistent with other parts of the Code. This action will be considered by the panel as a public comment.
Submitter: Edward M. Briesch, Underwriters Laboratories, Inc.
Recommendation: Revise text to read as follows:
(I) Combustible Gas Detection System. A combustible gas detection system shall be permitted as a means of protection in industrial establishments with restricted public access and where the conditions of maintenance and

supervision ensure that only qualified persons service the installation. Gas detection equipment shall be listed for detection of the specific gas or vapor to be encountered. Where such a system is installed, equipment specified in 505.8(I)(1), I(2), or I(3) shall be permitted. The type of detection equipment, its listing, installation location(s), alarm and shutdown criteria, and calibration frequency shall be documented when combustible gas detectors are used as a protection technique.

FPN No. 1: For further information, see ANSI/ISA-12.13.01, *Performance Requirements, Combustible Gas Detectors* ~~.~~ and ANSI/UL2075, Gas and Vapor Detectors and Sensors.

Substantiation: ANSI/UL2075 includes performance requirements for combustible gas detectors to ANSI/ISA-12.13.01 in addition to requirements for non-combustible gases and vapors.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-120 Log #2494 NEC-P14 **Final Action: Accept in Principle (505.8(I))**

Submitter: Edward M. Briesch, Underwriters Laboratories, Inc.

Recommendation: Revise text to read as follows:

(I) Combustible Gas Detection System. A combustible gas detection system shall be permitted as a means of protection in industrial establishments with restricted public access and where the conditions of maintenance and supervision ensure that only qualified persons service the installation. Gas detection equipment shall be listed for both the location in which it is installed and for detection of the specific gas or vapor to be encountered. Where such a system is installed, equipment, other than the gas detection equipment, specified in 505.8(I)(1), I(2), or I(3) shall be permitted. The type of detection equipment, its listing, installation location(s), alarm and shutdown criteria, and calibration frequency shall be documented when combustible gas detectors are used as a protection technique.

Substantiation: The current text is unclear with respect to the suitability of the gas detection equipment and the location in which it is installed. While the use of this technique permits equipment for Zone 2 or unclassified locations in a Zone 1 or 2 location respectively, the detection equipment itself should be suitable for the actual classified location in which it is installed.

Panel Meeting Action: Accept in Principle

Revise current text of 505.8(I) to read:

(I) Combustible Gas Detection System. A combustible gas detection system shall be permitted as a means of protection in industrial establishments with restricted public access and where the conditions of maintenance and supervision ensure that only qualified persons service the installation. ~~Gas detection equipment shall be listed for detection of the specific gas or vapor to be encountered.~~ Where such a system is installed, equipment specified in 505.8(I)(1), I(2), or I(3) shall be permitted. The type of detection equipment, its listing, installation location(s), alarm and shutdown criteria, and calibration frequency shall be documented when combustible gas detectors are used as a protection technique.

(1) Inadequate Ventilation. In a Class I, Zone 1 location that is so classified due to inadequate ventilation, electrical equipment suitable for Class I, Zone 2 locations shall be permitted. Combustible gas detection equipment shall be listed for Class I, Zone 1, the appropriate material group, and for the detection of the specific gas or vapor to be encountered.

(2) Interior of a Building. In a building located in, or with an opening into, a Class I, Zone 2 location where the interior does not contain a source of flammable gas or vapor, electrical equipment for unclassified locations shall be permitted. Combustible gas detection equipment shall be listed for Class I, Zone 1 or Class I, Zone 2, the appropriate material group, and for the detection of the specific gas or vapor to be encountered.

(3) Interior of a Control Panel. In the interior of a control panel containing instrumentation utilizing or measuring flammable liquids, gases, or vapors, electrical equipment suitable for Class I, Zone 2 locations shall be permitted. Combustible gas detection equipment shall be listed for Class I, Zone 1, the appropriate material group, and for the detection of the specific gas or vapor to be encountered.

Panel Statement: The panel action accomplishes the intent of the submitter.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-122 Log #1629 NEC-P14 **Final Action: Accept (Table 505.9(C))**

Submitter: Tom Henry, Code Electrical Classes, Inc.

Recommendation: Add the following text:

Gas Group Comment
II C See 505.6 (A)
II B See 505.6 (B)
II A See 505.6 (C)

Substantiation: Remove text (1) (2) (3) as there is no (1) (2) (3). Replace with (A) (B) (C) as shown above.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-123 Log #213 NEC-P14 **Final Action: Accept in Principle (505.9(C)(2))**

NOTE: The following proposal consists of Comment 14-79 on Proposal 14-89 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 14-89 was:

Revise text to read as follows:

(2) Zone Equipment. Equipment meeting one or more of the protection techniques described in 505.8 shall be marked with the following in the order shown:

(1) Class
(2) Zone
(3) Symbol "AEx"
(4) Protection technique(s) in accordance with Table 505.9(C)(2)(4)
(5) Applicable gas classification group(s) in accordance with Table 505.9(C)
(6) Temperature classification in accordance with 505.9(D)(1)

Exception No. 1 : Intrinsically safe associated apparatus shall be required to be marked only with (4), (5), and (6)

Exception No. 2: Simple Apparatus as defined in 504.2 shall not be required to have a marked operating temperature or temperature class.

Submitter: Jeremy Neagle, Intertek ETL SEMKO

Recommendation: Revise text to read as follows:

FPN No. 1: An example of such a required marking is "Class 1 Zone 0, AEx is IIC T6." An explanation of the marking that is required is shown in FPN Figure 505.9(C)(2).

FPN No. 2: Type of protection "m" may be further subdivided into ma or mb.

Substantiation: Standards are currently in preparation which include two levels of protection, 'ma' and 'mb' which are suitable for Zone 0 and Zone 1 locations respectively. IEC 60079-18, 2nd edition is in the final stages of publication, and adoption of this standard as ISA 12.23.01, 2nd edition is currently in process with publication expected in 2005. The necessary measures are not yet in place to allow for use of 'ma' in Zone 0 locations. However, it provides a greater level of safety than the current practice, while 'mb' provides an equivalent level of safety as the current practice. Adding this FPN clarifies the fact that both levels of protection 'ma' and 'mb' are both suitable for use in Class I Zone 1 locations. US standards will likely be published, and listed equipment available throughout the life span of this code edition, this FPN clarifies that apparatus marked 'm' as required, which is additionally marked to indicate level of protection 'a' or 'b' is still suitable for use in Class I, Zone 1 locations.

Panel Meeting Action: Accept in Principle

Panel Statement: The recommended action is accomplished through the panel action on Proposal 14-124.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-124 Log #2455 NEC-P14 **Final Action: Accept in Principle in Part (505.9(C)(2))**

Submitter: Eliana Beattie, ISA

Recommendation: Modify text as follows:

(2) Zone Equipment. Equipment meeting one or more of the protection techniques described in 505.8 shall be marked with all of the following in the order shown:

(1) Class
(2) Zone
(3) Symbol "AEx"
(4) Protection technique(s) in accordance with Table 505.9(C)(2)(4)

FPN: Where apparatus is protected by more than one protection technique, the designation will appear in alphabetical order, except in the case where the apparatus includes type of protection "n" in which case the type of protection "n" marking will appear first.

(5) Applicable gas classification group(s) in accordance with Table 505.9(C)
(6) Temperature classification in accordance with 505.9(D)(1)

Exception No. 1: Associated apparatus NOT suitable for installation in a hazardous (classified) locations shall be required to be marked only with (3), (4), and (5), but BOTH the symbol AEx (3) and the symbol for the type of protection (4) shall be enclosed within the same square brackets, for example, [AEx ia] IIC.

Exception No. 2: Simple apparatus as defined in 504.2 shall not be required to have a marked operating temperature or temperature class.

Electrical equipment of types of protection "e," "m," "p," or "q" shall be marked Group II. Electrical equipment of types of protection "d," "ia," "ib," "[ia]," or "[ib]" shall be marked Group IIA, IIB, or IIC, or for a specific gas or vapor. Electrical equipment of types of protection "n" shall be marked Group II unless it contains enclosed-break devices, nonincendive components, or energy-limited equipment or circuits, in which case it shall be marked Group IIA, IIB, or IIC, or a specific gas or vapor. Electrical equipment of other types of protection shall be marked Group II unless the type of protection utilized by the equipment requires that it be marked Group IIA, IIB, or IIC, or a specific gas or vapor.

FPN No. 1: An example of the required marking for intrinsically safe apparatus for installation in Class I, Zone 0 is “Class I, Zone 0, AEx ia IIC T6.” An explanation of the marking that is required is shown in FPN Figure 505.9(C)(2).

FPN No. 2: An example of the required marking for intrinsically safe associated apparatus mounted in a flameproof enclosure for installation in Class I, Zone 1 is “Class I, Zone 1 AEx d[ia] IIC T4.”

FPN No. 3: An example of the required marking for intrinsically safe associated apparatus NOT for installation in a hazardous (classified) location is “[AEx ia] IIC.”

FPN Figure 505.9(C)(2) Zone Equipment Marking.

Table 505.9(C)(2)(4) Types of Protection Designation

Designation	Technique	Zone*
d	Flameproof enclosure	1
e	Increased safety	1
ia	Intrinsic safety	0
ib	Intrinsic safety	1
[ia]	Associated apparatus	Unclassified**
[ib]	Associated apparatus	Unclassified**
m	Encapsulation	1
ma	Encapsulation	0
mb	Encapsulation	1
nA	Nonsparking ~~equipment~~	2
nC	Sparking equipment in which the contacts are suitably protected other than by restricted breathing enclosure	2
nL	Energy-limited apparatus	2
nAnL	Self-protected energy-limited apparatus	2
[nL]	Associated Energy-limited apparatus	Unclassified**
nR	Restricted breathing enclosure	2
o	Oil immersion	1
p	Purged and pressurized	1 or 2
q	Powder filled	1

*Does not address use where a combination of techniques is used

**Associated intrinsically safe and associated energy-limited apparatus may be installed in a hazardous (Classified) location if suitably protected using another technique.

Substantiation: Table 505.9(C)(2)(4) modified to include the additional protection concepts in the Type “n” standard ANSI/ISA-60079-15 and ANSI/UL 60079-15 and types of protection “ma” and “mb” as defined in ANSI/ISA-60079-18 and ANSI/UL 60079-18.

Table modified to include the possibility of installing associated apparatus in a hazardous (classified) location if it is suitably protected by another means such as Flameproof or Purged.

New FPN added to align with the current edition of ANSI/ISA-60079-0 and ANSI/UL 60079-0.

Panel Meeting Action: Accept in Principle in Part

Accept the recommendation in principle in part with the following actions:

1) Revise Table 505.9(C)(2)(4) to read as shown:

Table 505.9(C)(2)(4) Types of Protection Designation

Designation	Technique	Zone*
d	Flameproof enclosure	1
e	Increased safety	1
ia	Intrinsic safety	0
ib	Intrinsic safety	1
[ia]	Associated apparatus	Unclassified**
[ib]	Associated apparatus	Unclassified **
m	Encapsulation	1
ma	Encapsulation	0
mb	Encapsulation	1
nA	Nonsparking equipment	2
nC	Sparking equipment in which the contacts are suitably protected other than by restricted breathing enclosure	2
nR	Restricted breathing enclosure	2
o	Oil immersion	1
px	Pressurization	1
py	Pressurization	1
pz	Pressurization	2
q	Powder filled	1

*Does not address use where a combination of techniques is used.

** Associated apparatus is permitted to be installed in a hazardous (Classified) location if suitably protected using another type of protection.

2) Revise first sentence of the second paragraph (following Exception No. 2) in existing code text to read:

Electrical equipment of types of protection “e,” “m,” “ma”, “mb”, ~~“p”~~ “px”, “py”, “pz”, or “q” shall be marked Group II.

3) Reject inclusion of the recommended fine print note.

Panel Statement: The panel rejects the recommended fine print note because it does not provide information that is necessary in an installation document. The panel revised the existing text of the second paragraph in the NEC to include all of the encapsulation (“ma” and “mb” added) and pressurization (“p” replaced with “px”, “py” and “pz” methods.

In the recommended changes to Table 505.9(C)(2)(4), the panel deleted “nL”, “nAnL”, and [nL] because the standard covering those methods is not currently published. The panel also replaced pressurization “p” with “px”, “py”, and “pz” for correlation with the revisions in the Code text. The recommended new note to the table (indicated with **) was revised for clarity and to align with terminology used in the NEC.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-125 Log #653 NEC-P14 **Final Action: Accept**
(505.9(D)(1))

TCC Action: The Technical Correlating Committee directs the panel to reconsider the proposal and place the example text of the recommendation into a Fine Print Note. This action will be considered by the Panel as a Public Comment.

Submitter: William G. Lawrence, Jr., S. Yarmouth, MA

Recommendation: Add new text as follows:

Electrical equipment that is designed for use in a range of ambient temperatures other than -20°C to +40°C is considered to be special; and the ambient temperature range shall then be marked on the equipment, including either the symbol “Ta” or “Tamb” together with the special range of ambient temperatures, in degrees Celsius . As an example, such a marking might be “-30°C ≤ Ta ≤ +40°C.”

Substantiation: Even though the standard ambient range is specified in degrees Celsius, this section does not specify that any special ambient temperature is also to be expressed in degrees Celsius. If the ambient temperature range is expressed in degrees Fahrenheit, the potential exists for misapplication of the equipment.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-126 Log #2565 NEC-P14 **Final Action: Accept in Principle**
(505.9(F))

Submitter: Peter Schimmoeller, CSA International

Recommendation: Add new text as follows:

505.9(F) Fiber Optic Cable Assembly. Where a fiber optic cable assembly contains conductors that are capable of carrying current, the fiber optic cable assembly shall be installed in accordance with the requirements of Article 505, as applicable.

Substantiation: Current Code does not address fiber optical cables with electrical conductors used in Zone 0, 1, or 2 classified locations. This proposal adds wording similar to that found in Division classified locations.

Panel Meeting Action: Accept in Principle

The panel accepts the recommendation in principle with the following revision:

505.9(F) Fiber Optic Cable Assembly. Where a fiber optic cable assembly contains conductors that are capable of carrying current, the fiber optic cable assembly shall be installed in accordance with 505.15 and 505.16, as applicable.

Panel Statement: The panel has revised the recommendation to specifically require compliance with the applicable wiring method and sealing rules.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-121 Log #2472 NEC-P14 **Final Action: Accept in Principle**
(505.15(B)(1) and (c))

TCC Action: The Technical Correlating Committee directs the panel to reconsider this proposal and to relocate the reference in the FPNs into Annex A to be consistent with other parts of the Code. This action will be considered by the panel as a public comment.

Submitter: Donald W. Ankele, Underwriters Laboratories Inc.

Recommendation: Revise text to read as follows:

(b) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type MC-HL cable, listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, separate grounding conductors in accordance with 250.122, and provided with termination fittings listed for the application.

FPN 1 : See 330.12 for restrictions on use of Type MC cable.
FPN 2: For further information on construction, testing and marking requirements for Type MC-HL cable and Type MC-HL cable sealing fittings, see ANSI/UL 2225, Cables and Cable Fittings for Use in Hazardous (Classified) Locations.

(c) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type ITC-HL cable, listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material and provided with termination fittings listed for the application.

FPN 1: See 727.4 and 727.5 for restrictions on use of Type ITC cable.
FPN 2: For further information on construction, testing and marking requirements for Type MC-HL cable and Type MC-ML cable sealing fittings, see ANSI/UL 2225, Cables and Cable Fittings for Use in Hazardous (Classified) Locations.

Substantiation: Add FPN 2 to reference the ANSI standard for Type MC-HL cable and Type ITC-HL cables and cable fittings to aid approval of the installation for the location involved.

Add FPN 1 to reference Article 727 for Type ITC cable.

Panel Meeting Action: Accept in Principle

Revise the recommended fine print note to 505.15(B)(1)(c) to read: FPN No. 2: For further information on construction, testing and marking requirements for Type ITC-HL cable and Type ITC-HL cable sealing fittings, see ANSI/UL 2225, Cables and Cable Fittings for Use in Hazardous (Classified) Locations.

Panel Statement: The panel notes that this proposal is to 505.15(B)(1)(b) & (c). The panel accepts the recommendation and corrects the type of cable covered by the new fine print note to 505.15(B)(1)(c).

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-128 Log #1929 NEC-P14 **Final Action: Reject**
(505.15(B)(1)(f))

TCC Action: The Technical Correlating Committee directs the panel to reconsider the action on this proposal and remove the redundant reference to Article 352 since this is already covered by 90.3. This action will be considered by the panel as a public comment. The Technical Correlating Committee also directs that this proposal be sent to Code-Making Panel 8 for comment.

Submitter: William Wagner, Certification Solutions

Recommendation: Revise the first sentence of item (f) of 505.15(B)(1) as follows:

(f) Rigid nonmetallic conduit ~~complying with Article 352~~ shall be permitted where encased in a concrete envelope a minimum of 50 mm (2 in.) thick and provided with not less than 600 mm (24 in.) of cover measured from the top of the conduit to grade.

Substantiation: 4.1.1 of the NEC Style Manual does not permit references to be made to an entire article unless additional conditions are specified. Therefore, the reference to Article 352 should be deleted.

Panel Meeting Action: Reject

Panel Statement: The use of rigid nonmetallic conduit in this section is conditional because this requirement specifies a minimum 2 inches of concrete encasement. Under this condition, the NEC Style Manual permits a reference to an entire article.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

COOK, D.: Based on the information in 90.3, the text “complying with Article 352” adds nothing to the requirement.

14-129 Log #2961 NEC-P14 **Final Action: Reject**
(505.15(B)(1)(g))

Submitter: Robert L. Seitz, Artech Engineering

Recommendation: Add text to read as follows:

(g) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installations, and where the cable is not subject to physical damage, listed Marine Shipboard Cable, with overall jacket of suitable material, separate grounding conductors in accordance with 250.122 and provided with termination fittings listed for the application. Marine Shipboard cable shall be permitted to be installed in the same manner as permitted for TC-ER cable as described in 336. Where conditions warrant additional protection Marine Shipboard cable with basket weave armor may be installed. Minimum bending radius for non-armored cable shall be 6X diameter, and for armored cable 8X diameter. Instrumentation and control cables with shielded components are permitted. Conduit sleeves may be used to cross high risk areas.

Substantiation: MC-HL cable does not permit proper installation of all listed and marked Zone 1 devices because of size and stiffness of the cable and the bulk and rigidness of the connector. Other less functional devices are often selected for installations to avoid difficulties with these installations. Marine Shipboard cable listed under UL 1309 and complaint with IEEE 1580 provides a reasonable means to provide a safe installation in a Zone 1 area without the corrugated armor. Where additional protection might be required there are a variety of basket weave armors that can be selected, while retaining necessary flexibility.

MC-HL cable is often damaged during installation, and when equipment and devices are removed for maintenance or replacement by crimping of the metallic sheath when the cable is bent to move it out of the way.

Where flexible connections to instruments or control devices is required, necessary configurations of extra hard usage cord are not available Only power cords seem to be available as extra hard usage cord or cable.

Cable tray, both ladder type and wire basket tray afford adequate protection of cable installed. The small wire basket tray can be run to close proximity of devices and equipment to provide protection of the cable. Marine Shipboard cable is required to have the crush and impact required for MC-HL cable. Much of the Marine Shipboard cable available exceeds the requirement by 5 times.

Where cable tray cannot be run or there is elevated risk of damage to a cable MC-HL cable would be selected. By 505.15, the MC-HL cable installations are to be “not subject to physical damage”, but conditions during overhauls and reconfiguration can present a risk even for MC-HL cable. Installation of Marine Shipboard cable in cable tray (wire basket type) can afford more protection than the armor of MC-Hl cable by allowing different routing allowed by a smaller bending radius of the Marine Shipboard cable. Some basket tray configurations have partial coverage on the top that would prevent objects from being placed on the cable.

Marine Shipboard cable is a proven cable for harsh environments, is better for use in high vibration areas than MC-HL cable, and is available with low temperature ratings, flame retardant, resistant to oil, abrasion, chemicals and sunlight.

The introduction of the wire basket tray in the US provides the means to provide protection of the cable while retaining the flexibility the Marine Shipboard cable affords.

A companion proposal for article 310 is also submitted to add Marine Shipboard cable to Table 310.13.

Where the higher risk environments exist, the basket weave armor can be specified during design. Where the environment is harsh enough MC-HL cable can be specified. If there is great risk from falling objects, conduit sleeves may be employed or covers on the cable tray. The flexibility and smaller bending radius of the Marine Shipboard cable can allow installations that are more safe than those with MC-HL cable just by being able to route out of the way better.

This cable will allow Zone 1 approved products to be used more effectively than is possible with the MC-HL cable.

Panel Meeting Action: Reject

Panel Statement: The submitter has not substantiated that a marine shipboard cable is suitable for use in a Class I, Zone 1 premises wiring system and will offer equivalent performance to the wiring methods currently permitted in these locations. The NEC does not currently recognize the use of this cable in Chapter 3. The recommendation equates installation requirements with those for Type TC-ER, however the panel notes that Type TC-ER is not permitted in a Class I, Zone 1 location. As recommended, this particular product is not required to be armored and CMP-14 considers armor to be an essential protection feature for cables installed in Class I, Zone 1 locations.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-127 Log #2481 NEC-P14 **Final Action: Accept in Principle**
(505.15(B)(1)(b) and (c))

TCC Action: See Technical Correlating Committee Note on Proposal 14-121.

Submitter: Donald W. Ankele, Underwriters Laboratories Inc.

Recommendation: Revise as follows:

(b) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type MC-HL cable, listed for use in Class I, Zone 1 or Division 1 locations with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, separate grounding conductors in accordance with 250.122, and provided with termination fittings listed for the application.

FPN 1: See 330.12 for restrictions on use of Type MC cable.
FPN 2: For further information on construction, testing and marking requirements for Type MC-HL cable and Type MC-HL cable sealing fittings, see ANSI/UL 2225, Cables and Cable Fittings for Use in Hazardous (Classified) Locations .

(c) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type ITC-HL cable, listed for use in Class I, Zone I or Division I locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material and provided with termination fittings listed for the application.

FPN 1: See 727.4 and 727.5 for restrictions on use of Type ITC cable.
FPN 2: For further information on construction, testing and marking requirements for Type MC-HL cable and Type MC-HL cable sealing fittings, see ANSI/UL 2225, Cables and Cable Fittings for Use in Hazardous (Classified) Locations .

Substantiation: Add FPN 2 to reference the ANSI standard for Type MC-HL cable and Type ITC-HL cables and cable fittings to aid approval of the installation for the location involved.

Add FPN 1 to reference Article 727 for type ITC cable.

Panel Meeting Action: Accept in Principle

Panel Statement: The recommended action is accomplished through the panel action on Proposal 14-121.

14-130 Log #2479 NEC-P14 **Final Action: Accept**

(505.16, FPN 3 (New))

TCC Action: The Technical Correlating Committee directs the panel to reconsider this proposal and to relocate the reference in the FPNs into Annex A to be consistent with other parts of the Code. This action will be considered by the panel as a public comment.

Submitter: Donald W. Ankele, Underwriters Laboratories Inc.

Recommendation: Revise text to read as follows:

505.16 Sealing and Drainage. Seals in conduit and cable systems shall comply with 501.15(A) through 501.15(E).

FPN No. 1: Seals are provided in conduit and cable systems to minimize the passage of gases and vapors and prevent the passage of flames from one portion of the electrical installation to another through the conduit. Such communication through Type MI cable is inherently prevented by construction of the cable. Unless specifically designed and tested for the purpose, conduit and cable seals are not intended to prevent the passage of liquids, gases, or vapors at a continuous pressure differential across the seal. Even at differences in pressure across the seal equivalent to a few inches of water, there may be a slow passage of gas or vapor through a seal and through conductors passing through the seal. See 505.16(C)(2)(b). Temperature extremes and highly corrosive liquids and vapors can affect the ability of seals to perform their intended function. See 505.16(D)(2).

FPN No. 2: Gas or vapor leakage and propagation of flames may occur through the interstices between the strands of standard stranded conductors larger than 2 AWG. Special conductor constructions, for example, compacted strands or sealing of the individual strands, are means of reducing leakage and preventing the propagation of flames.

FPN No. 3: For further information, see ANSI/UL 2225, Cable and Cable Fittings for Use in Hazardous (Classified) Locations. Also see ANSI/UL 1203, Explosionproof and Dust-Ignition-Proof Electrical Equipment for Use in Hazardous (Classified) Locations.

Substantiation: Add FPN 3 to reference the ANSI standard for cable fittings to aid approval of the installation for the location involved.

Panel Meeting Action: Accept

Panel Statement: The panel notes that the referenced standard in FPN No.3 is 2225.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-131 Log #2478 NEC-P14 **Final Action: Accept**

(505.16(B)(2), FPN 1)

Submitter: Donald W. Ankele, Underwriters Laboratories Inc.

Recommendation: Revise text to read as follows:

Cables with a gas/vaportight continuous sheath and that will not transmit gases or vapors through the cable core in excess of the quantity permitted for seal fittings shall not be required to be sealed except as required in 505.16(C)(2)(a). The minimum length of such cable run shall not be less than the length that limits gas or vapor flow through the cable core to the rate permitted for seal fitting [200 cm 3 /hr (0.007 ft 3 /hr) of air at a pressure of 1500 pascals (6 in. of water)]

FPN No. 1: ~~See ANSI/UL 886 1994, Outlet Boxes and Fittings for Use in Hazardous (Classified) Locations.~~ For further information on construction, testing and marking requirements for conduit sealing fittings, see ANSI/UL 1203, Explosionproof and Dust-Ingition-Proof Electrical Equipment for Use in Hazardous (Classified) Locations.

FPN No. 2: The cable core does not include the interstices of the conductor strands.

Substantiation: Delete the reference to UL 886, which has been replaced by UL 1203. Add FPN to reference the ANSI standard for conduit sealing fittings to aid approval of the installation for the location involved.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-132 Log #2438 NEC-P14 **Final Action: Accept**

(505.16(E)(3))

Submitter: Eliana Beattie, ISA

Recommendation: 505.16(E)(3) - 2nd FPN

Change ISA 12.27.01 to ANSI/ISA-12.27.01-2003.

Substantiation: Change format to match actual ISA standards numbering.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-133 Log #2480 NEC-P14 **Final Action: Accept**

(505.17)

TCC Action: The Technical Correlating Committee directs the panel to reconsider this proposal and to relocate the reference in FPN No. 2 into Annex A to be consistent with other parts of the Code. This action will be considered by the panel as a public comment.

Submitter: Donald W. Ankele, Underwriters Laboratories Inc.

Recommendation: Revise text to read as follows:

505.17 Flexible Cords, Class I, Zones 1 and 2. A flexible cord shall be permitted for connection between portable lighting equipment or other portable utilization equipment and the fixed portion of their supply circuit. Flexible cord shall also be permitted for that portion of the circuit where the fixed wiring methods of 505.15(B) cannot provide the necessary degree of movement for fixed and mobile electrical utilization equipment, in an industrial establishment where conditions of maintenance and engineering supervision ensure that only qualified persons install and service the installation, and the flexible cord is protected by location or by a suitable guard from damage. The length of the flexible cord shall be continuous. Where flexible cords are used, the cords shall comply with ~~all of~~ the following:

(1) Be of a type listed for extra-hard usage

(2) Contain, in addition to the conductors of the circuit, a grounding conductor complying with 400.23

(3) Be connected to terminals or to supply conductors in an approved manner

(4) Be supported by clamps or by other suitable means in such a manner that there will be no tension on the terminal connections

(5) Be provided with listed seals where the flexible cord enters boxes, fittings, or enclosures that are required to be explosionproof or flameproof

(6) Cord entering a increased safety "e" enclosure shall be terminated with a listed increased safety "e" cord connector.

Exception: As provided in 505.16.

FPN 1: See Article 400.7 for permitted uses of flexible cords.

FPN 2: For further information on construction, testing and marking requirements for increased safety "e" and flameproof "d" cord connectors, see ANSI/UL 2225, *Cable and Cable Fittings for Use in Hazardous (Classified) Locations.*

Substantiation: 505.17 lacks clear statements regarding the requirements for cord connectors entering type of protection "e" enclosures. Add FPN's to reference the ANSI standard for "d" and "e" cord connectors to aid approval of the installation of the required fittings.

Panel Meeting Action: Accept

Panel Statement: The panel notes that in the recommendation for FPN No.1, the word "Article" should be removed from preceding 400.7.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-134 Log #1248 NEC-P14 **Final Action: Reject**

(505.17(3))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Revise: Be connected to terminals or supply conductors in ~~an approved manner~~ accordance with 110.14.

Substantiation: Edit. Proposal is more specific.

Panel Meeting Action: Reject

Panel Statement: The reference to 110.14 is not necessary because it is a general rule that applies throughout the Code.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

COOK, D.: I agree with the submitter's substantiation that current text is not specific. The current text requires terminations of supply conductors of a flexible cord to be connected to terminals in an "approved manner". "Approved" is defined as acceptable to the authority having jurisdiction (AHJ). Nothing in the current text or in Chapter 5 of the NEC would provide a basis for the AHJ to accept anything other than a termination that complies with the requirements in 110.14 unless those terminations were permitted to be uninsulated by 505.19. The panel statement indicates the reference to 110.14 is not necessary because it is a general rule. The requirement for supply conductors to be connected to terminals in an approved manner is not necessary either since the general rule in 110.2 requires all conductors and equipment to be approved. I will offer the following alternate wording for public comment:

505.17(3) Be connected to terminals or supply conductors in accordance with 110.14 and 505.19.

14-135 Log #2483 NEC-P14 **Final Action: Reject**
(505.20(C) Exception No. 4, FPN 3 (New))

Submitter: Frederick Bried, Spring, TX
Recommendation: New FPN No. 3: For further information on the application of electric motors in Class I, Division 2 hazardous (classified) locations, see IEEE Std. 1349-2006, IEEE Guide for the Application of Electric Motors in Class I, Division 2, and Class I, Zone 2 Hazardous (Classified) Locations.
Substantiation: IEEE 1349-2001 is being revised and will be completed in 2006. The standard will include information related to application of electric motors in Class I, Division 2 and Class I, Zone 2 hazardous (classified) locations.
Panel Meeting Action: Reject
Panel Statement: The document referenced in the recommendation has not been approved by the IEEE Standards Board.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-136 Log #2766 NEC-P14 **Final Action: Reject**
(505.25(A))

Submitter: Truman C. Surbrook, Michigan State University
Recommendation: Add a new last sentence to 505.25(A) to read as follows:
When a bonding jumper is used, it shall be sized in accordance with 250.102(D).
Substantiation: There is no clear statement specifying the minimum size required when a bonding jumper is used for bonding back to the service for a circuit serving a classified hazardous location.
Panel Meeting Action: Reject
Panel Statement: Since 90.3 states the general requirements apply unless modified by the special requirements in Chapters 5, 6, and 7, the requirements in 250.102(D) are applicable without reference. This section does not modify the sizing requirement.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-137 Log #2406 NEC-P14 **Final Action: Reject**
(505.25(A) Exception)

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reconsidered and correlated with the action on Proposal 5-119. This action will be considered by the panel as a public comment.
Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Revise text to read:
505.25 Grounding and Bonding. Grounding and bonding shall comply with Article 250 and the requirements in 505.25(A) and 505.25(B).
(A) Bonding. The locknut-bushing and double-locknut types of contacts shall not be depended on for bonding purposes, but bonding jumpers with proper fittings or other approved means of bonding shall be used. Such means of bonding shall apply to all intervening raceways, fittings, boxes, enclosures, and so forth, between Class I locations and the point of grounding for service equipment or point of grounding of a separately derived system.
~~Exception: The specific bonding means shall be required only to the nearest point where the grounded circuit conductor and the grounding electrode conductor are connected together on the line side of the building or structure disconnecting means as specified in 250.32(A), (B), and (C), provided the branch circuit overcurrent protection is located on the load side of the disconnecting means.~~
Substantiation: This is a companion proposal to my proposal to delete 250.32(B)(2). If 250.32(B)(2) is deleted as I am requesting, this section will need to be revised as well.
Panel Meeting Action: Reject
Panel Statement: The panel rejects this proposal based on the fact that the sole substantiation is acceptance of a companion proposal by CMP-5. Without current knowledge of CMP-5's actions on these companion proposals, CMP-14 has no alternative other than to reject and await any necessary correlating action recommended by the TCC.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
BERNSEN, M.: I agree with the change being proposed in Proposal 5-119. The use of an equipment grounding conductor in the feeder or branch circuit supplying a separate building should not be optional. The current rule is an exception to the general requirement found in 250.24(A)(5), stating that a "grounding connection shall not be made to the grounded conductor on the load side of the service disconnecting means." It took the code making process a long time to rectify the exception to the rule for ranges and clothes dryers. Proposal 14-43 would remove another unnecessary exception to the rule.
My vote to Reject proposal 14-43 concurs with the substantiation provided by Code-Making Panel 14. My vote, however, would be to Accept this proposal if Code-Making Panel 5 makes a wise decision and votes to Accept Proposal 5-119.

14-138 Log #1505 NEC-P14 **Final Action: Accept in Principle**
(505.25(B))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Delete:
"...and is to be relied on to complete a sole equipment grounding path".
Substantiation: Edit. These raceways cannot be used as the sole grounding path. This wording is not used in 502.30(B) or 503.30(B).
Panel Meeting Action: Accept in Principle
Revise 505.25(B) to read:
Flexible metal conduit and liquidtight flexible metal conduit shall not be used as the sole ground-fault current path. Where equipment bonding jumpers are installed, they shall comply with 250.102.
Retain the exisiting exception.
Panel Statement: The panel concurs that flexible metal conduit and liquidtight flexible metal conduit cannot be used in Class I, Zone 2 location as the sole ground-fault current path and has revised the current text for clarity.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-139 Log #2436 NEC-P14 **Final Action: Accept**

Submitter: Eliana Beattie, ISA
Recommendation: 506.1 - FPN 2
Change ISA 12.10.05 to ANSI/ISA-61241-10 (12.10.05)-2004.
Substantiation: Change format to match actual ISA standards numbering.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 506 — ZONE 20, 21, AND 22 LOCATIONS FOR COMBUSTIBLE DUSTS, FIBERS, AND FLYINGS

14-139a Log #CP1409 NEC-P14 **Final Action: Accept**
(506.2)

TCC Action: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the panel as a public comment.
Submitter: Code-Making Panel 14,
Recommendation: Add the following new definitions to 506.2:
Protection by pressurization 'pD'. Type of protection that guards against the ingress of a mixture of combustible dust, fibers, or flyings in air into an enclosure containing electrical equipment by providing and maintaining a protective gas atmosphere inside the enclosure at a pressure above that of the external atmosphere.
FPN: For additional information see, ISA 61241-2 (12.10.04), Electrical Apparatus for use in Zone 21 and Zone 22 Hazardous (Classified) Locations-Protection by Pressurization "pD".
Protection by Intrinsic Safety 'iD'. Type of protection where any spark or thermal effect is incapable of causing ingition of a mixture of combustible dust, fibers, or flyings in air under prescribed test conditions.
FPN: For additional information see ISA 61241-11 (12.10.06), Electrical Apparatus for use in Zone 20, Zone 21 and Zone 22 Hazardous (Classified) Locations- Protection by Intrinsic Safety "iD".
Substantiation: These definitions are added to agree with ISA standards ISA 61241-2 and 61241-11 for the recognized types of protection.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 11 Negative: 3
Explanation of Negative:
BRIESCH, E.: The Panel Action should be Reject. The referenced standards for the protection techniques "pD" and "iD" are not currently published.
COOK, D.: Panel should reject this proposal based on the fact that applicable product standards are not published.
LAWRENCE, JR., W.: The panel action should have been to "reject" as the reference standards ISA 61241-2 and 61241-11are not yet published.

14-140 Log #1416 NEC-P14 **Final Action: Reject**
(506.2)

Submitter: Al Engler, Det Norske Veritas
Recommendation: Add text as follows:
Protection by Enclosure "tD". Type of protection for explosive dust atmospheres where electrical apparatus is provided with an enclosure providing dust ingress protection and a means to limit surface temperatures.
FPN: For additional information see ISA 61241-0 (12.10.02) Electrical Apparatus for Use in Zone 20, Zone 21 and Zone 22 Hazardous (Classified) Locations–General requirements (IEC 61241-0 Mod), and ISA 61241-1 (12.10.03) Electrical Apparatus for Use in Zone 21 and Zone 22 Hazardous (Classified) Locations–Protection by Enclosure "tD" (IEC 61241-1 Mod).

Substantiation: ISA 61241-0 and ISA 6124-1 define the requirements for the type of protection “tD”, which is suitable for Zone 21 and Zone 22 locations.
Panel Meeting Action: Reject
Panel Statement: The standard covering the protection technique specified in the recommendation is not currently published.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

(506.2)

Submitter: Edward M. Briesch, Underwriters Laboratories, Inc.
Recommendation: Revise text to read as follows:
Dusttight. Enclosures constructed so that dust will not enter under specified test conditions.
FPN: See ANSI/ISA 12.12.01-2000, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations* . ~~;~~
~~and UL 1604-1994, *Electrical Equipment for Use in Class I and II, Division 2 and Class III Hazardous (Classified) Locations*~~ .
Substantiation: UL1604 has been withdrawn.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-143 Log #2670 NEC-P14 **Final Action: Reject**
(506.2)

Submitter: Eliana Beattie, ISA
Recommendation: Add text as follows:
Protection by encapsulation “mD”. Type of protection where electrical parts that could cause ignition of a mixture of combustible dust, fibers, or flyings in air are protected by enclosing them in a compound in such a way the explosive atmosphere cannot be ignited.
FPN No. 1: For additional information see ISA-61241-18 (12.10.07)-2006 Electrical Apparatus for Use in Zone 20, Zone 21 and Zone 22 Hazardous (Classified) Locations-Protection by Encapsulation “mD”.
FPN No. 2: Encapsulation is designated level of protection “maD” for use in Zone 20 locations. Encapsulation is designated level of protection “mbD” for use in Zone 21 locations.
Substantiation: ISA-61241-18 includes two levels of protection, “maD” and “mbD” which are suitable for Zone 20 and Zone 21 locations, respectively.
Panel Meeting Action: Reject
Panel Statement: The standard covering the protection technique specified in the recommendation is not currently published.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-144 Log #2452 NEC-P14 **Final Action: Reject**
(506.4(A) & 506.9(C))

Submitter: Eliana Beattie, ISA
Recommendation: 1) Revise 506.4(A) as follows:
506.4 General.
(A) Documentation for Industrial Occupancies.
(1) Area Classification. All areas designated as hazardous (classified) locations shall be properly documented. This documentation shall be available to those authorized to design, install, inspect, maintain, or operate electrical equipment at the location.
(2) Certificates of Conformity. The documentation, for electrical equipment marked in accordance with 506.9(C) shall include a Certificate of Conformity showing compliance with the applicable standards.
(a) Where the Certificate number includes an “X” suffix, the electrical equipment Listing includes Special Condition for Safe Use which shall be observed.
(b) Where the Certificate number includes a “U” suffix, the equipment is an incomplete component and is not suitable for installation without further evaluation.
2) Provide a new marking 506.9(C) on “Marking” with the following underlined additional text:
C) Marking.
Equipment shall be permitted to be marked with a certificate reference, see 506.4(A).
Equipment identified for Class II, Division 1 or Class II, Division 2 shall, in addition to being marked in accordance with 500.8(B), be permitted to be marked with both of the following:
(1) Zone 20, 21, or 22 (as applicable)
(2) Temperature classification in accordance with 506.9(D)
Substantiation: While listing and labeling are marks to indicate equipment meets specific standards, Certificates offer an extremely important long term benefit of providing documentation that will enable users to understand the Models certified, the applicable standards, the effective date and any special conditions for safe use, long after the normal life of most other product literature. Certificates are this important documentation that provides vital information to users to better assure that equipment will be properly installed within a hazardous (classified) location.
Examples of certificates, selected at random from public sources, are provided for improved understanding.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: This proposal would add permission to permit a certificate that is not prohibited by the current requirements. The additional text serves no purpose. The panel rejection of the proposal in no way prohibits the manufacturer and/or the certification body from providing a certificate if it is needed or desired for other reasons.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-148 Log #363 NEC-P14 **Final Action: Reject**
(506.6(A) (New))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Add a new 506.6(A) as follows:
(A) Supervision of Work. Classification of areas and selection of equipment and wiring methods shall be under the supervision of a qualified Registered Professional Engineer.
Renumber the balance of this section accordingly.
Substantiation: Hazardous (classified) locations under the Zone System of classification are currently few and far between in North America. 505.7(A) continues to require areas classified under the Zone System of classifying hazardous (classified) locations in the 2005 NEC. There was activity to remove this requirement in the 2005 NEC cycle that was rejected by the CMP and the Technical Correlating Committee as a result of ballot votes and not receiving the necessary 2/3. (Note: See action on Proposal 14-78 and Comment 14-74). Since Article 506 is new to the NEC and the methods of area classification provided in the article use the Zone System (20, 21, and 22) for classifying hazardous locations, the requirement for engineering supervision should be consistent. The proposed wording provided is identical to that already used in 505.7(A).

Panel Meeting Action: Reject
Panel Statement: The elements involved in installation, design, and inspection all require qualified individuals and should not rely exclusively on the qualifications or certification of a single individual or entity.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 11 Negative: 3
Explanation of Negative:
COOK, D.: See my explanation of negative vote on Proposal 14-109.

Submitter: Code-Making Panel 14,
Recommendation: Revise as indicated and add the following all new text following tD and renumber as indicated:
(1) Division Equipment. Equipment identified for Class II, Division 1 or Class II, Division 2 shall, in addition to being marked in accordance with 500.8(B), be permitted to be marked with both of the following:
(1) Zone 20, 21, or 22 (as applicable)
(2) Temperature classification in accordance with 506.9(D)
(2) Zone Equipment. Equipment meeting one or more of the protection techniques described in 506.8 shall be marked with the following in the order shown:
(1) Symbol "AEx"
(2)Protection technique(s) in accordance with Table 506.20 (F) (1);
(3) Zone
(4) Temperature classification, marked as a temperature value, in degrees C, preceded by T;
(5) Ambient temperature marking in accordance with 506.9(D).
Substantiation: The recommendation provides marking requirements for zone equipment.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 2
Explanation of Negative:
COOK, D.: Panel should reject this proposal based on the fact that applicable product standards are not published.
LAWRENCE, JR., W.: The panel action should have been to "reject" as Table 506-20(F)(1) should not have been added (14-153a)as the types of protection referred to in the Table have not yet been added to Article 506.

14-151 Log #2566 NEC-P14 **Final Action: Accept in Principle**
(506.9(F))

Submitter: Peter Schimmoeller, CSA International
Recommendation: Add new text as follows:
506.9(F) Fiber Optic Cable Assembly. Where a fiber optic cable assembly contains conductors that are capable of carrying current, the fiber optic cable assembly shall be installed in accordance with the requirements of Article 506, as applicable.
Substantiation: Current Code does not address fiber optical cables with electrical conductors used in Zone 20, 21, or 22 classified locations. This proposal adds wording similar to that found in Division classified locations.
Panel Meeting Action: Accept in Principle
The panel accepts the recommendation in principle with the following revision:
506.9(F) Fiber Optic Cable Assembly. Where a fiber optic cable assembly contains conductors that are capable of carrying current, the fiber optic cable assembly shall be installed in accordance with 506.15 and 506.16, as applicable.
Panel Statement: The panel has revised the recommendation to specifically require compliance with the applicable wiring method and sealing rules.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-152 Log #2473 NEC-P14 **Final Action: Accept**
(506.15(A)(3))

TCC Action: The Technical Correlating Committee directs the panel to reconsider this proposal and to relocate the reference in the FPNs into Annex A to be consistent with other parts of the Code. This action will be considered by the panel as a public comment.
Submitter: Donald W. Ankele, Underwriters Laboratories Inc.
Recommendation: Revise text to read as follows:
(3) In industrial establishments with limited public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type MC- HL cable, listed for use in Zone 20 locations, with a gas/vaportight continuous corrugated metallic sheath, and overall jacket of suitable polymeric material, separate grounding conductors in accordance with 250.122, and provided with termination fittings listed for the application, shall be permitted.
Exception: Type MC- HL cable and fittings listed for Class II, Division 1 locaitons are permitted to be used.
FPN 1: See 330.12 for restrictions on use of Type MC cable.
FPN 2: For further information on construction, testing and marking requirements for Type MC-HL cable and Type MC-HL cable fittings, see ANSI/UL 2225, Cables and Cable Fittings for Use in Hazardous (Classified) Locations.

Substantiation: Type MC cable listed specifically for hazardous locations carries the HL marking. This is consistent with similar portions of Chapter 5. Add FPN 1 to refer to Article 330. Add FPN 2 to reference the ANSI standard for Type MC-HL cable and Type ITC-HL cables and cable fittings to aid approval of the installation for the location involved.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-153 Log #2210 NEC-P14 **Final Action: Reject**
(506.15(C)(6))

Submitter: Kyle Cope, Prysmian Cables and Systems
Recommendation: Revise as follows:
Type MC, MI, PA , MV in TC cable installed in ladder, ventilated trough..
Substantiation: Statement of problem: Material technology advancements now allow for cable designs that provide improved mechanical damage protection. i.e., crush and impact, over standard Type MC cable without sacrificing flame performance properties. The characteristics achieved using traditional metallic components can now be realized using polymeric materials. The use of polymeric materials also provides the opportunity for lighter and smaller diameter cables.
Substantiation for Proposal: Type PA has been proposed as a new type (Article 3XX) and should be included in this list (506.15(C)(6)) as it offers enhanced mechanical benefits as an alternate to Type MC cable. See test data provided. A UL Fact-Finding study comparing the subject cable to type MC is ongoing at the time of proposal submittal. This data will be forwarded once the study is complete.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: This cable is not currently recognized as a Chapter 3 wiring method. CMP-14 notes that CMP-7 rejected a proposal to include this type of cable in Chapter 3.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-153a Log #CP1411 NEC-P14 **Final Action: Accept**
(506.20 & Table 506.20(F) (New))

TCC Action: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the panel as a public comment.
Submitter: Code-Making Panel 14,
Recommendation: Add the following new text following tD and renumber as indicated:
(F) Types of Protection Allowed. The types of protection allowed in Zones, 20, 21 and 22 are shown in Table 506.20 (F).

Table 506.20(F) Types of Protection Designation

Protection Type	Zone 20	Zone 21	Zone 22
Protection by enclosures 'tD'	Not allowed	tD	tD
Protection by pressurization "pD"	Not allowed	pD	pD
Protection by intrinsic safety "iD"	iaD	iaD ibD	iaD ibD
Protection by encapsulation "mD"	maD	maD mbD	maD mbD

Substantiation: This table is provided as a means of reflecting the correct zone of application for the defined type of protection.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 10 Negative: 4
Explanation of Negative:
BRIESCH, E.: The Panel Action should be Reject. The standards defining the protection techniques tabulated in Table 506.20(F) are not currently published. The Table therefore serves no purpose.
COOK, D.: Panel should reject this proposal based on the fact that applicable product standards are not published.
LAWRENCE, JR., W.: The panel action should have been to "reject" as the types of protection referred to in the Table have not yet been added to Article 506.
NEAGLE, J.: The standards covering the types of protection listed in the table have not yet been published. The panel action should be to reject this proposal.

14-154 Log #2767 NEC-P14 **Final Action: Reject**
(506.25(A))

Submitter: Truman C. Surbrook, Michigan State University
Recommendation: Add a new last sentence to 506.25(A) to read as follows:
When a bonding jumper is used, it shall be sized in accordance with 250.102(D).
Substantiation: There is no clear statement specifying the minimum size required when a bonding jumper is used for bonding back to the service for a circuit serving a classified hazardous location.
Panel Meeting Action: Reject
Panel Statement: Since 90.3 states the general requirements apply unless modified by the special requirements in Chapters 5, 6, and 7, the requirements in 250.102(D) are applicable without reference. This section does not modify the sizing requirement.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-155 Log #2407 NEC-P14 **Final Action: Reject**
(506.25(A) Exception)

TCC Action: It was the action of the Technical Correlating Committee that this proposal be reconsidered and correlated with the action on Proposal 5-119. This action will be considered by the panel as a public comment.
Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Revise text to read:
506.25 Grounding and Bonding. Grounding and bonding shall compu with Article 250 and the requirements in 506.25(A) and 506.25(B).
(A) Bonding. The locknut-bushing and double-locknut types of contacts shall not be depended on for bonding purposes, but bonding jumpers with proper fittings or other approved means of bonding shall be used. Such means of bonding shall apply to all intervening raceways, fittings, boxes, enclosures, and so forth, between Zone 20, Zone 21, and Zone 22 locations and the point of grounding for service equipment or point of grounding of a separately derived system.
~~Exception: The specific bonding means shall be required only to the nearest point where the grounded circuit conductor and the grounding electrode conductor are connected together on the line side of the building or structure disconnecting means as specified in 250.32(A), (B), and (C), if the branch circuit overcurrent protection is located on the load side of the disconnecting means.~~
Substantiation: This is a companion proposal to my proposal to delete 250.32(B)(2). If 250.32(B)(2) is deleted as I am requesting, this section will need to be revised as well.
Panel Meeting Action: Reject
Panel Statement: The panel rejects this proposal based on the fact that the sole substantiation is acceptance of a companion proposal by CMP-5. Without current knowledge of CMP-5's actions on these companion proposals, CMP-14 has no alternative other than to reject and await any necessary correlating action recommended by the TCC.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
BERNSEN, M.: I agree with the change being proposed in Proposal 5-119. The use of an equipment grounding conductor in the feeder or branch circuit supplying a separate building should not be optional. The current rule is an exception to the general requirement found in 250.24(A)(5), stating that a "grounding connection shall not be made to the grounded conductor on the load side of the service disconnecting means." It took the code making process a long time to rectify the exception to the rule for ranges and clothes dryers. Proposal 14-43 would remove another unnecessary exception to the rule.
My vote to Reject proposal 14-43 concurs with the substantiation provided by Code-Making Panel 14. My vote, however, would be to Accept this proposal if Code-Making Panel 5 makes a wise decision and votes to Accept Proposal 5-119.

14-155a Log #CP1403 NEC-P14 **Final Action: Accept**
(506.25(B))

Submitter: Code-Making Panel 14,
Recommendation: Revise 506.25(B) to read:
Liquidtight flexible metal conduit shall not be used as the sole ground-fault current path. Where equipment bonding jumpers are installed, they shall comply with 250.102.
Retain the exisiting exception.
Substantiation: The revised wording clarifies the requirement and is parallel language to the same requirements in Articles 501, 502, 503, and 505
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 511 — COMMERCIAL GARAGES, REPAIR AND STORAGE

14-156 Log #3412 NEC-P14 **Final Action: Reject**
(511.2 (New) and 511.3)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Add a new 511.2 and Revise 511.3 to read as follows:
511.2 Definitions.
Major Repair Garage. A building or portions of a building where major repairs, such as engine overhauls, painting, body and fender work, and repairs that require draining of the motor vehicle fuel tank are performed on motor vehicles, including associated floor space used for offices, parking, or showrooms. [NFPA 30A-2003, 3.3.12.1]
Minor Repair Garage. A building or portions of a building used for lubrication, inspection, and minor automotive maintenance work, such as engine tune-ups, replacement of parts, fluid changes (e.g., oil, antifreeze, transmission fluid, brake fluid, air conditioning refrigerants, etc.), brake system repairs, tire rotation, and similar routine maintenance work, including associated floor space used for offices, parking, or showrooms. [NFPA 30A-2003, 3.3.12.2]
511.3 Area Classification, General. Where Class I liquids or gaseous fuels are stored, handled, or transferred, electrical wiring and electrical utilization equipment shall be designed in accordance with the requirements for Class I, Division 1 or 2 hazardous (classified) locations as classified in accordance with 500.5 and 500.6, and this article. A Class I location shall not extend beyond an unpierced wall, roof, or other solid partition that has no openings. [NFPA 30A-2003, 8.3.5, 8.3.2]
(A) Parking Garages. Parking garages used for parking or storage shall be unclassified.
FPN: For further information, see NFPA 88A-2002, Standard for Parking Structures, and NFPA 30A-2003, Code for Motor Fuel Dispensing Facilities and Repair Garages.
(B) Repair Garages, With Dispensing. Major and minor repair garages that dispense motor fuels into the fuel tanks of vehicles, including flammable liquids having a flash point below 38°C (100°F), such as gasoline, or gaseous fuels, such as natural gas, hydrogen, or LPG, shall have the dispensing functions and components classified in accordance with Table 514.3(B)(1) in addition to any classification required by this section. Where Class I liquids, other than fuels, are dispensed, the area within 900 mm (3 ft) of any fill or dispensing point, extending in all directions, shall be a Class I, Division 2 location.
(C) Major Repair Garages. Where flammable liquids having a flash point below 38°C (100°F), such as gasoline, or gaseous fuels, such as natural gas, hydrogen, or LPG, will not be dispensed, but repair activities that involve the transfer of such fluids or gases are performed, the classification rules in (1), (2) and (3) shall apply.
(1) Floor Areas.
(a) Ventilation Provided. The floor area shall be unclassified where there is mechanical ventilation providing a minimum of four air changes per hour or one cubic foot per minute of exchanged air for each square foot of floor area. Ventilation shall provide for air exchange across the entire floor area and exhaust air shall be taken at a point within 0.3 m (12 in.) of the floor.
(b) Ventilation Not Provided. The entire floor area up to a level of 450 mm (18 in.) above the floor shall be classified as Class I Division 2 if the ventilation does not comply with 511.3(B)(1)(a).
(2) Ceiling Areas. Where lighter-than-air gaseous fueled vehicles, such as vehicles fueled by natural gas or hydrogen, are repaired or stored, the area within 450 mm (18 in.) of the ceiling shall be considered for classification in accordance with (a) and (b).
(a) Ventilation Provided. The ceiling area shall be unclassified where ventilation is provided, from a point not less than 450 mm (18 in.) from the highest point in the ceiling, to exhaust the ceiling area at a rate of not less than 0.3 $m^3/min/m^2$ (1 cfm/ft^2) of ceiling area at all times that the building is occupied or when vehicles using lighter-than-air gaseous fuels are parked below this area.
(b) Ventilation Not Provided. Ceiling areas that are not ventilated in accordance with 511.3(C)(2)(a) shall be classified as Class I, Division 2.
(3) Pit Areas in Lubrication or Service Room. Any pit, belowgrade work area, or subfloor work area shall be classified as provided in (a) or (b).
(a) Ventilation Provided. The pit area shall be a Class I Division 2 location where there is mechanical ventilation providing a minimum of six air changes per hour.
{Where ventilation is provided to exhaust the pit area at a rate of not less than 0.3 $m^3/min/m^2$ (1 cfm/ft^2) of floor area at all times that the building is occupied or when vehicles are parked in or over this area and where exhaust air is taken from a point within 300 mm (12 in.) of the floor of the pit, belowgrade work area, or subfloor work area, the pit shall be unclassified. [NFPA 30A-2003, 7.4.5.4 & Table 8.3.1]}
(b) Ventilation Not Provided. Where ventilation is not provided in accordance with 511.3(C)(3)(a), any pit or depression below floor level shall be a Class I, Division 1 location that extends up to the floor level.
(D) Minor Repair Garages. Where flammable liquids having a flash point below 38°C (100°F), such as gasoline, or gaseous fuels, such as natural gas or hydrogen, will not be dispensed or transferred, the classification rules in (1), (2) and (3) shall apply to the lubrication and service rooms.
(1) Floor Areas. Floor areas in minor repair garages without pits, belowgrade work areas, or subfloor work areas shall be unclassified. Where floor areas include pits, belowgrade work areas or subfloor work areas in lubrication or service rooms, the classification rules in (a) or (b) shall apply.
(a) Ventilation Provided. The entire floor area shall be unclassified where there is mechanical ventilation providing a minimum of four air changes per hour or one cubic foot per minute of exchanged air for each square foot of floor area. Ventilation shall provide for air exchange across the entire floor area and exhaust air shall be taken at a point within 0.3 m (12 in.) of the floor.
(b) Ventilation Not Provided. The floor area up to a level of 450 mm (18 in.) above any unventilated pit, belowgrade work area, or subfloor work area and extending a distance of 900 mm (3 ft) horizontally from the edge of any such pit, belowgrade work area, or subfloor work area shall be classified as Class I Division 2.
(2) Ceiling Areas. Where lighter-than-air gaseous fuels (such as natural gas or hydrogen) will not be transferred, such locations shall be unclassified.
(3) Pit Areas in Lubrication or Service Room. Any pit, belowgrade work area, or subfloor work area shall be classified as provided in (a) or (b).
(a) Ventilation Provided. Where ventilation is provided to exhaust the pit area at a rate of not less than 0.3 $m^3/min/m^2$ (1 cfm/ft^2) of floor area at all times that the building is occupied or when vehicles are parked in or over this area and where exhaust air is taken from a point within 300 mm (12 in.) of the floor of the pit, belowgrade work area, or subfloor work area, the pit shall be unclassified. [NFPA 30A-2003, 7.4.5.4 & Table 8.3.1]
(b) Ventilation Not Provided. Where ventilation is not provided in accordance with 511.3(D)(3)(a), any pit or depression below floor level shall be a Class I, Division 2 location that extends up to the floor level.
(E) Modifications to Classification.
(1) Specific Areas Adjacent to Classified Locations. Areas adjacent to classified locations in which flammable vapors are not likely to be released, such as stock rooms, switchboard rooms, and other similar locations, shall be unclassified where mechanically ventilated at a rate of four or more air changes per hour, or designed with positive air pressure, or where effectively cut off by walls or partitions.
(2) Alcohol-Based Windshield Washer Fluid. The area used for storage, handling, or dispensing into motor vehicles of alcohol-based windshield washer fluid in repair garages shall be unclassified unless otherwise classified by a provision of 511.3. [NFPA 30A-2003. 8.3.5, Exception]
Substantiation: This proposal generally preserves the technical content of 511.3, but presents the information in a much more user-friendly manner. There are two editorial difficulties with the organization of the panel action on the proposal. First, by presenting the user with two disconnected laundry lists of areas that either are or are not classified, it makes finding the requirements for a given area under consideration difficult. For example, in garages where flammable liquids will not be transferred, one finds these locations on two lists; the one in (A)(6) saying they are not classified, and the one in (B)(2) saying they are in some locations. Although there is a cross reference, the organization is confusing at best. Second, the layout fails to take full advantage of the crucial distinctions in NFPA 30A between major and minor repair garages. This is particularly problematic in that 511.3(B)(4) specifically uses the termonology "major repair garages."
Therefore, and since the distinctions between major and minor repair garages, particularly the potential "transfer" of flammable materials inform most of the technical provisions in the current NEC text, the submitter opens this proposal with those two definitions extracted from NFPA 30 and placed in 511-2, the appropriate section for definitions. The comment then organizes the requirements based on specific locations, as follows:
511.3: This adds appropriate parent language for area classification for this section, including additional language extracted from 30A. The lettered subsections following all cover area classifications within their scope.
511.3(A): This is the parking garage material, unamended.
511.3(B): This is the language that brings in Article 514 when actual fuel dispensing is part of the operation. This is 511.3(B)(1) and 511.3(B)(3)(5) in the NEC.
511.3(C): This is where major repair garages land. They have three areas requiring consideration for classification, and the numbered subsections proceed accordingly. The parent language effectively calls attention to the provision in the definition regarding fuel tanks, thereby reiterating the distinction for clarity.
511.3(C)(1)(a): This is 511.3(A)(5) in the NEC.
511.3(C)(1)(b): This is 511.3(B)(3)(1) and (4) in the NEC
511.3(C)(2)(a) and (b): These are 511.3(A)(7) and 511.3(B)(4) in the NEC
511.3(C)(3)(a) and (b): These are 511.3(B)(3)(2), and 511.3(B)(3)(3) in the NEC. Note that the ventilated pit rules in the NEC arguably conflict with NFPA 30A allowances for an unclassified location with adequate ventilation; this allowance in NFPA 30A appears to apply to both major and minor repair garages. CMP 14 should decide whether the extract policy will affect the outcome of this classification rule. If it does, the correlated text appears within {curly braces}.
511.3(D)(1): This is 511.3(A)(6) in the proposal incorporated into the floor area requirement, and correlation of the floor area requirements for above "pits" that are in 511.3(A)(4) and 511.3(B)(2) in the NEC. If a minor repair garage has an unventilated pit, it could be argued the NEC classifies the floor

area around the pit as Div. 2, even if the general shop floor met the ventilation requirements for a major repair garage, even though the pit itself is only Class I Div. 2. The structure in this proposal provides overall consistent technical content to that of the NEC: The entire floor area is unclassified if ventilated, and even if not, only the floor area over or to the edge (within 3 ft) of an unventilated pit is classified.

511.3(D)(2): The submitter understands that the issue of ceiling classifications for minor repair garages has been discussed within the 30A Committee, and the conclusion reached that potential gas releases were too minor to warrant classification, which is why 30A only imposes the ceiling classification requirement on major repair garages. This does need to be addressed, however, in this part of the requirements in order to avoid obvious questions.

511.3(D)(3): This is 511.3(A)(4) and 511.3(B)(2)(1) of the NEC. Note that 511.3(B)(2)(2) of the NEC is included in 511.3(D)(1)(b) of this proposal, assuming no general floor ventilation.

511.3(E): This is 511.3(A)(2) and 511.3(A)(3) in the proposal, editorially modified to make a positive declaration of classification. Since these topics are of comparatively minor interest and application, it made more sense to place them at the end of the section.

The reformatted layout includes all provisions contained in the NEC, but reformatted by location. This proposal is offered as a constructive suggestion for a far more user-friendly presentation of this material, and the submitter requests CMP 14 consider it accordingly. The submitter wishes to thank Marshall Klein of the 30A Committee, who graciously took time to review this material on several occasions.

Panel Meeting Action: Reject

Panel Statement: The panel concludes that the recommended text does not improve the usability of this section. The panel notes that the recommendation includes a change that creates mandatory language considering the classification of parking garages, which is different from the permissive language in the 2005 NEC.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-157 Log #1628 NEC-P14 **Final Action: Accept**

(511.3(A)(6))

Submitter: Tom Henry, Code Electrical Classes, Inc.

Recommendation: Revise text to read as follows:

Such location shall be considered to be unclassified ~~.~~ <u>,</u> unless the location is required to be classified in accordance with 511.3(B)(2) or (B)(4).

Substantiation: Remove period and replace with comma as shown above.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-158 Log #998 NEC-P14 **Final Action: Accept**

(511.3(B)(1))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Change "Article 514" to "514.3".

Substantiation: Edit. To conform to Style Manual requirements.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-159 Log #3414 NEC-P14 **Final Action: Reject**

(511.4(A))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Recommendation: Insert a second paragraph as follows:

Raceways buried beneath the floor of a classified location covered in 511.3 shall not be considered to be in a classified location, but shall be sealed within 3.05 m (10 ft) of the point of emergence above grade in accordance with 501.15(A)(4).

Substantiation: CMP 14 removed the classification requirements for these raceways in the 2005 cycle based on the premise that there was insufficient oxygen available to create an explosive fuel-air mixture. Although this is presumably true, the concentration of flammable materials below grade in these areas is well known. As these chemicals infiltrate the underground conduit system, they will migrate through the conduit to a point where air is plentiful. Remember that the current NEC does require a boundary seal, but with the underground area no longer classified, that boundary seal could be placed at a point before the conduit system enters the floor from the repair garage area. This proposal restores a sealing requirement (need not be explosionproof) at the point where a hazardous fuel-air mixture could form. Note that 514.8 retains a similar requirement. Note also that a short underground run accomplished with an unbroken length of conduit qualifies under this wording for treatment under 501.15(A)(4) Exception No.1, and only one seal at either end of the raceway is allowable.

Panel Meeting Action: Reject

Panel Statement: The panel reaffirms its action for the 2005 NEC, and the submitter has not provided technical substantiation that convinces the panel it is necessary to require an explosionproof seal at the point of emergence. Additionally, based on the reference to 501.15(A)(4) in the recommended text, the panel does not concur with the submitter's substantiation that the seal does not have to be explosionproof. Seals installed to meet the requirements of 501.15(A)(4) are required to be explosionproof.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-160 Log #2211 NEC-P14 **Final Action: Reject**

(511.7(A)(1))

Submitter: Kyle Cope, Prysmian Cables and Systems

Recommendation: Revise as follows:

"... or liquidtight flexible nonmetallic conduit, or shall be Type MC, AC, MI, <u>PA</u> manufactured wiring systems...".

Substantiation: Statement of problem: Material technology advancements now allow for cable designs that provide improved mechanical damage protection. i.e., crush and impact, over standard Type MC cable without sacrificing flame performance properties. The characteristics achieved using traditional metallic components can now be realized using polymeric materials. The use of polymeric materials also provides the opportunity for lighter and smaller diameter cables.

Substantiation for Proposal: Type PA has been proposed as a new type (Article 3XX) and should be included in this list (511.7(A)(1)) as it offers enhanced mechanical benefits as an alternate to Type MC cable. See test data provided. A UL Fact-Finding study comparing the subject cable to type MC is ongoing at the time of proposal submittal. This data will be forwarded once the study is complete.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: This cable is not currently recognized as a Chapter 3 wiring method. CMP-14 notes that CMP-7 rejected a proposal to include this type of cable in Chapter 3.

Number Eligible to Vote: 14

14-161 Log #237 NEC-P14 **Final Action: Reject**

(511.7(B)(1)(b))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education

Recommendation: Revise as follows:

"Fixed Lighting. Lamps and lampholders for fixed lighting that is located over lanes through which vehicles are commonly driven or that may otherwise be exposed to ~~physical~~ damage shall be located not less than...".

Substantiation: Use of the word "physical" is superfluous - the intent is obvious given the context.

Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every unnecessary instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on. Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."

Panel Meeting Action: Reject

Panel Statement: See the panel statement on Proposal 14-50 which provides a thorough explanation for the rejection of this proposal and others recommending the elimination of "physical".

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-162 Log #236 NEC-P14 **Final Action: Reject**

(511.10(B)(3))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education

Recommendation: Revise as follows:

Where an automatic arrangement is provided to pull both cord and plug beyond the range of ~~physical~~ damage, no additional connector shall be required in the cable or at the outlet.

Substantiation: Use of the word "physical" is superfluous - the intent is obvious given the context.

Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every unnecessary instance, as I am attempting to do, we actually cut the NEC down by up to oh, maybe a quarter page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.

Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the

Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."
Panel Meeting Action: Reject
Panel Statement: See the panel statement on Proposal 14-50 which provides a thorough explanation for the rejection of this proposal and others recommending the elimination of "physical".
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-163 Log #514 NEC-P14 **Final Action: Accept in Part**
(511.16(A) & (B))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read:
511.16 ~~Grounded and~~ Grounding and Bonding Requirements.
(A) General Grounding and Bonding Requirements. All metal raceways, the metal armor or metallic sheath on cables, and all normally non-current-carrying metal parts of fixed or portable electrical equipment, regardless of voltage, shall be grounded and bonded as provided in Article 250.
(B) Supplying Circuits with Grounded and Grounding Conductors in Class I Locations. Grounding in Class I location shall comply the grounding and bonding ~~with~~ requirements in 501.30.
Substantiation: 501.30 includes both grounding and bonding requirements for Class I locations. Both grounding and bonding requirements should be referenced here since 501.30 includes both grounding and bonding rules and is referenced from this section.
Panel Meeting Action: Accept in Part
Panel Statement: The panel accepts only the recommendation to revise the title of this section. The panel rejects the revisions to (A) and (B) because the submitter has not provided technical substantiation to support the recommendation.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
COOK, D.: The proposed change and substantiation is correct.

14-164 Log #1255 NEC-P14 **Final Action: Reject**
(511.16(A))

TCC Action: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting in accordance with 4.1.1 of the NEC Style Manual. This action will be considered by the panel as a public comment.
Submitter: Daniel Leaf, Seneca, SC
Recommendation: Delete: "as provided in Article 250".
Substantiation: Edit. To comply with the Style Manual. Article 250 already applies per 90.3.
Panel Meeting Action: Reject
Panel Statement: The grounding requirement in this section is unique in that it applies regardless of the voltage. Where the reference to an entire article is conditional based on specific requirements in a particular article, the NEC Style Manual permits the reference to an entire article.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
COOK, D.: Submitter is correct that compliance with Article 250 is required by 90.3. Deleting that text will not change the requirement.

14-165 Log #1754 NEC-P14 **Final Action: Accept**
(511.16(B)(2))

Submitter: David Belt, Underwriters Laboratores Inc.
Recommendation: Replace the term "portable lamp" with the term " portable luminaire ". Revise text as follows:
511.16 Grounded and Grounding Requirements
(B) Supplying Circuits with Grounding and Grounding Conductors in Class I Locations
(2) Approved Means. Approved means shall be provided for maintaining continuity of the grounding conductor between the fixed wiring system and the non-current-carrying metal portions of pendant luminaires (fixtures), portable ~~lamps~~ luminaires , and portable utilization equipment.
Substantiation: The term "luminaire" has already been accepted in the Code as the correct terminology for a lighting system and replaces the terms "fixture" or "lighting fixture", which were terms for fixed lighting systems.
The term "portable luminaire" has been accepted by the IEC as the correct term for cord and plug connected lighting products and has also been adopted by UL in their ANSI/UL153 Safety Standard, which was previously titled "Portable Electric Lamps" and is now titled "Portable Electric Luminaires".
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 513 — AIRCRAFT HANGARS

14-165a Log #CP1413 NEC-P14 **Final Action: Accept**
(513.2)

Submitter: Code-Making Panel 14,
Recommendation: Add a new definition to read:
Aircraft Painting Hangar. An aircraft hangar constructed for the express purpose of spray/coating/dipping applications and provided with dedicated ventilation supply and exhaust.
Substantiation: Aircraft paint hangars have not been previously defined and with the acceptance of proposal Log# CP1412 this is a necessary definition.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-165b Log #CP1412 NEC-P14 **Final Action: Accept**
(513.3(C))

Submitter: Code-Making Panel 14,
Recommendation: Revise current text and add new text as follows:
(C) Vicinity of Aircraft.
(1) Aircraft Maintenance and Storage Hangars. [retain current text of 513.3(C)]
(2) Aircraft Painting Hangars. The area within 3m (10ft) horizontally from aircraft surfaces from the floor to 3m (10ft) above the aircraft shall be classified as Class I, Division 1 or Class I, Zone 1. The area horizontally from aircraft surfaces between 3.0m (10ft) and 9.0m (30) from the floor to 9.0m (30ft) above the aircraft surface shall be classified as Class I, Division 2 or Class I, Zone 2.
FPN: See NFPA 33-2003, Standard for Spray Application Using Flammable or Combustible Materials for information on ventilation and grounding for static protection in spray painting areas.
Substantiation: NFPA 409-2005 has been revised to specifically separate the hazardous locations near aircraft for aircraft paint hangars from those of general maintenance. Aircraft paint hangars while constructed like huge paint booths do not have the same dimensional clearances found in traditional paint booths. The shape of the aircraft creates clearances far greater than that found in any other painting system. This creates a level of safety not found in traditional paint booths and supports hazardous location classification that is less than the entire hangar.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
COOK, D.: While I understand the need and use for the proposed new item (C)(2), it should be clarified that the classified area described in (C)(2) is in addition to the described in (C)(1) not a replacement of the classified area from (C)(1).

14-166 Log #2180 NEC-P14 **Final Action: Accept**
(513.3(D))

Submitter: Dann Strube, Strube Consulting
Recommendation: Revise text to read as follows:
"...electrical control rooms, and other similar locations, ~~shall not be classified~~ shall be unclassified where...".
Substantiation: 500.2 defines areas that have not been classified as "Unclassified Locations". This change will put the language of this section into agreement with the 500.2 definition.
4.3.2.2 of the NEC Style Manual allows revision of extracted text to make the extract consistent with the style of the NEC.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-167 Log #2212 NEC-P14 **Final Action: Reject**
(513.7(A))

Submitter: Kyle Cope, Prysmian Cables and Systems
Recommendation: Revise as follows:
"... shall be installed in metal raceways or shall be Type MI, TC, PA or MC cable.
Substantiation: Statement of problem: Material technology advancements now allow for cable designs that provide improved mechanical damage protection. i.e., crush and impact, over standard Type MC cable without sacrificing flame performance properties. The characteristics achieved using traditional metallic components can now be realized using polymeric materials.

The use of polymeric materials also provides the opportunity for lighter and smaller diameter cables.

Substantiation for Proposal: Type PA has been proposed as a new type (Article 3XX) and should be included in this list (513.7(A)) as it offers enhanced mechanical benefits as an alternate to Type MC cable. See test data provided. A UL Fact-Finding study comparing the subject cable to type MC is ongoing at the time of proposal submittal. This data will be forwarded once the study is complete.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: This cable is not currently recognized as a Chapter 3 wiring method. CMP-14 notes that CMP-7 rejected a proposal to include this type of cable in Chapter 3.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-168 Log #1755 NEC-P14 **Final Action: Accept**

(513.10(E)(1), 513.16(B)(2))

Submitter: David Belt, Underwriters Laboratores Inc.

Recommendation: Replace the term “portable lamp” with the term “ portable luminaire “. Revise text as follows:

513.10 Special Equipment

(1) Portable Lighting Equipment. Portable lighting equipment that is used within a hangar shall be identified for the location in which they are used. For portable ~~lamps~~ luminaires , flexible cord suitable for the type of service and identified for extra-hard usage shall be used. Each such cord shall include a separate equipment grounding conductor.

513.16 Grounding and Grounding Requirements

(B) Supplying Circuits with Grounded and Grounding Conductors in Class I Locations

(2) Approved Means. Approved means shall be provided for maintaining continuity of the grounding conductor between the fixed wiring system and the non-current-carrying metal portions of pendant luminaires (fixtures), portable ~~lamps~~ luminaires , and portable utilization equipment.

Substantiation: The term “luminaire” has already been accepted in the Code as the correct terminology for a lighting system and replaces the terms “fixture” or “lighting fixture”, which were terms for fixed lighting systems.

The term “portable luminaire” has been accepted by the IEC as the correct term for cord and plug connected lighting products and has also been adopted by UL in their ANSI/UL153 Safety Standard, which was previously titled “Portable Electric Lamps” and is now titled “Portable Electric Luminaires”.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-169 Log #513 NEC-P14 **Final Action: Accept in Part**

(513.16(A))

Submitter: Michael J. Johnston, Plano, TX

Recommendation: Revise text to read:

513.16 ~~Grounded and~~ Grounding and Bonding Requirements.

(A) General Grounding and Bonding Requirements. All metal raceways, the metal armor or metallic sheath on cables, and all normally non-current-carrying metal parts of fixed or portable electrical equipment, regardless of voltage, shall be grounded and bonded as provided in Article 250. Grounding and bonding in Class I locations shall comply with 501.30 for Class I, Division 1 and 2 locations and 505.25 for Class I, Zone 0, 1, and 2 locations.

Substantiation: 501.30 and 505.25 include both grounding and bonding requirements for Class I locations. This proposed change is an effort to clarify what is actually covered by this section.

Panel Meeting Action: Accept in Part

Panel Statement: The panel accepts only the recommendation to revise the title of this section. The panel rejects the revisions to (A) because the submitter has not provided technical substantiation to support the recommendation.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

COOK, D.: The proposed change and substantiation is correct.

14-170 Log #1500 NEC-P14 **Final Action: Reject**

(513.16(A))

TCC Action: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting in accordance with 4.1.1 of the NEC Style Manual. This action will be considered by the panel as a public comment.

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Delete:

“... in accordance with Article 250”.

Substantiation: Edit. 250.1 indicates Article 250 covers (1) required grounding; (2) permitted grounding: (3) not permitted grounding; and (4) substitution for grounding. Apparent intent is to apply (1) required grounding, which is clarified by the proposal. Some sections requiring grounding do not refer to Article 250, e.g. 490.36. Article 250 already applies, per 90.3.

Panel Meeting Action: Reject

Panel Statement: The grounding requirement in this section is unique in that it applies regardless of the voltage. Where the reference to an entire article is conditional based on specific requirements in a particular article, the NEC Style Manual permits the reference to an entire article.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

COOK, D.: Submitter is correct that compliance with Article 250 is required by 90.3. Deleting that text will not change the requirement.

ARTICLE 514 — MOTOR FUEL DISPENSING FACILITIES

14-171 Log #2912 NEC-P14 **Final Action: Reject**

(514.1)

TCC Action: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.

Submitter: Marcus Sampson, Lysistrata Electric

Recommendation: Revise as follows:

514.1 Scope. This article shall apply to motor fuel dispensing facilities, marine/motor fuel dispensing facilities, motor fuel dispensing facilities located inside buildings, and fleet vehicle motor fuel dispensing facilities. The requirements of this article do not apply to dispensing facilities used exclusively for diesel motor fuel.

Substantiation: Although 514.3(A) makes it clear that areas where flammable liquids with a flash point above 38°C (100°F) shall not be required to be classified, diesel fuel dispensing facilities are often required to conform to the criteria of this article. This statement in the scope of Article 514 would assist installers and inspectors in their understanding and enforcement of the requirements.

Panel Meeting Action: Reject

Panel Statement: The assessment of whether diesel fuel should fall within the requirement of Article 514 is dependent on ambient temperature, how the fuel is stored, and the range of diesel fuels that are available. There are some diesel fuels that have flashpoints below 100 degrees F. The scope of the article does not preclude the application of requirements that are in addition to the area classification rules. Some of the requirements apply to all motor fuel dispensing facilities.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-172 Log #1667 NEC-P14 **Final Action: Reject**

(Table 514.3(B)(1))

Submitter: Wayne H. Robinson, Prince George County Government

Recommendation: Revise text to read as follows:

Dispensing Device 2, 5, 1

(except overhead type)

Dispensing Device 5, 1

(Overhead type 3)

Substantiation: The 2005 Code added marine fuel dispensing facilities to Article 514, note 1 was added on page 70-396 but wasn’t applied to the table.

Panel Meeting Action: Reject

Panel Statement: The application of the notes within the table are adequately expressed in the current text. Table note 1 is found at the top of the column “Extent of Classified Location 1 .”

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-173 Log #1627 NEC-P14 **Final Action: Reject**

(514.4)

Submitter: Tom Henry, Code Electrical Classes, Inc.

Recommendation: Add new text as follows:

5 14.4 Wiring and equipment installed in Class I locations.

Substantiation: Add the 5 to 14.4, the 5 is missing.

Panel Meeting Action: Reject

Panel Statement: The recommended action has been accomplished through a correction to the first printing to the 2005 NEC and NECH.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-174 Log #3066 NEC-P14 **Final Action: Reject**

(514.11(B))

Submitter: Richard F. Van Wert, Middle Department Inspection Agency / Rep. Benjamin Franklin Chapter IAEI

Recommendation: Revise text to read as follows:

514.11(B) Attended Self-Service Motor Fuel Dispensing Facilities. An attended self-service facility is one where an employee is assigned exclusively to monitor the activity of self-service customers at the dispenser location.

Emergency controls as specified in 514.11(A) shall be installed at a location ~~acceptable to the authority having jurisdiction~~ within sight of the dispensers , ~~but controls~~ and shall not be more than 30 m (100 ft) from the fuel dispensers.

Substantiation: The problem is that there is no definition of "attended". This rewrite will clarify and make it possible to comply with rules of safety.

Panel Meeting Action: Reject

Panel Statement: The recommended text is inconsistent with the use of the term in NFPA 30A and does not improve the usability and application of these requirements. The operational requirements for "attended self-service motor fuel dispensing facilities" are covered in NFPA 30A.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-175 Log #3067 NEC-P14 **Final Action: Reject**
(514.11(C))

Submitter: Richard F. Van Wert, Middle Department Inspection Agency / Rep. Benjamin Franklin Chapter IAEI

Recommendation: Revise text to read as follows:

514.11(C) Unattended Self-Service Motor Fuel Dispensing Facilities. An unattended self-service facility is one where all employees are assigned exclusively to conduct business indoors and remote from the fuel dispensers. Emergency controls as specified in 514.11(A) shall be installed at a location ~~acceptable to the authority having jurisdiction~~ within sight of the dispensers , ~~but the control~~ and shall be more than 6 m (20 ft) but less than 30 m (100 ft) from the fuel dispensers. Additional...".

Substantiation: The problem is that there is no definition of "unattended". This rewrite will clarify and make it possible to comply with rules of safety. The phrase "acceptable to the authority having jurisdiction" is not necessary here.

Panel Meeting Action: Reject

Panel Statement: The recommended text is inconsistent with the use of the term in NFPA 30A and does not improve the usability and application of these requirements. The term "unattended self-service motor fuel dispensing facilities" is clear, and operational requirements for these facilities are covered in NFPA 30A.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-176 Log #354 NEC-P14 **Final Action: Reject**
(514.13)

Submitter: Michael J. Johnston, Plano, TX

Recommendation: Revise text to read as follows:

514.13 Each dispensing device shall be provided with a means to remove all external voltage sources, including feedback, during periods of maintenance and service of the dispensing equipment. The location of this means shall be permitted to be other than inside or adjacent to the dispensing device. The means shall be capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker and shall remain in place with or without the lock installed.

Substantiation: This proposed change in wording is to provide consistency between other similar rules in the NEC that also call for disconnecting means to be capable of being locked in the open position. The phrase "capable of being locked in the open position" is used over 25 times in the NEC and the purpose is the same in every instance. Electrical safety rules for the worker should be consistent and the wording and requirements should be consistent where this phrase is used. The last sentence is being proposed because there are claims that some of the portable units available for snapping on to circuit breakers do remain with the switch or circuit breaker after they are installed on the breakers when the lock is not installed, but they are portable. The actions by CMP 11 in the 2002 cycle in 430.102(B) Exception were fairly clear that the provisions for adding a lock should be more substantial and not portable units.

Panel Meeting Action: Reject

Panel Statement: The panel is concerned that the recommended text would preclude the use of some forms of locking (other than portable) devices for disconnecting means, and because of the complexity of some dispensing equipment, the recommended text may not be practical for this application.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

COOK, D.: The proposed text is consistent with 430.102(B) Exception that addresses the method to lock a motor off from a remote location. The hazard to workers is the same.

Comment on Affirmative:

BERNSEN, M.: The proposal to require locking devices to remain in place whether or not a lock is installed provides added safety for electricians working on electrical systems in energized buildings. In an era where we are more aware of the arc fault dangers of energized circuits, we should make every attempt to provide permanent methods for assuring that a circuit which is turned off for maintenance or repair can be made to remain off until the work is complete.

The means to comply with the requirements of this proposal are currently available and are currently required by other articles of the Code. The proposal does not make the requirement retroactive; it would only be applied to new installations. The proposal would enhance the safety of the future installations with little effect on the economics of the installation. The changes make sense and should be approved.

14-177 Log #2040 NEC-P14 **Final Action: Reject**
(514.13)

Submitter: James T. Dollard, Jr., IBEW Local 98

Recommendation: Revise text to read as follows:

514.13 Provisions for Maintenance and Service of Dispensing Equipment Each dispensing device shall be provided with a means to remove all external voltage sources, including feedback, during periods of maintenance and service of the dispensing equipment. The location of this means shall be permitted to be other than inside or adjacent to the dispensing device. The means shall be capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed.

Substantiation: The problem with the present wording of this section is that the disconnect for some motor fuel dispensing equipment applications is a circuit breaker in a panelboard or a switch that is not made with permanent provisions for locking the circuit breaker or switch in the open position.

This requirement for a disconnect is for the safety of the installer/maintainer of the equipment. Permanent provisions for making circuit breakers and switches capable of being locked in the open position are readily available from circuit breaker and switch manufacturers.

This proposal does not represent a large increase in the cost of an installation but will result in a dramatic increase in safety.

Where motor fuel dispensing equipment is involved we know that maintenance will take place, we must ensure that only a lock is needed by an installer/maintainer to work safely.

The practical safeguarding of persons from electrical hazards as detailed in the scope of the NEC must not be permitted to hinge on whether or not an installer just happens to have enough different types of devices and hopefully one that that happens to fit the circuit breaker or switch in an installation.

Note that this language was accepted by CMP-11 and is a present requirement, in the 2002 NEC, when a circuit breaker or switch is used as a disconnecting means not within sight of a motor. Also included in the 2005 NEC is the same language in 422.31 for appliances

The same level of safety is needed for these disconnecting means for motor fuel dispensing equipment.

Panel Meeting Action: Reject

Panel Statement: The panel is concerned that the recommended text would preclude the use of some forms of locking (other than portable) devices for disconnecting means and because of the complexity of some dispensing equipment, the recommended text may not be practical for this application.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

COOK, D.: The proposed text is consistent with 430.102(B) Exception that addresses the method to lock a motor off from a remote location. The hazard to workers is the same.

Comment on Affirmative:

BERNSEN, M.: See my Comment on Affirmative on Proposal 14-176.

14-178 Log #501 NEC-P14 **Final Action: Accept**
(514.16)

Submitter: Michael J. Johnston, Plano, TX

Recommendation: Revise as follows:

514.16 Grounding and Bonding. All metal raceways, the metal armor or metallic sheath on cables, and all non-current-carrying metal parts of fixed portable electrical equipment, regardless of voltage, shall be grounded as provided in Article 250. Grounding and bonding in Class 1 locations shall comply with 501.130.

Substantiation: 501.130 includes both grounding and bonding requirements for Class I locations. This proposed change is an effort to clarify what is actually covered by this section.

Panel Meeting Action: Accept

Panel Statement: The panel notes that the correct reference is 501.30.

Number Eligible to Vote: 14

ARTICLE 515 — BULK STORAGE PLANTS

14-183 Log #2186 NEC-P14 **Final Action: Accept**
(Table 515.3)

Submitter: Dann Strube, Strube Consulting
Recommendation: On the table, in four places, change the word “ordinary” to “unclassified”.
Substantiation: 500.2 defines areas that have not been classified as “Unclassified Locations”. This change will put the language of this section into agreement with the 500.2 definition.
4.3.2.2 of the NEC Style Manual allows revision of extracted text to make the extract consistent with the style of the NEC.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-184 Log #1930 NEC-P14 **Final Action: Accept in Principle**
(515.7(A))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be sent to Code-Making Panel 8 for comment.
Submitter: William Wagner, Certification Solutions
Recommendation: Revise the first sentence of 515.7(A) as follows:
(A) Fixed Wiring. All fixed wiring above Class I locations shall be in metal raceways or ~~PVC~~ Schedule 80 rigid ~~nonmetallic~~ PVC conduit, or equivalent, or be Type MI, TC, or MC cable.
Substantiation: This is a companion proposal for the new definition of Rigid Nonmetallic Conduit in Article 100 and the revised Article 352 for Type PVC Conduit and results in the use of consistent terminology for this product throughout the code.
Panel Meeting Action: Accept in Principle
Accept the recommended action with the following revision:
(A) Fixed Wiring. All fixed wiring above Class I locations shall be in metal raceways or ~~PVC~~ Schedule 80 ~~rigid nonmetallic~~ PVC conduit, RTRC, ~~or equivalent,~~ or be Type MI, TC, or MC cable.
Panel Statement: The use of “rigid” has been deleted because it is redundant and, “or equivalent” has been deleted because it is too subjective. The panel has added RTRC conduit because it is an equivalent wiring method to Schedule 80 PVC.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-185 Log #2213 NEC-P14 **Final Action: Reject**
(515.7(A))

Submitter: Kyle Cope, Prysmian Cables and Systems
Recommendation: Revise as follows:
All fixed wiring above Class I locations shall be in meal raceways or PVC Schedule 80 rigid nonmetallic conduit, or equivalent, or be Type MI, TC, PA or MC cable.
Substantiation: Statement of problem: Material technology advancements now allow for cable designs that provide improved mechanical damage protection. i.e., crush and impact, over standard Type MC cable without sacrificing flame performance properties. The characteristics achieved using traditional metallic components can now be realized using polymeric materials. The use of polymeric materials also provides the opportunity for lighter and smaller diameter cables.
Substantiation for Proposal: Type PA has been proposed as a new type (Article 3XX) and should be included in this list (515.7(A)) as it offers enhanced mechanical benefits as an alternate to Type MC cable. See test data provided. A UL Fact-Finding study comparing the subject cable to type MC is ongoing at the time of proposal submittal. This data will be forwarded once the study is complete.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: This cable is not currently recognized as a Chapter 3 wiring method. CMP-14 notes that CMP-7 rejected a proposal to include this type of cable in Chapter 3.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-186 Log #1756 NEC-P14 **Final Action: Accept**
(515.7(C))

Submitter: David Belt, Underwriters Laboratores Inc.
Recommendation: Replace the term “portable lamp” with the term “ portable luminaire “. Revise text as follows:
515.7 Wiring and Equipment Above Class I Locations
(C) Portable Lamps or Other Utilization Equipment. Portable ~~lamps~~ luminaires or other utilization equipment and their flexible cords shall comply with the provisions of Article 501 or Article 505 for the class of location above which they are connected or used.
Substantiation: The term “luminaire” has already been accepted in the Code as the correct terminology for a lighting system and replaces the terms “fixture” or “lighting fixture”, which were terms for fixed lighting systems.
The term “portable luminaire” has been accepted by the IEC as the correct term for cord and plug connected lighting products and has also been adopted by UL in their ANSI/UL153 Safety Standard, which was previously titled “Portable Electric Lamps” and is now titled “Portable Electric Luminaires”.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-187 Log #1244 NEC-P14 **Final Action: Reject**
(515.8(A))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Change "rigid metal conduit" to "rigid steel conduit, silicon bronze conduit, or stainless steel conduit".
Substantiation: Aluminum conduit may be damaged by corrosive elements present.
Panel Meeting Action: Reject
Panel Statement: Proper application of metal conduit in respect to corrosive elements is adequately covered in 300.6 and 344.10(B).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-188 Log #503 NEC-P14 **Final Action: Accept**
(515.16)

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise as follows:
515.16 Grounding and Bonding . All metal raceways, the metal armor or metallic sheath on cables, and all non-current-carrying metal parts of fixed or portable electrical equipment, regardless of voltage, shall be grounded and bonded as provided in Article 250.
Grounding and bonding in Class I locations shall comply with 501.30 for Class I, Division 1 and 2 locations and 505.25 for Class I, Zone 0, 1, and 2 locations.
Substantiation: 501.30 and 505.25 include both grounding and bonding requirements for Class I locations. This proposed change is an effort to clarify what is actually covered by this section.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 516 — SPRAY APPLICATION, DIPPING, AND COATING PROCESSES

14-189 Log #1757 NEC-P14 **Final Action: Accept**
(516.4(D), 516.10(C)(1))

Submitter: David Belt, Underwriters Laboratores Inc.
Recommendation: Replace the term "portable lamp" with the term " portable luminaire ". Revise text as follows:
516.4 Wiring and Equipment in Class I Locations.
(D) Portable Equipment. Portable electric ~~lamps~~ luminaires or other utilization equipment shall not be used in a spray area during spray operations.
Exception No. 1: Where portable electric ~~lamps~~ luminaires are required for operations in spaces not readily illuminated by fixed lighting within the spraying area, they shall be of the type identified for Class I, Division 1 or Class 1, Zone 1 locations where readily ignitible residues may be present. [NFPA 33:6.9]
516.10 Special Equipment
(C) Powder Coating
(1) Electric Equipment and Sources of Ignition. Electric equipment and other sources of ignition shall comply with the requirements of Article 502. Portable electric ~~lamps~~ luminaires and other utilization equipment shall not be used within a Class II location during operation of the finishing processes. Where such ~~lamps~~ luminaires or utilization equipment are used during cleaning or repairing operations, they shall be of a type identified for Class II, Division 1 locations, and all exposed metal parts shall be effectively grounded.
Exception: Where portable electric ~~lamps~~ luminaires are required for operations in spaces nor readily illuminated by fixed lighting within the spraying area, they shall be of the type listed for Class II, Division 1 locations where readily ignitible residues may be present.
Substantiation: The term "luminaire" has already been accepted in the Code as the correct terminology for a lighting system and replaces the terms "fixture" or "lighting fixture", which were terms for fixed lighting systems.
The term "portable luminaire" has been accepted by the IEC as the correct term for cord and plug connected lighting products and has also been adopted by UL in their ANSI/UL153 Safety Standard, which was previously titled "Portable Electric Lamps" and is now titled "Portable Electric Luminaires".

Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-191 Log #1544 NEC-P14 **Final Action: Accept**
(516.10(C)(1))

Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Delete the term "effectively" from the terms "effectively grounded" and "effectively bonded" from Articles 516 and revise text as shown for the affected NEC sections.
516.10(C)(1): (1) Electric Equipment and Sources of Ignition. Electric equipment and other sources of ignition shall comply with the requirements of Article 502. Portable electric lamps and other utilization equipment shall not be used within a Class II location during operation of the finishing processes. Where such lamps or utilization equipment are used during cleaning or repairing operations, they shall be of a type identified for Class II, Division 1 locations, and all exposed metal parts shall be ~~effectively~~ connected to an equipment grounding conductor ~~grounded~~ .
Substantiation: 516.10(C)(1): The definition is ambiguous and very subjective without any defined values or parameters for one to judge as either "effective" or "ineffective." This section has been revised to prescribe the connection to the equipment grounding conductor.
This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to delete the term "grounded, effectively" and its definition from Article 100 and other companion proposals throughout the NEC relative to this Task Group's recommendations. The substantiation of this proposal is as follows.
The term "Effectively Grounded" is used 29 times in the NEC. It appears as though in the majority of the locations where it is used, the word "grounded" or phrase "connected to an equipment grounding conductor" could be used. Other proposals are submitted to make those changes.
The 1996 NEC in Section 250.51 used the term "effective grounding path," and those concepts were incorporated in 250.2 (1999 NEC) and then expanded in 250.4(A) and (B) in the 2002 NEC. The performance criteria of grounding and bonding are currently provided in Section 250.4 and include the concepts contained in the vague definition of the term "effectively grounded."
The definition "Effectively Grounded" is very subjective and without any defined values or parameters for one to judge grounding as either "effective" or "ineffective." "Effective" is described in Section 250.4(A) and (B), but it relates to the effective ground-fault current path as a performance criteria. Deleting the term in the NEC and the definition is logical because there are no definitive parameters for Code users to make a determination on what constitutes "effectively grounded." Systems are solidly grounded, grounded through a resistor or impedance, or ungrounded. Equipment (normally noncurrent-carrying metal parts are grounded where connected to an equipment grounding conductor.
This proposal is to change the term "Effectively Bonded" to just "Bonded" in each of the section where it is used. The term "Effectively Bonded" is currently not defined in the NEC.
The term "effectively bonded" is also used a few times in the NEC and is undefined. The same situation exists. There are no defined parameters for Code users to judges what the difference between "Effectively Bonded" and "Bonded" really is. Where the term appears in the NEC, it is revised to just "bonded" and still has the same meaning in each rule.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-192 Log #502 NEC-P14 **Final Action: Accept in Part**
(516.16)

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise as follows:
All metal raceways, the metal armors or metallic sheath on cables, and all normally non-current-carrying metal parts of fixed or portable electrical equipment, regardless of voltage, shall be grounded and bonded as provided in Article 250. Grounding and bonding shall comply with 501.30, 502.30, or 505.25, as applicable.
Substantiation: 501.30, 502.30, and 505.25 all include both grounding and bonding requirements for Class I and Class II locations. Both grounding and bonding requirements should be referenced here since 501.30, 502.30 and 505.25 each include both grounding and bonding rules and are referenced from this section.
Panel Meeting Action: Accept in Part
Panel Statement: The panel accepts the addition of "and bonded" and "bonding". The panel rejects adding "normally" because it is identified in the NEC Style Manual as a potentially vague and unenforceable term.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-193 Log #1064 NEC-P14 **Final Action: Reject**
(516.16)

TCC Action: It was the action of the Technical Correlating Committee that further consideration be given to 4.1.1 of the NEC Style Manual. This action will be considered by the panel as a public comment.
Submitter: Daniel Leaf, Seneca, SC
Recommendation: Delete "in accordance with the requirements of Article 250".
Substantiation: Edit. To comply with the Style Manual. Article 250 already applies per 90.3.
Panel Meeting Action: Reject
Panel Statement: The grounding requirement in this section is unique in that it applies regardless of the voltage. Where the reference to an entire article is conditional based on specific requirements in a particular article, the NEC Style Manual permits the reference to an entire article.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 517 — HEALTH CARE FACILITIES

15-2 Log #1526 NEC-P15 **Final Action: Accept in Principle in Part**
(517, 520, 525, and 530)

TCC Action: It was the action of the Technical Correlating Committee that this proposal be sent to the Technical Correlating Committee Grounding and Bonding Task Group for comment.
Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Revise Articles 517, 520, 525, and 530 as described in the following, relative to the terms bonding and grounding.
Article 517: In 517.13(A) change:
(A) Wiring Methods All branch circuits serving patient care areas shall be provided with a ground path for fault current by installation in a metal raceway system, or a cable having a metallic armor or sheath assembly. The metal raceway system, or metallic cable armor, or sheath assembly shall itself qualify as an equipment grounding conductor ~~return path~~ in accordance with 250.118.
In 517.13(B) change:
(B) Insulated Equipment Grounding Conductor The grounding terminals of all receptacles and all non–current-carrying conductive surfaces of fixed electric equipment likely to become energized that are subject to personal contact, operating at over 100 volts, shall be ~~grounded by~~ connected to an insulated copper equipment grounding conductor. The equipment grounding conductor shall be sized in accordance with Table 250.122 and installed in metal raceways or as a part of listed cables having a metallic armor or sheath assembly with the branch-circuit conductors supplying these receptacles or fixed equipment.
Exception No. 1: Metal faceplates shall be permitted to be ~~grounded~~ connected to the equipment grounding conductor by means of a metal mounting screw(s) securing the faceplate to a ~~grounded~~ outlet box or ~~grounded~~ wiring device connected to an equipment grounding conductor .
Exception No. 2: Luminaires (light fixtures) more than 2.3 m (7 1/ 2 ft) above the floor and switches located outside of the patient vicinity shall not be required to be ~~grounded by~~ connected to an insulated equipment grounding conductor.
In 517.18(B) change:
(B) Patient Bed Location Receptacles Each patient bed location shall be provided with a minimum of four receptacles. They shall be permitted to be of the single or duplex types or a combination of both. All receptacles, whether four or more, shall be listed ``hospital grade'' and so identified. Each receptacle shall be ~~grounded by means of~~ connected to an insulated copper conductor sized in accordance with Table 250.122.
In 517.19(B)(2) change:
(2) Receptacle Requirements The receptacles required in 517.19(B)(1) shall be permitted to be of the single or duplex types or a combination of both. All receptacles, whether six or more, shall be listed ``hospital grade'' and so identified. Each receptacle shall be ~~grounded~~ connected to the reference grounding point by means of an insulated copper equipment grounding conductor.
In 517.19(D) change:
(D) Panelboard Grounding Where a grounded electrical distribution system is used and metal feeder raceway or Type MC or MI cable is installed, ~~grounding~~ the effective ground-fault current path of a panelboard or switchboard shall be ensured by one of the following means at each termination or junction point of the raceway or Type MC or MI cable:
In 517.20(A) Exception change:
Exception: Branch circuits supplying only listed, fixed, therapeutic and diagnostic equipment shall be permitted to be supplied from a normal grounded service, single- or 3-phase system, provided that
(a) Wiring for grounded and isolated circuits does not occupy the same raceway, and
(b) All conductive surfaces of the equipment are ~~grounded~~ connected to an equipment grounding conductor .
In 527.61(C)(1) change:
(1) Wiring Methods Wiring serving other-than-hazardous (classified) locations, as defined in 517.60, shall be installed in a metal raceway system or cable assembly. The metal raceway system or cable armor or sheath assembly shall qualify as an equipment grounding ~~return path~~ conductor in accordance with 250.118. Type MC and Type MI cable shall have an outer metal armor, ~~or~~ sheath , or sheath assembly that is identified as an acceptable equipment grounding ~~return path~~ conductor .
In 517.62 Grounding change:
In any anesthetizing area, all metal raceways and metal-sheathed cables and all non–current-carrying conductive portions of fixed electric equipment shall be ~~grounded~~ connected to an equipment grounding conductor . Grounding in Class I locations shall comply with 501.30.
Exception: Equipment operating at not more than 10 volts between conductors shall not be required to be ~~grounded~~ connected to an equipment grounding conductor .
In 517.63(B)(2) change:
(2) All conductive surfaces of the equipment are ~~grounded~~ connected to an equipment grounding conductor .
In 517.63(C)(2) change:
(2) All conductive surfaces of luminaires (fixtures) are ~~grounded~~ connected to an equipment grounding conductor .
In 517.64(C)(2) change:
(2) The core and case ~~grounded~~ connected to an equipment grounding conductor
In 517.78(C) change:
(C) Noncurrent–Carrying Metal Parts Noncurrent-carrying metal parts of X-ray and associated equipment (controls, tables, X-ray tube supports, transformer tanks, shielded cables, X-ray tube heads, etc.) shall be ~~grounded~~ connected to an equipment grounding conductor in the manner specified in Article 250, as modified by 517.13(A) and 517.13(B).
In 517.13(A) change:
(A) Wiring Methods All branch circuits serving patient care areas shall be provided with ~~a ground path for fault current~~ an effective ground-fault current path by installation in a metal raceway system, or a cable having a metallic armor or sheath assembly. The metal raceway system, or metallic cable armor, or sheath assembly shall itself qualify as an equipment grounding return path in accordance with 250.118.
In 517.14 Panelboard Bonding change:
The equipment grounding terminal buses of the normal and essential branch-circuit panelboards serving the same individual patient vicinity shall be ~~bonded~~ connected together with an insulated continuous copper conductor not smaller than 10 AWG. Where two or more panelboards serving the same individual patient vicinity are served from separate transfer switches on the emergency system, the equipment grounding terminal buses of those panelboards shall be ~~bonded~~ connected together with an insulated continuous copper conductor not smaller than 10 AWG. This conductor shall be permitted to be broken in order to terminate on the equipment grounding terminal bus in each panelboard.
Article 520: In 520.81 change:
All metal raceways and metal-sheathed cables shall be ~~grounded~~ connected to an equipment grounding conductor . The metal frames and enclosures of all equipment, including border lights and portable luminaires (lighting fixtures), shall be ~~grounded~~ connected to an equipment grounding conductor . Grounding, where used, shall be in accordance with Article 250.
In 520.81 change:
All metal raceways and metal-sheathed cables shall be grounded. The metal frames and enclosures of all equipment, including border lights and portable luminaires (lighting fixtures), shall be grounded. Grounding, where used, shall be in accordance with Parts VI and VII of Article 250.

Article 525: In 525.31 change:

All equipment requiring grounding shall be ~~grounded by~~ connected to an equipment grounding conductor of a type and size recognized by 250.118 and installed in accordance with Article 250. The equipment grounding conductor shall be bonded to the system grounded conductor at the service disconnecting means or, in the case of a separately derived system such as a generator, at the generator or first disconnecting means supplied by the generator. The grounded circuit conductor shall not be connected to the equipment grounding conductor on the load side of the service disconnecting means or on the load side of a separately derived system disconnecting means.

In 525.11 Multiple Sources of Supply change:

Where multiple services or separately derived systems or both supply rides, attractions, and other structures, all sources of supply that serve rides, attractions, or other structures separated by less than 3.7 m (12 ft) shall be ~~bonded~~ connected to the same grounding electrode system.

In 525.31 Equipment Grounding change:

All equipment requiring grounding shall be grounded by an equipment grounding conductor of a type and size recognized by 250.118 and installed in accordance with Article 250. The equipment grounding conductor shall be ~~bonded~~ connected to the system grounded conductor at the service disconnecting means or, in the case of a separately derived system such as a generator, at the generator or first disconnecting means supplied by the generator. The grounded circuit conductor shall not be connected to the equipment grounding conductor on the load side of the service disconnecting means or on the load side of a separately derived system disconnecting means.

Article 530: In 530.20 change:

Type MC cable, Type MI cable, metal raceways, and all non–current-carrying metal parts of appliances, devices, and equipment shall be ~~grounded~~ connected to an equipment grounding conductor as specified in Article 250. This shall not apply to pendant and portable lamps, to stage lighting and stage sound equipment, or to other portable and special stage equipment operating at not over 150 volts dc to ground.

In 530.64(B) change:

(B) Circuit Breaker Frames Frames of dc circuit breakers installed on switchboards shall not be required to be ~~grounded~~ connected to an equipment grounding conductor .In 530.20 change:

Type MC cable, Type MI cable, metal raceways, and all non–current-carrying metal parts of appliances, devices, and equipment shall be grounded as specified in Parts VI and VII of Article 250. This shall not apply to pendant and portable lamps, to stage lighting and stage sound equipment, or to other portable and special stage equipment operating at not over 150 volts dc to ground.

Substantiation: Article 517: These changes clarify the present requirement in more prescriptive language and to clarify the connection referred to in the section. Connected is proposed to work cooperatively with the proposed revision of the definition of grounded (grounding) and equipment grounding conductor.

Article 520: The proposed change in (A) provides language that better describes the requirement for the ground path and is in alignment with NEC 250.4.

Article 520 (517.14): These changes clarify the present requirement in more prescriptive language and to clarify the connection referred to in the section. Connected is proposed to work cooperatively with the proposed revision of the definition of bonded (bonding).

Article 520: These changes clarify the present requirement in more prescriptive language and to clarify the connection referred to in the section. Connected is proposed to work cooperatively with the proposed revision of the definition of grounded (grounding) and equipment grounding conductor.

Article 520 (520.81): The additions of Parts VI and VII of Article 250 enhance clarity.

Article 525: These changes clarify the present requirement in more prescriptive language and to clarify the connection referred to in the section. Connected is proposed to work cooperatively with the proposed revision of the definition of grounded (grounding) and equipment grounding conductor.

Article 525 (525.11): These changes clarify the present requirement in more prescriptive language and to clarify the connection referred to in the section. Connected is proposed to work cooperatively with the proposed revision of the definition of bonded (bonding).

Article 530: These changes clarify the present requirement in more prescriptive language and to clarify the connection referred to in the section. Connected is proposed to work cooperatively with the proposed revision of the definition of grounded (grounding) and equipment grounding conductor.

Article 530 (530.20): The additions of Parts VI and VII of Article 250 enhance clarity.

This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to the proposed revision to the terms "bonded", "grounded", and "equipment grounding conductor" in Article 100 relative to this Task Group's recommendations. These changes clarify the present requirement in more prescriptive language.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle in Part

Accept as proposed, except for the following editorial revisions:

"517.13(B) *Exception No. 1: Metal faceplates shall be permitted to be ~~grounded~~ connected to the equipment grounding conductor by means of a metal mounting screw(s) securing the faceplate to a grounded outlet box or a grounded wiring device."*

"517.18(B) Patient Bed Location Receptacles. Each patient bed location shall be provided with a minimum of four receptacles. They shall be permitted to be of the single or duplex type or a combination of both. All receptacles, whether four or more, shall be listed "hospital grade" and so identified. The grounding terminal of ~~E~~ e ach receptacle shall be connected to ~~grounded by means of~~ an insulated copper equipment grounding conductor sized in accordance with Table 250.122."

"517.19(B)(2) Receptacle Requirements. The receptacles required in 517.19(B)(1) shall be permitted to be of the single or duplex type or a combination of both. All receptacles, whether six or more, shall be listed "hospital grade" and so identified. The grounding terminal of ~~E~~ e ach receptacle shall be ~~grounded~~ connected to the reference grounding point by means of an insulated copper equipment grounding conductor."

517.19 **(D) Panelboard Grounding and Bonding.** Where a grounded electrical distribution system is used and metal feeder raceway or Type MC or MI cable that qualifies as an equipment grounding conductor in accordance with 250.118 is installed, grounding ~~the effective ground-fault current path~~ of a panelboard or switchboard shall be ensured by one of the following bonding means at each termination or junction point of the metal raceway or Type MC or MI cable:

517.61(C)(1) The proposal contained a typographical error and should read "527.61(C)(1)".

In 520.81, the panel does not Accept the addition of "Parts VI and VII".

In 530.64(B), the panel does not Accept the addition of "Parts VI and VII".

Panel Statement: The panel's reasons for the revisions are as follows:

In 517.13(B) Exception. No. 1, the panel left the word "grounded" where it is an adjective that describes an outlet box or wiring device, rather than an installation requirement.

In 517.18(B) and 517.19(B)(2), language was added to describe what is to be connected to the equipment grounding conductor in the proposal.

In 517.19(D) action was taken to correlate with the changes accepted in Proposal 15-38.

It is the panel's contention that the proposed changes to 520.81 and 530.64(B) to add "Parts VI and VII" is outside the scope of the task group. The panel also notes other references to complete articles that have not been revised.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Conry, C.

Comment on Affirmative:

VANICE: My vote is based on the understanding that the definition of Equipment Grounding Conductor EGC will be "the conductive path installed to connect normally non-current-carrying metal parts of equipment together and to the system grounded conductor or to the grounding electrode conductor". Entertainment industry venues have special grounding issues. If the words in the NEC with respect to grounding and bonding change from the above understanding of any other changes that might occur, the entertainment industry needs to be able to compensate for these changes by modifying the entertainment articles.

In this proposal, we rejected the concept of adding parts to the last sentence of 520.81, in proposal 15-143, we deleted the whole last sentence.

Note that the revised text as stated for 525.11 was further revised in proposal 15-150.

Note that the revised text as stated for 525.31 was further revised in proposal 15-158.

WISEMAN, J.: Under Panel Meeting Action, the line reading

"517.61(C)(1) The proposal contained a typographical and should read "527.61(C)(1)"."

should, instead read:

"527.61(C)(1) The proposal contained a typographical error and should read "517.61(C)(1)"."

15-3 Log #1161 NEC-P15 **Final Action: Reject**

(517.2)

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Revise as follows:

~~A~~ An ungrounded system comprised of ~~comprising~~ an isolation ~~isolating~~ transformer(s), a generator(s), or batteries, which conform to the definition of Separately Derived System in Article 100, or ~~it's~~ the equivalent, a lie isolation monitor and ungrounded conductors supplied from an ungrounded system .

Substantiation: Ungrounded SYSTEMS is apparently intended. Ungrounded conductors may be supplied from isolation transformers with a grounded secondary, such as a 2-wire 240-volt circuit from a 120/240 secondary which is grounded. There is no definition of an isolating transformer.

Panel Meeting Action: Reject

Panel Statement: The existing text is identical to NFPA 99:3.3.85 and should remain and be identified as extracted text from that document.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12

Ballot Not Returned: 1 Conry, C.

15-4 Log #2113 NEC-P15 **Final Action: Reject**
(517.2)

Submitter: Burton R. Klein, Burton Klein Associates
Recommendation: 1. Revise the term "Wet location" to "Wet (procedure) location".
2. Add "[NFPA 99: 3.3.185]".
Substantiation: 1. Term is the responsibility of TC on Health Care Facilities. Proposal has been submitted to TC on Health Care Facilities to revise term the same way in order to not be confused with "Wet location" as defined in Article 100 of NFPA 70, and used everywhere in NFPA 70, except in Article 517.
2. Conform to NFPA Standards Council on policy for extracted text.
Panel Meeting Action: Reject
Panel Statement: The proposed word "procedure" has not been included in the definition of a "Wet Location" in the 2005 Edition of NFPA 99. The existing text of "Wet Location" in 517.2 is not the same as in NFPA 99, and does not meet the NEC Style Manual requirement for extracted text.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.
Comment on Affirmative:
WHITE, A.: While the rationale for using the term "Wet (Procedure) location" is flawed, the phrase adds clarity as to the type of occupancies cited in comparison as to how the term "Wet Location" is used in other parts of the Code.

15-5 Log #1160 NEC-P15 **Final Action: Reject**
(517.2.Isolation)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Change "Isolation" to "isolating".
Substantiation: Edit. The definition of Isolated Power Systems in this section uses the term "isolating". The use of different terms for the same thing may cause confusion and is to be avoided.
Panel Meeting Action: Reject
Panel Statement: The text in 517.2 for definition of an "Isolation Transformer" is similar to the text in NFPA 99:3.3.86, and should remain consistent for clarity.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-6 Log #1776 NEC-P15 **Final Action: Reject**
(517.2, Ambulatory Health Care Facility)

Submitter: Marvin J. Fischer, Monroe Township, NJ
Recommendation: Add "[NFPA 101: Chapter 3]"
Substantiation: 1. Term is the responsibility of T/C on Safety to Life.
2. Conform to NFPA Standards Council on policy for extracted text.
Panel Meeting Action: Reject
Panel Statement: The definition cited is inconsistent with the definition provided in 517.2; therefore, the text is not extracted and the proposed citation is inappropriate.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 11 Negative: 1
Ballot Not Returned: 1 Conry, C.
Explanation of Negative:
ERICKSON, D.: The new definition in the NFPA Life Safety Code adds a third item that needs to be included in the NEC text. This is not just a matter of NEC style or ownership; it is a matter of adding material that will clarify uses of ambulatory health care facilities.

15-7 Log #1777 NEC-P15 **Final Action: Reject**
(517.2, Anesthetizing Location)

Submitter: Marvin J. Fischer, Monroe Township, NJ
Recommendation: Add "[NFPA 99: 3.3.9]"
Substantiation: 1. Term is the responsibility of T/C on Health Care Facilities.
2. Conform to NFPA Standards Council on policy for extracted text.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 15-1. The differences between the definition in 517.2 and NFPA 99, 3.3.9, are substantial.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-8 Log #1778 NEC-P15 **Final Action: Reject**
(517.2, Critical Branch)

Submitter: Marvin J. Fischer, Monroe Township, NJ
Recommendation: Add "[NFPA 99: 3.3.26]"
Substantiation: 1. Term is the responsibility of T/C on Health Care Facilities.
2. Conform to NFPA Standards Council on policy for extracted text.
Panel Meeting Action: Reject
Panel Statement: The NFPA Glossary of Terms indicates that NFPA 70 is the responsible document for the definition of "Critical Branch". Therefore, it is not correct to identify this definition in 517.2 as extracted text.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-9 Log #1779 NEC-P15 **Final Action: Reject**
(517.2, Critical Care Areas)

Submitter: Marvin J. Fischer, Monroe Township, NJ
Recommendation: Add "[NFPA 99: 3.3.138.2]"
Substantiation: 1. Term is the responsibility of T/C on Health Care Facilities.
2. Conform to NFPA Standards Council on policy for extracted text.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 15-1. The differences between the definition in 517.2 and NFPA 99, 3.3.138.2, are substantial.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-10 Log #1780 NEC-P15 **Final Action: Reject**
(517.2, Electrical Life Support Equipment)

Submitter: Marvin J. Fischer, Monroe Township, NJ
Recommendation: Add "[NFPA 99: 3.3.37]"
Substantiation: 1. Term is the responsibility of T/C on Health Care Facilities.
2. Conform to NFPA Standards Council on policy for extracted text.
Panel Meeting Action: Reject
Panel Statement: The NFPA Glossary of Terms indicates that NFPA 70 is the responsible document for the definition of "Electrical Life Support Equipment". Therefore, it is not correct to identify this definition in 517.2 as extracted text.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-11 Log #1781 NEC-P15 **Final Action: Accept**
(517.2, Emergency System)

Submitter: Marvin J. Fischer, Monroe Township, NJ
Recommendation: Add "[NFPA 99: 3.3.41]"
Substantiation: 1. Term is the responsibility of T/C on Health Care Facilities.
2. Conform to NFPA Standards Council on policy for extracted text.
Panel Meeting Action: Accept
Panel Statement: The panel notes that although the extact information is correct; it is not in the proper format.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-12 Log #1782 NEC-P15 **Final Action: Reject**
(517.2, Equipment System)

Submitter: Marvin J. Fischer, Monroe Township, NJ
Recommendation: Add "[NFPA 99: 3.3.43]"
Substantiation: 1. Term is the responsibility of T/C on Health Care Facilities.
2. Conform to NFPA Standards Council on policy for extracted text.
Panel Meeting Action: Reject
Panel Statement: The NFPA Glossary of Terms indicates that NFPA 70 is the responsible document for the definition of "Equipment System". Therefore, it is not correct to identify this definition in 517.2 as extracted text.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

Ballot Not Returned: 1 Conry, C.

15-18 Log #1788 NEC-P15 **Final Action: Accept in Principle**
(517.2, Hospital)

Submitter: Marvin J. Fischer, Monroe Township, NJ
Recommendation: Add "[NFPA 101: Chapter 3]"
Substantiation: 1. Term is the responsibility of T/C on Safety to Life.
2. Conform to NFPA Standards Council on policy for extracted text.
Panel Meeting Action: Accept in Principle
Revise the proposed text to read:
"NFPA 101: 3.3.124"
Panel Statement: The Chapter 3 reference provided is too broad. The correct reference is 3.3.124.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-19 Log #1789 NEC-P15 **Final Action: Reject**
(517.2, Life Safety Branch)

Submitter: Marvin J. Fischer, Monroe Township, NJ
Recommendation: Add "[NFPA 99: 3.3.96]"
Substantiation: 1. Term is the responsibility of T/C on Health Care Facilities.
2. Conform to NFPA Standards Council on policy for extracted text.
Panel Meeting Action: Reject
Panel Statement: The NFPA Glossary of Terms indicates that NFPA 70 is the responsible document for the definition of "Life Safety Branch". Therefore, it is not correct to identify this definition in 517.2 as extracted text.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-20 Log #1790 NEC-P15 **Final Action: Accept in Principle**
(517.2, Limited Care Facility)

Submitter: Marvin J. Fischer, Monroe Township, NJ
Recommendation: Add "[NFPA 101: Chapter 3]"
Substantiation: 1. Term is the responsibility of T/C on Safety to Life.
2. Conform to NFPA Standards Council on policy for extracted text.
Panel Meeting Action: Accept in Principle
Revise the proposed text to read as follows:
"Limited Care Facility. A building or ~~part~~ portion thereof used on a 24-hour basis for the housing of four or more persons who are incapable of self-preservation because of age; physical limitation due to accident or illness; or ~~mental~~ limitations such as mental retardation/developmental disability, mental illness, or chemical dependency. [NFPA 99:3.3.97]"
Panel Statement: The Chapter 3 reference to NFPA 101 provided is too broad. The correct reference in NFPA 101 is 3.3.77.2. However, the panel contends that the correct reference should be NFPA 99, 3.3.97. The revisions to the present definition are considered to be minor, and the panel contends that it is important to correlate the definition with NFPA 99.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-21 Log #1791 NEC-P15 **Final Action: Accept in Principle**
(517.2, Nursing Home)

Submitter: Marvin J. Fischer, Monroe Township, NJ
Recommendation: Add "[NFPA 101: Chapter 3]"
Substantiation: 1. Term is the responsibility of T/C on Safety to Life.
2. Conform to NFPA Standards Council on policy for extracted text.
Panel Meeting Action: Accept in Principle
Revise the proposed text to read:
"NFPA 99: 3.3.129".
Panel Statement: The NFPA 101 Chapter 3 reference provided is too broad. The correct reference is NFPA 99 3.3.129. This action is also needed to correlate with the panel action on Proposal 15-1.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-22 Log #1792 NEC-P15 **Final Action: Reject**
(517.2, Patient Care area)

Submitter: Marvin J. Fischer, Monroe Township, NJ
Recommendation: Add "[NFPA 99: 3.3.138]"
Substantiation: 1. Term is the responsibility of T/C on Health Care Facilities.
2. Conform to NFPA Standards Council on policy for extracted text.
Panel Meeting Action: Reject
Panel Statement: There is a significant difference between the two definitions (517.2 and NFPA 99, 3.3.138). As a result, the definition in 517.2 cannot be considered extracted material.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 11 Negative: 1
Ballot Not Returned: 1 Conry, C.
Explanation of Negative:
ERICKSON, D.: While the proposal to place an extract from NFPA 99 under this paragraph should be rejected, the need to accept this proposal in principle is necessary and the definition modified to reflect the changes in NFPA 99.
To maintain consistency with NFPA 99 a new definition of wet location needs to be developed around the definition in 99. The definition of Patient Care Area should read as follows:
Patient Care Area. Any portion of a health care facility wherein patients are intended to be examined or treated. Areas of a health care facility in which patient care is administered are classified as general care areas or critical care areas, ~~either of which may be classified as a wet location.~~
~~The governing body of the facility designates these areas in accordance with the type of patient care anticipated and with the following definitions of the area classification.~~
FPN: Business offices, corridors, lounges, day rooms, dining rooms, or similar areas typically are not classified as patient care areas.
New definition of Wet Location.
Wet Locations. ~~Those patient care areas that are normally subject to wet conditions while patients are present. These include standing fluids on the floor or drenching of the work area, either of which condition is intimate to the patient or staff. Routine housekeeping procedures and incidental spillage of liquids do not define a wet location.~~
<u>Those patient care areas where a procedure is performed that is normally subject to wet conditions while patients are present including standing fluids on the floor or drenching of the work area, either of which condition is intimate to the patient or staff.</u>

15-23 Log #1793 NEC-P15 **Final Action: Accept**
(517.2, Patient Vicinity)

Submitter: Marvin J. Fischer, Monroe Township, NJ
Recommendation: 1. Change term in sentence one of Definition to read: "Patient care vicinity" and change term in sentence to read "Patient care vicinity."
2. Add "[NFPA 99: 3.3.140]"
Substantiation: 1. Term is the responsibility of T/C on Health Care Facilities. "Patient care vicinity" in NFPA 99.
2. Conform to NFPA Standards Council on policy for extracted text.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the proposed changes to the wording of the text but wishes to note that extract material is not in the proper format. This action is also necessary to correlate with the action taken on Proposal 15-1.
The panel affirms that the action on this proposal will change the term being defined to "Patient Care Vicinity."
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-24 Log #1794 NEC-P15 **Final Action: Reject**
(517.2, Selected Receptacles)

Ballot Not Returned: 1 Conry, C.

15-25a Log #CP1500 NEC-P15 **Final Action: Accept**
(517.11, FPN)

Submitter: Code-Making Panel 15,
Recommendation: In the sections shown below, change "Patient Vicinity" to "Patient Care Vicinity".
517.11 FPN;
517.13(B) Ex. 2;
517.14 (2 appearances);
517.19(C) (2 appearances);
517.19(C) FPN; and
517.82(B)
Substantiation: These changes are made to correlate with the action taken on Proposal 15-23.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-26 Log #3628 NEC-P15 **Final Action: Reject**
(517.13(A))

Submitter: Raymond C. Paulson, City of Lincoln, Nebraska
Recommendation: Revise as follows:
517.13(A) Exception: Rigid Nonmetallic Conduit may be used for underfloor installations where metallic conduits would be subject to corrosion.
When RNMC is used, an insulated 10 AWG Copper grounding conductor shall be installed in addition to the redundant insulated grounding conductor sized in accordance with Table 250.122.
Substantiation: When metallic conduits are in contact with earth, especially with the presence of ground moisture, the grounding properties of the conduit are compromised. Metallic conduits sometime rust away to nonexistance. RNMC has an excellent track record in this installation. A 10 AWG insulated copper conductor is used extensively in other parts of 517 and would provide a greater degree of safety in these under slab conduit installations.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its long-standing position to retain two different methods and materials for grounding. This proposal would compromise that principle. Maintaining this protection principle alone would be sufficient to reject this proposal.
The second equipment grounding conductor does not provide a separate and distinct grounding method.
Finally, this proposal does not take into account the equipment grounding conductor size that would be required for circuits rated over 60 amps.
The word "redundant" in the second sentence is not a Code-defined term.
The issues of corrosion may be addressed by long-standing methods. See 300.6.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-27 Log #2911 NEC-P15 **Final Action: Reject**
(517.13(A) Exception (New))

Submitter: Raymond C. Paulson, City of Lincoln, NE
Recommendation: Add an exception to 517.13(A) to read as follows:
Exception No. 1: Rigid Nonmetallic Conduit may be used for underfloor installations where metallic conduits would be subject to corrosion conditions. A 10 AWG insulated copper conductor shall be installed as the primary grounding path. Compliance with 517.13(B) shall be required.
Substantiation: Metallic conduit in direct contact with soil under slab construction leads to deterioration of an assured grounding path. RNMC has an excellent track record for this type of installation. A 10 AWG insulated conductor in addition to the redundant grounding conductor would provide a greater degree of safety.

Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 15-26.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-28 Log #3364 NEC-P15 **Final Action: Reject**
(517.13(B) Exception No. 2)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc. / Rep. Massachusetts Electrical Code Advisory Committee
Recommendation: Delete Exception No. 2.
Substantiation: This exception leads many to conclude that the wiring method rules in 517.13(A) don't apply to these lighting outlets as well. In fact they do, and this exception is more trouble than it is worth. Any electrical contractor will tell you that the expense in one of these installations is that of installing the raceway. Once the raceway is in place, adding a green wire is a negligible additional consideration. Similarly, in the case of a cable assembly, installing Type AC cable with a separate equipment grounding conductor is comparable to installing the same cable without the separate grounding conductor. This exception adds very little in the way of practical benefit, but at substantial cost in the form of additional confusion and disagreements between installers and inspectors.
Panel Meeting Action: Reject
Panel Statement: The panel contends that Exception No. 2 is not confusing, and that adding a green wire to all affected circuits can be a significant consideration without material safety benefit. There is no prohibition to adding the redundant ground.

Without this exception, all luminaires and switches would have to be connected to an insulated equipment grounding conductor in addition to the raceway or metal cable ground, even though patient contact is unlikely.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-29 Log #2738 NEC-P15 **Final Action: Reject**
(517.17(B))

Submitter: Jim Pauley, Square D Company
Recommendation: Delete the following text from 517.17(B):
~~The additional levels of ground-fault protection shall not be installed as follows:~~
~~(1) On the load side of an essential electrical system transfer switch~~
~~(2) Between the on-site generating unit(s) described in 517.35(B) and the essential electrical system transfer switch(es)~~
~~(3) On electrical systems that are not solidly grounded wye systems with greater than 150 volts to ground but not exceeding 600 volts phase-to-phase~~
Substantiation: This proposal has been submitted as a means to improve the reliability of electrical systems in healthcare facilities. In order to fully understand the impact, the following two basic issues must be understood:
1) The present NEC does not prohibit ground-fault protection on the main feeder disconnecting means of an alternate source of supply for an essential electrical system of a hospital. NEC 700.26 does not prohibit ground-fault protection on an emergency system; it only states that it is not required. As such, an essential electrical system can be designed with GFP on the main feeder device. In fact, one cannot likely achieve the required selective coordination (NEC 700.27) unless GFP is installed to handle the coordination of ground-faults.
2) The current language in 517.17(B) prohibits a <u>second</u> level of GFP from being installed in the system. This is clearly evident in the opening language that states "The additional levels… shall not be installed…" The language in 517.17(B) has nothing to do with the first level of GFP that may be installed, required or allowed by 230.95, 215.10 or 700.26.

The requirements as they currently appear actually reduce the reliability of the system. System designs that properly utilize ground-fault protection of equipment will better limit the outage that the system may be subjected to. I would ask that the panel consider the following points regarding the reliability issue:
1) In today's large health care facility designs the generation systems are not a simply a "standby generator" that will supply a limited load. One recent installation had over 8MW of generation capacity that not only served as the emergency backup, but also as cogeneration operating in parallel with the utility. With generation capacities growing, the ability to supply significant amounts of ground-fault current also grows. As such, equipment "burn-down" due to a ground-fault can occur just as easily with a generator as it can with the utility source.
2) Allowing these large systems to be installed without ground-fault protection actually decreases the reliability of the system. Consider a ground-fault on a 1000A feeder contained in an emergency system switchboard that is on the load side of essential system transfer switch.

Since GFP is prohibited by 517.17(B), the fault will take out the first device ahead of the essential system transfer switch that has GFP installedm (e.g. the normal power main overcurrent device). This causes the normal power system to shut down and the system switches over to emergency power. However, the ground-fault may still be on the 1000A feeder (an in fact may be worse because of the damage that has already occurred). Now the system has the potential to not only shutdown the emergency generators, but may also start a fire at the point where the arcing ground fault is occurring. In fact, the zero sequence reactance of large standby or emergency generators are often significantly less than the zero sequence reactance of the power class transformers that will powered by the local electrical utility. Consequently, the initial available fault current flow from a "phase-to-ground" fault is often significantly greater than a "phase-to-phase" fault if the fault is powered from large generators. In addition, if a "phase-to-ground" fault were to occur downstream when power is provided by the generator, then for a minimum of two cycles the generator will provide more I sc to the fault than a power class transformer of equal KVA Rating.
If GFP were properly installed and coordinated, the 1000A feeder would have been isolated from the system allowing the balance of the system to continue functioning.
3) Having multiple levels of GFP is the only way to have a reliable emergency system installation relative to handling the common ground-fault condition. The number of levels is determined by the design engineer and is predicated on getting the protection down to a level where GF coordination can be done with standard overcurrent devices. The previous conventional wisdom was to eliminate GFP and allow the system to operate in a faulted condition. This might have been acceptable where the generation system would not supply enough fault current to continue the destruction of the equipment, but with the larger systems being installed that is no longer the case.
In summary, there are a number of concerns associated with the current language. It inhibits the design engineer's ability to provide the most reliable system in the modern environment of health care facilities. Specifically noted is:
1) The current language prohibits the design engineer from establishing a more reliable system by using multiple levels of GFP throughout the critical circuits.
2) The objective of the NEC is to provide a system that is essentially free from hazard. Allowing ground-faults to continue to burn up equipment and conductors in the electrical system without taking them off line is contrary to that objective.
3) The design engineer needs the flexibility to be able to provide multiple levels of GFP to accomplish his/her expected level of system reliability.
4) Multi-level GFP systems will provide the most coordinated way to limit the impact of ground faults on the system. Waiting until faults reach a magnitude that will open the normal overcurrent devices in the system can result in not only increased damage, but also (depending on the overall loading) a decrease of coordination.
It is realized that this is a thought process that is different than the code-panel may have taken in the past. However, there is a significant change in the alternate power systems being employed in health care facilities. This proposal will modernize the NEC approach and give the system designer the ability to provide the levels of protection necessary to have maximum reliability.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The issue addressed in the proposed change is the reliability of the emergency system operation to support life and patient care.

The panel defends the principle of multiple levels of ground fault, but acceptance of this proposal would compromise reliability of the emergency system and would be in conflict with the provisions of 700.7(D) and 700.26.

The risk of burn-down is low because the vast majority of hospitals have relatively small standby generators as opposed to the 8 megawatt generators cited in the submitter's example.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 11 Negative: 1
Ballot Not Returned: 1 Conry, C.
Explanation of Negative:

WISEMAN, J.: NEMA disagrees with the panel action and panel statement. Everyone agrees that a reliable emergency supply system is needed. However, the portion of the panel statement that states "acceptance of this proposal would compromise the reliability of the emergency system and would be in conflict with the provisions on 700.7(D) and 700.26" is completely incorrect.

NEC 700.26 does not prohibit ground-fault to be installed on the emergency system. It is the choice of the designer. As pointed out in the proposal, there are very large systems being installed where a proper design decision to install GFP is being made because of the size of the emergency supply. The current provisions of 517.17 PROHIBIT the installation of a second level of ground fault protection. When the designer has elected to install the first level of ground fault protection, installation of a second level (and, sometimes additional levels) will improve reliability. The current language creates a situation where reliability is compromised and this proposal will remedy that situation.

Although the panel statement indicates that a large number of hospitals have small standby generators, there are very large installations being installed, to which the code also must be responsive.
Comment on Affirmative:

MORGAN, E.: I agree with the panel action to reject this proposal as submitted, as the elimination of all reference to Ground-Fault Protection of Emergency systems would make it appear as though it was required. However, the proposal has a lot of merit, as there are a growing number of very large generators serving hospital emergency systems. A hospital in the jurisdiction I serve is in the process of installing a new set of generators with 4.5 megawatt capacity, far larger than the emergency needs of the hospital. The intent is to have capacity for on-grid power production in the event of a regional power failure.

No part of the Emergency System should be considered "sacrificial". Yet, without the ability to isolate the portion of a system that may have caused the "normal" system to shut down, the emergency system would likely also fail unless isolated by Ground-Fault Protection. This very essential concept is supported by Hospital Engineers whom I have personally interviewed since the Panel meeting. The Panel should give more consideration to this subject during the Report on Comment meetings.

15-30 Log #1798 NEC-P15 **Final Action: Reject**
(517.18(A))

Submitter: Marvin J. Fischer, Monroe Township, NJ
Recommendation: Add "[NFPA 99: 4.3.2.2.1.1]" at the end of the paragraph, before Exception No. 1.
Substantiation: 1. Text is the performance criteria, and the responsibility of T/CC on Health Care Facilities.
2. Conform to NFPA Standards Council on policy for extracted text.
Panel Meeting Action: Reject
Panel Statement: Since the two requirements are substantially different, 517.18(A) should not be identified as extracted material.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-31 Log #1796 NEC-P15 **Final Action: Reject**
(517.18(A) Exception No. 1)

Submitter: Marvin J. Fischer, Monroe Township, NJ
Recommendation: Add "[NFPA 99: 4.3.2.2.1.3]" at the end of the Exception.
Substantiation: 1. Text is the performance criteria, and the responsibility of T/CC on Health Care Facilities.
2. Conform to NFPA Standards Council on policy for extracted text.
Panel Meeting Action: Reject
Panel Statement: Since the two requirements are substantially different, 517.18(A), Exception No. 1, should not be identified as extracted material.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-32 Log #1797 NEC-P15 **Final Action: Reject**
(517.18(A) Exception No. 3)

Submitter: Marvin J. Fischer, Monroe Township, NJ
Recommendation: Add "[NFPA 99: 4.3.2.2.1.2]" at the end of the Exception.
Substantiation: 1. Text is the performance criteria, and the responsibility of T/CC on Health Care Facilities.
2. Conform to NFPA Standards Council on policy for extracted text.
Panel Meeting Action: Reject
Panel Statement: Since the two requirements are substantially different, 517.18(A), Exception No. 3, should not be identified as extracted material.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-33 Log #1799 NEC-P15 **Final Action: Reject**
(517.18(B))

Submitter: Marvin J. Fischer, Monroe Township, NJ
Recommendation: Add "[sentence 1: NFPA 99: 4.3.2.2.6.2]" at the end of the paragraph, before Exception No. 1.
Substantiation: 1. Text is the performance criteria, and the responsibility of T/CC on Health Care Facilities.
2. Conform to NFPA Standards Council on policy for extracted text.
Panel Meeting Action: Reject
Panel Statement: Since the two requirements are substantially different, 517.18(B) should not be identified as extracted material.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-34 Log #2114 NEC-P15 **Final Action: Accept in Principle in Part**
(517.18(B) and 517.19(B)(2))

Submitter: Burton R. Klein, and John DiMeglio, & John Shena, Massachusetts General Hospital, Burton Klein Associates
Recommendation: Add the following to each section:
<u>Receptacles shall have a built-in light indicating power to the receptacle.</u>
Substantiation: 1. Provide visual indication to medical and nursing staff as to whether power (whether from normal or emergency system) is available from these receptacles.
2. Problems have occurred when a circuit breaker tripped and power to one feeder was interrupted. Some receptacles on the emergency system were affected, thus confusing staff as to which receptacles were still active. Incident occurred in a pediatric intensive care unit, and resulted in the need to ventilate infants manually because of uncertainty of which receptacles had power, and the lack of time to make determination due to the condition of patients.
Panel Meeting Action: Accept in Principle in Part
Revise the proposed wording to read as follows:
"Receptacles shall have an integral light indicating the receptacle is powered or be part of a listed headwall assembly that provides indication of power to each receptacle."
The revised wording is to be placed in 517.19(B)(2) but is not to be placed in the wording of 517.18(B) for general care areas.
Panel Statement: The panel contends that power indication only needs to be applied to the receptacles in critical care areas.
The revised wording recognizes that it is possible to accomplish indication as part of a listed assembly.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 8 Negative: 4
Ballot Not Returned: 1 Conry, C.
Explanation of Negative:
DUNCAN, J.: There is insufficient technical and user justification to add a light to all individual receptacles in critical patient care areas to indicate the receptacle is powered. This light duplicates the function of indicating lights on life safety equipment that already immediately inform medical staff that the equipment is plugged into a powered receptacle. In addition, all current life safety equipment contain an integral battery backup so the device continues to function in the rare case that a receptacle on the emergency system critical branch loses power. There is plenty of time if medical staff would need to plug the equipment into another receptacle.
Over time the medical staff will see the indicating lights as part of the background, and when needed may not recognize or remember the significance of the light. There is also the possibility that the light may malfunction, so medical staff would mistakenly think there was not power available at a particular receptacle. In a critical care patient room with a dozen or more receptacles, the glowing indicator receptacle lights could be very annoying to patients who are trying to sleep.
ERICKSON, D.: The proposal should be rejected. The NEC should not be mandating a new standard based on one reported incident. Where is the national statistical data to indicate a global need to install receptacles with illuminated faces or indicator lights? If a hospital wants to install illuminated devices, they are permitted to do so as long as they are hospital grade. A code is a set of standards that have a substantial justification and should not be changed as a result of a few isolated instances where the staff may not have been properly trained on the environment in which they are working.
LAU, L.: Proposal 15-34 should be Rejected. My voting substantiation is as follows:
There is no national statistical data to support the installation of receptacles equipped with illuminated face or indicator lights for the entire country that is necessary.
NASH, JR., H.: Increased cost of lighted receptacle is unnecessary. Substantiation is inadequate. We cannot justify change based on one incident.

15-35 Log #1800 NEC-P15 **Final Action: Reject**
(517.19(A))

Submitter: Marvin J. Fischer, Monroe Township, NJ
Recommendation: Add "[sentence 1: NFPA 99: 4.3.2.2.6.2]" at the end of the paragraph, before Exception No. 1.
Substantiation: 1. Text is the performance criteria, and the responsibility of T/CC on Health Care Facilities.
2. Conform to NFPA Standards Council on policy for extracted text.
Panel Meeting Action: Reject
Panel Statement: Since the two requirements are substantially different, 517.19(A) should not be identified as extracted material.
Number Eligible to Vote: 13

Ballot Not Returned: 1 Conry, C.

15-36 Log #1801 NEC-P15 **Final Action: Reject**
(517.19(A) Exception No. 2)

Submitter: Marvin J. Fischer, Monroe Township, NJ
Recommendation: Add at end of Exception: "[NFPA 99: 4.3.2.2.1.2]".
Substantiation: 1. Requirement is the responsibility of T/C on Health Care Facilities.
2. Conform to NFPA Standards Council on policy for extracted text.
Panel Meeting Action: Reject
Panel Statement: Since the two requirements are substantially different, 517.19(A), Exception No. 2, should not be identified as extracted material.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-37 Log #1802 NEC-P15 **Final Action: Accept**
(517.19(C))

Submitter: Marvin J. Fischer, Monroe Township, NJ
Recommendation: 1. Change "Patient Vicinity" to "Patient Care Vicinity".
2. Change "patient vicinity" to read "patient care vicinity" wherever it appears in text.
3. Correlate with proposal on 517.2, Patient Vicinity submitted separately.
Substantiation: 1. Term is the responsibility of T/C on Health Care Facilities. Term as used in NFPA 99 is "Patient care vicinity".
2. Conform to NFPA Standards Council on policy for extracted text.
3. Correlate with proposal in 517.2 on the term "Patient Vicinity".
Panel Meeting Action: Accept
Panel Statement: See panel actions and statements on Proposals 15-1 and 15-23.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-38 Log #1645 NEC-P15 **Final Action: Accept**
(517.19(D))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read as follows:
(D) Panelboard Grounding <u>and Bonding.</u> Where a grounded electrical distribution system is used and metal feeder raceway or Type MC or MI cable <u>that qualifies as an equipment grounding conductor in accordance with 250.118 is installed,</u> grounding of a panelboard or switchboard shall be ensured by one of the following <u>bonding</u> means at each termination or junction point of the <u>metal</u> raceway or Type MC or MI cable:
(1) A grounding bushing and a continuous copper bonding jumper, sized in accordance with 250.122, with the bonding jumper connected to the junction enclosure or the ground bus of the panel
(2) Connection of feeder raceways or Type MC or MI cable to threaded hubs or bosses on terminating enclosures
(3) Other approved devices such as bonding-type locknuts or bushings.
Substantiation: Grounding of the panelboard or switchboard can be assured by an equipment grounding conductor of the wire type conductor included with the feeder where properly sized. Copper sheath of Type MI cable is suitable for grounding where used with suitable fittings whereas the steel alloy sheath MI cable is not. MC cables in the larger sizes (for feeders) typically include an equipment grounding conductor of the wire type in accordance with the product standard. Adding the text proposed helps clarify what is required to be assured relative to the equipment grounding. Where an equipment grounding conductor included in the feeder as required by 215.6 is a conductor (wire type), grounding should be assured by proper connection of the equipment grounding conductors at termination points all the way back to the point of origin of the feeder. The redundant equipment grounding conductor paths required by 517.13(A) and (B) are not currently applicable in this section for feeders. Adding the term "and bonding" in this section is appropriate because the section covers both grounding and bonding provisions.
Panel Meeting Action: Accept
Panel Statement:
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-39 Log #1711 NEC-P15 **Final Action: Accept**
(517.19(D))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read as follows:
(D) Panelboard Grounding <u>and Bonding</u> . Where a grounded electrical distribution system is used and metal feeder raceway or Type MC or MI cable <u>that qualifies as an equipment grounding conductor in accordance with 250.118 is installed,</u> grounding of a panelboard or switchboard shall be ensured by one of the following <u>bonding</u> means at each termination or junction point of the <u>metal</u> raceway or Type MC or MI cable:
(1) A grounding bushing and a continuous copper bonding jumper, sized in accordance with 250.122, with the bonding jumper connected to the junction enclosure or the ground bus of the panel.
(2) Connection of feeder raceways or Type MC or MI cable to threaded hubs or bosses on terminating enclosures.
(3) Other approved devices such as bonding-type locknuts or bushings.
Substantiation: Grounding of the panelboard or switchboard can be assured by an equipment grounding conductor of the wire type conductor included with the feeder where properly sized. Copper sheath of Type MI cable is suitable for grounding where used with suitable fittings whereas the steel alloy sheath MI cable is not. MC cables in the larger sized (for feeders) typically include an equipment grounding conductor of the wire type in accordance with the product standard. Adding the text proposed helps clarify what is required to be assured relative to the equipment grounding. Where an equipment grounding conductor included in the feeders as required by 215.6 is a conductor (wire type), grounding should be assured by proper connection of the equipment grounding conductors at termination points all the way back to the point of origin of the feeder. The redundant equipment grounding conductor paths required by 517.13(A) and (B) are not currently applicable in this section for feeders. Adding the term "and bonding" in this section is appropriate because the section covers both grounding and bonding provisions.

(517.19(E) Exception)

Submitter: Marvin J. Fischer, Monroe Township, NJ
Recommendation: Add at the end of Exception: "[NFPA 99: 4.3.2.6.3.2]".
Substantiation: 1. Requirement is the responsibility of T/C on Health Care Facilities.
2. Conform to NFPA Standards Council on policy for extracted text.
Panel Meeting Action: Reject
Panel Statement: Since the two requirements are substantially different, 517.19(E) should not be identified as extracted material.

Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-41 Log #2115 NEC-P15 **Final Action: Accept**
(517.20(A) Exception)

Submitter: Burton R. Klein, Burton Klein Associates
Recommendation: Delete the word "normal" so Exception reads:
Branch circuits supplying only listed, fixed, therapeutic and diagnostic equipment shall be supplied from a ~~normal~~ grounded service, single- or 3-phase system, provided that...(remainder of Exception the same).
Substantiation: 1. Exception is addressing the issue of allowing this equipment to be fed from a grounded service, irrespective of whether that service is from the normal or essential electrical system.
2. This is extracted text from NFPA 99, which does not include the word "normal."
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-42 Log #1044 NEC-P15 **Final Action: Reject**
(517.26)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:
The essential electrical system shall meet the <u>applicable</u> requirements ~~of Article 700~~ <u>for emergency systems</u> except as amended by Article 517.
Substantiation: Edit. To comply with Style Manual requirements.
Panel Meeting Action: Reject
Panel Statement: The reference to Article 700 should not be deleted or replaced by the term "for emergency systems," as the term "emergency systems" is utilized elsewhere in the Code.
It is consistent with the NEC Style Manual to refer to an entire chapter (Article) when additional conditions are specified.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-43 Log #2508 NEC-P15 **Final Action: Accept**
(517.26)

Submitter: Hugh O. Nash, Jr., Nash Lipsey Burch, LLC
Recommendation: Revise text to read as follows:
517.26 Application of Other Articles. The life safety branch of the emergency system ~~essential electrical system~~ shall meet the requirements of Article 700, except as amended by Article 517. The critical branch shall not be required to meet the requirements of Article 700.
Substantiation: The life safety branch of the health care facility is comparable to the emergency system of commercial (and other) building types, since both provide power for life safety systems. The critical branch of the health care facility serves patient care related circuits and equipment, and thus it is not appropriate to apply Article 700.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 11 Negative: 1
Ballot Not Returned: 1 Conry, C.
Explanation of Negative:
MORGAN, E.: I strongly disagree with the panel action on this proposal. Throughout NFPA 99 and NEC Article 517, the critical branch is considered an inseparable part of the emergency system. By definition, the critical branch serves such important functions as task illumination, special power circuits, and selected receptacles related to patient care. A more complete list of the locations served by these circuits is in NFPA 99, 4.4.2.2.2.3. It includes locations such as coronary care, intensive care, postoperative recovery rooms, hemodialysis rooms and emergency rooms.
Removal of the requirement to comply with Article 700 is more than an editorial change. It would literally remove requirements such as: Identification of boxes, enclosures and panels as part of the emergency system (700.9); the requirement for audible and visual signals for the alternate power source (700.7); and the periodic testing required by 700.4.
Removing the critical branch from requirements of Article 700 may also be mistakenly seen by some designers and installers of smaller facilities as eliminating the requirements for emergency systems in Article 517; such as separation from other circuits, and mechanical protection.

15-44 Log #1804 NEC-P15 **Final Action: Reject**
(517.30(B)(1))

Submitter: Marvin J. Fischer, Monroe Township, NJ
Recommendation: Add at the end of paragraph: “[NFPA 99: 4.4.2.2.1]”.
Substantiation: 1. Requirement is the performance criteria and responsibility of T/C on Health Care Facilities.
2. Conform to NFPA Standards Council on policy for extracted text.
Panel Meeting Action: Reject
Panel Statement: Since the two requirements are substantially different, 517.19(A) should not be identified as extracted material.
Number Eligible to Vote: 13

Ballot Not Returned: 1 Conry, C.

15-51 Log #3025 NEC-P15 **Final Action: Reject**
(517.30(C)(4))

Submitter: Barry F. O’Connell, Tyco Thermal Controls
Recommendation: Add 517.30(C)(4):
Fire Protection of the Emergency Systems Wiring. The wiring of the emergency systems shall be protected to resist potential damage by fire for a period of 2 hours using one of the following methods:
(1) Be encased in a minimum 50 mm (2 in.) of concrete
(2) Be protected by a fire-rated assembly listed to achieve a minimum fire rating of 2 hours
(3) Be a listed electrical circuit protective system with a minimum 2-hour fire rating.
Substantiation: It is common practice to fire protect emergency system wiring in hospitals. This proposal would explicitly incorporate the allowable methods traditionally used in 700.9(D) except extending the time to 2-hours. In a hospital, additional time is required to evacuate, because of limited occupant mobility.
Panel Meeting Action: Reject
Panel Statement: Fire protection is primarily a function of the Building Code and Life Safety Code. If incorporated into the wiring requirements for an emergency system, it should be done through expanding the occupancy classes listed in 700.9(D).

Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-52 Log #1811 NEC-P15 **Final Action: Reject**
(517.30(C)(1))

Submitter: Marvin J. Fischer, Monroe Township, NJ
Recommendation: Add at end of paragraph 1, add: "[NFPA 99: 4.4.2.2.4.1]".
Substantiation: 1. Text is performance criteria and the responsibility of T/CC on Health Care Facilities.
2. Conform to NFPA Standards Council on policy for extracted text.
Panel Meeting Action: Reject
Panel Statement: Since the two requirements are substantially different, 517.30(C)(1), should not be identified as extracted material.
Section 517.30(C)(1) has additional requirements beyond Section 4.4.2.2.4.1 of NFPA 99.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-53 Log #1812 NEC-P15 **Final Action: Reject**
(517.30(C)(3))

Submitter: Marvin J. Fischer, Monroe Township, NJ
Recommendation: Add at end of paragraph 1, before subparagraph 1, add: "[sentence 1: NFPA 99: 4.4.2.2.4.4]".
Substantiation: 1. Text is performance criteria and the responsibility of T/CC on Health Care Facilities.
2. Conform to NFPA Standards Council on policy for extracted text.
Panel Meeting Action: Reject
Panel Statement: NFPA 99, Section 4.4.3.3.4.4, refers to NFPA 70 for requirements; therefore 517.30(C)(3) is not extracted text.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-54 Log #3300 NEC-P15 **Final Action: Reject**
(517.30(C)(3))

Submitter: Richard Temblador, Southwire Company
Recommendation: Revise text to read as follows:
(3) Mechanical Protection of the Emergency System. The wiring of the emergency system in hospitals shall be mechanically protected. Where installed as branch circuits in patient care areas, the installation shall comply with the requirements of 517.13(A) and 517.13(B). The following wiring methods shall be permitted:
(1) Nonflexible metal raceways, Type MI cable, or Schedule 80 rigid nonmetallic conduit. Nonmetallic raceways shall not be used for branch circuits that supply patient care areas.
<u>(2) Listed MC cable identified as providing crush, impact and penetration circuit protection performance equivalent to Electrical Metallic Tubing.</u>
(~~2~~ <u>3</u>) Where encased in not less than 50 mm (2 in.) of concrete, Schedule 40 rigid nonmetallic conduit, flexible nonmetallic or jacketed metallic raceways, or jacketed metallic cable assemblies listed for installation in concrete. Nonmetallic raceways shall not be used for branch circuits that supply patient care areas.
(~~3~~ <u>4</u>) Listed flexible metal raceways and listed metal sheathed cable assemblies in any of the following:
a. Where used in listed prefabricated medical headwalls
b. In listed office furnishings
c. Where fished into existing walls or ceilings, not otherwise accessible and not subject to physical damage
d. Where necessary for flexible connection to equipment
(~~4~~ <u>5</u>) Flexible power cords of appliances or other utilization equipment connected to the emergency system.
(~~5~~ <u>6</u>) Secondary circuits of Class 2 or Class 3 communication or signaling systems
Substantiation: Traditionally, nonflexible metal raceways and MI cable have been used to provide the needed mechanical protection as required for emergency and critical branch circuits along with redundant ground paths as required by 517.13. MC cable can be designed and constructed to provide the needed mechanical protection - crush, impact and penetration - for emergency and critical branch that is equivalent to that of electrical metallic tubing with redundant ground paths as required by 517.13.
Panel Meeting Action: Reject
Panel Statement: The panel is reluctant to expand the use of MC cable beyond its permitted uses.
The substantiation indicates that MC cable "can be designed and constructed to provide the needed mechanical protection". This statement does not provide the evidence or data to warrant acceptance of this proposed change.
The panel recommends that the submitter provide the panel with a fact finding report to substantiate this change and evidence that this product can be listed and identified as special construction.
In addition, the panel recommends that this information would be more appropriately located in Article 330 under Uses Permitted.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-55 Log #2969 NEC-P15 **Final Action: Reject**
(517.30(C)(3)(3))

Submitter: James H. Maxfield, Dover, NH
Recommendation: Add 517.30(C)(3)(3)e.
Where protected from physical damage for its entire length by any raceway identified in (1) and (2).
Substantiation: Any raceway identified and installed in accordance with (1) or (2) provide adequate physical damage protection for branch circuit conductors that supply patient care areas. Similarly, when installed for its entire length in such raceways listed flexible metal raceways and listed metal sheathed cable assemblies will be as well protected from physical damage. The requirements of 517.13(A) and 517.3(B) are not compromised by the installation of listed flexible metal raceways and listed metal sheathed cable assemblies protected by a nonmetallic raceway. Raceway sections identified in (1) and (2) already permit such an installation. For example, 352.22 "cables shall be permitted to be installed where such use is not prohibited by the respective cable article."
Panel Meeting Action: Reject
Panel Statement: Listed cable assemblies are not tested for performance when installed entirely within a raceway system. Installation of a cable within another raceway "along its entire length" becomes an installation problem for proper termination of the cable system and the raceway at junction points. Proper sizing of a raceway to contain a single cable is unfamiliar to many installers and inspectors.
Section 517.30(C)(3)(3) covers the use of flexible methods. Installation in accordance with the submitter's proposal would constitute a nonflexible installation.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-56 Log #3453 NEC-P15 **Final Action: Reject**
(517.30(C)(3)(3))

Submitter: William A. Wolfe, Steel Tube Institute of North America
Recommendation: Revise the charging paragraph of the exceptions to read as follows:
Listed flexible metal raceways and listed metal sheathed cable assemblies <u>complying with 250.118 and 517.13 are permitted</u> in any of the following:
Substantiation: Both Section 250.118 and 517.13 contain important information regarding specific grounding requirements for the wiring methods named in (3). Without these references it could be interpreted that these requirements are superseded by the exceptions in 517.30(3)(3). While there is a FPN calling the user's attention to 517.13, this is not enforceable and the safety in patient care areas could be compromised. This revised text should assure that necessary grounding requirements and limitations are met.
Panel Meeting Action: Reject
Panel Statement: Compliance with 517.13 is unnecessary for cables in office furnishings where fished into existing walls or ceilings, or to connect equipment outside the patient care area. Paragraph (3) clearly states the requirement for compliance with 517.13 where located in a patient care area, and 517.13(A) contains the needed reference to 250.118.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-57 Log #1931 NEC-P15 **Final Action: Accept**
(517.30(C)(3)(4) and 517.30(C)(3)(2))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 8-53. This action will be considered by the Panel as a Public Comment. The Technical Correlating Committee also directs that this proposal be forwarded to Code-Making Panel 8 for Comment.
Submitter: William Wagner, Certification Solutions
Recommendation: Revise 517.30(C)(3)(1) and 517.30(C)(3)(2) as follows:
(1) Nonflexible metal raceways, Type MI cable, or Schedule 80 rigid ~~nonmetallic~~ <u>PVC</u> conduit. Nonmetallic raceways shall not be used for branch circuits that supply patient care areas.
(2) Where encased in not less than 50 mm (2 in.) of concrete, Schedule 40 rigid ~~nonmetallic~~ <u>PVC</u> conduit, flexible nonmetallic or jacketed metallic raceways, or jacketed metallic cable assemblies listed for installation in concrete. Nonmetallic raceways shall not be used for branch circuits that supply patient care areas.

Substantiation: This is a companion proposal for the new definition of Rigid Nonmetallic Conduit in Article 100 and the revised Article 352 for Type PVC conduit. It clarifies that rigid polyvinyl chloride conduit is designated as Type PVC, rather than the broader designation of rigid nonmetallic conduit (Type RNC) which includes PVC, HDPE and RTRC. It also results in the use of consistent terminology for this product throughout the code.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.
Comment on Affirmative:
MORGAN, E.: This proposal seemed logical enough when it was being considered by the panel. The actual result could be other than was intended. Depending on the outcome of proposals to separate the existing Article 352 into three new articles covering type PVC, type HDPE and type RTRC conduit, Panel 15 may wish to revisit this in the Comment Meetings. We may have inadvertently eliminated all but PVC conduit for use in installations governed by Section 517.30(C)(1) and (2).

15-58 Log #886 NEC-P15 **Final Action: Accept in Principle**
(517.30(C)(3)(5))

Submitter: Noel Williams, Noel Williams Consulting
Recommendation: Revise (5) to read as follows:
" Cable types from Chapter 7 or Chapter 8 with or without raceways for secondary circuits of Class 2 or Class 3 communication or signaling systems."
Substantiation: The list following 517.30(C)(3) is supposed to be a list of permitted wiring methods. The existing item (5) does not describe any wiring methods. The proposed language restores the details of the 2002 exception that was reworded for 2005, especially the clear statement that raceways are not required.
Panel Meeting Action: Accept in Principle
In the current Code text, add "with or without raceways" to the end of the sentence.
Panel Statement: The revised language clarifies that raceway is not required in this application.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-59 Log #1813 NEC-P15 **Final Action: Reject**
(517.30(D))

Submitter: Marvin J. Fischer, Monroe Township, NJ
Recommendation: Add at end of first paragraph, add: "[sentence 1: NFPA 99: 4.4.2.1.1.9]".
Substantiation: 1. Text is performance criteria and the responsibility of T/CC on Health Care Facilities.
2. Conform to NFPA Standards Council on policy for extracted text.
Panel Meeting Action: Reject
Panel Statement: The referenced number to NFPA 99 provided by the submitter does not exist. Although the requirements of NFPA 99, 4.4.1.1.9, are similar to those of 517.30(D), the requirements are substantially different and, therefore, 517.30(D) should not be identified as extracted material.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-60 Log #1814 NEC-P15 **Final Action: Reject**
(517.32)

Submitter: Marvin J. Fischer, Monroe Township, NJ
Recommendation: Add at end of first paragraph, before paragraph (A), add: "[sentence 1: NFPA 99: 4.4.2.2.2.2]".
Substantiation: 1. Text is performance criteria and the responsibility of T/CC on Health Care Facilities.
2. Conform to NFPA Standards Council on policy for extracted text.
Panel Meeting Action: Reject
Panel Statement: Since the two requirements are substantially different, 517.32, should not be identified as extracted material.
The text of 517.32 contains more information than 4.4.2.2.2.2 of NFPA 99.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-61 Log #2509 NEC-P15 **Final Action: Accept in Principle**
(517.32(E))

TCC Action: The Technical Correlating Committee notes that the word "emergency" should be inserted between "for" and "battery- powered" to be consistent with the existing code text.
Submitter: Hugh O. Nash, Jr., Nash Lipsey Burch, LLC
Recommendation: Revise text to read as follows:
517.32(E) Generator Set and Transfer Switch Location s. Task illumination battery charger for emergency battery-powered lighting unit(s) and selected receptacles at the generator set and essential electrical system automatic transfer switch location s .
Substantiation: (1) Battery emergency lighting is necessary to troubleshoot and repair automatic transfer switches during a power outage. (2) This change is necessary to correlate with NFPA 99.
Panel Meeting Action: Accept in Principle
Revise the proposed text to read as follows:
"517.32(E) Generator Set and Transfer Switch Location s . Task Illumination battery charger for battery-powered lighting units(s) and selected receptacles at the generator set and essential transfer switch locations. [NFPA 99:4.4.2.2.2.2(5)]"
Panel Statement: As revised, paragraph (E) is the same as the NFPA 99 requirement and should be so identified.
Also, the additional wording satisfies the submitter's intent.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-62 Log #1815 NEC-P15 **Final Action: Reject**
(517.32(H) (New))

Submitter: Marvin J. Fischer, Monroe Township, NJ
Recommendation: Add new paragraph (H) to read:
"(H) Auxiliary functions of fire alarm combination systems complying with NFPA 72, National Fire Alarm Code. [NFPA 99: 4.4.2.2.2.2(1) to (8)]."
Substantiation: 1. Text is performance criteria and the responsibility of T/CC on Health Care Facilities.
2. Conform to NFPA Standards Council on policy for extracted text.
Panel Meeting Action: Reject
Panel Statement: The proposal does not provide specific language to indicate those functions deemed necessary to be supplied by the life safety branch.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-63 Log #2510 NEC-P15 **Final Action: Accept in Principle**
(517.32(H) (New))

Submitter: Hugh O. Nash, Jr., Nash Lipsey Burch, LLC
Recommendation: Add text to read as follows:
517.32(H) Other Life Safety Equipment. Heating ventilation and air conditioning accessories required for life safety, including control systems, air evacuation and pressurization fans, and electrically operated dampers. Fan motors shall be permitted to be connected to the equipment system.
Substantiation: HVAC controls, dampers, and certain motors are related to the safety of life. The designer should have the option to connect large motors to the equipment system where it is not practical to connect them to the life safety branch.
Panel Meeting Action: Accept in Principle
Create a new 517.32(C)(3) to read as follows:
"517.32(C)(3) Mechanical, control, and other accessories required for effective life safety systems operation shall be permitted to be connected to the life safety branch."
Panel Statement: The new wording meets the intent of the submitter in that it makes it possible to connect smoke dampers, and smoke control actuators, initiated by the fire alarm system, to the life safety branch.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-64 Log #2511 NEC-P15 **Final Action: Accept in Principle**
(517.32(I) (New))

Submitter: Hugh O. Nash, Jr., Nash Lipsey Burch, LLC
Recommendation: Add text to read as follows:
517.32 (I) Generator Accessories. Accessories for the onsite standby generator shall be permitted to be connected to the life safety branch. These accessories shall also be permitted to be served by the critical branch or equipment system.

Substantiation: (1) Generator accessories are generally provided for the onsite generator, which is required for the safety of life. (2) For outdoor generators located in weatherproof enclosures, 517.34(E) and most jurisdictions require lighting and receptacles to be supplied by the life safety branch. It is generally best to provide the lighting and receptacles circuits, as well as other accessories (i.e. day tank) from a panel located in the outdoor generator enclosure. Having all circuits from the same panel reduces risk (i.e. the possibility that a worker might open all breakers and then sustain injury from a life safety circuit that originates outside of the generator enclosure). The provision that accessory circuits may also be connected to the critical branch or equipment system covers other contingencies, such as indoor generator installations. The generator accessories should not be restricted to a single branch or system, since the generator exists for patient care, life safety, and other purposes.
Panel Meeting Action: Accept in Principle
Create a new 517.32(F) to read as follows:
"517.32(F) Generator Set Accessories. Generator set accessories as required for generator performance."
Renumber existing (F), (G), and a new (H), accordingly.
Panel Statement: The revised wording meets the intent of the submitter in that all accessories could be connected to the same panel.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-65 Log #1816 NEC-P15 **Final Action: Reject**
(517.33(A)(9))

Submitter: Marvin J. Fischer, Monroe Township, NJ
Recommendation: Add at end of sub paragraph (9), revise to read: "[sentence 1: NFPA 99: 4.4.2.2.2.3(1) to (9)]".
Substantiation: 1. Text is performance criteria and the responsibility of T/CC on Health Care Facilities.
2. Conform to NFPA Standards Council on policy for extracted text.
Panel Meeting Action: Reject
Panel Statement: Since the two requirements are substantially different, 517.33(A)(9) should not be identified as extracted material.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-66 Log #2520 NEC-P15 **Final Action: Accept**
(517.34(A)(7) (New))

Submitter: Hugh O. Nash, Jr., Nash Lipsey Burch, LLC
Recommendation: Add text to read as follows:
<u>517.34(A)(7) Supply, return, and exhaust ventilating systems for operating and delivery rooms.</u>
Substantiation: O.R. and D.R. ventilation systems should be connected to the equipment system for the same reasons that the loads described in 517.34(A)(6) are connected to the equipment systems. These loads insure that air circulation, filtration, and air pressure relationships are maintained for infection control purposes. The requirement for space heating in 517.34(B)(1) is not specific to air movement and permits manual transfer, which is not acceptable for infection control purposes. (Note that it is not proposed that these loads be permitted to be supplied from the critical branch as in 517(A)(6). O.R. and D. R. air handling units are generally too large for the life safety branch and a short delay before transfer is acceptable.)
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 11 Negative: 1
Ballot Not Returned: 1 Conry, C.
Explanation of Negative:
WHITE, A.: The current phrase "protective environment rooms" found in 517.34(A)(6) adequately describes the rooms in question.

15-67 Log #2512 NEC-P15 **Final Action: Accept**
(517.34(A) and (B))

Submitter: Hugh O. Nash, Jr., Nash Lipsey Burch, LLC
Recommendation: Revise text to read as follows:
517.34(A) Equipment for Delayed Automatic Connection. The following equipment shall be <u>permitted to be</u> arranged for delayed automatic connection to the alternate power source:
517.34(B) Equipment for Delayed Automatic or Manual Connection. The following equipment shall be <u>permitted to be</u> arranged for either delayed automatic or manual connection to the alternate power source:
Substantiation: (1) In spilt of the present code language, few modern health care facilities are programming their automatic transfer switches for delayed automatic transfer. (2) Modern standby generators can handle 100 percent step load with little difficulty, thus there is generally no need for delaying the transfer of loads. (3) Small facilities with essential system loads of less than 150 kVA (or 120 kW) (see 517.30(B)(4)), would be required to have multiple automatic transfer switches if delayed automatic transfer is required. (4) This change is required to correlate with NFPA 99.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-68 Log #1817 NEC-P15 **Final Action: Accept in Principle**
(517.34(A)(6))

Submitter: Marvin J. Fischer, Monroe Township, NJ
Recommendation: 1. Add at end of sub paragraph (6), revise to read: "[NFPA 99: 4.4.2.2.3.4(1) to (6)]".
2. Delete reference at the end of subparagraph (A)(5).
Substantiation: 1. Text is performance criteria and the responsibility of T/CC on Health Care Facilities.
2. Conform to NFPA Standards Council on policy for extracted text.
Panel Meeting Action: Accept in Principle
The recommended text is to appear after (6) and before the exception.
Also, the extract reference in (5) and in (6) is removed.
Panel Statement: The revision complies with the NEC Style Manual.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-69 Log #1818 NEC-P15 **Final Action: Reject**
(517.34(B))

Submitter: Marvin J. Fischer, Monroe Township, NJ
Recommendation: 1. Add at end of first sentence, before subparagraph (1) add: "[NFPA 99: from 4.4.2.2.2.5(1) to (9)]".
2. In Exception to subparagraph (1), change first word from "eating" to "Heating".
Substantiation: 1. Text is performance criteria and the responsibility of T/CC on Health Care Facilities.
Conform to NFPA Standards Council on policy for extracted text.
2. Editorial.
Panel Meeting Action: Reject
Panel Statement: Since the two requirements are substantially different, 517.34(B)(1) through (9) should not be identified as extracted material.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 11 Negative: 1
Ballot Not Returned: 1 Conry, C.
Explanation of Negative:
ERICKSON, D.: While the proposal to place an extract from NFPA 99 under this paragraph should be rejected, the need to accept this proposal in principle is necessary and the editorial change made.
(B) Equipment for Delayed Automatic or Manual Connection.
The following equipment shall be arranged for either delayed automatic or manual connection to the alternate power source:
(1) Heating equipment to provide heating for operating, delivery, labor, recovery, intensive care, coronary care, nurseries, infection/isolation rooms, emergency treatment spaces, and general patient rooms and pressure maintenance (jockey or make-up) pump(s) for waterbased fire protection systems.
Exception: Heating of general patient rooms and infection/isolation rooms during disruption of the normal source shall not be required under any of the following conditions;

15-70 Log #1819 NEC-P15 **Final Action: Accept**
(517.34(B)(5))

TCC Action: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the panel as a public comment.
Submitter: Marvin J. Fischer, Monroe Township, NJ
Recommendation: Delete subparagraph (5): ["Automatically operated doors"].
Substantiation: 1. Text is performance criteria and the responsibility of T/CC on Health Care Facilities.
Conform to NFPA Standards Council on policy for extracted text.
2. Subject of automatically operated doors - those within means of egress - were moved to Life Safety Branch in NFPA 99.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 11 Negative: 1
Ballot Not Returned: 1 Conry, C.
Explanation of Negative:
WHITE, A.: Automatic doors used for egress are required to be connected to the Life Safety Branch as per 517.32(D). There are many applications for non-egress automatic doors within a hospital, Article 517.34(B)(5) provides for the continued operation of these doors in an off-normal situation while not further burdening the Life Safety Branch.
Comment on Affirmative:
MORGAN, E.: The substantiation indicates connection of automatically operated doors was relocated to requirements under the Life Safety Branch. It is true that <u>egress</u> doors are required to be connected to the Life Safety

Branch, both in NFPA 99, 4.4.2.2.2.2(7), as well as NEC 517.32(G). But acceptance of this proposal means there will not be a requirement for connection of automatically operated doors for Operation Rooms or Delivery Rooms to any of the alternate power sources.

Existing 517.34(B)(5) does require delayed automatic or manual connection of "Automatically operated doors" to the equipment system. Since egress doors are already covered in Life Safety Branch requirements, it appears this should have remained to cover the connection of O.R. and D.R. rooms. This also should be revisited at the Comment Meeting.

15-71 Log #1820 NEC-P15 **Final Action: Reject**
(517.35(C))

Submitter: Marvin J. Fischer, Monroe Township, NJ
Recommendation: Add at end of paragraph, before FPN, add: "[NFPA 99: 4.4.1.1.2(5)]".
Substantiation: 1. This text is performance criteria and the responsibility of the Health Care Facilities Project.
2. Conform to NFPA Standards Council Policy on extracted text.
Panel Meeting Action: Reject
Panel Statement: Section 517.35(C) is not extracted from NFPA 99, 4.4.1.1.2. The reference stated does not exist.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-72 Log #1821 NEC-P15 **Final Action: Reject**
(517.40(A) Exception)

Submitter: Marvin J. Fischer, Monroe Township, NJ
Recommendation: Add at end of subparagraph (c), revise extracted reference to read: "[NFPA 99: 17.3.1.4.2, 18.3.4.1.2]".
Substantiation: Update reference paragraph number.
Panel Meeting Action: Reject
Panel Statement: Section 517.40 is not extracted from the stated reference.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 11 Negative: 1
Ballot Not Returned: 1 Conry, C.
Explanation of Negative:
ERICKSON, D.: The proposal to update the extract from NFPA 99 under this paragraph should be accepted as this does have a current NFPA 99 extract associated with the language.
(c) An automatic battery-operated system(s) or equipment is provided that shall be effective for at least 11/2 hours and is otherwise in accordance with 700.12 and that shall be capable of supplying lighting for exit lights, exit corridors, stairways, nursing stations, medical preparation areas, boiler rooms, and communications areas. This system shall also supply power to operate all alarm systems.
[NFPA 99: 17.3.4.1.2(3), 18.3.4.1.2(3)]

15-73 Log #1822 NEC-P15 **Final Action: Reject**
(517.40(B))

Submitter: Marvin J. Fischer, Monroe Township, NJ
Recommendation: Revise 517.40(B) to read:
"(B) Inpatient hospital care facilities. <u>Nursing homes and limited care facilities that admit patients who need to be sustained by electrical life support equipment, the essential electrical system from the source to the portion of the facility where such patients are treated</u> shall comply with requirements of Part III, 517.30 through 517.35. " <u>[NFPA 99: 17.3.4.2.4, 18.3.4.2.4</u>]" (changes underlined)
Substantiation: 1. This text is performance criteria and the responsibility of the Health Care Facilities Project. It was revised for the 2005 edition of NFPA 99.
2. Conform with the NFPA Standards Council policy on extracted text.
Panel Meeting Action: Reject
Panel Statement: Since the two requirements are substantially different, 517.40(B), should not be identified as extracted material.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 11 Negative: 1
Ballot Not Returned: 1 Conry, C.
Explanation of Negative:
ERICKSON, D.: This proposal needs to be accepted as the language in NFPA 99 has changed and the proposed language provides the user and enforcer with better guidance. The panel substantiation does not match the recommendation to modify the current language.

15-74 Log #1823 NEC-P15 **Final Action: Reject**
(517.40(C))

Submitter: Marvin J. Fischer, Monroe Township, NJ
Recommendation: Add at end of paragraph, before FPN, add: "[NFPA 99: 13.3.4.3]".
Substantiation: 1. Requirement is performance criteria and the responsibility of T/C on Health Care Facilities.
2. Conform to NFPA Standards Council on policy for extracted text.
Panel Meeting Action: Reject
Panel Statement: The text cited is inconsistent with the language in 517.40(C); therefore, the text is not extracted and the proposed citation is inappropriate.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.
Comment on Affirmative:
ERICKSON, D.: The submitter should be directed to paragraph 517.30(B)(6) and the extract is already included.

15-75 Log #1824 NEC-P15 **Final Action: Reject**
(517.41(C))

Submitter: Marvin J. Fischer, Monroe Township, NJ
Recommendation: Add at end of paragraph, before FPN, add: "[NFPA 99: 4.5.1]".
Substantiation: 1. This text is performance criteria and the responsibility of the Health Care Facilities Project.
2. Conform to the Standards Council Policy on extracted text.
Panel Meeting Action: Reject
Panel Statement: Since the two requirements are substantially different, 517.41(C) should not be identified as extracted material.

Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-76 Log #1825 NEC-P15 **Final Action: Reject**
(517.42)

Submitter: Marvin J. Fischer, Monroe Township, NJ
Recommendation: Add at end of paragraph, before FPN, add: "[NFPA 99: 4.5.2.2.2(1) to (7)]".
Substantiation: 1. This text is performance criteria and the responsibility of the Health Care Facilities Project.
2. Conform to the Standards Council Policy on extracted text.
Panel Meeting Action: Reject
Panel Statement: Since the two requirements are substantially different, 517.42 should not be identified as extracted material.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-77 Log #2116 NEC-P15 **Final Action: Reject**
(517.42)

Submitter: Burton R. Klein, Burton Klein Associates
Recommendation: 1. Revise title of 517.42 to read:
517.42 Connection to Emergency System
2. Change "life safety branch" to "emergency system" wherever it appears in 517.42.
3. Revise Figures 517.41, No. 1 and 517.41, No. 2 accordingly.
Substantiation: 1. While 517.42 currently only requires items related to life safety to be connected to emergency power, activities in nursing homes is changing. The TC on Electrical Systems (for Chapter 4 of NFPA 99) has recognized this shift and has included a new paragraph in 2005 addressing nursing homes that have "patients" connected to "electrical life support equipment." Thus, it is only a matter of time before nursing homes will have a "life safety branch" and a "critical branch" that needs to be connected to emergency power within 10 seconds (i.e., they will have an "emergency system" of the essential electrical system like hospitals.
2. This change is in concert with Chapter 17 of NFPA 99-2005.
Panel Meeting Action: Reject
Panel Statement: Article 517 and NFPA 99 both recognize the use of terms "Life Safety Branch" and "Critical Branch" as divisions of the facility emergency system. The terms should not be interposed.
It is the panel's position that NFPA 99 should address this substantive change in system arrangement prior to Article 517 being changed.
Number Eligible to Vote: 13

Substantiation: 1. This text is performance criteria and the responsibility of the Health Care Facilities Project.
2. Conform to the Standards Council Policy on extracted text.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-79 Log #2117 NEC-P15 **Final Action: Reject**
(517.43)

Submitter: Burton R. Klein, Burton Klein Associates
Recommendation: 1. Revise title of 517.43 to read:
517.43 Connection to Equipment System
2. Change "critical branch" to "equipment system" wherever it appears in 517.43.
3. Revise Figures 517.41, No. 1 and 517.41, No. 2 accordingly.
Substantiation: 1. Except for first item listed in 517.43(A), all items in this section are "equipment related" (similar to 517.34 which uses the term "Equipment" to describe these items). When nursing homes or limited care facilities begin to treat "patients" (and some already are), they will have to provide for a "critical branch". Thus, this change is recommended now in order to prevent confusion in the future.
2. A similar proposal is being submitted to NFPA 99 for correlation purposes.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 15-77.

15-82a Log #CP1502 NEC-P15 **Final Action: Accept**
(517.44(B))

TCC Action: The Technical Correlating Committee understands that the reference in the recommendation is to 517.40(A) Exception, and not to 517.40(A) main paragraph.
Submitter: Code-Making Panel 15,
Recommendation: In existing 517.44(B), Revise Exception No. 2 to read as follows:
"Exception No. 2: Nursing homes or limited care facilities meeting the requirement of 517.40(A) and other healthcare facilities meeting the requirement of 517.45 shall be…".
Delete all the existing extract references.
Substantiation: Other facilities, under certain conditions described in 517.40 are permitted to have batteries.

Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.
Comment on Affirmative:
WISEMAN, J.: In the Recommendation, the word "Exception" was inadvertently omitted and should be reinserted following "517.40(A)." It is the requirements of 517.40(A), Exception that apply, not the requirements of 517.40(A).

15-83 Log #1829 NEC-P15 **Final Action: Reject**
(517.44(C))

Submitter: Marvin J. Fischer, Monroe Township, NJ
Recommendation: Add at end of paragraph, add: "[NFPA 99: A.4.4.1.1.1.2(5)]".
Substantiation: 1. This text is performance criteria and the responsibility of the Health Care Facilities Project.
2. Conform to the Standards Council Policy on extracted text.
Panel Meeting Action: Reject
Panel Statement: The NEC Style Manual prohibits the extraction of non-mandatory text.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-84 Log #2181 NEC-P15 **Final Action: Reject**
(517.60(B))

Submitter: Dann Strube, Strube Consulting
Recommendation: Revise text to read as follows:
(B) ~~other than hazardous (classified) location~~ <u>unclassified locations</u> ...shall be considered to be an ~~other than hazardous (classified~~) <u>unclassified location</u> .
Substantiation: 500.2 defines areas that have not been classified as "Unclassified Locations". This change will put the language of this section into agreement with the 500.2 definition.
4.3.2.2 of the NEC Style Manual allows revision of extracted text to make the extract consistent with the style of the NEC.
The base rule in 500.2 clearly states that the definitions in Article 500 only apply for Articles 500-516. Howeve,r it seems logical that Article 517 would follow the same definitions provided for similar locations.
Panel Meeting Action: Reject
Panel Statement: The phrase "Other than Hazardous" found in Article 517 designates a location where installations are to be modified per the requirements of 517.61(C). The phrase "Unclassified Location" as used in Article 500 indicates an installation that occurs in a location not designated as a hazardous location for the purposes of Article 500, it is assumed the general requirements of Chapters 1 through 4 of the NEC are not modified. The suggestion that the two articles are referring to similar locations is in error; Article 500 paints with a very broad brush and Article 517 refers to a location designated for very specific use. Using "Unclassified Locations" in Article 517 will cause confusion as to the applicability of 517.61(C).
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-86 Log #528 NEC-P15 **Final Action: Accept**
(517.61(B)(4))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read:
(4) Seals. <u>Listed</u> ~~Approved~~ seals shall be provided in conformance with 501.15 and 501.15(A)(4) shall apply to horizontal as well as to vertical boundaries of the defined hazardous (classified) locations.
Substantiation: Approved is defined as acceptable to the authority having jurisdiction. This proposed revision is an effort to provide consistency in how defined words are used in NEC requirements. This section 517.61(B)(4) references 501.15. 501.15(C)(1) requires sealing fittings to be listed. CMP-14 addressed the words approved, identified, and listed in the 2002 NEC cycle and in many cases the word approved was changed to the word listed where appropriate. This proposed revision is intended to provide consistency with those actions.
Note: Supporting material is available for review at NFPA Headquarters.

Ballot Not Returned: 1 Conry, C.
Comment on Affirmative:
ERICKSON, D.: The submitter should be notified that he made a mistake and did not add “hospital grade” as he did in all previous submittals on the same subject. I believe this was an oversight and the Panel should have AIP and added “hospital grade”.

15-92 Log #494 NEC-P15 **Final Action: Accept in Principle in Part**
(517.62)

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise as follows:
517.62 Grounding <u>and Bonding.</u> In any anesthetizing area, all metal raceways and metal-sheathed cables and all <u>normally</u> non-current-carrying conductive portions of fixed electric equipment shall be grounded <u>and bonded.</u> Grounding <u>and bonding</u> in Class I locations shall comply with 501.30.
Substantiation: 501.30 includes both grounding and bonding requirements for Class I locations. This proposed change is an effort to clarify what is actually covered by this section. 517.62 references 501.30 and includes both grounding and bonding rules applicable in such areas.

Panel Meeting Action: Accept in Principle in Part

Revise the proposed wording to read as follows:

"517.62 G rounding. In any anesthetizing area, all metal raceways and metal-sheathed cables and all normally non-current-carrying conductive portions of fixed electric equipment shall be connected to an equipment grounding conductor. Grounding and bonding in Class I locations shall comply with 501.30."

The panel notes that the word "normally" is not contained in Proposal 15-2, nor is the phrase "and bonding" in the last sentence and directs the NFPA editorial staff to be aware of the need to include this wording.

Panel Statement: The panel revised the wording to correlate with the panel action on Proposal 15-2. In addition, the revised wording accomplishes the objective of the submitter to address bonding.

Ballot Results: Affirmative: 12
Ballot Not Returned: 1 Conry, C.

15-106 Log #3656 NEC-P15 **Final Action: Accept in Principle**
(517.160(A)(5))

Submitter: Patricia Johnson, Local Union # 98 IBEW
Recommendation: (1) Isolated conductor No. 1 - orange with blue stripes
(2) Isolated conductor No. 2 - brown with blue stripes Examples
Substantiation: In the Report of Proposals - May 2004 15-53 (Log #2216) NEC-P15 (517-160). This proposal is confusing and could become a safety issue. Orange is used as a “high leg” color (110.15). Orange and brown are also used for 480/227V Y transformer colors and now another use is being proposed for the orange and brown color. For the isolated conductor use orange with blue stripes or brown with blue stripes added to the colors, or use another odd color - such as purple for the isolated conductor to avoid confusion.

Panel Meeting Action: Accept in Principle

Revise the proposed text to read as follows:

(1) Isolated conductor No. 1 - orange with a distinctive colored stripe other than white, green or gray

(2) Isolated conductor No. 2 - brown with a distinctive colored stripe other than white, green or gray.

Revise the first sentence of the following paragraph by adding "with a distinctive colored stripe other than white, green or gray" after the word "yellow".

Revise the second sentence of the same paragraph to read: "striped orange".

Panel Statement: Although the panel accepts the concept, the recommended colors have been revised to ensure ready availability of colored striped conductors.

The critical nature of these circuits demands that their conductors be identified in a manner that leaves no question as to the nature of their service.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 11 Negative: 1

Ballot Not Returned: 1 Conry, C.

Explanation of Negative:

WISEMAN, J.: NEMA disagrees with the panel action and panel statement. While we certainly agree with the critical nature of these circuits, we do not agree that a change in color coding is desirable. The use of orange and brown in isolated power systems has been mandated by the NEC since 1978, at least. It is our contention that this long-standing use along with the low probability of intermixing, as cited below, "leaves no question as to the nature of their service" (quoting the Panel Statement.)

The submitter correctly notes that the NEC also uses orange as the color to identify the high leg of a 3-phase, 4-wire delta system, and also cites the practice of using orange and brown in 480Y/277 V systems. While the latter may be true, it is not a requirement of the NEC. But, more importantly, the probability of encountering either of the other two uses of the orange / brown color-coding in the same area occupied by conductors on an isolated power system is extremely low.

Properly designed and installed, isolated power systems have very few joints made up within junction boxes or other enclosures. And they are not installed in the same raceway with other systems. So the probability of an electrician being misled through the act of checking for voltage-to-ground on a brown or orange wire – an example of the potential problems that was cited during the Panel meeting – is very low. (That same approach for determining if a circuit is de-energized would be ineffectual if used on the orange wire of a 4-wire delta system. Only through knowledge of the voltage systems in use in the area and the use of proper verification techniques can an electrician assure a circuit is not energized.)

Additionally, we are concerned that this change would significantly impact reasonable availability of properly color-coded conductors for isolated power systems. This has two components. The first is the obvious one of a striped conductor having lower commercial demand than a solid-colored one. The other issue is that isolated power systems typically are designed to use insulated conductors having a very low dielectric constant (as mentioned in 517.160(A)(6) FPN No. 2) in order to meet the requirements of NFPA 99 and expected performance requirements. Availability of such conductors with striped insulation should be assured before a change of this nature is considered.

15-107 Log #1831 NEC-P15 **Final Action: Reject**
(517.160(B))

Submitter: Marvin J. Fischer, Monroe Township, NJ

Recommendation: Before subparagraph (A), add: "[NFPA 99: 4.3.2.6.3.2, 4.3.2.6.3.3, 4.3.2.6.3.4]".

Substantiation: 1. This text is performance criteria and the responsibility of the Health Care Facilities Project.

2. Conform to the Standards Council Policy on extracted text.

Panel Meeting Action: Reject

Panel Statement: Since the two requirements are substantially different, 517.160(B) should not be identified as extracted text.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12

Ballot Not Returned: 1 Conry, C.

ARTICLE 518 — PLACES OF ASSEMBLY

15-108 Log #1167 NEC-P15 **Final Action: Accept in Principle in Part**
(518.3(A) and (B))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Delete present text of (A) and substitute:

Except as specifically amended in this article all applicable provisions of this code apply.

In (B) revise first sentence: In exhibition halls used for display booths, as in trade shows, the temporary wiring shall be ~~installed~~ permitted in accordance with ~~Article~~ 590. 3 through 590.6 .

Substantiation: Edit. To comply with Style Manual. Temporary wiring methods of Article 590 should be permitted, not required. "Permanent" type wiring methods of Chapter 3 are not prohibited for installations for temporary or short periods.

Panel Meeting Action: Accept in Principle in Part

The panel rejects the changes to proposed (A) and revises (B) to read as follows:

"(B) In exhibition halls used for display booths, as in trade shows, the temporary wiring shall be permitted to be installed in accordance with Article 590."

Panel Statement: The panel does not agree with the proposed revision of (A), as the proposed text does not improve the meaning or enforceability of (A).

Paragraph (B) language is amended by the panel to improve readability, consistent with intent of this part of the proposal.

The panel's contention is that all provisions of Article 590 shall be permitted.

Number Eligible to Vote: 17

Ballot Results: Affirmative: 16

Ballot Not Returned: 1 Conry, C.

15-109 Log #1039 NEC-P15 **Final Action: Accept in Principle**
(518.4)

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Revise last sentence:

Type ~~MI~~ MC or AC cables containing an insulated equipment grounding conductor sized in accordance with Table 250.122, or Type MI cable .

Substantiation: Type MI cable sheath is generally acceptable as an EGC. The proposal is intended to permit panel clarification whether a wire type EGC is intended for Type MI cable.

Panel Meeting Action: Accept in Principle

Revise the proposed wording to read as follows:

"(A) The fixed wiring method shall be metal raceways, flexible metal raceways, nonmetallic raceways encased in not less than 50 mm (2 in.) of concrete, Type MI, MC, or AC cable . ~~s~~ ~~containing~~ The wiring method shall itself qualify as an equipment grounding conductor according to 250.118, or shall contain an insulated equipment grounding conductor sized in accordance with Table 250.122."

Panel Statement: The submitter's request for clarification of the requirement for an equipment grounding path is addressed in the panel revisions to this paragraph. Either the metal raceway or cable sheath shall be a qualified equipment grounding conductor or shall contain an insulated equipment grounding conductor.

Number Eligible to Vote: 17

Ballot Results: Affirmative: 16

Ballot Not Returned: 1 Conry, C.

15-110 Log #3452 NEC-P15 **Final Action: Reject**
(518.4(A))

TCC Action: The Technical Correlating Committee concludes that the panel has addressed the proposal outside of the issues of toxicity. The Technical Correlating Committee does not deem it necessary for this proposal to be forwarded to the Toxicity Advisory Committee at this time.

Submitter: William A. Wolfe, Steel Tube Institute of North America

Recommendation: Add text after (d) to apply to all exceptions:

Conductors and cables shall be protected in a metal raceway or in a 2-hour rated shaft, or the concealed space shall be FULLY sprinklered with a NFPA 13 Type sprinkler system. These conductors and cables shall not be installed exposed.

Substantiation: There is much more knowledge now about the hazards of communications, signaling, and fire alarm conductors and cables that are installed in concealed spaces. The quantity has grown much greater than ever was anticipated, creating a substantial fire load. In addition, the fire characteristics of some cables are not even equal to the fire characteristics required for plenum construction. Those that do meet flame and smoke requirements are primarily fluropolymers that present an elevated concern about hazard from toxic smoke as evidenced by the enclosed supporting information. Although the Code requires that abandoned cables be removed, this is only required where they are deemed accessible or where they are not tagged for future use. This requirement is very difficult and costly to enforce. This proposed requirement for additional protection is especially important for Places of Assembly.

As a matter of information, the Standards Council has ruled that other NFPA standards are permitted to be referenced in the NEC (e.g. 362.10(2) Exception)

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: This proposal concerns toxicity issues and is outside the purview of the panel. The panel recommends to the Technical Correlating Committee that this proposal be forwarded to the Toxicity Advisory Committee for Comment.

Toxicity issues aside, recent changes in technology have resulted in substantial improvements in smoke and flame performance.

The NEC also contains requirements for the removal of abandoned cable, and the panel understands that this is being enforced.

In conclusion, the panel does not see a need for such a substantial revision to 518.4 and also contends that 518.4 may not be the most appropriate place for this requirement to be located. As a minimum, it should be considered for inclusion into Articles 640, 725, 760, and 800.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Conry, C.

15-111 Log #3464 NEC-P15 **Final Action: Reject**
(518.4(B))

Submitter: William A. Wolfe, Steel Tube Institute of North America
Recommendation: Revise text to read:

In addition to the wiring methods of 518.4(A), nonmetallic-sheathed cable, Type AC cable, electrical nonmetallic tubing, and rigid nonmetallic conduit shall be permitted to be installed in those buildings ~~or portions thereof~~ that are not required to be of fire-rated construction by the applicable building code.
Substantiation: Where an auditorium or other assembly area is a portion of a building, and that building is permitted to have combustible wiring, the danger from a concealed space fire in the other portions of the building is exacerbated. The Beverly Hills Supper Club is a perfect example of original non-fire-rated construction that was added to over the years. By wiring with N/M cable an avenue was provided for spread of the fire to concealed spaces beyond the source of the fire. Buildings containing an assembly area should be wired by noncombustible methods because electrical wiring can be a source of ignition.
Panel Meeting Action: Reject
Panel Statement: Buildings that have both fire-rated and nonrated construction are required to have fire-resistive construction between the rated and nonrated areas. The addition of rated construction to an existing building that is nonrated should not cause the rewiring of the existing structure, because it is part of the same building.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Conry, C.

15-112 Log #1932 NEC-P15 **Final Action: Reject**
(518.4(C) Exception and FPN (New))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be sent to Code-Making Panel 3 for consideration in Article 300 during the public comment stage. The issues raised in the proposal are not unique to Article 518 and are more appropriately judged by Code-Making Panel 3 relative to general wiring methods. This action will be considered by Code-Making Panel 3 as a public comment. The Technical Correlating Committee also directs that this proposal be sent to Code-Making Panel 8 for comment back to Code-Making Panel 3.
Submitter: William Wagner, Certification Solutions
Recommendation: Add an exception and FPN to 518.4(C) as follows:

Electrical nonmetallic tubing and rigid nonmetallic conduits are not recognized for use in other space used for environmental air in accordance with 300.22(C).

<u>Exception: Type RTRC rigid nonmetallic conduit shall be permitted for use in other space used for environmental air as covered in 300.22(C) if listed as having adequate fire-resistant and low smoke-producing characteristics.</u>

FPN <u>No. 1</u> : A finish rating is established for assemblies containing combustible (wood) supports. The finish rating is defined as the time at which the wood stud of wood joist reaches an average temperature rise of 121°C (250°F) or an individual temperature rise of 163°C (325°F) as measured on the plane of the wood nearest the fire. A finish rating is not intended to represent a rating for a membrane ceiling.

<u>FPN No. 2: One method of defining that RTRC is a fire-resistant and low smoke-producing raceway is that it exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with the plenum test in UL 2024, Standard for Optical Fiber Cable Raceway.</u>
Substantiation: This is a companion proposal for the revised 300.22 and new Article 355.

Manufacturers have developed Type RTRC rigid nonmetallic conduit products that they believe are suitable for use as wiring methods in other space used for environmental air in accordance with 300.22(C). This proposal would permit these products to be employed in this application providing that they have been specifically evaluated as having adequate fire-resistant and low smoke-producing characteristics and listed for such use. Additionally, the new Fine Print Note No. 2 provides a suggested methodology for evaluating the fire and smoke producing aspects of these products, which is based upon other nonmetallic raceway products that have previously been listed for use in these environments.
Panel Meeting Action: Reject
Panel Statement: The submitter is asking the panel to agree to performance criteria without any data or documentation on this type of conduit.

The panel contends that this issue is best addressed by Code-Making Panel 3 in Article 300.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Conry, C.

6-92a Log #214 NEC-P06 **Final Action: Reject**
(518.4(D) (New))

NOTE: The following proposal consists of Comment 6-84 on Proposal 15-69 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 15-69 was:

Add a new Section as follows:

518.4(D). Installed in Thermal Insulation. Where ENT or RNC is installed in thermal insulation, the conductor insulation rating shall be 90 o C. The ampacity shall be in accordance with 310.15 but in no case shall the ampacity be de-rated less than the following:

(a) 1-3 conductors: 70% of values in Table 310.16
(b) 4-6 conductors: 50% of values in Table 310.16
(c) 7-9 conductors: 40% of values in Table 310.16

It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 6 for consideration of action in Article 310. This action will be considered by Code-Making Panel 6 as a Public Comment.
Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 6 for consideration of action in Article 310. This action will be considered by Code-Making Panel 6 as a Public Comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Reject
Panel Statement: This proposal deals with a specific application in a specific occupancy. There is no technical support to make this rule applicable to general applications. The panel action and statement should be referred to CMP 15 for information.

Panel Statement: This proposal deals with a specific application in a specific occupancy. There is no technical support to make this rule applicable to general applications. This appears to be an exact duplicate of 6-92A Comment 6-84 from the 2004 Cycle. The panel action and statement should be referred to CMP 15 for information.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

(Note: Sequence nos. 15-113 and 5-114 were not used)

15-115 Log #1601 NEC-P15 **Final Action: Accept**
(518.5)

TCC Action: The Technical Correlating Committee understands that the panel action taken on Proposal 15-116 reflects the final changes to the code text.
Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Make the following change in 518.5:
Change "neutral" to "neutral conductor."
The revised text would appear as follows:
Portable switchboards and portable power distribution equipment shall be supplied only from listed power outlets of sufficient voltage and ampere rating. Such power outlets shall be protected by overcurrent devices. Such overcurrent devices and power outlets shall not be accessible to the general public. Provisions for connection of an equipment grounding conductor shall be provided. The neutral <u>conductor</u> of feeders supplying solid-state, 3-phase, 4-wire dimmer systems shall be considered a current-carrying conductor.
Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).
The Task Group has proposed the following definitions to be added to Article 100:
● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.
● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.
This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals
● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.
● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.
Additional information is available in the Task Group report.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Conry, C.
Comment on Affirmative:
VANNICE, K.: Note that the revised text as stated was further revised in proposal 15-116.

15-116 Log #3316 NEC-P15 **Final Action: Accept in Principle**
(518.5)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 6 for comment as it relates to the use of the term "derating".
Submitter: Steven R. Terry, ETC
Recommendation: Change the last sentence of this paragraph to read:
The neutral of feeders supplying solid-state <u>phase-control</u> , 3-phase, 4-wire dimming systems shall be considered a current-carrying conductor.
Add an additional sentence at the end of the paragraph:
<u>The neutral of feeders supplying solid-state sine wave, 3-phase, 4-wire dimming systems shall not be considered a current-carrying conductor.</u>
Add a FPN:
<u>FPN: For definitions of solid state dimmer types, see section 520.2.</u>
Substantiation: A new class of listed solid state dimmer has been introduced to the professional performance lighting market: the Solid State Sine Wave dimmer. This type of dimmer varies the amplitude of the applied voltage wave form, without any of the nonlinear switching found in traditional phase-control solid state dimmers. Heretofore, nonlinear phase control dimmers were the only type of readily available solid state dimmers. Since solid state sine wave dimmers are linear loads, they do not require the neutral of the feeder to the dimmers to be considered a current-carrying conductor. Wording is now required to clearly state the feeder requirements for <u>both</u> types of solid state dimmers that are now available, in order to avoid the confusion that might arise if only phase-control dimmers were mentioned in the requirement for neutral characteristics. The FPN is required to direct the reader to 520.2 for the definition of both types of solid state dimmers (provided in a separate proposal), since Article 518 has no definitions section.
Panel Meeting Action: Accept in Principle
In the present text, add the phrase "for purposes of derating" to the end of the last sentence.
In the accepted text, add the phrase "for purposes of derating" to the end of the text.
Add an exception before the fine print note to read as follows:
"Exception: The neutral conductor of feeders supplying systems that use or may use both phase-control and sine-wave dimmers shall be considered as current-carrying for purposes of derating."
In the proposed text, change all references to "neutral" to "neutral conductor".
Panel Statement: At least one manufacturer is marketing a mixed phase-control and sine-wave dimming system.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16

(Proposed)

<u>ARTICLE 519</u>

<u>Control Circuits for Permanent Amusement Attractions</u>

NOTICE: A reference in brackets [ ] following a section or paragraph indicates material that has been substantially or exactly extracted from another NFPA document or nationally recognized standard.

<u>I. General</u>

<u>519.1 Scope</u>

<u>This article covers the installation of electrical equipment and wiring used in the control circuits and control systems of a permanent amusement attraction, including associated control wiring in or on all structures, where the conditions of maintenance and supervision ensure that qualified persons service the systems.</u>

<u>519.2 Definitions</u>

<u>Control circuit.</u> <u>A circuit that carries the electric signals directing the performance of a controller, but does not carry the main power current</u> [*UL-508A*]

<u>Entertainment Device.</u> <u>A mechanical device such as show action props, animated props, show action equipment, animated figures, and special effects coordinated with audio and lighting to provide an entertainment experience for patrons.</u>

<u>Overcurrent Protection.</u> <u>A device designed to open a circuit when the current through it exceeds a predetermined value. The ampere rating of the device is selected for a circuit to terminate a condition where the current exceeds the rating of conductors and equipment due to overloads, short circuits and faults to ground.</u> [*UL-508A*]

<u>Permanent Amusement Attraction.</u> <u>An amusement ride or attraction consisting of ride devices, entertainment devices, or combination thereof, that is affixed or installed in such a manner as to make relocation impractical, or whereby the nature of design, is not portable.</u>

<u>Programmable Electronic System (PES).</u> <u>A system based on one or more central processing units (CPUs) connected to sensors or actuators, or both, for the purpose of control or monitoring.</u> [*NFPA 79-2002*]

<u>FPN: The term PES includes all elements in the system extending from sensors to other input devices via data communication paths to the actuators or other output devices.</u> [*NFPA 79-1997*]

<u>Redundancy.</u> <u>The application of more than one device or system, or part of a device or system, with the objective of ensuring that in the event of one failing to perform its function another is available to perform that function.</u> [*NFPA 79-2002*]

<u>Ride Device.</u> <u>A device or combination of devices or elements that carry, convey, or direct a person(s) over or through a fixed or restricted course or within a defined area, for the primary purpose of amusement or entertainment.</u> [*ASTM F 747.*]

Self Checking. An automated test method that detects a fault and the result is indicated.

Static Device. A device that has no moving parts, as associated with electronic and other control or information-handling circuits. [*NFPA 79-1997*.]

FPN: Examples of static devices include displays, keypads, microelectronic circuit boards, solid state semiconductor devices, valve control cards, etc.

II. Supply

519.10 Power Sources other than Transformers

Power sources other than transformers shall be protected by over-current devices rated at not more than 167 percent of the volt-ampere rating of the source divided by the rated voltage. The over-current device shall be permitted to be an integral part of the power supply. [*Article 725.21*]

519.11 Voltage Limitations.

(A) Alternating-Current (ac). Alternating-current (ac) control voltage shall be 150 volts or less to ground. Control circuits utilizing voltages greater than 150 volts (ac) shall comply with Article 725.

(B) Direct-Current (dc). Direct-current (dc) control voltage shall be 250 volts or less to ground. Control circuits utilizing voltages greater than 250 volts (dc) shall comply with Article 725. [*NFPA 79-2002*]

III. Wiring Methods.

519.20 Conductors

(A) Copper Conductors. Stranded copper conductors shall be permitted. Solid copper conductors shall be permitted where not subject to flexing.

(B) Conductors other than Copper. Conductors constructed of materials other than copper, where required for their function, such as RTDs, shall be permitted

(C) Printed Wire Assemblies. Printed wire assemblies of listed flame-retardant material shall be permitted in place of conductor assemblies provided they are within control enclosures and mounted in such a way as to minimize flexing or stress. [*NFPA 79-2002*]

519.21 Conductor Sizing

(A) Conductors within a listed component or assembly. Conductors of size 30 AWG or larger shall be permitted within a listed component or as part of the wiring of a listed assembly.

(B) Conductors within an enclosure or operator station. Conductors of size 30 AWG or larger shall be permitted in a jacketed multiconductor cable within an enclosure or operator station. Conductors in a non-jacketed multiconductor cable, such as ribbon cable, shall not be smaller than 26 AWG. Single conductors shall not be smaller than 24 AWG.

Exception: Single Conductors 30 AWG or larger shall be permitted for jumpers and special wiring applications.[*NFPA 79-2002*]

(C) Conductors outside of control enclosures and operator stations. The size of conductors in a jacketed, multiconductor cable shall not be smaller than 26 AWG. Single conductors shall not be smaller than 18 AWG. [*Ref Article 760.71(B*)]

519.22 Conductor Ampacity

The continuous current carried by conductors 16 AWG and smaller shall not exceed the values given in Table 519.22. The continuous current carried by conductors shall not exceed the values given in Table 310.16 for general wiring, Tables 400.5 (A) and (B) for flexible cords and cables, or Table 402.5 for fixture wires.

519.23 Overcurrent Protection

Overcurrent protection shall be in accordance with the conductor ampacity.

519.24 Separation

Amusement attraction control circuits shall be separated by at least 50 mm (2 in.), separated by a nonconductive sleeve such as flexible tubing, or separated by a barrier, from Class 1, Class 2 and Class 3 circuits, power limited fire alarm, non–power-limited fire alarm and medium power network-powered broadband communications circuits. For other than the circuit types listed above, an amusement attraction control conductor shall be separated by at least 50 mm (2 in.), separated by a nonconductive sleeve such as flexible tubing, or separated by a barrier from a conductor used in a different circuit unless the conductors of both circuits are insulated for the maximum voltage present of either circuit.

Exception No. 1: Associated circuits within enclosures utilizing 150 volts or less to ground and requiring separation shall be permitted to be separated by at least 6 mm (1/4 in.).

Exception No. 2: Different voltage insulation levels or conductor properties shall be permitted in the same cable assembly, provided the cable assembly is listed and has been designed and tested to the identified application. [*NFPA 79-2002*]

519.25 Grounding and Detection

Two-wire dc circuits shall be permitted to be ungrounded. A Ground Fault Detection Device shall monitor ungrounded control circuits operating at greater than 50 volts. [*NEC 685.12, NEC 250.162(A) Exception No. 1*]

519.26 Wet or Submerged locations

Where wet contact (immersion not included) is likely to occur, ungrounded two-wire dc control circuits shall be limited to 30 volts. [*NEC Table 11(B) Note 4*]

Table 519.22 Conductor Ampacity based on copper conductors with 60°C and 75°C insulation in an ambient temperature of 30°C. [*NFPA 79-2002*]

Conductor Size AWG	Ampacity in Cable or Raceway 60°C	Ampacity in Cable or Raceway 75°C	Control Enclosure 60°C
30	-	0.5	0.5
28	-	0.8	0.8
26	-	1	1
24	2	2	2
22	3	3	3
20	5	5	5
18	7	7	7
16	10	10	10

Note 1: For ambient temperatures other than 30°C, see Table 310.16 correction factors. [*NFPA 79-2002*]

Note 2: Ampacity adjustment for conductors with 90°C or greater insulation shall be based on ampacities in the 75°C column.[*NFPA 79-2002*]

A Ground Fault Detection Device shall monitor ungrounded control circuits in wet or submerged locations operating at greater than 15 volts.

Control circuit components or enclosures that are located in wet locations shall carry NEMA 6 or IEC IP67 classification.

Control circuit components or enclosures that are submerged shall carry NEMA 6P or IEC IP68 classification.

Control circuit wiring in submerged environments shall be listed for usage in that environment. [*NEC 400.4*]

Except as modified by above, wiring and equipment in or adjacent to wet or submerged locations shall comply with the applicable provisions of Article 680.

519.27 Safety control circuits – Emergency Stop Circuits

Emergency Stop Circuits utilizing redundancy and self-checking, shall be permitted to follow the wiring methods listed in this article. Emergency Stop Circuits utilizing no redundancy or are not self-checking shall follow the Class 1 wiring methods as listed in Article 725.8.
Submitter: Steve Alkhoja, ITEC Entertainment Corporation
Recommendation: I have no modifications to the proposed new wording. I would like to encourage the implementation of this proposal.
Substantiation: There are several areas of concern with the present interpretation of the current document which this new proposal addresses. I believe that the proposed Article 519 address the areas of concern.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 15-121.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11

(519)

NOTE: The following proposal consists of Comment 15-47 on Proposal 15-72 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. [Refer to Proposal 15-117 (Log #216)
Submitter: Jody D. Gerstner, Walt Disney Imagineering / Rep. Walt Disney World Company
Recommendation: Recommend Accepting Proposal in Principle with the understanding that the submittal was not per the NFPA style guide.
Substantiation: Permanent Amusement attractions embody large scale integrated Control Systems similar in nature to that found in the Industrial Complex. When inspected by our Authority Having Jurisdiction, we have been judged against the NEC. The tools of the trade in industrial controls includes predominantly low voltage (NEC Class 2) devices of insulation and wire size that do no comply with Class 1 category against which we are judged. Therefore, we are left with the option of getting exceptions on every product from the AHJ, or forgo the use of common industrial products (sensors, switches, high-tech integrated vision & optical devices). Since we cannot accomplish our mission of guest safety and system functionality without the tools of the trade, we are required to appeal for variances and request alternate methods. This is no way to regulate an industry! Article 519 provides the foundation for which inspection can be made against a consistent standard rather than on subjective variances and alternate methods consideration. Article 519 would result in consistent safe implementations across the industry rather than subjective variances based upon the perspectives of the municipality and the AHJ. Article 519 would also allow the practitioner to use the products unique to our amusement industry in a manner that would be consistent with the goals of the NEC and would be acceptable to the AHJ.

(519)

NOTE: The following proposal consists of Comment 15-48 on Proposal 15-72 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. [Refer to Proposal 15-117 (Log #216)
Submitter: Sam McCoy, Walt Disney World Co
Recommendation: Recommned Accepting Proposal 15-72 or Accept in Principle.
Substantiation: In regards to proposal 15-72 Log #2495 NEC-P15: I would submit to the Panel that this article (519) gives a clear attempt to the Permanent Amusement Attraction Industry (who by the way is totally focused on the health and safety of the public) the ability to install control systems that would not compromise the ability to install or maintain attractions such as a high speed roller coaster ride. Today, the Authority Having Jurisdiction is holding our industry to Article 725 of the NEC. Article 725 and the fact that all our safety critical applications fall in the Class 1 power requirements by NEC definition, requires that wiring size and insulation type usage of unreasonable size and restricts safe construction and maintainability. One example: the use of low voltage, and current limited circuits (24 volts dc) in attractions for controls does not pose any failure or hazard that would cause a shock or fire hazard that 600-volt insulation and 18-awg wire fixes (given that separation practices are used). This higher insulation and gauge class required by article 725 sometimes compromises good design practices. I agree on the panel's point that this Proposal is limited in scope and does not cover all that should be addressed, however, by your own words in the panel's statement the panel agrees that other electrical considerations of permanent amusement attractions should be addressed, implying some merit in the Proposal. This proposal is the start of addressing some of the issues and if we do not start somewhere then it becomes very difficult to move forward in the quest for safety. I agree that the NEC is not intended to be a design manual and in that regard, the proposed Article (519) was not intended to do that but to give a minimum guideline for the inspector. I appeal to you as engineers to reconsider this Proposal 15-72 Log #2495 NEC-P15 and accept it to be adopted into the 2005 NEC.

Submitter: Joseph F. Maida, Maida Engineering Inc.
Recommendation:
There have been significant additions and some modifications
Add new text as follows:
I. General.
519.1 Scope
This article covers the installation of electrical equipment and wiring that are an integral part of a permanent amusement attraction including associated control wiring, where the conditions of maintenance and supervision ensure that qualified persons service the systems.
Control circuits and equipment associated with permanent amusement attractions, herein referred to as permanent amusement control circuits, shall comply with Article 519. Only those sections of Article 725 referenced in this article shall apply to permanent amusement control circuits.
519.2 Definitions
Control Circuit. A circuit that carries the electric signals directing the performance of a controller, but does not carry the main power current*(UL-508A)*
Entertainment Device. Mechanical device such as show action props, animated props, show action equipment, animated figures and special effects coordinated with audio and lighting to provide an entertainment experience for patrons.
Over current Protection. A device designed to open a circuit when the current through it exceeds a predetermined value. The ampere rating of the device is selected for a circuit to terminate a condition where the current exceeds the rating of conductors and equipment due to overloads, short circuits and faults to ground.*(UL-508A)*
Permanent Amusement Attraction. An amusement ride or attraction consisting of ride devices, entertainment devices, or combination thereof, that is affixed or installed in such a manner so as to make relocation impractical, or whereby the nature of design, is not portable.
Redundancy. The application of more than one device or system, or part of a device or system, with the objective of ensuring that in the event of one failing to perform its function another is available to perform that function.*(NFPA 79-2002)*
Ride Device. A device or combination of devices or elements that carry , convey or direct a person(s) over or through a fixed or restricted course or within a defined area, for the primary purpose of amusement of entertainment. (*ASTM F 747)*
Self Checking. An automated test method that detects a fault and the result is indicated.
II Supply.
519.10 Power sources
(A) Alternating-Current (AC). AC Power source control transformers supplying permanent amusement attraction control circuits shall not exceed 120 volts AC and the available short circuit current shall not exceed 1, 000 amperes rms. *(NFPA 79-2002)*

(B) Direct-Current (DC). DC power source supplying permanent amusement attraction control circuits shall be 250 V DC or less.*(NFPA 79-2002)*

III. Wiring Methods.

519.20 Conductors

(A) Power Source Supply Side: Wiring methods on the supply side of the power source shall be installed in accordance with appropriate requirements of Chapters 1 thru 4. A control transformer or other power supply or device supplied from an AC light or power circuit shall be protected by an over current device rated not greater than 20 amperes.

(B) Power Source Load Side: Wiring methods can include individual conductors in raceways, mulitconductor cables supported in accordance with the methods defined in 300.11(A) and 300,17 and multiconductor cables in a cable tray.

(C) Plenum. Permanent amusement attraction control circuit cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CL2P or CL3P.

Abandoned cables shall not be permitted to remain. Listed wires and cables installed in compliance with 300.22 shall be permitted. *(725.61(A))*

(D) Riser. Permanent amusement attraction control circuit cables installed in risers shall be as described in any of (1) or (2):

(1) Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft shall be type CL2R or CL3R. Floor penetrations requiring Type CL2R or CL3R shall contain only cables suitable for riser or plenum use. Abandoned cables shall not be permitted to remain.

(2) Other cables as covered in Table 519-20 and other listed wiring methods as covered in Chapter 3 shall be installed in metal raceways or located in a fireproof shaft having fire stops at each floor. (*725.61(B))*

(E) Cable Trays. Permanent amusement attraction control circuit cables installed in cable trays outdoors shall be Type PLTC. Cables installed in cable trays indoors shall be Types PLTC. CL3P, CL3R, CL3, CL2P CL2R and CL2. (725.61)(C)

(F) Other wiring within Buildings. Permanent amusement attraction control circuit cables installed in building locations other than those covered in 519.20(C) through (E) shall be as described in any of (1) through (4). Abandoned cables in hollow spaces shall not be permitted to remain.

(1) Type CL2 or CL3 shall be permitted.

(2) Type CL2X or CL3X shall be permitted to be installed in a raceway or in accordance with other wiring methods covered in Chapter 3.

(3) Cables shall be permitted to be installed in nonconcealed spaces where the exposed length of cable does not exceed 3 m (10 ft).

(4) Type CMUC undercarpet communications wires and cables shall be permitted to be installed under carpet. {725.61(E)}

(F) Cross Connect Arrays Type CL2 or CL3 conductors or cables shall be used for cross-connect arrays. {725.61(F)}

(G) Permanent Amusement Attraction Control Circuit Cable Uses and Permitted Substitutions. The uses and permitted substitutions for Class 2 and Class 3 cables listed in Table 725.61 shall be considered suitable for the purpose and shall be permitted. {725.61(G)}

(H) Conductors. Stranded conductors shall be permitted. Solid conductors shall be permitted where not subject to flexing.

(I) Conductors other than Copper. Conductors constructed of materials other than copper where required for their functions shall be permitted.

(J) Printed Wire Assemblies. Printed wire assemblies of listed flame-retardant material shall be permitted in place of conductor assemblies provided they are within control enclosures and mounted in such ways to minimize flexing or stress. {*NFPA 79-2002}*

519.21 Conductor Sizing

(A) Conductors within a listed component or assembly. Conductors of size 30 AWG or larger shall be permitted within a listed component or as part of the wiring of a listed assembly.

(B) Conductors within an enclosure. Conductors of Size 30 AWG or larger shall be permitted in a multiconductor cable within an enclosure. Conductors in a non-jacketed mulitconductor cable assembly such as ribbon cable, shall not be smaller than 26 AWG. Single conductors shall not be smaller than 24 AWG.

Exception: Single Conductors 30 AWG or larger shall be permitted for jumpers and special wiring applications. {NFPA 79-2002}

(C) Conductors outside of enclosures. The size of conductors in a multiconductor cable shall not be smaller than 2 AWG. Single Conductors shall not be smaller than 18 AWG. {ref Article 760.71 (B)}

519.22 Conductor Ampacity

The continuous current carried by conductors 16 AWG and smaller shall not exceed the values given in Table 519.22. The continuous current carried by conductors shall not exceed the values given in Table 310.16 for general wiring. Tables 400.5(A) and (B) for flexible cords and cables, or Table 402.5 for fixture wires.

Table 519.22 Conductor Ampacity based on copper conductors with 60°C and 75°C insulation in an ambient temperature of 30°C. {NFPA 79-2002}

Conductor Size AWG	Ampacity in Cable or Raceway 60° C	Ampacity in Cable or Raceway 75°C	Control Enclosure 60° C
30		0.5	0.5
28		0.8	0.8
26		1	1
24	2	2	2
22	3	3	3
20	5	5	5
18	7	7	7
16	10	10	10

Note 1: for ambient temperature other than 30°C see table 310.16 correction factors. {NFPA 79-2002}

Note 2: Ampacity adjustment for conductors with 90°C or greater insulation shall be based on ampacitites in the 75° C Column {NFPA 79-2002}

519.23 Overcurrent protection

Overcurrent protection shall be in accordance with the conductor ampacity.

519.24 Separation

Permanent amusement attraction control circuit conductors and multiconductor cables shall be separated by at least 50 mm (2 in), separated by a nonconductive sleeve such as flexible tubing, or separated by a barrier, from lighting and power class 1, class 2 and class 3 circuits, power limited fire alarm non-power limited fire alarm and medium power network-powered broadband communications circuits. For other than the circuit types listed above, a permanent amusement attraction control circuit conductors and multiconductor cables shall be separated by at least 50 mm (2 in.), separated by a nonconductive sleeve such as flexible tubing, or separated by a barrier from a conductor used in a different circuits unless the conductors of both circuits are insulated for the maximum voltage present of either circuit and are functionally associated.

Exception No. 1: Associated circuits within enclosures utilizing 150 volts or less to ground and requiring separation shall be permitted to be separated by at least 6 mm (1/4 in.).

Exception No. 2: Different voltage insulation levels or conductor properties shall be permitted in the same cable assembly, provided the cable assembly is listed and has been designed and tested to the identified application. {NFPA 79-2002}

Exception No. 3: Permanent amusement attraction control circuit conductors and multiconductor cables shall be permitted within the same raceways, cable assembly or enclosure with lighting and power circuits when the circuits are functionally associated; the permanent amusement attraction control circuit conductors and multiconductor cables are #18 AWG or larger and have 600 volt insulation; and when installed in accordance with Article 300 and other appropriate articles in Chapter 3, {NEC 725.25}

519.25 Grounding and Detection

Two-wire dc circuits shall be permitted to be ungrounded. A Ground Fault Detection Device shall monitor ungrounded control circuits operating at greater than 50 volts. *{NEC 685.12, NEC 250.162(A) Exception No. 1}*

519.26 Wet or Submerged locations

Where wet contact (immersion not included) is likely to occur, ungrounded two-wire dc permanent amusement attraction control circuits shall be limited to 30 volts. {NEC Table 11(B) Note 4}

A Ground Fault Detection Device shall monitor ungrounded permanent amusement attraction control circuits in wet or submerged locations operating at greater than 15 volts.

Permanent amusement attraction control circuit wiring, components and enclosure in submerged environments shall be listed for usage in that environment. {NEC 400.4}

519.27 Safety-Control Equipment

(A) Remote Control Circutis. Remote-control circuits utilizing redundancy and self-checking for safety-control permanent amusement attraction control equipment, shall be permitted to follow the wiring methods listed in this article if the failure of the equipment to operate introduces a direct fire or life safety hazard.

(B) Physical Protection. Where damage to remote-control circuits of safety-control equipment would introduce a hazard, as covered in 519.7(A), all conductors of such remote-control circuits shall be installed in rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, electrical metal tubing, Type MI cable, Type MC cable, or be otherwise suitably protected from physical damage.

Substantiation: Amusement and theme parks evolved from what were once known as “Carnivals”, where the rides, side shows, booths, and other structures such as the haunted house, dunking barrel and fast food serving, were supplied by temporary wiring. These structures were moved all over the country. Therefore, the power and control wiring systems for the rides and shows, collectively referred to as amusements, were unique because the amusements had to be arranged so that their mechanical parts could be disassembled and their power and control wiring easily disconnected and reconnected at another site without damaging them. The NEC Article 305, Temporary Wiring applies to these "Carnivals". It was introduced into the 1971 NEC, prior to 1971, it was "fly by the seat of your pants", depending on how strict the local ordinances were at the time.

With the opening of Disneyland followed by Walt Disney World in 1971, more sophisticated rides and shows were needed to satisfy the demands of a more sophisticated amusement industry. These rides and shows have prompted engineers to create new control equipment and complex control circuits which have become an integral part of permanent amusement attractions within the theme park industry. The NEC has not been revised since 1971 with regard to the installation of permanent amusement attractions, therefore permanent amusement attraction control systems must be inspected using the same "fly by the seat of your pants" that existed for Carnivals until 1971.

The patrons of theme parks want an experience that combines both the traditional rides, like the merry-go-round, with the latest and the greatest in thrill rides and shows. the demand for more thrills, and in many cases bringing the movies to life, has been the impetus for new rides and shows which are a hundred times more complex than rides and shows developed less than thirty years ago. Designing and building the effects which have been seen on the movie screen and having the patron of the theme park safely experience the excitement and sometimes fear caused by these effects, has been the responsibility of the engineers in the theme park industry.

Traditionally, many engineers within the theme park industry came from high technology industries. This was beneficial in that much of the advanced control technology utilized to build permanent amusement attractions in the theme park industry required the training derived from their experience in the high technology industries. Because of their training, the advanced control technology they developed did not follow standards established for the building and construction industry. The control system they developed however, met the theme park industry's standards for safety and sustainability. The safety requirement is essential in that millions of theme park patrons pay to safely experience the joy of these rides and shows every year. The sustainability requirement is essential because the effects created for the theme park are build to happen thousand of times and must be repeated many times everyday. With these requirements for safety and sustainability and the advantage of today's control system technology enhanced by personal computers, the design, testing and commissioning of a ride and show control system for permanent amusement attractions follows a path that is similar to the design, testing and commissioning of a pharmaceutical manufacturing line or process. Although phrases like Standard Operating Procedures, Qualifications and Validation are not as commonly used in the theme park industry other phrases like Detailed Design Review (DDR), Failure Modes Effects Analysis(FMEA) and Factory and Site Acceptance Tests (FAT and SAT) are commonly used in both industries. In many ways, steps taken to create, qualify and validate the safeguards and repeatability of a ride or show are the same steps taken by the pharmaceutical industry for the manufacturer of pharmaceutical drugs which is governed by standards which are enforced by the Federal Drug Administration (FDA).

The theme park industry, although subject to review and final acceptance by local governmental agencies, has largely been responsible for policing itself for the rides and shows they have constructed in permanent amusement parks. The Local Authorities Having Jurisdiction in defining the methods to be utilized to construct the rides or shows rarely have the resources available to review every part of a ride and show control systems, For the most part, the agencies which are supported by the local tax base, have relied on the knowledge and skills of the theme park industry engineer who is responsible for making the ride and show safe for the patrons, actors and operators and also compliant with all applicable code and standards, such as the NEC. As a result, many safe and sustainable ride and show permanent amusement attraction control circuits are:

1. Being inspected using the standard defined with the NEC that were never intended to be used for a permanent amusement attraction.

2. Require variances in that they do not comply with some of the provisions of the NEC.

3. Are designed and installed with NEC violations that are missed by inspectors.

The construction material and techniques utilized in many of today's ride and show control system comply with standards like ASTM FM-24 and Underwriter's Laboratories, Inc. (UL) and comply with many of the standards and recommendations written by the National Fire Protection Association (NFPA) but they do not comply with specific articles found within NFPA 70, the National Electrical Code (NEC). The NEC which is one of the finest and most complete codes ever developed has been the basis for electrical codes utilized throughout the world. The NEC however, is a lengthy document and until recently articles in Chapters 5, 6,7 and 8 have not been the focus of many of the theme park industry's controls engineers and the inspectors employed by local governing bodies.

The theme park industry wants to comply with the NEC but finds itself in a situation where the risks and cost associated with doing so requires that they first explore ways of changing the NEC to accept the industry's established techniques and materials. The techniques and materials have been field proven to be safe. Changing the techniques and materials:

* Will introduce opportunities for omissions or errors.

* Will not enhance the safety of the control systems.

* Will decrease the theme park industry engineers abilities to create the rides and shows that are now expected by patrons visiting theme parks.

In an effort to correct an omission of many years, Kevin Schultz, PE of WDW has submitted a proposed Article 519 to the 2005 NEC. I have reviewed this Article and believe that it is an excellent beginning of an Article that should have been included in the NEC many years ago. I have made additions and modifications to the original Article submitted by Kevin Shultz and I am recommending that this revised Article 519 be included into the 2005 NEC. The inclusion of Article 519 into the 2005 NEC will resolve the following technical issues and omissions within the NEC:

1. The 2005 NEC will permit the use of non Class 1 circuits that are as reliable, or even more reliable than class 1 circuits due to the redundancy and self checking for life safety applications in permanent amusement attractions. These circuits are currently permitted on moving vehicles that are not covered by the NEC and should be permitted for ride and show equipment that is tested upon installation and periodically thereafter where conditions of maintenance and supervision ensure that qualified persons service the systems. This will enable the addition of safety features to rides and shows which are not or might not be possible with larger size conductors required for Class 1 circuits.

2. The 2005 NEC will prohibit installing permanent amusement attraction control circuit conductors with other conductors that are utilized for systems not related to the ride or show, thus making these systems easier to inspect and minimizing the possibility that someone working on the building's BAS, fire alarm or telephone system could damage or disturb the permanent amusement attraction control circuit conductors.

3. The 2005 NEC will permit the installation of adequately sized power supplies for all of the permanent amusement attraction control circuits within a ride or show. Presently, in order to comply with the Article 725's provision for Class 2 circuits, a show control system can require multiple, and in one case as many as twelve (12) separate Class 2 power supplies even though these control systems are maintained by qualified personnel. Prior to 1996 NEC, a power supply with properly sized overcurrent protection could be used for Class 2 circuits. The revisions within the 1996 NEC should not have applied to installation where condition of Maintenance and supervision exist that will ensure that only qualified persons service the Class 2 system. The same conditions that apply to power and lighting circuits, which are derived from a comparatively unlimited power source and are protected by overcurrent protection, should be applied to permanent amusement attraction control circuits because of the requirement that they be maintained by qualified personnel. The installation of multiple power supplies increases complexity and therefore increases the probability of failure of a control system that needs to be safe, repeatable and sustainable.

4. The 2005 NEC will provide a standard which engineers and contractors can use for the proper installation of and which inspectors can use for the proper inspection of permanent amusement attraction control circuits. For once, the methods permitted for properly installing permanent amusement attraction control circuits will be clearly defined. Although the 2002 NEC does define the methods for Class 1 and Class 2 cables very well, it is not unusual for engineers and inspectors who are not familiar with Chapter 7 of the 2002 NEC to over look these methods or not apply them properly. Even when they are applied properly, they are not as well suited or as safe as some field proven techniques which are not permitted.

5. Additional provisions for ground fault monitoring have been added for permanent amusement attraction control circuits in wet or submerged locations operating at greater than 15V DC. Currently, there are no standards applicable to control or power circuits for flume rides and other water rides.

With the inclusion of Article 519 into the 2005 NEC, there will now be a place to address many of the specialized type of structures utilized within theme parks which are presently not covered by the NEC. Not including this article in the form presented herein or some variation the form presented herein could not only jeopardize the theme park industry but could jeopardize the life safety of millions of patrons who visit theme parks every year. Currently, rides and shows which include pyrotechnics and special effects and could present hazard to both the actors and audiences, are being engineered and constructed with standards that are less than adequate or nonexistent. The inclusion of Article 519 into the 2005 NEC is a necessary first step to correct this deficiency for the good and well being of the general public.

Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 15-121.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Conry, C.

15-121 Log #2111 NEC-P15 **Final Action: Accept**
(519 (New))

TCC Action: The Technical Correlating Committee directs the following actions on this proposal.
The Technical Correlating Committee directs that the new Article be numbered as Article 522 to provide for proper placement and allow some additional open article numbers to remain.

Article scope statements and titles are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee is modifying the panel action on the scope to make it clear that the

conductors covered by the article are control circuit conductors to read as follows:.

"519.1 Scope. This article covers the installation of control circuit power sources and control circuit conductors for electrical equipment, including associated control wiring in or on all structures, that are an integral part of a permanent amusement attraction."

The Technical Correlating Committee accepts the title of the new article.

The Technical Correlating Committee directs the panel to reconsider the proposal and clarify the intended application of wiring methods. The current text permits multi-conductor cable assemblies to be used, but allows conductors down to 30 AWG. It is unclear as to whether Chapter 3 wiring methods are required or some other method is intended. This action will be considered by Code-Making Panel 15 as a Public Comment.

The Technical Correlating Committee directs that this proposal be sent to Code-Making Panel 3 for comment during the public comment phase.

The Technical Correlating Committee directs that Code-Making Panel 3 consider the power limited source and wiring method requirements and submit appropriate public comments.

The Technical Correlating Committee directs the Panel in 519.28 to change the parenthetical reference to a Fine Print Note or remove it.

Submitter: Joe Van Dam, Walt Disney World

Recommendation: Proposing a new Article 519, "Control Systems for Permanent Amusement Attractions" to read as follows:

I. General.

519.1 Scope. This article covers the installation of control circuit power sources and conductors for electrical equipment, including associated control wiring in or on all structures, that are an integral part of a permanent amusement attraction.

519.2 Definitions.

Control Circuit. For the purposes of this article the circuit of a control system that carries the electric signals directing the performance of the controller but does not carry the main power current.

Entertainment Device. A mechanical or electromechanical device that provides an entertainment experience.

FPN: These devices may include animated props, show action equipment, animated figures, and special effects, coordinated with audio and lighting to provide an entertainment experience.

Permanent Amusement Attraction. Ride devices, entertainment devices, or combination thereof, that are installed so that portability or relocation is impracticable.

Ride Device. A device or combination of devices that carry, convey, or direct a person(s) over or through a fixed or restricted course within a defined area for the primary purpose of amusement or entertainment.

519.3 Other Articles. Wherever the requirements of other articles of this Code and Article 519 differ, the requirements of Article 519 shall apply.

519.5 Voltage Limitations. Control voltage shall be a maximum of 150 volts, nominal ac to ground or 300 volts dc to ground.

519.7 Maintenance. The conditions of maintenance and supervision shall ensure that only qualified persons service the permanent amusement attraction.

II. Control Circuits.

519.10 Power Sources for Control Circuits.

(A) Power-Limited Control Circuits. Power-limited control circuits shall be supplied from a source that has a rated output of not more than 30 volts and 1000 volt-amperes.

(1) Control Transformers. Transformers used to supply power-limited control circuits shall comply with the applicable sections within Parts I and II of Article 450.

(2) Other Power-Limited Control Power Sources. Power-limited control power sources, other than transformers, shall be protected by overcurrent devices rated at not more than 167 percent of the volt-ampere rating of the source divided by the rated voltage. The fusible overcurrent devices shall not be interchangeable with fusible overcurrent devices of higher ratings. The overcurrent device shall be permitted to be an integral part of the power source.

To comply with the 1000 volt-ampere limitation of 519.10(A), the maximum output of power sources, other than transformers, shall be limited to 2500 volt-amperes, and the product of the maximum current and maximum voltage shall not exceed 10,000 volt-amperes. These ratings shall be determined with any overcurrent-protective device bypassed.

(B) Non-Power-Limited Control Circuits. Non-power-limited control circuits shall not exceed 300 volts. The power output of the source shall not be required to be limited.

(1) Control Transformers. Transformers used to supply non-power-limited control circuits shall comply with the applicable sections within Parts I and II of Article 450.

(2) Other Non-Power-Limited Control Power Sources. Non-power-limited control power sources, other than transformers, shall be protected by overcurrent devices rated at not more than 125 percent of the volt-ampere rating of the source divided by the rated voltage. The fusible overcurrent devices shall not be interchangeable with fusible overcurrent devices of higher ratings. The overcurrent device shall be permitted to be an integral part of the power source.

III. Control Circuit Wiring Methods.

519.20 Conductors, Busbars, and Slip Rings.

Insulated Control Circuit Conductors. Insulated control circuit conductors shall be copper and shall be permitted to be stranded or solid. Listed multi-conductor cable assemblies shall be permitted.

Exception No. 1: Busbars and slip rings shall be permitted to be materials other than copper.

Exception No. 2: Conductors used as specific purpose devices, such as thermocouples and resistive thermal deices shall be permitted to be materials other than copper.

519.21 Conductor Sizing.

(A) Conductors Within a Listed Component or Assembly. Conductors of size 30 AWG or larger shall be permitted within a listed component or as part of the wiring of a listed assembly.

(B) Conductors Within an Enclosure or Operator Station. Conductors of size 30 AWG or larger shall be permitted in a listed and jacketed multi-conductor cable within an enclosure or operator station. Conductors in a non-jacketed multi-conductor cable, such as ribbon cable, shall not be smaller than 26 AWG. Single conductors shall not be smaller than 24 AWG.

Exception: Single Conductors 30 AWG or larger shall be permitted for jumpers and special wiring applications.

(C) Conductors Outside of an Enclosure or Operator Station. The size of conductors in a listed and jacketed, multi-conductor cable shall not be smaller than 26 AWG. Single conductors shall not be smaller than 18 AWG and shall only installed where part of a recognized wiring method of Chapter 3.

519.22 Conductor Ampacity. Conductors sized 16 AWG and smaller shall not exceed the continuous current values provided in Table 519.22.

Revise text as follows:

505.2 Definitions. For purposes of this article, the following definitions apply.

Combustible Gas Detection System. A protection technique utilizing stationary gas detectors in industrial establishments.

Electrical and Electronic Equipment. Materials, fittings, devices, appliances, and the like that are part of, or in connection with, an electrical installation.

FPN: Portable or transportable equipment having self-contained power supplies, such as battery-operated equipment, could potentially become an ignition source in hazardous (classified) locations.

Encapsulation "m". Type of protection where electrical parts that could ignite an explosive atmosphere by either sparking or heating are enclosed in a compound in such a way that this explosive atmosphere cannot be ignited.

FPN: See ISA 12.23.01-1998, *Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations, Type of Protection - Encapsulation "m";* IEC 60079-18-1992, *Electrical Apparatus for Explosive Gas Atmospheres - Part 18: Encapsulation "m";* and ANSI/UL 2279-1997 (Part 18), *Electrical Equipment for Use in Class I, Zone 0, 1, and 2 Hazardous (Classified) Locations* ANSI/UL 60079-18, *Electrical apparatus for explosive gas atmospheres - Part 18: Encapsulation "m".*

Flameproof "d". Type of protection where the enclosure will withstand an internal explosion of a flammable mixture that has penetrated into the interior, without suffering damage and without causing ignition through any joints or structural openings in the enclosure, of an external explosive gas atmosphere consisting of one or more of the gases or vapors for which it is designed.

FPN: See ISA 12.22.01-1998, *Electrical Apparatus for Use in Class I, Zone 1 and 2 Hazardous (Classified) Locations, Type of Protection - Flameproof "d";* IEC 60079-1-2000, *Electrical Apparatus for Explosive Gas Atmospheres, Part 1 - Construction and Verification Test of Flameproof Enclosures of Electrical Apparatus;* ANSI/UL 2279-1997, (Part 1), *Electrical Equipment for Use in Class I, Zone 0, 1, and 2 Hazardous (Classified) Locations* ANSI/UL 60079-1, *Electrical apparatus for explosive gas atmospheres - Part 1: Flameproof enclosures "d".*

Increased Safety "e". Type of protection applied to electrical equipment that does not produce arcs or sparks in normal service and under specified abnormal conditions, in which additional measures are applied so as to give increased security against the possibility of excessive temperatures and of the occurrence of arcs and sparks.

FPN: See ISA - 12.16.01-1998, *Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations, Type of Protection - Increased Safety "e",* IEC 60079-7-1990, *Electrical Apparatus for Explosive Gas Atmospheres, Part 7: - Increased Safety "e",* Amendment No. 1 (1991) and Amendment No. 2 (1993); and ANSI/UL 2279-1997 (Part 7), *Electrical Equipment for Use in Class I, Zone 0, 1, and 2 Hazardous (Classified) Locations* ANSI/UL 60079-7, *Electrical apparatus for explosive gas atmospheres - Part 7: Increased Safety "e".*

Intrinsic Safety "i". Type of protection where any spark or thermal effect is incapable of causing ignition of a mixture of flammable or combustible material in air under prescribed test conditions.

FPN No. 1: See ANSI/UL 913-1997, *Intrinsically Safe Apparatus and Associated Apparatus for Use in Class I, II, and III, Hazardous Locations;* ISA- 12.02.01-1999, *Electrical Apparatus for Use in Class I, Zones 0, 1 and 2 Hazardous (Classified) Locations - Intrinsic Safety "i";* IEC 60079-11-1999, *Electrical Apparatus for Explosive Gas Atmospheres - Part II; Intrinsic Safety "i"'* and ANSI/UL 2279-1997 (Part II). *Electrical Equipment for Use in Class I, Zone 0, 1, and 2 Hazardous (Classified) Locations* ANSI/UL 60079-11, *Electrical apparatus for explosive gas atmospheres - Part II: Intrinsic safety "i".*

FPN No. 2: Intrinsic safety is designated type of protection "ia" for use in Zone 0 locations. Intrinsic safety is designated type of protection "ib" for use in Zone 1 locations.

FPN No. 3: Intrinsically safe associated apparatus, designated by [ia] or [ib], is connected to intrinsically safe apparatus ("ia" or "ib," respectively) but is located outside the hazardous (classified) locations unless also protected by another type of protection (such as flameproof).

Oil Immersion "o". Type of protection where electrical equipment is immersed in a protective liquid in such as way that an explosive atmosphere that may be above the liquid or outside the enclosure cannot be ignited.

FPN: See ISA 12.26.01-1998, *Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations, Type of Protection - Oil-Immersion "o";* IEC 60079-6-1995, *Electrical Apparatus for Explosive Gas Atmospheres, Part 6 - Oil-Immersion "o";* and ANSI/UL 2279-1997 (Part 6), *Electrical Equipment for Use in Class I, Zone 0, 1, and 2 Hazardous (Classified) Locations* ANSI/UL 60079-6, *Electrical apparatus for explosive gas atmospheres - Part 6: Oil-immersion "o".*

Powder Filling "q". Type of protection where electrical parts capable of igniting an explosive atmosphere are fixed in position and completely surrounded by filling material (glass or quartz powder) to prevent the ignition of an external explosive atmosphere.

FPN: See ISA-12.25.01-1996, *Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations Type of Protection - Powder Filling "q";* IEC 60079-5-1996, *Electrical Apparatus for Explosive Gas Atmospheres - Part 5: Powder Filling, Type of Protection "q";* and ANSI/UL 2279-1997 (Part 5), *Electrical Equipment for Use in Class I, Zone 0, 1, and 2 Hazardous (Classified) Locations* ANSI/UL 60079-5, *Electrical apparatus for explosive gas atmospheres - Part 5: Powder filling "q".*

Purged and Pressurized. Type of protection for electrical equipment that uses the technique of guarding against the ingress of the external atmosphere, which may be explosive, into an enclosure by maintaining a protective gas therein at a pressure above that of the external atmosphere.

FPN No. 1: See NFPA 496-1998, *Standard for Purged and Pressurized Enclosures for Electrical Equipment.*

FPN No. 2: See IEC 60079-2-2000, *Electrical Apparatus for Explosive Gas Atmospheres - Part 2: Electrical Apparatus, Type of Protection "p";* and IEC 60079-13-1982, *Electrical Apparatus for Explosive Gas Atmospheres - Part 13: Construction and Use of Rooms or Buildings Protected by Pressurization.*

Type of Protection "n". Type of protection where electrical equipment, in normal operation, is not capable of igniting a surrounding explosive gas atmosphere and a fault capable of causing ignition is not likely to occur.

FPN: See IEC 60079-15-2000, *Electrical Apparatus for Explosive Gas Atmospheres, Part 15 - Electrical Apparatus with Type of Protection "n";* and ANSI/UL 2279-1997 (Part 15), *Electrical Equipment for Use in Class I, Zone 0, 1, and 2 Hazardous (Classified) Locations* ANSI/UL 60079-15, *Electrical apparatus for explosive gas atmospheres- Part 15: Type of protection "n".*

Unclassified Locations. Locations determined to be neither Class I, Division 1; Class I, Division 2: Class I, Zone 0; Class I, Zone 1; Class 1, Zone 2; Class II, Division 1; Class II, Division 2; Class III, Division 1; Class III, Division 2; or any combination thereof.

519.23 Overcurrent Protection for Conductors. Conductors 30 AWG through 16 AWG shall have overcurrent protection in accordance with the appropriate conductor ampacity in Table 519.22. Conductors larger than 16 AWG shall have overcurrent protection in accordance with the appropriate conductor ampacity in Table 310.16.

519.24 Conductors of Different Circuits in the Same Cable, Cable Tray, Enclosure, or Raceway. Control circuits shall be permitted to be installed with other circuits as specified in 519.24(A) and 519.24(B).

(A) Two or More Control Circuits. Control circuits shal be permitted to occupy the same cable, cable tray, enclosure, or raceway without regard to whether the individual circuits are alternating current or direct current, provided all conductors are insulated for the maximum voltage of any conductor in the cable, cable tray, enclosure, or raceway.

(B) Control Circuits with Power Circuits. Control circuits shall be permitted to be installed with power conductors as specified in 519.24(B)(1) through (B)(3).

(1) In a Cable, Enclosure, or Raceway. Control circuits and power circuits shall be permitted to occupy the same cable, enclosure, or raceway only where the equipment powered is functionally associated.

(2) In Factory- or Field-Assembled Control Centers. Control circuits and power circuits shall be permitted to be installed in factory-or field-assembled control centers.

(3) In a Manhole. Control circuits and power circuits shall be permitted to be installed as underground conductors in a manhole in accordance with one of the following:

(1) The power or control circuit conductors are in a metal-enclosed cable or Type UF cable.

(2) The conductors are permanently separated from the power conductors by a continuous firmly fixed nonconductor, such as flexible tubing, in addition to the insulation on the wire.

(3) The conductors are permanently and effectively separated from the power conductors and securely fastened to racks, insulators, or other approved supports.

(4) In cable trays, where the control circuit conductors and power conductors not functionally associated with them are separated by a solid fixed barrier of a material compatible with the cable tray, or where the power or control circuit conductors are in a metal-enclosed cable.

519.25 Ungrounded Control Circuits. Separately derived ac and 2-wire dc circuits and systems 50 volts or greater shall be permitted to be ungrounded, provided that all the following conditions are met:

a. Continuity of control power is required for orderly shutdown.

b. Ground detectors are installed on the control system.

519.28 Control Circuits in Wet Locations. Where wet contact (immersion not included) is likely to occur, ungrounded two-wire dc control circuits shall be limited to 30 volts maximum for continuous dc or 12.4 volts peak for dc that is interrupted at a rate of 10 to 200 Hz. (Reference - Chapter 9, Table 11B).

Substantiation: The Amusement Ride Industry presented several proposals for a new Article 519 during the 2005 NEC cycle. Panel 15 agreed at the Comment Meeting to "hold" the proposals until a Task Force comprised of industry representatives and panel members could be assembled. The Task Force was assigned the responsibility of reviewing the unique characteristics of the equipment, new technology, and provisions for safety that are not already addressed in existing Code Articles. That information was then put into standard Code language and format. This proposal is the result of that collaborative effort.

Commercially available and standard technologies used by this industry incorporate smaller conductors. The limitation of larger conductors required under the current code hinders the use of these technologies and does not offer any additional safety. In complex control systems for permanent amusement attractions, where control reliability principles are employed, the current wiring methods limit or prevent the use of newer micro devices, connectors, and computer based technologies used for the increased monitoring, verification, redundancy and diagnostics of the apparatus under control. The current restrictions require regular petitioning and work with the authorities having jurisdiction (AHJ) to allow alternate materials and methods appropriate to the application in order to attain the increased level of safety that can be offered to the public.

This proposal was written with the intent to be an inspection code, to provide direction for inspectors, and not intended to be a design manual (design is being addressed by the ASTM Std 2291).

The permanent "theme" or "amusement" park industry has experienced tremendous growth over the past 50 years, with most of the growth occurring over the past two decades. In 1950, there were fewer than 50 theme park sites in the United States; today there are 450 and counting. A theme park brings together a unique combination of rides, show elements, transportation, theaters, standard facilities, live shows and new technologies.

The standard facilities, theaters, projection rooms and stages have a long history of acceptable electrical design practices and are regulated by specific sections of the National Electrical Code (NEC). Transportation systems have their own regulations. But where do the permanent ride and show electrical systems fall? Article 525 of the NEC only addresses portable rides. Permanent rides are not a facility, but usually reside in or around one. The standard components used for the design of the ride and show systems are more closely related to industrial processes, such as those regulated by NFPA 79, than those defined within the NEC.

This inability to classify the ride and show systems presents challenges for design engineers, electricians and inspectors. Application of the NEC should be the baseline for acceptance by the AHJ. However, if the NEC is applied in its present form, standard industrial control products cannot be used due to limitations on component voltage ratings and power supplies presented in Article 725. The resultant design would include ancillary components, wiring transition boxes, and interposing relays, that complicate the design and decrease the reliability and safety of the system. The majority of these integrated systems will also require the AHJ to approve alternative materials and methods not currently addressed in the NEC in order to assure orderly shutdown.

One solution to this dilemma would be to modify Article 525 of the NEC or NFPA 79, but these are industry specific. Modification of these existing standards may force changes to established practices that are not necessary; therefore, it is proposed that we add a new article to the NEC that specifically addresses the control circuits for the rides and shows of this rapidly growing, unique industry. This article will be based on design standards and practices recognized by NFPA, as shown in the supporting documentation. (Not Received by NFPA)

The code currently allows for alternate wiring methods for elevators and other applications. These applications incorporate safety features such as redundancy, orderly shutdown and a systems analysis approach, as do permanent amusement attractions. Due to the similarities to those applications, the same latitude should be allowed for permanent amusement attractions. This requires the introduction of a new article.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11

Ballot Not Returned: 1 Conry, C.

15-122 Log #220 NEC-P15 **Final Action: Accept in Principle**
(519.12)

NOTE: The following proposal consists of Comment 15-52 on Proposal 15-72 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. [Refer to Proposal 15- (Log #216)]
Submitter: Terance J. Hoffman, Ridetronics LLC
Recommendation: 1. 519.12 Power Limitations
Supply power sources, regardless of technology employed, shall not be power limited by this Article. Conductors connected to the load side of power supplies not sized to accommodate the full rated output current of the supply shall be protected by suitable overcurrent protection. Multiple taps from the same load side of a power supply are permissible provided separate overcurrent protection is provided for each conductor.
2. Recommend accepting proposal for addition of Article 519 as revised or accepting it in principle.
Substantiation: The Theme Park and Amusement Industry employs state of the art technology in non-traditional, unique applications that often do not fall within the intent of the NEC of NFPA standards. We often use industrial controls normally used for factory automation to physically handle people. This, as experience has shown, can be a very safe practice. Experience has also shown that local inspectors are often uncertain how to interpret and apply codes written for buildings with elevators and fire alarms to what are essentially industrial systems. We ask that the NEC recognize Permanent Amusement Attractions (PAAs) as a unique entity requiring special attention and provide clear, useable codes for the installation and inspection of such systems. Article 725, although applicable for some PAA systems, is not applicable for the majority of those systems. For example, Article 725, in the case of power supply limitations requires that our large low voltage, high current supplies be split into a number of smaller supplies, increasing the complexity of wiring, circuit isolation, emergency shutdown, etc., thereby decreasing reliability and increasing risk of failure.
The proposed Article 519 is probably not all-inclusive of every legitimate concern in the industry, but it does address a set of immediate needs. As with all other codes, Article 519 will expand and mature with time. The current proposal gives us a solid platform on which to build a set of installation standards to complement the new Design standards of ASTM F2291.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action on Proposal 15-121. The submitter's concerns have been adequately addressed by the action taken on Proposal 15-121.

ARTICLE 520 — THEATERS, AUDIENCE AREAS OF MOTION PICTURE AND TELEVISION STUDIOS, AND SIMILAR LOCATIONS

15-123 Log #1623 NEC-P15 **Final Action: Reject**
(520 & 530)

Submitter: Dennis Clements, Oregon Building Codes Division / Rep. BCD Electrical Section
Recommendation: Combine Articles 520 and 530 into a single section for clarity.
Substantiation: Electrical professionals searching for code references regarding motion picture and television studios have to look in two different places for information. Combining these articles into one will alleviate confusion.
Panel Meeting Action: Reject
Panel Statement: These are two different occupancies. A motion picture or television studio without an audience is occupied by professionals familiar with the facilities. These occupancies operate in a controlled environment. A theatre (and Motion Picture or Television Studio with an audience) is occupied by both the general public who is unfamiliar with the space along with professionals. A "520 space" is more like a "518 space" than a "530 space" in terms of the occupants, while the equipment is more similar between 520 and 530.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Conry, C.

15-124 Log #235 NEC-P15 **Final Action: Accept**
(520.2)

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
Cables or conductors that are ~~physically~~ tied, wrapped, taped, or otherwise periodically bound together.
Substantiation: Use of the word "physical" is superfluous - the intent is obvious given the context.
Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for one main reason. If we eliminate every unnecessary instance, as I am attempting to do, we actually cut the NEC down by up to oh, maybe a quarter-page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on. In many instances, the use of "physically" is bad writing. Here it is not, serving as emphasis; but it's still unnecessary.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Conry, C.

15-125 Log #3317 NEC-P15 **Final Action: Accept in Principle**
(520.2.Solid-State Phase-Control Dimmer, Solid-State Sine Wave Dimmer)

Submitter: Steven R. Terry, ETC
Recommendation: Add definitions to read:
<u>Solid State Phase-Control Dimmer. A solid state dimmer where the wave shape of the steady-state current does not follow the wave shape of the applied voltage, such that it is a nonlinear load.</u>
<u>Solid State Sine Wave Dimmer. A solid state dimmer where the wave shape of the steady-state current follows the wave shape of the applied voltage, such that it is a linear load.</u>
Substantiation: A new class of listed solid state dimmer has been introduced to the market: the Solid State Sine Wave dimmer. This type of dimmer varies the amplitude of the applied voltage wave form, without any of the nonlinear switching found in traditional phase control solid state dimmers. Heretofore, these phase control dimmers were the only type of readily available solid state dimmers. Since Article 520 makes reference in multiple sections to solid state dimmers as nonlinear loads with special requirements, a definition of solid state dimmer is now required that differentiates nonlinear and linear solid state dimmers.
Panel Meeting Action: Accept in Principle
Revise the proposed wording to read as follows:
" Solid-State Phase-Control Dimmer. A solid-state dimmer where the wave shape of the steady-state current does not follow the wave shape of the applied voltage, such that the wave shape is nonlinear.
Solid-State Sine-Wave Dimmer. A solid-state dimmer where the wave shape of the steady-state current follows the wave shape of the applied voltage, such that the wave shape is linear."
Panel Statement: A dimmer is not a load, it is merely a control device. Therefore, the removal of the word "load" is appropriate.
The revised wording better represents the meaning of the definitions and accomplishes the goal of the submitter.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Conry, C.

15-126 Log #1095 NEC-P15 **Final Action: Reject**
(520.8)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:
Control of emergency systems shall comply with <u>Part V</u> of Article 700.
Substantiation: To conform to Style Manual requirements.
Panel Meeting Action: Reject
Panel Statement: Because of the special conditions surrounding Article 520, the panel contends that the reference to all of Article 700 is appropriate.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Conry, C.

15-127 Log #1603 NEC-P15 **Final Action: Accept**
(520.27(A)(2))

Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Make the following change in 520.27(A)(2):
Change "neutral" to "neutral conductor."
The revised text would appear as follows:
(2) Multiple Feeders to Intermediate Stage Switchboard (Patch Panel). Multiple feeders of unlimited quantity shall be permitted, provided that all multiple feeders are part of a single system. Where combined, neutral conductors in a given raceway shall be of sufficient ampacity to carry the maximum unbalanced current supplied by multiple feeder conductors in the

same raceway, but they need not be greater than the ampacity of the neutral conductor supplying the primary stage switchboard. Parallel neutral conductors shall comply with 310.4.
Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).
The Task Group has proposed the following definitions to be added to Article 100:
● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.
● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.
This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals
● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.
● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.
Additional information is available in the Task Group report.
Note: Supporting material is available for review at NFPA Headquarters.

Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Conry, C.
Comment on Affirmative:
VANNICE, K.: Note that the revised text as stated was further revised in proposal 15-129.

15-129 Log #3318 NEC-P15 **Final Action: Accept in Principle**
(520.27(B))

TCC Action: See the Technical Correlating Committee Note on Proposal 15-116.
Submitter: Steven R. Terry, ETC
Recommendation: Change section to read:
(B) Neutral. The neutral of feeders supplying solid-state phase-control , 3-phase, 4-wire dimming systems shall be considered a current-carrying conductor. The neutral of feeders supplying solid-state sine wave, 3-phase, 4-wire dimming systems shall not be considered a current-carrying conductor.
Substantiation: A new class of listed solid state dimmer has been introduced to the professional performance lighting market: the Solid State Sine Wave dimmer. This type of dimmer varies the amplitude of the applied voltage wave form, without any of the nonlinear switching found in traditional phase-control solid state dimmers. Heretofore, nonlinear phase control dimmers were the only type of readily available solid state dimmers. Since solid state sine wave dimmers are linear loads, they do not require the neutral of the feeder to the dimmers to be considered a current-carrying conductor. Wording is now required to clearly state the feeder requirements for both types of solid state dimmers that are now available, in order to avoid the confusion that might arise if only phase-control dimmers were mentioned in the requirement for neutral characteristics.
Panel Meeting Action: Accept in Principle
Revise the proposed wording to read as follows:
" (B) Neutral Conductor. For the purpose of derating, the following shall apply:
(1) The neutral conductor of feeders supplying solid-state, phase control 3-phase, 4-wire dimming systems shall be considered a current-carrying conductor.
(2) The neutral conductor of feeders supplying solid-state, sine wave 3-phase, 4-wire dimming systems shall not be considered a current-carrying conductor.
(3) The neutral conductor of feeders supplying systems that use or may use both phase-control and sine-wave dimmers shall be considered as current-carrying."
Panel Statement: The panel recognizes the need to differentiate between solid-state sine wave and solid-state phase control dimmers.
The panel contends that the revised wording more clearly addresses the differences between these two dimmer technologies.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Conry, C.

15-130 Log #1605 NEC-P15 **Final Action: Accept**
(Table 520.44)

Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Make the following change in 520.44 Table 520.44 Third paragraph in Note:
Change "neutral" to "neutral conductor", change "common" to "neutral". Change "wires" to "conductors."
The revised text would appear as follows:
In a 3-wire circuit consisting of two phase ~~wires~~ conductors and the neutral conductor of a 4-wire, 3-phase, wye-connected system, ~~a common~~ the neutral conductor carries approximately the same current as the line-to-neutral currents of the other conductors and shall be considered to be a current-carrying conductor.
Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).
The Task Group has proposed the following definitions to be added to Article 100:
● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.
● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.
This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals
● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.
● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.
Also, the word "wires" should be replaced by "conductors" for consistency.
Additional information is available in the Task Group report.
Note: Supporting material is available for review at NFPA Headquarters.

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:

Backstage lamps (bare bulbs) installed in backstage and ancillary areas where they can come in contact with scenery shall be located and guarded so as to be free from ~~physical~~ damage and shall provide an air space of not less than 50 mm (2 in.) between such lamps and any combustible material.

Substantiation: Use of the word "physical" is superfluous - the intent is obvious given the context.

Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every unneccessary instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.

Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: four our purposes, "damage" means "physical damage."

Panel Meeting Action: Reject
Panel Statement: "Physical damage" is one of the special terms included in the NEC Style Manual (3.2.5.5) and should be retained.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Conry, C.

15-133 Log #1602 NEC-P15 **Final Action: Accept**
(520.51)

TCC Action: The Technical Correlating Committee directs that the action on this proposal be correlated with the action taken on Proposal 15-134. This action will be considered by the Panel as a Public Comment.
Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Make the following change in 520.51:

Change "neutral" to "neutral conductor."

The revised text would appear as follows:

Portable switchboards shall be supplied only from power outlets of sufficient voltage and ampere rating. Such power outlets shall include only externally operable, enclosed fused switches or circuit breakers mounted on stage or at the permanent switchboard in locations readily accessible from the stage floor. Provisions for connection of an equipment grounding conductor shall be provided. The neutral conductor of feeders supplying solid-state, 3-phase, 4-wire dimmer systems shall be considered a current-carrying conductor.

Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).

The Task Group has proposed the following definitions to be added to Article 100:

● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.

● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals

● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.

● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.

Additional information is available in the Task Group report.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Conry, C.
Comment on Affirmative:

VANNICE, K.: Note that the revised text as stated was further revised in proposal 15-134.

15-134 Log #3319 NEC-P15 **Final Action: Accept in Principle**
(520.51)

TCC Action: See the Technical Correlating Committee Note on Proposal 15-116.
Submitter: Steven R. Terry, ETC
Recommendation: Change the last sentence of the section to read:

The neutral of feeders supplying solid-state phase-control, <u>3-phase,</u> 4-wire dimming systems shall be considered a current-carrying conductor.

Add new wording at end of section:

<u>The neutral of feeders supplying solid-state sine wave, 3-phase, 4-wire dimming systems shall not be considered a current-carrying conductor.</u>

Substantiation: A new class of listed solid state dimmer has been introduced to the professional performance lighting market: the Solid State Sine Wave dimmer. This type of dimmer varies the amplitude of the applied voltage wave form, without any of the nonlinear switching found in traditional phase-control solid state dimmers. Heretofore, nonlinear phase control dimmers were the only type of readily available solid state dimmers. Since solid state sine wave dimmers are linear loads, they do not require the neutral of the feeder to the dimmers to be considered a current-carrying conductor. Wording is now required to clearly state the feeder requirements for <u>both</u> types of solid state dimmers that are now available, in order to avoid the confusion that might arise if only phase-control dimmers were mentioned in the requirement for neutral characteristics.

Panel Meeting Action: Accept in Principle

Replace the last sentence of the present text with the following:

"For purposes of conductor derating, the requirements of 520.27(B) shall apply."

Panel Statement: This condition referenced in the submitter's proposal is already covered in 520.27(B) as modified by the panel action on Proposal 15-129.

The panel contends it is more efficient to refer to the appropriate section rather than restating the information.

Number Eligible to Vote: 16
Ballot Results: Affirmative: 15
Ballot Not Returned: 1 Conry, C.

15-135 Log #1608 NEC-P15 **Final Action: Accept**
(520.53(0)(2))

Submitter: Technical Correlating Committee on National Electrical Code
Recommendation: Make the following change in 520.53(O)(2):
Change "neutral" to "neutral conductor."
The revised text would appear as follows:
(2) Supply Neutral Conductor . The power supply conductors for portable switchboards shall be sized considering the neutral conductor as a current-carrying conductor. Where single-conductor feeder cables, not installed in raceways, are used on multiphase circuits, the grounded neutral conductor shall have an ampacity of at least 130 percent of the ungrounded circuit conductors feeding the portable switchboard.
Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).
The Task Group has proposed the following definitions to be added to Article 100:
● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.
● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.
This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals
● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.
● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.
Additional information is available in the Task Group report.

Ballot Not Returned: 1 Conry, C.
Comment on Affirmative:
VANNICE, K.: Note that the revised text as states was further revised in Proposal 15-134.

15-136 Log #3320 NEC-P15 **Final Action: Accept in Principle**
(520.53(0)(2))

Submitter: Steven R. Terry, ETC
Recommendation: Revise text to read:
(2) Supply Neutral. The power supply conductors for portable switchboards utilizing solid state phase-control dimmers shall be sized considering the neutral as a current-carrying conductor. The power supply conductors for portable switchboards utilizing only solid state sine wave dimmers shall be sized considering the neutral as a non-current-carrying conductor. Where single-conductor feeder cables, not installed in raceways, are used on multiphase circuits feeding portable switchboards containing solid state phase-control dimmers, the grounded neutral conductor shall have an ampacity of at least 130 percent of the ungrounded circuit conductors feeding the portable switchboard. Where such feeders are supplying only solid state sine wave dimmers, the grounded neutral conductor shall have an ampacity of at least 100 percent of the ungrounded circuit conductors feeding the portable switchboard.
Substantiation: A new class of listed solid state dimmer has been introduced to the professional performance lighting market: the Solid State Sine Wave dimmer. This type of dimmer varies the amplitude of the applied voltage wave form, without any of the nonlinear switching found in traditional phase-control solid state dimmers. Heretofore, nonlinear phase control dimmers were the only type of dimmers used in portable switchboards. Since solid state sine wave dimmers are linear loads, they do not require an oversize neutral in the feeder to the dimmers since they produce no harmonics and no neutral overcurrent. Wording is now required to clearly state the feeder requirements for both types of solid state dimmers that are now available, in order to avoid the confusion that might arise if only phase-control dimmers were mentioned in the requirement for neutral characteristics.
Panel Meeting Action: Accept in Principle
Revise the proposed wording to read as follows:
"(2) Supply Neutral Conductor. The power supply conductors for portable switchboards utilizing solid state phase-control dimmers shall be sized considering the neutral conductor as a current-carrying conductor for derating purposes. The power supply conductors for portable switchboards utilizing only solid state sine wave dimmers shall be sized considering the neutral conductor as a non-current-carrying conductor for derating purposes. Where single-conductor feeder cables, not installed in raceways, are used on multiphase circuits feeding portable switchboards containing solid state phase-control dimmers, the neutral conductor shall have an ampacity of at least 130 percent of the ungrounded circuit conductors feeding the portable switchboard. Where such feeders are supplying only solid state sine wave dimmers, the neutral conductor shall have an ampacity of at least 100 percent of the ungrounded circuit conductors feeding the portable switchboard."
Panel Statement: The panel recognizes the need to differentiate between solid-state sine wave and solid-state phase control dimmers.
The panel contends that the revised wording more clearly addresses the differences between these two dimmer technologies.

ARTICLE 525 — CARNIVALS, CIRCUSES, FAIRS, AND SIMILAR EVENTS

15-144a Log #CP1501 NEC-P15 **Final Action: Accept**
(525.2)

Submitter: Code-Making Panel 15,
Recommendation: Add a new definition for "Operator" to 525.2 to read as follows:
"525.2 Definitions.
Operator. As used in this Article, the operator shall be the individual responsible for starting, stopping, and controlling an amusement ride or supervising a concession.
Portable Structures. For the purposes of this Article the term portable structures shall include, but is not limited to, amusement rides, attractions, concessions, tents, trailers, trucks and similar units."
Substantiation: The panel chose to add the term "operator" to the definitions in 525.2, as in some situations the operator is considered to be the owner of the portable structure and not the individual that is actually controlling or attending the equipment.
Panel Meeting Action: Accept
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Conry, C.
Comment on Affirmative:
VANNICE, K.: Note that the definition for Portable Structures was accepted here and then revised in proposal 15-145.

15-145 Log #2892 NEC-P15 **Final Action: Accept in Principle**
(525.2)

TCC Action: The Technical Correlating Committee directs that the panel clarify the panel action on this proposal in accordance with 2.2.2 of the NEC Style Manual to not contain the term being defined. The panel is also directed to correlate this proposal with the action taken on Proposal 15-144a. This action will be considered by the panel as a public comment.
Submitter: Mark R. Hilbert, Wolfeboro, NH
Recommendation: Add a new section to read:
525.2 Definition.
Portable Structures. For the purposes of this Article the term portable structures shall include, but is not limited to, amusement rides, attractions, concessions, tents, trailers, trucks and similar units.
Substantiation: Adding a definition of the term "portable structures" will add clarity to what types of portable equipment is actually covered by Article 525. The term has been added to the following sections; 525.5(B), 525.6, 525.11, and 525.30 in companion proposals.
Panel Meeting Action: Accept in Principle
Add a new defintion for Portable Structures to read as follows:
"Portable Structures. The term portable structures applies to units designed to be moved including, but not limited to, amusement rides, attractions, concessions, tents, trailers, trucks, and similar units."
Panel Statement: The revised wording is more concise and more accurately reflects the terms used within the industry.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Conry, C.

15-146 Log #2893 NEC-P15 **Final Action: Accept in Principle in Part**
(525.5)

Submitter: Mark R. Hilbert, Wolfeboro, NH
Recommendation: Revise text to read:
525.5 Overhead Conductor clearances.
(A) Vertical Clearance From Ground . Outdoor conductors shall have a vertical clearance from ~~ground~~ final grade in accordance with 225.18. ~~These clearances shall apply only to wiring installed outside of tents and concessions.~~
(B) Clearance to ~~Rides and Attractions~~ Portable Structures .
(1) Under 600 Volts. ~~Amusement rides and amusement attractions~~ Portable structures shall be maintained not less than 4.5 m (15 ft) in any direction from overhead conductors operating at 600 volts or less, except for the conductors supplying the ~~amusement ride or attraction~~ portable structure. Portable structures included in 525.3(D) shall maintain a 6.9 m (22.5 ft) clearance in any direction from any part of portable structure.
(2) Over 600 Volts. ~~Amusement rides or attractions~~ Portable structures shall not be located under or within 4.5 m (15 ft) horizontally of conductors operating in excess of 600 volts.
Substantiation: Changing the title and text by using the term "portable structures" as it is defined in the new 525.2 will add clarity to what type of equipment is included and will expand the requirement to maintain clearances from overhead conductors for concessions, tents, power plants and similar equipment. This type of equipment was not necessarily considered under the previous language but the same hazards exist with overhead conductors. Further, revising this section as proposed will add clarity to the clearance requirements and resolve a conflict with the requirements of Table 680.8, Parts A and C. As previously written the clearance requirement of 22.5 ft in Table 680.8, Part A had been reduced to 15 ft by Section 525.5(B). Conversely, the horizontal clearance requirement of Table 680.8 Part C reduced the 15 ft requirement of 525.5(B) to 10 ft.
Panel Meeting Action: Accept in Principle in Part
The panel rejects the proposed (A) and the revises the last sentence of proposed (B)(1) to read: "Portable structures included in 525.3(D) shall comply with Article 680, Table 680.8."
The panel accepts the remainder of (B)(1) and all of (B)(2).
Panel Statement: The proposed changes to part (A) are unnecessary as this section applies to overhead conductors.
The proposed change to the second sentence of (B)(1) would conflict with the present requirements of 525.3(D) and, therefore, needed clarification.
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Conry, C.

15-147 Log #233 NEC-P15 **Final Action: Reject**
(525.6)

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise as follows:
Electrical equipment and wiring methods in or on rides, concessions, or other units shall be provided with mechanical protection where such equipment or wiring methods are subject to ~~physical~~ damage.
Substantiation: Use of the word "physical" generally is superfluous - the intent is obvious given the context. (I leave it to you whether you want to get more specific naming some sources of damage such as "blows or abrasion.").
Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every unnecessary instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: four our purposes, "damage" means "physical damage."

Recommendation: Revise text to read:
525.6 Protection of Electrical Equipment. Electrical equipment and wiring methods in or on ~~rides, concessions or other units~~ portable structures shall be provided with mechanical protection where such equipment or wiring methods are subject to physical damage.
Substantiation: This proposal is a companion proposal to replace the terms "rides, concessions or other units" with the term "portable structures" for clarity and consistency of identifying amusement equipment throughout Article 525.
Panel Meeting Action: Accept
Number Eligible to Vote: 17
Ballot Results: Affirmative: 16
Ballot Not Returned: 1 Conry, C.

15-149 Log #1354 NEC-P15 **Final Action: Reject**
(525.11)

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Revise as follows:
~~525.11 Multiple Sources of Supply.~~
~~Where multiple services or separately derived systems or both supply rides, attractions, and other structures, all sources of supply that serve rides, attractions, or other structures separated by less than 3.7 m (12 ft) shall be bonded to the same grounding electrode system.~~
Substantiation: This change to the 2005 edition of the code should never have been accepted. There was no technical substantiation.

Are there any documented cases of this being a problem?
Where did 12' come from? Is 11' unsafe? Is 12'1" safe?
Also, this requirement is so vague in its language that it is impossible to create uniform interpretation.
What is to be bonded together here? The generators? The attractions? The rides? The electrodes? Every structure within 12' of any other structure? How do I bond them? 500Kcmil copper? 6 AWG? What portions of Article 250 apply? Do I base the size on 250.122? Do I use Table 250.66?
What happens when a voltage is imposed from one system (during a fault) to the metal, non-current carrying parts of the other system and its rides and attractions? Why are we energizing attractions that were safe until we bond them to something that is under fault? Isn't isolation safer than bonding? I don't want to be touching a ferris wheel that is perfectly safe, only to get shocked because a different generator had a fault and imposed its voltage on me for the time duration of the overcurrent device to open. I would rather just not get shocked! Isolation is the answer, not bonding.

I urge the members of Panel 15 to delete this proposal that never should have passed in the first place.

Panel Meeting Action: Reject

Panel Statement: The panel reaffirms its position onthe electrical safety provided when two or more sources of supply serving equipment in close proximity (within 12 ft) are bonded together. This is consistent with the requirement for bonding together to a common grounding electrode system as found in 250.58.

The panel contends that the distance of 12 ft. is representative of twice the arm reach of an individual.

Unless otherwise superceded by Article 525, it is understood that the common grounding electrode requirements are covered in Article 250.

Number Eligible to Vote: 17

Ballot Results: Affirmative: 15 Negative: 1

Ballot Not Returned: 1 Conry, C.

Explanation of Negative:

DUNN, T.: This proposal should have been accepted.

The submitter expressed legitimate concerns in his substantiation. I know these concerns to be legitimate because I have fielded these same questions since 525.11 appeared in the 2005 edition of the NEC.

The panel's comments do not address these concerns. 250.28 applies to, "Where an ac system is connected to a grounding electrode in or at a building or structure ...". At a 525 venue an ac system is connected to a grounding electrode at a generator .

The submitter asks, "Are there any documented cases of this being a problem," the answer is no .

The submitter is correct in that, there was no technical substantiation for introducing this into the 2005 edition.

15-150 Log #2895 NEC-P15 **Final Action: Accept in Principle in Part (525.11)**

Submitter: Mark R. Hilbert, Wolfeboro, NH

Recommendation: Revise text to read:

525.11 Multiple Sources of Supply. Where multiple services or separately derived systems or both supply ~~rides, attractions, and other~~ portable structures , the grounding conductor systems ~~all sources of supply~~ that serve ~~rides, attractions, or other~~ portable structures separated by less than 3.7 m (12 ft) shall be bonded. ~~to the same grounding electrode system.~~

Substantiation: This proposal is a companion proposal to replace the terms "rides, concessions or other units" with the term "portable structures" for clarity and consistency of identifying amusement equipment throughout Article 525. Further, the current text requires all sources of supply to be bonded to the same grounding electrode system. Permitting bonding of the two portable structures separated by less than 3.7 m (12 ft) at the structures in many instances is a more effective means to reduce voltage gradients between the two portable structures, particularly in cases where the sources of supply may be located great distances from each other.

Panel Meeting Action: Accept in Principle in Part

Revise the proposed text to read as follows:

"Multiple Sources of Supply. Where multiple services or separately derived systems, or both, supply portable or other structures, all sources of supply that serve such structures separated by less than 3.7 m (12 ft) shall be connected to the same grounding electrode system."

Panel Statement: The addition of the word "portable" agrees with the definition of Portable Structures. Changing "bonded" to "connected" correlates with the panel action taken on Proposal 15-2.

See panel action and statement on Proposal 15-149.

Number Eligible to Vote: 17

Ballot Results: Affirmative: 16

Ballot Not Returned: 1 Conry, C.

15-151 Log #232 NEC-P15 **Final Action: Reject (525.20(A))**

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education

Recommendation: Revise as follows:

Where flexible cords or cables are used, they shall be listed for extra hard usage. Where flexible cords or cables are used and are not subject to ~~physical~~ damage, they shall be permitted to be listed for hard usage. Where used outdoors, flexible cords and cables shall also be listed for wet locations and shall be sunlight resistant. Extra-hard usage flexible cords or cables shall be permitted for use as permanent wiring on portable amusement rides and attractions where not subject to ~~physical~~ damage.

Substantiation: Use of the word "physical" is superfluous - the intent is obvious given the context. (I leave it to you whether you want to get more specific naming some sources of damage such as "blows or abrasion.").

Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every unnecessary instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.

Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well – but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: four our purposes, "damage" means "physical damage."

Panel Meeting Action: Reject

Panel Statement: "Physical damage" is one of the special terms included in the NEC Style Manual (3.2.5.5) and should be retained.

Number Eligible to Vote: 17

Ballot Results: Affirmative: 16

Ballot Not Returned: 1 Conry, C.

15-152 Log #2896 NEC-P15 **Final Action: Accept in Principle in Part (525.21(A))**

Submitter: Mark R. Hilbert, Wolfeboro, NH

Recommendation: Revise text to read:

525.21 Rides, Tents and Concessions.

(A) Disconnecting Means. Each ride and concession shall be provided with a disconnecting means in accordance with (1), (2) or (3).

(1) A fused disconnect switch or circuit breaker located within sight and within 1.8 m (6 ft) of the operator's station. The disconnecting means shall be readily accessible to the operator, including when the ride is in operation. Where accessible to unqualified persons, the enclosure for the switch or circuit breaker shall be of the lockable type.

(2) Where the ride or concession is provided with fused disconnect switch or circuit breaker, an additional disconnecting means without internal overcurrent protection shall be permitted where it is located within sight and within 1.8 m (6 ft) of the operator's station. The disconnecting means shall be readily accessible to the operator, including when the ride is in operation. Where accessible to unqualified persons, the enclosure for the switch or circuit breaker shall be of the lockable type.

(3) A shunt trip device that opens the fused disconnect or circuit breaker when a switch located in the ride operator's console is closed shall be a permissible method of opening the circuit.

Substantiation: Revising this section as proposed will address a very real problem and permit an additional disconnecting means without internal overcurrent protection to be used within sight and within 6 ft of the operator's station when the ride or concession has been provided with overcurrent protection. This will allow the amusement company to carry additional disconnecting means that can be used in a variety of ways such as for a ride that does not have a means that disconnects all conductors or in place of a shunt trip that has been found inoperative, etc. For example, this disconnecting means could be provided with single pole connectors for the line and load connections and placed "in line" of a feeder where necessary.

Panel Meeting Action: Accept in Principle in Part

Change the wording of the first sentence of the existing Code language to read as follows:

"Each portable structure shall be provided with a disconnect switch located within sight of and within 1.8 m (6 ft) of the operator's station."

The remainder of the proposal is rejected.

Panel Statement: The panel acknowledges the submitter's concern for the requirement for overcurrent protection at the disconnecting means located at the operator's station. The panel has eliminated that requirement. The panel action does not prohibit the use of overcurrent protection at this location.

Number Eligible to Vote: 17

Ballot Results: Affirmative: 15 Negative: 1

Ballot Not Returned: 1 Conry, C.

Explanation of Negative:

VANNICE, K.: This appears to me to be a problem in that it wasn't taken far enough to make sense. We took the existing language from 525.21(A) and changed the first sentence. This removed the overcurrent protection component and left the disconnect component. I don't have a problem with that. The problem is that the remaining sentences are laced with overcurrent protection-type words. I think this should be held until the entire section is reworked.

15-153 Log #231 NEC-P15 **Final Action: Reject**
(525.21(B))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education

Recommendation: Revise as follows:

Electrical wiring for lighting, where installed inside of tents and concessions, shall be securely installed, and where subject to ~~physical~~ damage, shall be provided with mechanical protection.

Substantiation: Use of the word "physical" is superfluous - the intent is obvious given the context. (I leave it to you whether you want to get more specific naming some sources of damage such as "blows or abrasion.").

Submitting proposals removing the adjective may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every unnecessary instance, as I am attempting to do, we actually cut the NEC down by up to oh, half a page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.

Second, the use of "physical" is not only poor writing–look at William Zinsser's classic, On Writing Well– but silly, and reflects a bit poorly on the Code process. When the references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: four our purposes, "damage" means "physical damage."

Panel Meeting Action: Reject

Panel Statement: "Physical damage" is one of the special terms included in the NEC Style Manual (3.2.5.5) and should be retained.

Number Eligible to Vote: 17

Ballot Results: Affirmative: 16

Ballot Not Returned: 1 Conry, C.

15-154 Log #1476 NEC-P15 **Final Action: Accept**
(525.21(B))

Submitter: Ryan Jackson, West Valley City, UT

Recommendation: Revise as follows:

525.21 Rides, Tents and Concessions.

(B) Portable Wiring Inside Tents and Concessions. electrical wiring for lighting, where installed inside of tents and concessions, shall be securely installed and, where subject to physical damage, shall be provided with mechanical protection. All lamps for general illumination shall be protected from accidental breakage by a suitable <u>luminaire (fixture)</u> or lampholder with a guard.

Substantiation: Correlation with the rest of the code.

Panel Meeting Action: Accept

Number Eligible to Vote: 17

Ballot Results: Affirmative: 16

Ballot Not Returned: 1 Conry, C.

15-155 Log #3483 NEC-P15 **Final Action: Reject**
(525.23)

Submitter: Richard F. Van Wert, Middle Department Inspection Agency / Rep. Benjamin Franklin Chapter IAEI

Recommendation: Revise text to read:

525.23

(A) Where GFCI Protection is Required. <u>All 125 V, single phase, 15- and 20-ampere receptacles.</u>

~~(B) Where GFCI Protection is Not Required~~

Substantiation: This article needs rewording because there are not supposed to be any exceptions to this type of protection. Cordsets do not cut the muster because the carnival workers simply replace a faulty cordset with a non-GFCI-protected cordset which negates any GFCI protection. Every duplex type receptacle is accessible to the public so GFCI protect them. Why should items with a twist lock be exempted?

Panel Meeting Action: Reject

Panel Statement: It is the panel's intention to differentiate between receptacles that are mounted on portable structures and supply electrical equipment that is an integral part of the portable structure from those receptacles for general use.

Number Eligible to Vote: 17

Ballot Results: Affirmative: 15 Negative: 1

Ballot Not Returned: 1 Conry, C.

Explanation of Negative:

MORGAN, E.: The panel statement confirms what the apparent intent of the proposal was. It should have been Accepted in Principle in Part, with a minor revision to the proposal, indicating "general purpose" receptacles were required to be GFCI protected.

15-156 Log #2897 NEC-P15 **Final Action: Accept in Part**
(525.30(3))

Submitter: Mark R. Hilbert, Wolfeboro, NH

Recommendation: Revise text to read:

525.30 Equipment Bonding. The following equipment connected to the same source shall be bonded:

(3) Metal frames and metal parts of ~~rides, concessions, tents,~~ <u>portable structures,</u> trailers, trucks or other equipment that contain or support electrical equipment.

<u>The equipment grounding conductor of the circuit supplying the equipment in (1), (2) or (3) that is likely to energize the metal frame or part shall be permitted to serve as the bonding means.</u>

Substantiation: This proposal is a companion proposal to replace the term "rides, concessions or other units" with the term "portable structures" for clarity and consistency of identifying amusement equipment throughout Article 525. The acceptance of the new last sentence will clarify the bonding requirements of this section and will reduce the number varying interpretations of how the bonding is to take place. The requirement of 525.32 to verify the grounding conductor continuity added in the 2002 cycle further strengthens the integrity of permitting the equipment grounding conductor of the circuit likely to energize the metal frame or part as the bonding means.

Panel Meeting Action: Accept in Part

The panel accepts the addition of the term "portable structures", and rejects the remainder of the proposal.

Panel Statement: The acceptance of "portable structures" is in alignment with the new definition of "Portable Structures".

The remainder of the proposal is rejected because Code-Making Panel 5's Definition for "Equipment Grounding Conductor" addresses the submitter's concern.

Number Eligible to Vote: 17

Ballot Results: Affirmative: 16

Ballot Not Returned: 1 Conry, C.

15-157 Log #2430 NEC-P15 **Final Action: Reject**
(525.30(D))

Submitter: Robert P. McGann, City of Cambridge

Recommendation: Revise text to read as follows:

This equipment shall be installed to comply with applicable requirement of Article 680 <u>Part II</u> .

Substantiation: It is too confusing as to which part of 680 to use now. It is consistently misinterpreted to which (section) part should be enforced in each jurisdiction.

Panel Meeting Action: Reject

Panel Statement: The panel believes that the submitter intended to address the proposal to 525.3(D) rather than 525.30(D). The panel contends that all applicable parts of Article 680 should be applied.

Number Eligible to Vote: 17

Ballot Results: Affirmative: 16

Ballot Not Returned: 1 Conry, C.

15-158 Log #1049 NEC-P15 **Final Action: Accept in Principle**
(525.31)

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Revise text to read as follows:

All equipment ~~requiring grounding~~ <u>to be grounded</u> shall be grounded by an equipment grounding conductor of a type ~~and size~~ recognized by 250.118 ~~and installed in accordance with Article 250.~~

Substantiation: Edit. The requirements should apply where grounding is done by choice and not required. 250.1 indicates Article 250 applies to equipment "permitted" to be grounded. The word "size" infers a wire type EGC but, 250.118 doesn't refer to size and covers other than wire type equipment grounding conductors. Article 250 already applies per 90.3.

Panel Meeting Action: Accept in Principle

Revise the proposed wording to read as follows:

"All equipment to be grounded shall be connected to an equipment grounding conductor of a type recognized by 250.118 and installed in accordance with Parts VI and VII of Article 250."

Panel Statement: The revised wording correlates with the panel actions taken on Proposal 15-2 and meets the intent of the submitter.

Number Eligible to Vote: 17

Ballot Results: Affirmative: 16

Ballot Not Returned: 1 Conry, C.

15-159 Log #1072 NEC-P15 **Final Action: Reject**
(525.31)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise first sentence as follows:
All equipment to be grounded ~~requiring grounding~~ shall be grounded...". (remainder unchanged)
Substantiation: Edit. Where equipment is not required to be grounded, but grounded by choice, Code rules should also apply. Code provisions are not limited to mandatory requirements and 110.12 applies to all wiring. 250.1(1) indicates Article 250 covers installations "permitted" to be grounded and the proposal correlates this section.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 15-158.

ARTICLE 530 — MOTION PICTURE AND TELEVISION STUDIOS AND SIMILAR LOCATIONS

15-160 Log #2215 NEC-P15 **Final Action: Reject**
(530.11)

Submitter: Kyle Cope, Prysmian Cables and Systems
Recommendation: Revise as follows:
"The permanent wiring shall be Type MC cable, Type PA cable . Type AC cable containing an insulated equipment grounding conductor...".
Substantiation: Statement of problem: Material technology advancements now allow for cable designs that provide improved mechanical damage protection. i.e., crush and impact, over standard Type MC cable without sacrificing flame performance properties. The characteristics achieved using traditional metallic components can now be realized using polymeric materials. The use of polymeric materials also provides the opportunity for lighter and smaller diameter cables.
Substantiation for Proposal: Type PA has been proposed as a new type (Article 3XX) and should be included in this list (530.11) as it offers enhanced mechanical benefits as an alternate to Type MC cable. See test data provided. A UL Fact-Finding study comparing the subject cable to type MC is ongoing at the time of proposal submittal. This data will be forwarded once the study is complete.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The panel is aware that Code-Making Panel 7 has rejected the proposal for a new article covering PA cable.
There is insufficient technical data for this panel to make a decision to override the action taken by Code-Making Panel 7.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15

Ballot Not Returned: 1 Conry, C.

ARTICLE 545 — MANUFACTURED BUILDINGS

19-2 Log #464 NEC-P19 **Final Action: Reject**
(545.4(B))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise text to read as follows:
In closed construction, cables shall be permitted to be secured only at cabinets, boxes, or fittings where 10 AWG or smaller conductors are used and protection against ~~physical~~ damage is provided.
Substantiation: Use of the word "physical" is superfluous–the intent is obvious given the context. (I leave it to the CMP whether you want to get more specific instead, naming some source of damage such as "blows or abrasion.")
Submitting proposals removing the adjective, "physical," may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every unnecessary instance, as I am attempting to do, we actually cut the NEC down by up to oh, maybe a quarter-page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the unneeded use of "physical" not only is poor writing–look at William Zinsser's classic, On Writing Well–but is silly, and reflects a bit poorly on the Code process. When references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."

Panel Meeting Action: Reject
Panel Statement: The use of the term Physical Damage is consistent with its use in 300.4 and 300.5(D)(4).

The adjective "physical" is clearly understood and its deletion does not improve the readability of the Code.

In most cases this phrase is used in conjunction with a requirement for conductor/cable protection. If "physical" is deleted the revised text might be interpreted as requiring "total" protection for conductor/cables from any unforeseen circumstances. Such a proposal would be considered more than editorial and it does not appear that is the intent.

Definition of damage:

Harm or injury to property or a person, resulting in loss of value or the impairment of usefulness.

The word "Physical" differentiates mechanical damage from electrical damage.

In addition, this is also consistent with the NEC Style Manual.

Number Eligible to Vote: 8
Ballot Results: Affirmative: 8

ARTICLE 547 — AGRICULTURAL BUILDINGS

19-3 Log #1530 NEC-P19 **Final Action: Accept**
(547, 500, 551, 552, 553 and 675)

Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Revise Articles 547, 550, 551, 552, 553, and 675 as described in the following, relative to the terms bonding and grounding.

Article 547

547.9(A)(4): change "shall be bonded to" to "shall be connected to"

547.9(B)(3)(b)(2): change "is bonded to" to "is connected to"

547.10(B): change "shall be bonded to" to "shall be connected to"

547.5(F): change "shall be ~~grounded~~ connected by a copper equipment grounding conductor installed between the equipment and grounding connection of the building disconnecting means"

Article 550

550.16: change "The grounding bus shall be ~~grounded~~ connected through the green-colored insulated conductor in the supply cord or the feeder wiring to the service ground in the service-entrance equipment located adjacent to the mobile home location."

550.16(B)(3): change "Cord-Connected Appliances. Cord-connected appliances, such as washing machines, clothes dryers, and refrigerators, and the electrical system of gas ranges and so forth, shall be grounded by means of a cord with an equipment grounding conductor and grounding-type attachment plug."

Article 551

551.20(C): change "The non–current-carrying metal enclosure of the voltage converter shall be ~~bonded~~ connected to the frame of the vehicle with a minimum 8 AWG copper conductor."

551.40(A): in 2 places, change "with ground" to "with equipment grounding conductor"

551.56(D)(2): change "is bonded to" to "is connected to"

551.76(C): change "ground" to "equipment grounding conductor"

Article 552.10(C)(4): change "The chassis-grounding terminal of the battery shall be ~~bonded~~ connected to the unit chassis with a minimum 8 AWG copper conductor. In the event the power lead from the battery exceeds 8 AWG, the bonding conductor shall be of an equal size."

552.20(C): change "bonded to" to "connected to"

552.40(A): in 2 places, change "with ground" to "with equipment grounding conductor"

552.57(D)(2): change "is bonded to" to "is connected to"

Article 553.10(A): change "All enclosures and exposed metal parts of electrical systems shall be ~~bonded~~ connected to the grounding bus."

553.11: change "shall be bonded to" to "shall be connected to"

Article 675.14: change "Where electrical grounding is required on an irrigation machine, the metallic structure of the machine, metallic conduit, or metallic sheath of cable shall be ~~bonded~~ connected to the grounding conductor. Metal-to-metal contact with a part that is ~~bonded~~ connected to the grounding conductor and the non–current-carrying parts of the machine shall be considered as an acceptable bonding path."

Substantiation: Article 547: The proposed changes are intended to make the requirements more prescriptive in nature and to include a reference to where the requirements are found in Article 250.

Article 547.5(F): These changes clarify the present requirement in more prescriptive language and to clarify the connection referred to in the section. Connected is proposed to work cooperatively with the proposed revision of the definition of bonded (bonding).

Article 550: These changes clarify the present requirement in more prescriptive language and to clarify the connection referred to in the section. Connected is proposed to work cooperatively with the proposed revision of the definition of bonded (bonding).

Article 551: These changes clarify the present requirement in more prescriptive language and to clarify the connection referred to in the section. Connected is proposed to work cooperatively with the proposed revision of the definition of bonded (bonding).

Article 552: These changes clarify the present requirement in more prescriptive language and to clarify the connection referred to in the section. Connected is proposed to work cooperatively with the proposed revision of the definition of bonded (bonding).

Article 553: These changes clarify the present requirement in more prescriptive language and to clarify the connection referred to in the section. Connected is proposed to work cooperatively with the proposed revision of the definition of bonded (bonding).

Article 675: These changes clarify the present requirement in more prescriptive language and to clarify the connection referred to in the section. Connected is proposed to work cooperatively with the proposed revision of the definition of bonded (bonding).

This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to the proposed revision to the terms "bonded", "grounded", and "equipment grounding conductor" in Article 100 relative to this Task Group's recommendations. These changes clarify the present requirement in more prescriptive language.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept
Number Eligible to Vote: 7
Ballot Results: Affirmative: 7

19-4 Log #3433 NEC-P19 **Final Action: Accept in Principle in Part**
(547.1)

Submitter: David Filipiak, Sky Electric, Inc.
Recommendation: Add the following new paragraph to the scope to read as follows:

The provisions of this article shall be permitted to apply to other buildings and structures on the same property, and to buildings and structures on farm, ranch, orchard, or vineyard property where buildings or adjacent areas as described in 547.1(A) or 547.1(B) do not exist.

Substantiation: There are several provisions in this article that are unique to farm, ranch, orchard, and vineyard electrical installations that do not exist elsewhere in the code. There are thousands of farms and ranches in particular across the country that do not have buildings or areas as described in 547.1(A) or 547.1(B) that should be permitted to be wired according to the rules in Article 547, but are excluded by the scope as presently written. For example, the 2002 and 2005 editions of the NEC do not permit UF or NMC cable to be used in those other buildings according to 334.10 and 334.12 unless the cables are run within fire-rated construction. Most buildings on farms are not of fire-rated construction, and concealing cables within building cavities is not recommended because of possible rodent damage. It is better for the cable to be exposed where its condition can be easily visually monitored. Central point electrical distribution is not recognized unless at least one of the buildings meets the conditions described in 547.1(A) or 547.1(B). With this new paragraph added to the scope, the electrical contractor has the option of applying all of the rules in Article 547 to all buildings and structures on a farm.

Panel Meeting Action: Accept in Principle in Part

Revise the existing code as follows:

"547.2 Definitions

Distribution Point. An electrical supply point from which service drops, service conductors, feeders, or branch circuits to buildings or structures utilized under single management are supplied."

In 547.9 Electrical Supply to Building(s) or Structure(s) from a Distribution Point, add the following new first sentence (Note: The existing 1st sentence becomes the second sentence):

"A distribution point shall be permitted to supply any building or structure located on the same premises."

Revise 547.9(A)(1) to read as follows:

"(1) Where Required. A site-isolating device shall be installed at the distribution point where two or more agricultural buildings, or structures are supplied from the distribution point."

Panel Statement: The new language allows buildings without 547.1 environments to receive supply according to the provisions of 547.9.

There is inadequate technical justification provided that 547 wiring methods should be permitted to be used for internal wiring of building without 547.1 environments.

Number Eligible to Vote: 7
Ballot Results: Affirmative: 7

19-5 Log #2418 NEC-P19 **Final Action: Reject**
(547.2)

Submitter: Donald W. Zipse, Zipse Electrical Engineering, Inc.
Recommendation: Delete definition for Equipotential Plane.
Substantiation: For additional substantiation, please read also 547.10 Proposal.

The definition of "equipotential plane" is a complete misunderstanding and misconception as there is **no such item as an equipotential plane that prevents a difference in voltage from developing within the plane.**

Ohm's Law states that **Voltage = Current X Resistance**

Unless the buried in concrete metal mesh is at or near absolute zero temperature, the mesh will have some resistance. Any current flowing over and through the mesh will produce a voltage per Ohm's Law. This has been proven by testing as will be described below.

Cow Contact (cc) is defined as any two places on a cow that can encounter an energized "conductor" or conducting surface. For example, a cow drinking from a water trough that is energized standing on the earth would have a cow contact from the water through the tongue through the legs to the earth completing part of the circuit.

With the approval of Code Making Panel # 5's acceptance of the dangerous and hazardous multigrounded neutral distribution system, stray current has been measured flowing within dairies.

EPRI: "Created by the nation's electric utilities in 1973, EPRI is one of America's oldest and largest research consortia, with some 700 members and an annual budget of about $ 500 million. Linked to a global network of technical specialists, EPRI scientists and engineers develop innovative solutions to the world's toughest energy problems while expanding opportunities for a dynamic industry."

The Electric Power Research Institute (EPRI) an organization of utilities companies states that 40 to 60 percent of the return neutral current from the high voltage electrical circuit returns over or through the earth. We have measured as high as eighty-eight (88) percent of the neutral current returning over the earth and thus through the dairy, back yards of homes through hot tubs, swimming pools, etc.

Mr. Lawrence C Neubauer has conducted investigations and has measured stray current in over 600 – 800 dairies. To prove there is a voltage in an equipotential plane Mr. Neubauer took a large plastic container, which is an insulator. He placed a coil of bare copper under the bucket in intimate contact with the concrete. Next, he placed a coil of copper in the bottom of the plastic bucket. A milliammeter was connected between the coil in the bottom of the bucket and the coil of copper "connected" to the concrete holding area where the equipotential plane had been installed.

The plastic bucket was filled with water. As the cows entered they attempted to drink out of the plastic bucket, however, it was evident they received an electrical shock as they jerked their heads out of the water. When two or more cows drank the voltage divided between the cows and they continued to drink

The electrical circuit was from the equipotential, which supposedly prevents a difference in voltage from developing, up the legs of the cow, through the body to the tongue, into the water, through the copper in to bottom of the plastic bucket, to the milliammeter and finally to the copper which is in intimate contact with the concrete equipotential plane. Readings of over a milliamp were recorded on VHS.

The American Society of Agricultural Engineers (ASAE) EP473-2001, Equipotential Planes in Animal Containment Areas is incorrect as it is producing a false sense of security when actually the equipotential plane is harming the animals.

What happens is the equipotential plane is such a good, efficient low impedance contact with the earth that the equipotential plane acts as a "sink" for the majority of the stray neutral current flowing through earth in the vicinity. It becomes a magnet for collecting the stray current. This equipotential plane is connected to the equipment grounding conductor which is connected to the neutral service entrance conductor which, is connected to the utility power company's transformer which has the secondary neutral connected to the primary neutral thus completing the connection to the primary electrical circuit back to the transformer.

What should be done is to connect all conductive metallic surfaces that can become energized to the grounding system through bonding conductors. No more, no less just as would be done in a home or industry.

If equipotential planes were such a great idea, why not require the basements and garage floors to have equipotential planes in case someone walked on the floor in their bare feet? Now watch some panel think that this is a great idea. A fool is born every code cycle.

No doubt, someone will make the comment that equipotential planes must do some good, must have a little advantage or may afford some help. That person needs to face the facts – **THERE IS NO BENEFIT IN ANY WAY, SHAPE OR FORM FROM EQUIPOTENTIAL PLANES, ONLY HARM.** The concept was based on erroneous ideas and conclusions and mis-understanding of electrical principles.

The dairy farmers in Wisconsin long ago deleted from the state adopted NEC the sections on equipotential planes as they realized the danger and hazards equipotential planes presented to dairy farmers. Now if only the WI PUC was as smart.

Panel Meeting Action: Reject

Panel Statement: The panel contends that it is necessary to retain the definition of Equipotential Plane because it is used in Article 547.

Number Eligible to Vote: 7

Ballot Results: Affirmative: 7

19-6 Log #3255 NEC-P19 **Final Action: Reject**

(547.2)

Submitter: Donald Dekker, N. Muskegon, MI

Recommendation: Delete the following text:

~~(Equipotential Plane. An area where wire mesh or other conductive elements are embedded in or placed under concrete, bonded to all metal structures and fixed nonelectrical equipment that may become energized, and connected to the electrical grounding system to prevent a difference in voltage from developing within the plane.)~~

Substantiation: The term Equipotential Plane is defined in 2 separate sections of the Code and its methods are utilized in 3 distinct articles. I recommended deleting the 2 separate definitions and adding the definition of Equipotential Plane to 100-1. See companion proposals.

Panel Meeting Action: Reject

Panel Statement: The panel contends that it is necessary to retain the definition of Equipotential Plane because it is used in Article 547.

Number Eligible to Vote: 7

Ballot Results: Affirmative: 7

19-7 Log #3637 NEC-P19 **Final Action: Reject**

(547.2)

Submitter: Donald W. Zipse, Zipse Electrical Engineering, Inc.

Recommendation: Delete definition for Equipotential Plane.

Substantiation: For additional substantiation, please read also 547.10 Proposal.

The definition of "equipotential plane" is a complete misunderstanding and misconception as there is **no such item as an equipotential plane that prevents a difference in voltage from developing within the plane.**

Ohm's Law states that **Voltage = Current X Resistance**

Unless the buried in concrete metal mesh is at or near absolute zero temperature, the mesh will have some resistance. Any current flowing over and through the mesh will produce a voltage per Ohm's Law. This has been proven by testing as will be described below.

19-8 Log #2419 NEC-P19 **Final Action: Reject**
(547.3)

Submitter: Donald W. Zipse, Zipse Electrical Engineering, Inc.

Recommendation: New paragraph following existing paragraph 547.3 to read:

Grounding of agriculture Buildings shall follow Article 250 requirements.

Substantiation: With the deletion of equipotential planes, Section 547.10, the panel may feel more comfortable stating the obvious.

Panel Meeting Action: Reject

Panel Statement: The panel did not Accept the deletion of equipotential planes.

Number Eligible to Vote: 7

Ballot Results: Affirmative: 7

19-9 Log #2768 NEC-P19 **Final Action: Accept in Principle in Part**
(547.3)

Submitter: Truman C. Surbrook, Michigan State University

Recommendation: Revise the section as follows:

547.3 Other Articles. For ~~agricultural~~ buildings <u>and structures</u> not having conditions as specified in 547.1, the electrical installations shall be <u>permitted to be</u> made in accordance with the applicable articles in this code.

Substantiation: The term agricultural does not need to be repeated as it is implied by the title of the article. Structures need to be added as this section refers to wiring on structures as well as on or in buildings. The phrase "permitted to be" needs to be added to make it clear that the wiring methods of Article 547 are permitted to be used for other buildings on the farm not necessarily covered by 547.1(A) and (B). As it is stated now, it is required to wire the other buildings by methods in Chapters 1 through 4 and the methods of Article 547 are not permitted. The option of using the methods described in Article 547 needs to be open for use in all buildings on the farm property.

Panel Meeting Action: Accept in Principle in Part

The panel Rejected the inclusion of "permitted to be".

Panel Statement: There is inadequate technical justification provided that 547 wiring methods should be permitted to be used for internal wiring of building without 547.1 environments.

Also, see the panel action and statement on Proposal 19-4.

Number Eligible to Vote: 7

Ballot Results: Affirmative: 7

19-10 Log #3210 NEC-P19 **Final Action: Reject**
(547.5)

Submitter: H. Dean Schumacher, H. Dean Schumacher Electrical Inspections

Recommendation: Add new paragraph:

Type MC, IMC, RMC, FMC, LFMC, EMT, an FMT with approved termination fittings shall be the wiring methods employed for concealed wiring.

Substantiation: Rodents in agricultural buildings present a constant threat to concealed wring systems. Metallic barrier wiring system would minimize potential safety hazard to personnel and structures.

Panel Meeting Action: Reject

Panel Statement: Section 547.5(A), in conjunction with the appropriate articles in Chapter 3, already specify the acceptable wiring methods and installation instructions. The metallic wiring systems recommended by the submitter are permitted in 547.5(A) when suitable for the location.

Although the submitter is correct in claiming that metallic wiring systems would minimize "potential" hazards, data verifying the effects of these hazards should be submitted before this change is warranted.

Number Eligible to Vote: 7

Ballot Results: Affirmative: 7

Comment on Affirmative:

BERNSON, J.: There is legitimate concern about rodent destruction. The wiring methods suggested provide a viable solution to the problem and increase safety issues that occur due to rodent damage. Perhaps a FPN would be in order to remind installers that these particular wiring methods will be less subject to rodent damage.

19-11 Log #94 NEC-P19 **Final Action: Accept in Principle**
(547.5(A))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be sent to Code-Making Panel 7 for comment.

Submitter: Adam Joyce, Montrose, MI

Recommendation: Add a new last sentence as follows:

<u>"Cables shall be permitted to be installed as exposed or concealed wiring in any structure where not exposed to physical damage."</u>

Substantiation: In 334.10(3), it seems to be prohibiting the use of nonmetallic sheathed cables as exposed wiring or concealed within walls, ceilings, or floors that do not have a 15-minute finish fire rating. In 340.10(4), Type UF cable when installed in buildings is required to be installed according to the rules in Part II and Part III of Article 334. This seems to create a restriction on the use of Type UF cable for installation in agricultural buildings. The purpose of this new sentence is to make it clear that for installation in agricultural buildings, Type UF cable is permitted to be run as a surface wiring method. Use of Type UF cable and surface wiring where possible is the preferred wiring method for agricultural buildings.

Panel Meeting Action: Accept in Principle

In existing 547.5(A) add the following as a new second sentence:

"For the purpose of this section Types UF, NMC, and Copper SE cables shall be permitted to be exposed."

Panel Statement: Concealment of nonmetallic type cables in agricultural facilities increases the probability of rodent damage. Where the cable is concealed, insulation damage caused by rodents cannot be assessed. The revised wording addresses the concerns of the Submitter.

Number Eligible to Vote: 7

Ballot Results: Affirmative: 6 Negative: 1

Explanation of Negative:

BERNSON, J.: The cables mentioned are not permitted to be exposed in these types of building construction and we should not be allowing it here.

The submitter mentions that Type UF cable and surface wiring are the preferred wiring methods for agricultural buildings. A change of this nature should not be made based on individual preference. This preference statement does not provide adequate substantiation to allow cables to be used in a manner prohibited elsewhere in this Code.

If rodent damage is an issue, other wiring methods not susceptible to rodent damage should be selected (See Proposal 19-10). If the issue is that damaged cables can be detected and replaced more easily, there will be no issue if metallic wiring methods are used. Replacing the cable a time or two may prove more costly than using the metallic wiring methods. There is no reason to reduce the safety of an individual who may come into contact with these conductors, particularly when the argument is that they are very likely to withstand damage due to rodents.

19-12 Log #3250 NEC-P19 **Final Action: Reject**
(547.5(A))

Submitter: David Filipiak, Sky Electric, Inc.
Recommendation: Add text to read as follows:
Type NM cable shall be permitted in dry locations other than those areas described in 547.1(A) and 547.1(B).
Substantiation: In buildings where the conditions are dry, it should be permitted to use type NM cable particularly as surface wiring. According to 334.10, type NM cable for installations other than dwellings is only permitted to be installed within fire-rated construction. It is recommended to run wiring exposed in farm.
Panel Meeting Action: Reject
Panel Statement: Section 334.10(3) requires cables to be concealed within walls, floors or ceilings providing a thermal barrier. 334.15(B) requires protection from physical damage. Since, as the submitter claims, it is recommended to run wiring exposed on a farm, Type NM cable is not suitable. Section 547.3 already addresses the circumstances suggested in the Submitter's substantiation.
Number Eligible to Vote: 7
Ballot Results: Affirmative: 7

19-13 Log #1933 NEC-P19 **Final Action: Accept**
(547.5(A), FPN)

TCC Action: The Technical Correlating Committee directs the panel to reconsider the proposal relative to 353.44 which does not exist. This action will be considered by the panel as a public comment.
It was the action of the Technical Correlating Committee that this proposal be sent to Code-Making Panel 8 for comment.
Submitter: William Wagner, Certification Solutions
Recommendation: Revise the FPN to 547.5(A) as follows:
FPN: See 300.7 , ~~and~~ 352.44, 353.44, and 355.44 for installation of raceway systems exposed to widely different temperatures.
Substantiation: This is a companion proposal for the new definition of Rigid Nonmetallic Conduit in Article 100, the revised Article 352 for Type PVC Conduit and the new Article 355 for RTRC. It clarifies that the broad designation of rigid nonmetallic conduit (Type RNC) includes PVC, HDPE and RTRC, each of which will now have a separate Article, and includes references to the respective Articles.
Panel Meeting Action: Accept
Number Eligible to Vote: 7
Ballot Results: Affirmative: 7

19-14 Log #3420 NEC-P19 **Final Action: Accept in Principle**
(547.5(B))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be sent to Code-Making Panel 3 and Code-Making Panel 9 for comment.
The Technical Correlating Committee is concerned that the text modifies a basic rule of Chapters 1-4 without any specific substantiation, other than convenience, as to why the installations in Article 547 should be different. Although the text regarding Article 300 is in the existing NEC, the Technical Correlating Committee is raising the issue at this juncture to allow for public comments.
Submitter: Donald Dekker, N. Muskegon, MI
Recommendation: Revise text to read:
The 6 mm (1/4 in.) airspace required for nonmetallic boxes, fittings, conduit, and cables in 300.6 ~~(C)~~ (D) shall not be required in buildings covered by this article.
Substantiation: Change 300.6(C) to 300.6(D). 300.6(C) is the incorrect reference for this section. 300.6(D) refers to the minimum 1/4 in. airspace between the wall or supporting surface and nonmetallic boxes, fittings, conduit and cables.
Panel Meeting Action: Accept in Principle
Revised the proposed wording to read as follows:
"The 6 mm (1/4 in.) airspace required for nonmetallic boxes, fittings, conduit, and cables in 300.6 (D), and 312.2(A), shall not be required."
Panel Statement: The issue stated in the submitter's proposal is also addressed by 312.2(A), and was added to eliminate a conflict.
This change will allow mounting of nonmetallic raceways, boxes, and fittings on a wood surface without the 1/4 in. air space indoors or outdoors.
Number Eligible to Vote: 7
Ballot Results: Affirmative: 7

19-15 Log #1943 NEC-P19 **Final Action: Accept**
(547.5(C)(3), FPN 1)

Submitter: Brian Dolan, IBEW/NECA Technical Institute
Recommendation: Revise text to read:
"Where necessary to employ flexible connections, dusttight flexible connectors, liquidtight flexible metallic conduit, liquidtight flexible nonmetallic conduit , or...".
Substantiation: The current wording is not as concise as it could be. It forces the reader to interpret the phrase "liquidtight flexible conduit". That is, exactly which types of liquidtight flexible conduit are permitted?
Panel Meeting Action: Accept
Number Eligible to Vote: 7
Ballot Results: Affirmative: 7

19-17 Log #463 NEC-P19 **Final Action: Reject**
(547.5(E))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise text to read as follows:
~~Physical~~ Protection. All electrical wiring and equipment subject to ~~physical~~ damage shall be protected.
Substantiation: Use of the word "physical" is superfluous–the intent is obvious given the context. (I leave it to the CMP whether you want to get more specific instead, naming some source of damage such as "blows or abrasion.")
Submitting proposals removing the adjective, "physical," may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every unnecessary instance, as I am attempting to do, we actually cut the NEC down by up to oh, maybe a quarter-page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the unneeded use of "physical" not only is poor writing–look at William Zinsser's classic, On Writing Well–but is silly, and reflects a bit poorly on the Code process. When references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."
Panel Meeting Action: Reject
Panel Statement: The use of the term "Physical Damage" is consistent with its use in 300.4 and 300.5(D)(4).
The adjective "physical" is clearly understood and its deletion does not improve the readability of the Code.
In most cases this phrase is used in conjunction with a requirement for conductor/cable protection. If "physical" is deleted the revised text might be interpreted as requiring "total" protection for conductor/cables from any unforeseen circumstances. Such a proposal would be considered more than editorial and it does not appear that is the intent.
Definition of damage:
Harm or injury to property or a person, resulting in loss of value or the impairment of usefulness.
The word "physical" differentiates mechanical damage from electrical damage.
In addition, this is also consistent with the NEC Style Manual.
Number Eligible to Vote: 7
Ballot Results: Affirmative: 7

19-18 Log #221 NEC-P19 **Final Action: Accept**
(547.5(F))

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal. It is unclear as to whether the panel was accepting the held proposal or the held public comment. The Technical Correlating Committee also notes that this action is unclear relative to the action taken by accepting Proposal 19-3 that revised 547.5(F).

This action will be considered by the Panel as a Public Comment.

The Technical Correlating Committee also refers this proposal to the Technical Correlating Committee Bonding and Grounding Task Group for comment.

NOTE: The following proposal consists of Comment 19-8 on Proposal 19-10 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 19-10 was:

Revise text as follows:

(F) Separate Equipment ~~Grounding~~ <u>Bonding</u> Conductor. Non–current-carrying metal parts of equipment, raceways, and other enclosures, where required to be grounded, shall be grounded by a copper equipment ~~grounding~~ <u>bonding</u> conductor installed between the equipment and the building disconnecting means. If installed underground, the equipment ~~grounding~~ <u>bonding</u> conductor shall be insulated or covered.

Submitter: Monte Ewing, State of Wisconsin

Recommendation: Where an equipment grounding conductor is installed within a location falling under the scope of Article 547 it shall be a copper conductor. Where an equipment grounding conductor is installed underground it shall be insulated or covered copper.

Substantiation: Article 250 already requires noncurrent-carrying metal parts of equipment to be grounded (redundant language). The requirement to use copper from the building disconnect to the equipment does not prohibit the use of of the equipment grounds where the supply comes from other than the building disconnect. The copper restriction prohibits the use of aluminum messenger supported cable located outside the 547 area to get overhead from the building disconnect to other areas of the building (such as to a silo). This revision will allow copper out of the building to aluminum (above grade) and back to copper to go back in.

Panel Meeting Action: Accept

Number Eligible to Vote: 7

Ballot Results: Affirmative: 7

19-19 Log #1085 NEC-P19 **Final Action: Reject**
(547.5(F))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Revise as follows:

<u>Exposed</u> non-current-carrying metal parts of equipment ~~where required~~ to be grounded shall be...(remainder unchanged).

Substantiation: Where grounding is not required, but done by choice, the requirements should apply. 250.1 indicates Article 250 applies where grounding is "permitted".

Panel Meeting Action: Reject

Panel Statement: The present code text requires both concealed and exposed non-current carrying metal parts of all equipment likely to become energized to be bonded, which provides a greater level of safety. Where equipment bonding is not required by code, but is voluntarily installed, the insulated or covered copper conductor requirement does apply. By installation of the equipment grounding conductor, the installer has identified that the equipment is likely to become energized.

Number Eligible to Vote: 7

Ballot Results: Affirmative: 7

19-20 Log #2596 NEC-P19 **Final Action: Reject**
(547.5(F))

Submitter: Barry Bauman, Alliante Energy / Rep. American Society of Agricultural and Biological Engineers

Recommendation: Revise text to read:

547.5 Wiring Methods.

(F) Separate Equipment Grounding Conductor. Non-current-carrying metal parts of equipment, raceways, and other enclosures, where required to be grounded, shall be grounded by a copper equipment grounding conductor installed between the equipment and the building disconnecting means. ~~If installed underground, the~~ <u>A direct-buried</u> equipment grounding conductor shall be insulated or covered.

Substantiation: Existing text does not differentiate between conductors installed underground in a conduit and conductors used in a direct burial application. The existing text is intended to apply to direct burial applications. There has been no justification to require a copper equipment grounding conductor installed in an underground conduit to be insulated or covered. I am not aware of a failure of a copper conductor in an underground conduit.

Panel Meeting Action: Reject

Panel Statement: For the purpose of this Article the present text provides a greater level of survivability and safety than what is proposed. Unlike the text found in 547.9(D) which applies to supply conductors installed from a distribution point to a building or structure (which is typically not installed through confinement areas), 547.5(F) applies to branch circuits and feeders installed between buildings or structures and to equipment (such as heated livestock waterers located within confinement areas). The submitter has failed to provide justification to alter the requirements of the present text.

Number Eligible to Vote: 7

Ballot Results: Affirmative: 7

19-21 Log #1130 NEC-P19 **Final Action: Accept in Principle**
(547.5(G))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Delete "general purpose."

Substantiation: A perceived interpretation of "general use" indicates receptacles for a specific utilization equipment does not require GFCI protection. All such receptacles should have GFCI protection.

Panel Meeting Action: Accept in Principle

Revise the current Code wording to read as follows:

(G) All 125-volt, single-phase, 15- and 20-ampere general-purpose receptacles installed in the locations listed in (1) through (4) shall have ground-fault circuit-interrupter protection for personnel:

(1) In areas having an equipotential plane
(2) Outdoors
(3) Damp or wet locations
(4) Dirt confinement areas for livestock

(GFCI) protection shall not be required for an accessible receptacle supplying a dedicated load where a GFCI protected receptacle is located within 3 ft of the non-GFCI protected receptacle."

Panel Statement: The panel did not accept the deletion of "general-purpose" as it is a term generally used throughout the Code and is understood.

However, the panel has revised 547.5(G) by adding a new paragraph to require a GFCI protected general-purpose receptacle at each accessible non-GFCI protected receptacle.

Number Eligible to Vote: 7

Ballot Results: Affirmative: 7

Comment on Affirmative:

BERNSON, J.: This will allow specific non-GFCI-compatible utilization equipment to operate while enhancing safety by providing an alternate GFCI protected receptacle in these locations.

19-22 Log #3130 NEC-P19 **Final Action: Reject**
(547.5(G))

TCC Action: The Technical Correlating Committee directs that this proposal be reported as "Reject" because the use of the term "for personnel" is consistent with other parts of the Code when referring to the type of protection required.

Submitter: Jonathan R. Althouse, Michigan State University

Recommendation: At the end of the sentence delete the word "for personnel" to read as follows:

(G) Receptacles. All 125-volt, single-phase, 15- and 20-ampere general-purpose receptacles installed in the following locations shall have ground-fault circuit-interrupter protection ~~for personnel~~ .

Substantiation: The definition in Article 100 makes it clear that when the term ground-fault circuit-interrupter or GFCI is used in the Code it means for personnel protection. Some sections throughout the Code use these terms and state "for personnel" and other uses of the terms do not state "for personnel". The inconsistent use of the words "for personnel" confuses the user as to the purpose of ground-fault circuit-interrupter protection.

Panel Meeting Action: Accept

Number Eligible to Vote: 7

Ballot Results: Affirmative: 6 Negative: 1

Explanation of Negative:

MCNEIVE, T.: NEMA favors this explicit text as there still exists some confusion over the intended purpose of GFCI protection and its distinction from GFPE (Ground fault protection for equipment).

19-23 Log #1013 NEC-P19 **Final Action: Accept in Principle**
(547.8(B))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:
A luminaire (fixture) that ~~may be~~ exposed to physical damage shall be protected by a suitable guard.
Substantiation: "May be" is very "iffy" and subjective and encompasses conditions that may prevail in the future. Proposal allows assessment to be made with prevailing conditions, including location.
Panel Meeting Action: Accept in Principle
Revise the proposed wording to read as follows:
"Exposed to Physical Damage. Luminaires (lighting fixtures) exposed to physical damage shall be protected by suitable guard."
Panel Statement: The revised wording more clearly expresses the intent of the panel, and is editorial in nature. The language will now correlate with 410.4.
Number Eligible to Vote: 7
Ballot Results: Affirmative: 7

19-24 Log #1129 NEC-P19 **Final Action: Accept in Principle**
(547.8(B) and (C))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Change "may be" to "is".
Substantiation: Edit. "May be" is indefinite and requires consideration of future scenarios. Other similar code articles do not use this phrase. Judgement should be made according to prevailing conditions.
Panel Meeting Action: Accept in Principle
Revise the proposed wording to read as follows:
"Exposed to Water. Luminaires (lighting fixtures) exposed to water from condensation, building cleansing water, or solution shall be watertight."
Panel Statement: The revised wording more clearly expresses the intent of the panel, and is editorial in nature. The language will now correlate with 410.4(A).
Number Eligible to Vote: 7
Ballot Results: Affirmative: 7

19-25 Log #92 NEC-P19 **Final Action: Reject**
(547.9)

Submitter: Jerome Thelen, St. Johns, MI
Recommendation: Revise the first sentence as follows:
" ~~Overhead~~ Electrical supply <u>to buildings and structures</u> shall comply with ~~547.9(~~ A) and ~~547.9~~ (B), or with ~~547.9~~ (C). Underground electrical supply shall comply with ~~547.9(C) and 547.9~~ (D)."
Substantiation: Out of the meeting of CMP 19 in December, 2003 came a new rule for equipment at the farm distribution point that was never presented in proposal form and made available for public comment. It is my understanding this is not consistent with the NFPA code making process. The entirely new rule is the lead paragraph of 547.9. A site isolation device is now only permitted as the only device when the electrical supply to the agricultural buildings is overhead. The rule needs to remain as in NFPA 70-2002 and as presented by CMP 19 in Comment 19-18. No justification other than speculation was ever presented to make such a significant change in the requirements for the distribution point equipment.
The Code Panel frequently used the reason for proposal or comment rejection "submitter has not provided sufficient technical substantiation" yet accepted Comment 19-18 based on submitter statements, the validity of which are questionable, and with absolutely no technical substantiation. It appears considered in the decision were Proposals 19-16, 19-17, and 19-19 and Comments 19-19, 19-20, and 19-21 the substantiations of which were based on speculation and alleged possibilities and not on actual experience and documented facts or real probability.
The switch at the distribution point is exactly what the name implies "a site isolation device." I have been a farmer for over 30 years and now I am an electrician, and a switch at the distribution point is used to disconnect power to overhead and underground customer owned wires to buildings and structures, and to provide a point for the connection of a standby generator. Given the length and size of conductors serving agricultural buildings and structures from the distribution point, the probability of an explosion at the site isolation switch as alleged is an extremely low probability. A quality transfer switch to be used as a site isolation switch with sufficient interrupting rating for the conditions is not hard to find from an electrical wholesale distributor.
It is obvious that statements made in the ROP and ROC are from persons with a lack of knowledge of farm wiring installations outside their local area or state. There are thousands of farm distribution point installations nationwide where the only means of power disconnection is to open the primary fuse or pull the meter. Grade level transfer switches are common across the nation and yet I know of no documented accident as speculated could occur in Propoals 19-16, 19-17, and 19-19 and Comments 19-19, 19-20, and 19-21.
It seems reasonable to me that rules based upon probability that can be documented are appropriate in order to achieve an Article 547 that is reasonable. Maybe then states such as Michigan can be convinced it is good practice to include Article 547 as a part of the State Electrical Code. Presently, Article 547 is not part of the Michigan Electrical Code.
Panel Meeting Action: Reject
Panel Statement: The submitter's substantiation is incorrect w ith regard to a site-isolation device being the only method of disconnection permitted for overhead distribution. The present 547.9 language is written to provide two methods for site disconnection and three methods for distribution. In applying 547.9, overhead distribution shall comply with (A) and (B) (a site-isolating device located at the distribution point with the service disconnecting means located at the supplied building or structure), or (C) (up to 6 service disconnects installed in accordance with Article 230 at the distribution point). This provides the permitted 2 methods of site disconnecting means and 2 forms of overhead distribution (one method provides ground-fault, short-circuit, and overcurrent protection for the conductors while the other method does not). The third method of distribution is underground and 547.9 requires underground distribution to comply with (C) and (D). The present language also permits for a combined installation of (A) and (C) at the distribution point to supply both overhead and underground distribution.
Number Eligible to Vote: 7
Ballot Results: Affirmative: 7

19-26 Log #2411 NEC-P19 **Final Action: Accept in Principle**
(547.9)

TCC Action: It was the action of the Technical Correlating Committee that the panel reconsider the proposal and avoid repeating the requirements of Article 250 in 547.9. The Technical Correlating Committee notes that all of the requirements outlined in 547.9(B)(3) are covered in Article 250 with the exception of the increased requirement that the equipment grounding conductor be the same size as the ungrounded conductors.
For correlation purposes, it would be more appropriate for the panel to reference the requirements in Article 250 and include the increased requirement for the EGC sizing.
This action will be considered by the panel as a public comment.
Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Revise text to read:
547.9 Electrical Supply to Building(s) or Structure(s) from a Distribution Point. Overhead electrical supply shall comply with 547.9(A) and 547.9(B), or with 547.9(C). Underground electrical supply shall comply with 547.9(C) and 547.9(D).
(A) Remain unchanged.
(B) Service Disconnecting Means and Overcurrent Protection at the Building(s) or Structure(s). Where the service disconnecting means and overcurrent protection are located at the building(s) or structure(s), the requirements of 547.9(B)(1) through (B)(3) shall apply.
(1) Conductor Sizing. The supply conductors shall be sized in accordance with Part V of Article 220.
(2) Conductor Installation. The supply conductors shall be installed in accordance with the requirements of Part II of Article 225.
(3) Grounding and Bonding. <u>For each building or structure, a separate equipment-grounding conductor shall be run with the supply conductors to the building(s) or structure(s), and the following conditions shall be met:</u> ~~the conditions in either (B)(3)(a) or (B)(3)(b) shall be permitted.~~
~~(a) System with grounded neutral conductor. The grounded circuit conductor shall be connected to the building disconnecting means and to the grounding electrode system of that building or structure where all the requirements of 250.32(B)(2) are met.~~
~~(b) A separate equipment grounding conductor shall be run with the supply conductors to the building(s) or structure(s), and the following conditions shall be met:~~
(1) Remain unchanged.
(2) Remain unchanged.
(3) Remain unchanged.
(4) Remain unchanged.
FPN: A system with a separate equipment grounding conductor is commonly referred to as a "4-wire system" in single-phase applications.
Substantiation: This is a companion proposal to my proposal to delete 250.32(B)(2). If 250.32(B)(2) is deleted as I am requesting, this section will need to be revised as well.

Panel Meeting Action: Accept in Principle

Revise the text in the proposal to read as follows:

"547.9(B)(3) Grounding and Bonding. For each building or structure, a separate equipment grounding conductor shall be run with the supply conductors to the building(s) or structures(s), and the following conditions shall be met:

(1) The equipment grounding conductor shall be the same size as the largest supply conductor if of the same material, or adjusted in size in accordance with the equivalent size columns of Table 250.122 if of different materials.

(2) The equipment grounding conductor is bonded to the grounded circuit conductor and the site-isolating device at the distribution point.

(3) A grounding electrode system is provided in accordance with Part III of Article 250 and connected to the equipment grounding conductor at the building(s) or structure(s) disconnecting means.

(4) The grounded circuit conductor is not connected to a grounding electrode or to any equipment grounding conductor on the load side of the distribution point.

Exception: For existing premises wiring systems only, the grounded conductor run with the supply to the building or structure shall be permitted where all the requirements of 250.32(B)(1), Exception are met."

Panel Statement: The panel Accepts the Submitter's intent to require a separate equipment grounding conductor be installed with supply conductors to buildings or structures. Provisions for existing premises wiring systems, with no equipment grounding conductor run with the supply conductors to a building or structure, are included in new 547.9(B), Exception. The proposed new changes address the requirements, therefore, the FPNs in 547.9(B) were deleted. This action correlates with the accept in principle action taken by Code-Making Panel 5 on Proposal 5-119.

Number Eligible to Vote: 7

Ballot Results: Affirmative: 7

19-27 Log #2922 NEC-P19 **Final Action: Accept in Principle in Part**
(547.9(10))

Submitter: Marcus Sampson, Lysistrata Electric

Recommendation: Revise as follows:

547.9 Electrical Supply to Building(s) or Structure(s) from a Distribution Point.

<u>(10) Where multiple site isolating devices are installed or used, they shall be identified in accordance with 230.2.</u>

Substantiation: Where an existing service with a utility owned site isolating device is supplemented with an additional service as allowed in 230.2, an additional site isolating device will be installed. Both devices should be identified as isolating switches.

Panel Meeting Action: Accept in Principle in Part

Add language to read as follows:

"547.9(A)(10) Marking A site-isolating device shall be permanently marked to identify it as a site-isolating device. This marking shall be located on the operating handle or immediately adjacent thereto."

The panel Rejects "identified in accordance with 230.2".

Panel Statement: The submitter is proposing identification of these devices where 547.9(A)(9) permits the installation of a second site isolation device installed in series with the utility supplied site isolation device. A site-isolating device located at the distribution point acts as a disconnecting means for everything it supplies similar to the purpose of a service disconnect. The revised language meets the submitter's recommendation to require identification of the site-isolating devices where series devices are installed, in addition to requiring the identification of a site-isolating device where not installed in series. This should help eliminate confusion of which direction the service is supplied where both a site-isolating device and a service disconnect are incorporated together for distribution.

Number Eligible to Vote: 7

Ballot Results: Affirmative: 7

19-28 Log #649 NEC-P19 **Final Action: Reject**
(547.9(A)(2))

Submitter: Larry T. Smith, National Electrical Seminars

Recommendation: Revise text to read as follows:

(A) Site-Isolating Device. Site-isolating devices shall comply with 547.9(A)(1) through (A)(9).

(1) Where Required. A site-isolating device shall be ~~installed~~ <u>located on, or immediately adjacent to</u> ~~at~~ the distribution point where two or more agricultural buildings, structures, associated farm dwelling(s), or other buildings are supplied from the distribution point. <u>It shall meet the minimum clearance requirements of 230.24.</u>

~~(2) Location. The site-isolating device shall be pole-mounted and shall meet the clearance requirements of 230.24.~~

Substantiation: There is no logical reason to insist that the site-isolating device be pole-mounted; it could be mounted on a separate structure adjacent to the distribution point. Some agricultural installations are installed using service laterals - there is no pole - a separate structure is installed for the support of the site isolating device.

Panel Meeting Action: Reject

Panel Statement: The present language provides practical safeguarding with the requirement for pole mounting. This reduces the accessibility of the site-isolating device to those not qualified to work with electricity.

Number Eligible to Vote: 7

Ballot Results: Affirmative: 7

19-29 Log #650 NEC-P19 **Final Action: Reject**
(547.9(A)(3))

Submitter: Larry T. Smith, National Electrical Seminars

Recommendation: Revise text to read as follows:

(A) Site-Isolating Device. Site-isolating devices shall comply with 547.9(A)(1) through (A)(9).

(1) Where Required. A site-isolating device shall be installed at the distribution point where two or more agricultural buildings, structures, associated farm dwelling(s), or other buildings are supplied from the distribution point.

(2) Location. The site-isolating device shall be pole-mounted and shall meet the clearance requirements of 230.24.

(3) Operation. The site-isolating device shall ~~simultaneously disconnect all underground service conductors from the premises wiring~~ . <u>consist of not more than six switches or sets of circuit breakers, or a combination of not more than six switches and sets of circuit breakers, mounted in a single enclosure, in a group of separate enclosures, or in or on a switchboard.</u>

Substantiation: In central Colorado, for example, the serving utility provides, at the distribution point, a meter/main combination consisting of three main circuit breakers; one main for the dwelling unit, one main for the agricultural building, and one main for the water well. Simultaneously disconnecting all ungrounded conductors at the site isolating device disconnects power to the water well, interrupting water flow that may be needed to fight a fire. This arrangement has been deemed essential for fire fighting in that region of the country for years.

There just doesn't appear to be any practical reason for not allowing the site-isolating device to consist of up to six switches or circuit breakers as is permitted for services in 230.71(A).

Panel Meeting Action: Reject

Panel Statement: The provision of 547.9(C) permits the installation described in the submitter's substantiation. Also see panel statement on Proposal 19-25.

Number Eligible to Vote: 7

Ballot Results: Affirmative: 7

19-29a Log #CP1903 NEC-P19 **Final Action: Accept**
(547.9(E))

Submitter: Code-Making Panel 19,

Recommendation: Add the following new text:

"547.9(E) Identification. Where a site is supplied by more than one service with any two services located a distance of 150 m (500 ft) or less apart, as measured in a straight line, a permanent plaque or directory shall be installed at each of these distribution points denoting the location of each of the other distribution points and the buildings or structures served by each."

Substantiation: The submitter of Proposal 19-27 has brought to the committee's attention the lack of marking for isolating devices in comparison to service disconnecting means found in Article 230. Sites are now being supplied with multiple services due to load capacity and the need for different voltages. The proposed language is similar to the requirement found in 230.2(E) which is intended to provide an additional level of safety for the disconnection of the buildings or structures served as it pertains to 547.9. The basis for determining the distance of 500 ft. or less between distribution points is derived from the distribution policies of many utilities that for safety reasons prohibit more than one service where located less than 500 ft apart.

Panel Meeting Action: Accept

Number Eligible to Vote: 7

Ballot Results: Affirmative: 7

19-30 Log #2420 NEC-P19 **Final Action: Reject**
(547.10)

Submitter: Donald W. Zipse, Zipse Electrical Engineering, Inc.

Recommendation: Delete the whole Section 547.10.

Substantiation: For additional substantiation please read 547.2 also.

How did the misunderstood equipotential planes get into the NEC? In the early 1980s it is opined that some agriculture professors read IEEE Standard 80 and being familiar with cow shit and not electrical engineering, misunderstood IEEE Standard 80. Four Ag professors wrote three papers on equipotential planes and dairies.

In 1985 the misinformed Ad Hoc Subcommittee on Electrical Grounding of Agriculture Buildings submitted the above inaccurate, ill-conceived proposal # 19-16, Log # 1363, 1985 ROP for the 1987 NEC, which since it came from a supposable informed subcommittee, was adopted by Panel 19 Unanimously Affirmative. Now it is hoped that none of the original members of the above groups are still on Panel 19, because it is against human nature to disown a concept supported previously.

It is opined that Gustafson, et al and the NEC Making Panels did not take into consideration the purpose of the IEEE Standard 80, "Guide for Safety in AC Substation Grounding".

IEEE Standard 80 states:

"**1.2 Purpose.** The intent of this guide is to provide guidance and information pertinent to safe grounding practices in ac substation design.

"The specific proposes of this guide are to

a) Establish, as a basis for design, the safe limits of potential differences that can exist in a substation under fault conditions between points that can be contacted by the human body.

b) Review substation grounding practices with special reference to safety, and develop criteria for a safe design.

c) Provide a procedure for the design of practical grounding systems, based on these criteria.

d) Develop analytical methods as an aid in the understanding and solution of typical gradient problems."

It is very clear that Clause 1.2 a) states that IEEE Standard 80 is under **fault conditions.** Stray current or if one insists, stray voltage, exists under normal steady state, continuous operating conditions, not fault conditions.

Professor Robert J. Gustafson writes, "Gradient control is used by the electrical industry to minimize the risk of hazardous step (foot-to-foot) and touch (hand-to-foot) potentials **under fault conditions** (emphases by author) at substations and around electrical equipment. In addition to protecting people, animals, and equipment **under fault or lightning conditions** , proper equipotential systems in livestock facilities can solve stray voltage/current problems." The concept of "equipotential planes" made up by the same Ag professors is totally false.

Fault currents in electrical substations are several magnitudes larger than any fault current that will be found on dairy farms. In substations we expect hundreds of thousands of amperes where on a dairy farm in the middle of nowhere maybe have 5,000 amperes for seconds until the protective device such as the circuit breaker or fuse operates. They are two very different conditions, fault current and steady state normal flowing stray current, and are not related.

Now compare that small amount of FAULT current for a few seconds to the continuous flow of steady state stray neutral current flowing continuously from the dangerous and hazardous multigrounded neutral electrical distribution system which is flowing across the equipotential plane continuously causing the dairy cow harm. Electric Power Research Institute states that 40 to 60 percent of the neutral return current will flow over the earth.

It is evident that this is an enormous, immense, huge, gigantic, colossal, mammoth, tremendous, stupendous, gargantuan, mis-application of an electrical principle that has caused untold harm to dairy cows and to humans.

No doubt, someone will make the comment that equipotential planes must do some good, must have a little advantage or may afford some help. That person needs to face the facts – **THERE IS NO BENEFIT IN ANY WAY, SHAPE OR FORM FROM EQUIPOTENTIAL PLANES, ONLY HARM.** The concept was based on erroneous ideas and conclusions and mis-understanding of electrical principles.

The dairy farmers in Wisconsin long ago deleted from the state adopted NEC the sections on equipotential planes as they realized the danger and hazards equipotential planes presented to dairy farmers.

Please also read my proposals on 547.2 where additional substantiation and educational information is contained.

Panel Meeting Action: Reject

Panel Statement: The use of equipotential planes is an accepted practice in various industries for reducing step-touch potential. Code-Making Panel 19 maintains that they are appropriate in Article 547. The submitter's substantiation is anecdotal and provides insufficient data to justify removing the requirement for equipotential planes.

Number Eligible to Vote: 7

Ballot Results: Affirmative: 7

19-31 Log #3131 NEC-P19 **Final Action: Reject**
(547.10)

Submitter: Jeff Fitzloff, State of Idaho Division of Building Safety

Recommendation: Revise text as follows:

The installation and bonding of equipotential planes shall comply with 547.10(A) and 547.10(B). For the purposes of the section, the term livestock shall not include equine and poultry.

Substantiation: The equine businesses of Idaho have concerns that the introduction of the equipotential planes in the alley ways near and around stalls will have step voltage consequences where the equine step off of the concrete alley way into stalls with dirt floors. This concern is also voiced when the equine step from the alley to a riding arena area. The equine facilities are very well kept and do not have wet corrosive atmosphere that other large animal facilities have.

Panel Meeting Action: Reject

Panel Statement: The submitter did not substantiate how equine differ from other livestock.

Wet and corrosive atmospheres are not the only issues necessitating installation of the equipotential plane. If step voltage is at a level that livestock can feel when they enter or exit the equipotential plane, a voltage gradient ramp can be installed.

Number Eligible to Vote: 7

Ballot Results: Affirmative: 7

19-32 Log #3513 NEC-P19 **Final Action: Reject**
(547.10)

Submitter: Paul Dobrowsky, Holley, NY

Recommendation: Revise as follows:

547.10 Equipotential Planes and Bonding of Equipotential Planes. The installation and bonding of equipotential planes shall comply with 547.10(A) and 547.10(B). For the purposes of this section, the term livestock shall not include poultry.

(A) Where Required. Equipotential planes shall be installed in all concrete floor confinement areas in livestock buildings, and in all outdoor confinement areas such as feedlots, containing metallic equipment that ~~may~~ is likely to become energized become energized and is accessible to livestock. The equipotential plane shall encompass the area where the livestock stands while accessing metallic equipment that ~~may~~ is likely to become energized become energized.

Substantiation: The term "may" should be used only for granting permission as indicated in the NEC Style Manual. "Likely to become energized" is explained as the failure of insulation".

Panel Meeting Action: Reject

Panel Statement: There are issues with lightning and other sources of voltage differences in addition to those caused by insulation failure.

Number Eligible to Vote: 7

Ballot Results: Affirmative: 7

19-33 Log #3610 NEC-P19 **Final Action: Reject**
(547.10)

Submitter: Jim M. Schmer, Boise, ID

Recommendation: Add, equine and, after include and before poultry.

Substantiation: The equine businesses of Idaho have concerns that the introductions where the equine step off of the concrete alley way into stalls with dirt floors. This concern is also voiced when the equine step from the alley to a riding arena area. The equine facilities are very well kept and do not have wet corrosive atmosphere that other large animal facilities have.

Panel Meeting Action: Reject

Panel Statement: The submitter did not substantiate how equine differ from other livestock.

Number Eligible to Vote: 7

Ballot Results: Affirmative: 7

19-34 Log #3616 NEC-P19 **Final Action: Reject**
(547.10)

Submitter: Joseph A. Hertel, State of Wisconsin

Recommendation: The language in 547.10 (A) should be permissive and not require the installation of an equipotential plane. The opening sentence should read...

(A) Where Installed Equipotential planes may be installed in all concrete floor confinement areas...".

Substantiation: The installation of an equipotential plane in an agricultural facility is a design issue and as such should noit be mandated in the NEC.

Panel Meeting Action: Reject

Panel Statement: The purpose of the equipotential plane is to minimize voltage gradients at animal contact points. This is the practical safeguarding of property (livestock) as indicated in 90.1(A). No substantiation has been provided to warrant a less restrictive requirement.

Number Eligible to Vote: 7

Ballot Results: Affirmative: 7

19-35 Log #2597 NEC-P19 **Final Action: Accept**
(547.10, FPN)

Submitter: Barry Bauman, Alliante Energy / Rep. American Society of Agricultural and Biological Engineers
Recommendation: Revise text to read:
547.10 Equipotential Planes and Bonding of Equipotential Planes.
FPN No. 1: Methods to establish equipotential planes are described in American Society of Agricultural and Biological Engineers (ASAE) EP473. 2 -2001, Equipotential Planes in Animal Containment Areas.
FPN No. 2: Methods for safe installation of livestock waterers are described in American Society of Agricultural and Biological Engineers (ASAE) EP342.2-1995, Safety for Electrically Heated Livestock Waterers.
FPN No. ~~2~~ 3 : Low grounding electrode system resistances may reduce potential differences in livestock facilities.
Substantiation: The referenced engineering practice describes the safe installation of electrically heated livestock waters. Reference in a FPN will increase the use of this engineering practice. ASAE has added Biological to there name.
Panel Meeting Action: Accept
Panel Statement: This reference provides guidance for connecting livestock waterers to the equipment grounding conductor and the equipotential plane.
Number Eligible to Vote: 7
Ballot Results: Affirmative: 7

19-36 Log #2595 NEC-P19 **Final Action: Accept in Principle**
(547.10(A))

Submitter: Barry Bauman, Alliante Energy / Rep. American Society of Agricultural and Biological Engineers
Recommendation: Revise text to read:
547.10 Equipotential Planes and Bonding of Equipotential Planes.
(A) Where Required. Equipotential planes shall be installed in all concrete floor confinement areas in livestock buildings, and in ~~all~~ concrete pads located outdoor s ~~confinement areas such as feedlots~~ , containing metallic equipment that may become energized and is accessible to livestock. The equipotential plane shall encompass the area where the livestock stands while accessing metallic equipment that may become energized.
Substantiation: Analysis of changes, 2005 NEC, stated that outdoors dirt confinement areas containing metallic equipment that may become energized and is accessible to livestock requires an equipotential plane. This was not the intent of CMP-19. The proposed language clarifies this issue.
Panel Meeting Action: Accept in Principle
Revise the proposed text to read as follows:
"547.10 Equipotential Planes and Bonding of Equipotential Planes.
(A) Where Required. Equipotential planes shall be installed where required in (1) and (2).
(1) Indoors. Equipotential planes shall be installed in confinement areas with concrete floors where metallic equipment is located that may become energized and is accessible to livestock.
(2) Outdoors. Equipotential planes shall be installed in concrete slabs where metallic equipment is located that may become energized and is accessible to livestock.
The equipotential plane shall encompass the area where the livestock stands while accessing metallic equipment that may become energized."
Panel Statement: The text was rewritten for clarity and meets the submitter's objectives.
Number Eligible to Vote: 7
Ballot Results: Affirmative: 7

19-37 Log #3415 NEC-P19 **Final Action: Accept in Principle**
(547.10(A))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Revise as follows:
(A) Where Required. Equipotential planes shall be installed in all concrete floor confinement areas in livestock buildings, and in outdoor confinement areas that employ a concrete deck. The outdoor requirement may include feedlots, but shall be limited to areas that contain metallic equipment that may become energized and is accessible to livestock. The equipotential plane shall encompass the area where the livestock stands while accessing metallic equipment that may become energized.
Substantiation: The 2005 NEC effectively requires a concrete deck under outdoor confinement areas whether or not one was anticipated, because the term "equipotential plane" as defined in 547.2 includes a concrete floor or deck of some kind. According to members of the panel this submitter has spoken with, this was a mistake and it was never intended to require the use of concrete structures outdoors. This proposal removes the mandatory requirement for outdoor concrete decks.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 19-36.
Number Eligible to Vote: 7
Ballot Results: Affirmative: 7

19-38 Log #1355 NEC-P19 **Final Action: Reject**
(547.10(B))

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Revise as follows:
547.10(B)
~~FPN No. 2: Low grounding electrode system resistances may reduce potential differences in livestock facilities.~~
Substantiation: A low resistance connection to the earth does not reduce potential differences (from Stray Voltage) in a facility to any significant degree. Stray Voltage potential differences are reduced by bonding, as is indicated by this section.
Panel Meeting Action: Reject
Panel Statement: The submitter is correct that potential differences are reduced by bonding. Potential differences may be due to lightning or electrical faults and the substantiation only addresses stray voltage. No technical substantiation has been provided that warrants eliminating the Fine Print Note.
Number Eligible to Vote: 7
Ballot Results: Affirmative: 7

ARTICLE 550 — MOBILE HOMES, MANUFACTURED HOMES, AND MOBILE HOME PARKS

19-39 Log #1614 NEC-P19 **Final Action: Accept in Principle**
(550.4(C))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be sent to the Technical Correlating Committee Neutral Conductor Task Group for comment.
Submitter: Technical Correlating Committee on National Electrical Code
Recommendation: Make the following change in 550.4(C):
Change "neutral" to "neutral conductor."
The revised text would appear as follows:
(C) Connection to Wiring System. The provisions of this article shall apply to mobile homes intended for connection to a wiring system rated 120/240 volts, nominal, 3-wire ac, with grounded neutral conductor .
Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).
The Task Group has proposed the following definitions to be added to Article 100:
● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.
● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.
This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals
● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.
● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.
Additional information is available in the Task Group report.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Revise the proposed wording to read as follows:
"550.4(C) Connection to Wiring Systems. The provisions of this article shall apply to mobile homes intended for connection to a wiring system rated 120/240 volts, nominal, 3-wire ac, with a grounded neutral point."
Panel Statement: The panel concludes that the requirement refers to the point of connection to the wiring system and not the conductor itself.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-40 Log #1356 NEC-P19 **Final Action: Accept**
(550.11)

Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Revise as follows:
550.11 Disconnecting Means and Branch-Circuit Protective Equipment.
(B) Branch-Circuit Protective Equipment. Branch-circuit distribution equipment shall be installed in each mobile home and shall include overcurrent protection for each branch circuit consisting of either circuit breakers or fuses.
The branch-circuit overcurrent devices shall be rated as follows:
(1) Not more than the circuit conductors; and
(2) Not more than 150 percent of the rating of a single appliance rated 13.3 amperes or more that is supplied by an individual branch circuit; but
(3) Not more than the overcurrent protection size and of the type marked on the air conditioner or other motor-operated appliance.
(C) Two-Pole Circuit Breakers. Where circuit breakers are provided for branch-circuit protection, 240-volt circuits shall be protected by a 2-pole common or companion trip, or circuit breakers with identified handle ties. ~~or handle-tied paired circuit breakers.~~
Substantiation: This change is meant to provide correlation with the 2005 change to 240.20.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-41 Log #1610 NEC-P19 **Final Action: Accept**
(550.11(A))

Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Make the following change in 550.11(A):
Delete "neutral bar." Change the word "termination" to "terminations"
The revised text would appear as follows:
(A) Disconnecting Means. A single disconnecting means shall be provided in each mobile home consisting of a circuit breaker, or a switch and fuses and its accessories installed in a readily accessible location near the point of entrance of the supply cord or conductors into the mobile home. The main circuit breakers or fuses shall be plainly marked "Main." This equipment shall contain a solderless type of grounding connector or bar for the purposes of grounding, with sufficient terminals for all grounding conductors. The ~~neutral bar~~ termination s of the grounded circuit conductors shall be insulated in accordance with 550.16(A). The disconnecting equipment shall have a rating not less than the calculated load. The distribution equipment, either circuit breaker or fused type, shall be located a minimum of 600 mm (24 in.) from the bottom of such equipment to the floor level of the mobile home.
Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).
The Task Group has proposed the following definitions to be added to Article 100:
● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.
● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.
This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals
● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.
● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.
In this section, the phrase "neutral bar" does not correspond to "grounded circuit conductors."
Additional information is available in the Task Group report.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-42 Log #1120 NEC-P19 **Final Action: Reject**
(550.11(B)(1) and FPN (New))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Change the last word "and" in (1) to "or."
Add:
FPN: Where only motor loads are supplied, see Article 430 Part IV.
Substantiation: (B)(1) is a limited requirement and not mitigated by (B)(2) or (B)(3) which are ADDITIONAL requirements. There may be motor loads with a manufactured home., e.g., sump pump, well pump, food waste disposer, whole house exhaust fan, furnace blower, etc. a well pump motor with a FLA rating of 12 amperes supplied by No. 14 AWG conductors rated 15 amperes requires an overcurrent device rated 15 amps per (1) (prone to trip or blow a 15 ampere circuit breaker or nontime-delay fuse) since (2) does not apply, and in cases where it does, the 150 percent rating of the overcurrent device also requires the ampacity of the circuit conductors to be at least 150 percent, per (1). This is at odds with Article 430. 550.12(D) FPN references Article 440 for central air conditioning which appears to negate this section for air conditioning equipment.
Panel Meeting Action: Reject
Panel Statement: The submitter's first sentence explains how the provisions are to be used but does not substantiate a change. There are no documented instances of problems caused due to the current requirements in this section. This language parallels language used in recreational vehicles (551.43(A)). Requirements in 550 are permitted to modify those in Chapter 4, which applies generally.
550.12(D), FPN is used when determining the number of branch circuits. Therefore, it does not negate 550.11(B) which is used to determine the size of the branch-circuit protective device.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-43 Log #1032 NEC-P19 **Final Action: Reject**
(550.12(D)(3))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:
The ampere rating of a single cord- and plug connected appliance on a circuit ~~having no other outlets~~ supplying two or more outlets or receptacles shall not exceed 80 percent of the branch circuit rating.
Substantiation: This section appears analagous to 210.23, however, if a circuit with only one outlet (receptacle) supplying a single appliance appears to be an individual circuit, by definition in Article 100. 210.23 indicates an individual circuit may supply any load for which it is rated.
Panel Meeting Action: Reject
Panel Statement: No technical substantiation has been provided. Requirements in Article 550 are permitted to modify those in Article 210.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-44 Log #970 NEC-P19 **Final Action: Accept**
(550.13(D)(2))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Change "duplex" in the second sentence to "multiple type."
Substantiation: Edit. 550.13(A) permits multiple types other than duplex.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-46 Log #1125 NEC-P19 **Final Action: Reject**
(550.15(A))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Change "boxes" to "enclosures".
Substantiation: Edit. Boxes may be perceived as not including other enclosures such as cabinets, conduit bodies, etc.
Panel Meeting Action: Reject
Panel Statement: Section 550.15(A) overrides the Exceptions in 314.3 and does not pertain to the broader scope of all enclosures.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-47 Log #462 NEC-P19 **Final Action: Reject**
(550.15(B))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise text to read as follows:
Nonmetallic Cable Protection. Nonmetallic cable located 380 mm (15 in.) or less above the floor, if exposed, shall be protected from ~~physical~~ damage by covering boards, guard strips, or raceways.
Substantiation: Use of the word "physical" is superfluous–the intent is obvious given the context. (I leave it to the CMP whether you want to get more specific instead, naming some source of damage such as "blows or abrasion.")
Submitting proposals removing the adjective, "physical," may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every unnecessary instance, as I am attempting to do, we actually cut the NEC down by up to oh, maybe a quarter-page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the unneeded use of "physical" not only is poor writing–look at William Zinsser's classic, On Writing Well–but is silly, and reflects a bit poorly on the Code process. When references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."
Panel Meeting Action: Reject
Panel Statement: The use of the term Physical Damage is consistent with its use in 300.4 and 300.5(D)(4).
The adjective "physical" is clearly understood and its deletion does not improve the readability of the Code.
In most cases this phrase is used in conjunction with a requirement for conductor/cable protection. If "physical" is deleted the revised text might be interpreted as requiring "total" protection for conductor/cables from any unforeseen circumstances. Such a proposal would be considered more than editorial and it does not appear that is the intent.
Definition of damage:
Harm or injury to property or a person, resulting in loss of value or the impairment of usefulness.
The word "physical" differentiates mechanical damage from electrical damage.
In addition, this is also consistent with the NEC Style Manual.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-48 Log #1545 NEC-P19 **Final Action: Accept in Principle**
(550.15(D))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be sent to the Technical Correlating Committee Grounding and BondingTask Group for comment.
Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Delete the term "effectively" from the terms "effectively grounded" and "effectively bonded" from Articles 550 and revise text as shown for the affected NEC sections.
550.15(D): (D) Metal Faceplates. Where metal faceplates are used, they shall be ~~effectively~~ grounded by contact with the grounded mounting strap of the device .
Substantiation: 550.15(D): The definition of "effectively grounded" is ambiguous and very subjective without any defined values or parameters for one to judge as either "effective" or "ineffective." This section has been revised to prescribe the connection of the faceplate to the equipment grounding conductor by contact with the device mounting strap connected to the equipment grounding conductor.
This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to delete the term "grounded, effectively" and its definition from Article 100 and other companion proposals throughout the NEC relative to this Task Group's recommendations. The substantiation of this proposal is as follows.
The term "Effectively Grounded" is used 29 times in the NEC. It appears as though in the majority of the locations where it is used, the word "grounded" or phrase "connected to an equipment grounding conductor" could be used. Other proposals are submitted to make those changes.
The 1996 NEC in Section 250.51 used the term "effective grounding path," and those concepts were incorporated in 250.2 (1999 NEC) and then expanded in 250.4(A) and (B) in the 2002 NEC. The performance criteria of grounding and bonding are currently provided in Section 250.4 and include the concepts contained in the vague definition of the term "effectively grounded."
The definition "Effectively Grounded" is very subjective and without any defined values or parameters for one to judge grounding as either "effective" or "ineffective." "Effective" is described in Section 250.4(A) and (B), but it relates to the effective ground-fault current path as a performance criteria. Deleting the term in the NEC and the definition is logical because there are no definitive parameters for Code users to make a determination on what constitutes "effectively grounded." Systems are solidly grounded, grounded through a resistor or impedance, or ungrounded. Equipment (normally noncurrent-carrying metal parts are grounded where connected to an equipment grounding conductor.
This proposal is to change the term "Effectively Bonded" to just "Bonded" in each of the section where it is used. The term "Effectively Bonded" is currently not defined in the NEC.
The term "effectively bonded" is also used a few times in the NEC and is undefined. The same situation exists. There are no defined parameters for Code users to judges what the difference between "Effectively Bonded" and "Bonded" really is. Where the term appears in the NEC, it is revised to just "bonded" and still has the same meaning in each rule.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Revise the proposed wording to read:
"550.15(D) Metal Faceplates. Where metal faceplates are used, they shall be grounded."
Panel Statement: This is identical to the language used in 406.5(B). There is no need to be more prescriptive as to the method of grounding.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-45 Log #1079 NEC-P19 **Final Action: Accept in Principle in Part**
(550.15(E))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise text to read as follows:
~~If~~ Where a range, clothes dryer, or similar appliance is connected by metal covered cable or flexible ~~metal~~ conduit, a length of not less than 900 mm (3 ft) of free unsupported cable or conduit, but not longer than necessary to service the appliance shall be provided to service the appliance. The cable or flexible ~~metal~~ conduit shall be secured to the wall where the unsupported length begins . (remainder unchanged)
Substantiation: Edit. This section does not cover other types of flexible conduit permitted by the first paragraph of 550.15 such as LFMC and LFNMC and not prohibited by this section, although not addressed. Where used, they are not covered by this section.

Panel Meeting Action: Accept in Principle in Part

Revise proposed text to read as follows:

"550.15(E) Installation Requirements. Where a range, clothes dryer, or similar appliance is connected by metal covered cable or flexible metal conduit, a length of not less than 900 mm (3 ft) of unsupported cable or conduit, shall be provided to service the appliance. The cable or flexible metal conduit shall be secured to the wall."

Panel Statement: There is no justification to remove the requirement for metallic conduit or cable. In this type of installation, the metallic covering affords an extra level of protection against physical damage.

"Not longer than necessary to serve the appliance" is subjective and may be unenforceable.

"Where the unsupported length begins" is unnecessary language as the unsupported length clearly begins after the last support.

The panel points out to the submitter that the requirement is not directed at LFMC and LFNMC; it is directed at metal covered cable and FMC (Article 348). See the first sentence of 550.15

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

19-49 Log #461 NEC-P19 **Final Action: Reject**

(550.15(H))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education

Recommendation: Revise text to read as follows:

Where outdoor or under-chassis line-voltage (120 volts, nominal, or higher) wiring is exposed to moisture or ~~physical~~ damage, it shall be protected by rigid metal conduit or intermediate metal conduit.

Substantiation: Use of the word "physical" is superfluous–the intent is obvious given the context. (I leave it to the CMP whether you want to get more specific instead, naming some source of damage such as "blows or abrasion," which also would eliminate the awkwardness entailed by the fact that moisture is itself a potential source of damage, wet-location wiring or no.)

Submitting proposals removing the adjective, "physical," may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every unnecessary instance, as I am attempting to do, we actually cut the NEC down by up to oh, maybe a quarter-page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.

Second, the unneeded use of "physical" not only is poor writing–look at William Zinsser's classic, On Writing Well–but is silly, and reflects a bit poorly on the Code process. When references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."

Panel Meeting Action: Reject

Panel Statement: The use of the term "Physical Damage" is consistent with its use in 300.4 and 300.5(D)(4).

The adjective "physical" is clearly understood and its deletion does not improve the readability of the Code.

In most cases this phrase is used in conjunction with a requirement for conductor/cable protection. If "physical" is deleted the revised text might be interpreted as requiring "total" protection for conductor/cables from any unforeseen circumstances. Such a proposal would be considered more than editorial and it does not appear that is the intent.

Definition of damage:

Harm or injury to property or a person, resulting in loss of value or the impairment of usefulness.

The word "Physical" differentiates mechanical damage from electrical damage.

Ballot Results: Affirmative: 12

19-50 Log #2216 NEC-P19 **Final Action: Reject**

(550.15(J)(2))

Submitter: Kyle Cope, Prysmian Cables and Systems

Recommendation: Revise as follows:

"...These conductors shall be in a suitable raceway or Type AC, <u>type PA</u> or MC cable of at least...".

Substantiation: Statement of problem: Material technology advancements now allow for cable designs that provide improved mechanical damage protection. i.e., crush and impact, over standard Type MC cable without sacrificing flame performance properties. The characteristics achieved using traditional metallic components can now be realized using polymeric materials. The use of polymeric materials also provides the opportunity for lighter and smaller diameter cables.

Substantiation for Proposal: Type PA has been proposed as a new type (Article 3XX) and should be included in this list (550.15(J)(2)) as it offers enhanced mechanical benefits as an alternate to Type MC cable. See test data provided. A UL Fact-Finding study comparing the subject cable to type MC is ongoing at the time of proposal submittal. This data will be forwarded once the study is complete.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: A fact finding report is required before an article can be included in the Code for this new cable type.

See the panel statment on Proposal 7-10 for further information on this cable construction.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

19-51 Log #1609 NEC-P19 **Final Action: Accept**

(550.16)

Submitter: Technical Correlating Committee on National Electrical Code®,

Recommendation: Make the following change in 550.16:

Delete "(neutral)"

The revised text would appear as follows:

Grounding of both electrical and nonelectrical metal parts in a mobile home shall be through connection to a grounding bus in the mobile home distribution panelboard. The grounding bus shall be grounded through the green-colored insulated conductor in the supply cord or the feeder wiring to the service ground in the service-entrance equipment located adjacent to the mobile home location. Neither the frame of the mobile home nor the frame of any appliance shall be connected to the grounded circuit conductor ~~(neutral)~~ in the mobile home. Where the distribution panelboard is the service equipment as permitted by 550.32(B), the neutral conductors and the equipment grounding bus shall be connected.

Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).

The Task Group has proposed the following definitions to be added to Article 100:

- **Neutral conductor.** A circuit conductor connected to the neutral point of a system.
- **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals

- The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.
- The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.

Additional information is available in the Task Group report.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

19-52 Log #1611 NEC-P19 **Final Action: Accept**

(550.16(A))

Submitter: Technical Correlating Committee on National Electrical Code®,

Recommendation: Make the following change in 550.16(A):

Delete "(neutral)"

The revised text would appear as follows:

(A) Grounded ~~(Neutral)~~ Conductor.

Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).

The Task Group has proposed the following definitions to be added to Article 100:

- **Neutral conductor.** A circuit conductor connected to the neutral point of a system.
- **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals

● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.

● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.

Additional information is available in the Task Group report.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-53 Log #1612 NEC-P19 **Final Action: Accept**
(550.16(A)(1))

Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Make the following change in 550.16(A)(1):

Delete "(neutral)"

The revised text would appear as follows:

(1) Insulated. The grounded circuit conductor ~~(neutral)~~ shall be insulated from the grounding conductors and from equipment enclosures and other grounded parts. The grounded (neutral) circuit conductor terminals in the distribution panelboard and in ranges, clothes dryers, counter-mounted cooking units, and wall-mounted ovens shall be insulated from the equipment enclosure. Bonding screws, straps, or buses in the distribution panelboard or in appliances shall be removed and discarded. Where the distribution panelboard is the service equipment as permitted by 550.32(B), the neutral conductors and the equipment grounding bus shall be connected.

Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).

The Task Group has proposed the following definitions to be added to Article 100:

● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.

● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals

● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.

● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.

Additional information is available in the Task Group report.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept
Panel Statement: The panel understands that the submitter intended to delete the reference to "(neutral)" in the second sentence of 550.16(A)(1) although the proposed revised text does not include a strikeout for that term.

(550.16(B)(2))

Submitter: Ryan Jackson, West Valley City, UT
Recommendation: Revise as follows:

550.16 Grounding.

(B) Equipment Grounding Means.

(2) Electrical System. In the electrical system, all exposed metal parts, enclosures, frames, luminaire (fixture) canopies ~~lamp fixture canopies~~ , and so forth shall be effectively bonded to the grounding terminal or enclosure of the distribution panelboard.

Substantiation: Correlation with the rest of the code.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-55 Log #460 NEC-P19 **Final Action: Reject**
(550.16(C)(2))

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise text to read as follows:

...The bonding conductor shall be routed so as not to be exposed to ~~physical~~ damage.

Substantiation: Use of the word "physical" is superfluous–the intent is obvious given the context. (I leave it to the CMP whether you want to get more specific instead, naming some source of damage such as "blows or abrasion.")

Submitting proposals removing the adjective, "physical," may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every unnecessary instance, as I am attempting to do, we actually cut the NEC down by up to oh, maybe a quarter-page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.

Second, the unneeded use of "physical" not only is poor writing–look at William Zinsser's classic, On Writing Well–but is silly, and reflects a bit poorly on the Code process. When references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."

Panel Meeting Action: Reject
Panel Statement: The use of the term Physical Damage is consistent with its use in 300.4 and 300.5(D)(4).

The adjective "physical" is clearly understood and its deletion does not improve the readability of the Code.

In most cases this phrase is used in conjunction with a requirement for conductor/cable protection. If "physical" is deleted the revised text might be interpreted as requiring "total" protection for conductor/cables from any unforeseen circumstances. Such a proposal would be considered more than editorial and it does not appear that is the intent.

Definition of damage:

Harm or injury to property or a person, resulting in loss of value or the impairment of usefulness.

The word "physical" differentiates mechanical damage from electrical damage.

In addition, this is also consistent with the NEC Style Manual.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-56 Log #1613 NEC-P19 **Final Action: Accept**
(550.17(A))

Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Make the following change in 550.17(A):

Change "neutral" to "neutral conductor."

The revised text would appear as follows:

(A) Dielectric Strength Test. The wiring of each mobile home shall be subjected to a 1-minute, 900-volt, dielectric strength test (with all switches closed) between live parts (including neutral conductor) and the mobile home ground. Alternatively, the test shall be permitted to be performed at 1080 volts for 1 second. This test shall be performed after branch circuits are complete and after luminaires (fixtures) or appliances are installed.

Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).

The Task Group has proposed the following definitions to be added to Article 100:

● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.

● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals

● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.

● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.

Additional information is available in the Task Group report.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-57 Log #953 NEC-P19 **Final Action: Accept**
(550.18)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Change "legs" to "ungrounded conductors."
Substantiation: Edit. A 3-wire system has three "legs"; which two legs are not specified?
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-58 Log #1128 NEC-P19 **Final Action: Accept**
(550.18)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Change "legs" to "ungrounded conductors".
Substantiation: Edit. There are three "legs" of a 120/240 volt system; which two are not specified.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-59 Log #1177 NEC-P19 **Final Action: Reject**
(550.18(A)(2))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:
~~Number of circuits times 1500~~ 3000 volt-amperes for ~~each~~ the two or more twenty ampere small appliance branch circuits specified in 550.12(B).
Delete remainder.
Substantiation: All appliance circuits are not small appliance circuits. The requirement for 1500 va for each circuit tends to discourage installation of more than two circuits. Additional circuits provide reliability and diversity without actually increasing load. The apparent intent is not to require load calculation for the circuit permitted in 210.52(B)(1), Exception. Where more than the minimum number of circuits required by 550.12(A) is installed, no additional load is specified beyond that of 550.18(A)(1). Once minimum loads are calculated for the feeder or service,additional circuits for the small appliances do not increase this load.
Panel Meeting Action: Reject
Panel Statement: If more than two circuits are installed for small appliances, they should be calculated at 1500 VA each as required by this section. For other appliance circuits, requirements are given in 550.18(B)(4) and (6).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-60 Log #1180 NEC-P19 **Final Action: Accept in Part**
(550.20(A))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Delete this section or substitute the following:
(A) OUTDOOR USE . Luminaires (fixtures) installed outdoors shall comply with 410.4(A); receptacles installed outdoors shall comply with 406.8; switches installed outdoors shall comply with 404.4; utilization equipment installed outdoors shall comply with 110.11.
Substantiation: Most lighting fixtures for outdoor use are listed for wet or damp locations. This section doesn't require the "bubble" type cover required in 406.8(B) and modifies that section. Outdoor switches are not covered, therefore, 404.4 applies. "Equipment" is a general term (Article 100) and includes material and items which do not require listing. Some outdoor (utilization) equipment is listed for outdoor use, not "wet" or "damp" locations.
Panel Meeting Action: Accept in Part
Revise the existing Code text to read as follows:
"(A) Listed for Outdoor Use. Outdoor luminaires (fixtures) and equipment shall be listed for wet locations or outdoor use. Outdoor receptacles shall comply with 406.8. Where located on the underside of the home or located under roof extensions or similarly protected locations, outdoor luminaires (fixtures) and equipment shall be listed for use in damp locations."
Panel Statement: Outdoor switches are covered by the term "equipment" (See Article 100). Requirements in Article 550 modify those in Chapters 1 through 4. The first sentence of 550.20 already permits the use of equipment listed for outdoor use.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-61 Log #963 NEC-P19 **Final Action: Reject**
(550.xx (New))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Add:
LIGHTING OUTLETS REQUIRED . Lighting outlets shall be installed where specified in 210.70(A)(1), (2), and (3).
Substantiation: Manufactured home and mobile home occupants merit the same requirements for site-built units to comply with 90.1(A) and (B).
Panel Meeting Action: Reject
Panel Statement: The requirements in Chapters 1 through 4 apply generally, except as amended by Chapters 5 through 7. Since the lighting outlet requirements are not amended in Article 550, those requirements in Article 210 already apply.
There is no need for the additional language.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-62 Log #222 NEC-P19 **Final Action: Accept in Principle in Part**
(550.25)

TCC Action: See Technical Correlating Committee Note on Proposal 19-64.
NOTE: The following proposal consists of Comment 19-31 on Proposal 19-57 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 19-57 was:
Revise this section to refer to Article 100 for the definition of the term "arc-fault circuit-interrupter":
550.25 Arc-Fault Circuit-Interrupter Protection.
(A) ~~Definition.~~ Arc-fault circuit interrupters are defined in Article 100 ~~210.12(A)~~ .
(B) Bedrooms of Mobile Homes and Manufactured Homes. All branch circuits that supply 125-volt, single-phase, 15- and 20-ampere outlets installed in bedrooms of mobile homes and manufactured homes shall be protected by arc-fault circuit interrupter(s).
Submitter: Joseph A. Ross, Ross Seminars
Recommendation: Revise (B) and add new Exceptions as follows:
All branch circuits that supply ~~125~~ 120-volt, ~~single-phase,~~ 15 and 20-ampere outlets installed in bedrooms of mobile homes and manufactured homes shall be protected by arc-fault circuit interrupter(s).
Exception Nos. 1 and 2: (As accepted by CMP 2 addressing receptacle-type AFCIs, ROP 2-134a) and as accepted by CMP 2 addressing life-support equipment in dwelling unit bedrooms, ROP 2-167).
Exception No. 3: AFCI protection shall not be required for permanently installed alarm systems (fire, smoke, and burglar) in mobile homes and manufactured homes.
Substantiation: See substantiation for companion comments for Proposal Nos. 2-127, 2-134a, and 3-236. This is not new material. It certainly has had Public Review in the ROP and it addresses omissions and correlation (See NFPA Committee Regulations 4-4.6.2.1). Regardless of any Action by CMP 2 on new Exception No. 3, the provisions of 90.3 permit Chapter 5 (Article 550) to amend the general rules of Chapter 2 (Article 210). Alarm systems are life-saving systems. After all, isn't it saving lives that it's all about?
Panel Meeting Action: Accept in Principle in Part
The panel Accepts in Principle the change to include "120-volt".
The panel Rejects the remainder of the changes.
Panel Statement: The definition for arc-fault circuit-interrupters are in 210.12(A) and no exceptions are given for permanently installed alarm systems.
The change to "120-volt" was accepted in order to correspond with the language in 210.12.
The panel rejected the remainder of the proposed language in order to correlate with 550.25 and 210.12.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-63 Log #1127 NEC-P19 **Final Action: Reject**
(550.25(B))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Insert "receptacle" between "ampere" and "outlet".
Substantiation: There is no reason to require AFCI protection where a circuit supplies only fixed lighting outlets or equipment which is not cord connected or fire alarm/smoke detectors. If there are removed or dead batteries in the smoke/fire alarms and AFCI deenergizes the 120 volt power, the protection of those alarm systems is lost when they may be most needed.

Panel Meeting Action: Reject
Panel Statement: The panel intends 550.25 to correlate with 210.12 which makes no exceptions for permanently installed alarm systems.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-64 Log #1357 NEC-P19 **Final Action: Accept**
(550.25(B))

TCC Action: The Technical Correlating Committee notes that the text contained in this proposal is considered to be the final text and supercedes the action of the panel in Proposal 19-62.
Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Revise as follows:
(B) Bedrooms of Mobile Homes and Manufactured Homes.
All 120-volt branch circuits that supply ~~125-volt, single-phase,~~ 15- and 20-ampere outlets installed in bedrooms of mobile homes and manufactured homes shall ~~be protected by arc-fault circuit interrupter(s)~~ comply with 210.12(B) .
Substantiation: The current text of 550.25 is not in alignment with 210.12. The text of 550.25 could either be changed to match the text of 210.12, or 210.12 can simply be called out, making further edits unnecessary.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-65 Log #939 NEC-P19 **Final Action: Accept in Principle**
(550.31)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise second paragraph:
It shall be permissible to calculate the feeder or service load in accordance with Table 550.31. Where demand factors less than 100 percent are used, there shall be no reduction of the ampacity of the neutral as permitted in 220.61 (Remainder unchanged).
Substantiation: This section does not modify 220.61. A demand factor of 22 percent may be applied to the neutral. The last sentence does not exclude the provisions of 220.61 which are essentially the same as demand factors. Application of this section and 220.61 essentially results in a demand factor for a demand factor which could result in a neutral with insufficient ampacity.
Panel Meeting Action: Accept in Principle
In the existing Code text, delete the words "except as provided in this Code."
Panel Statement: The submitter is correct in that a demand factor applied to another demand factor could result in undersized conductors.
The revised language clearly states that the demand factors in Table 550.31 are permitted to be used and no other demand factors shall be allowed.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-66 Log #954 NEC-P19 **Final Action: Accept in Principle in Part**
(550.32(B)(2), (4), and (6))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:
(2) The installation of the service ~~equipment~~ shall comply with Part I through Part VII of Article 230.
(4) Bonding and grounding of the service shall be in accordance with Part II through Part V of Article 250.
Delete (6).
Alternatively, delete (2), (4), and (6).
Substantiation: To comply with Style Manual. Service "equipment" in (2) does not cover other portions of the service. In (6) the manufacturers may not know what type of grounding electrode will be used, which could affect the maximum size of the grounding electrode conductor.
90.3 already covers (2) and (4).
Panel Meeting Action: Accept in Principle in Part
In proposed (2), the panel Rejects the deletion of "equipment", and Accepts the addition of "Part I through Part VII".
In proposed (4), change "Part II" to "Part I".
The panel Rejects the deletion of (6).
Panel Statement: The definition of Equipment in Article 100 covers other portions of the service as the submitter intends.
The panel retains the use of references as allowed in 4.1 of the NEC Style Manual when they improve clarity of the rule.
In Item (4) the reference should be to Part I through Part V of Article 250 as the general rules for grounding shall apply.
The panel Rejects deleting item (6) as the manufacturer must specify the "minimum" size, not the "maximum" as suggested by the submitter.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-67 Log #1002 NEC-P19 **Final Action: Reject**
(550.32(B)(2) and (4))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Delete (2) and (4).
Substantiation: Edit Reference should not be made to an entire article per the Style Manual.
Panel Meeting Action: Reject
Panel Statement: Although the panel agrees with the submitter's substantiation; the panel disagrees with the proposed deletion.
See panel action and statement on Proposal 19-66.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-68 Log #1358 NEC-P19 **Final Action: Accept**
(550.33)

TCC Action: The Technical Correlating Committee directs the panel to reconsider the proposal and determine if the current reference to 310.15(B)(6) is necessary in 550.31 since the panel has accepted the addition of the same reference in 550.33(B). This action will be considered by the panel as a public comment.
Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Revise as follows:
(B) Feeder Capacity. Mobile home and manufactured home lot feeder circuit conductors shall have a capacity not less than the loads supplied and shall be rated at not less than 100 amperes at 120/240 volts , and shall be permitted to be sized in accordance with 310.15(B)(6).
Substantiation: This proposal is not intended to create a technical change, but rather to make the code a friendlier document. Section 550.33 contains everything that the code user needs to know, except which table to use to size the conductors. The allowance to use 310.15(B)(6) is already found in 215.2(A)(3); this proposed change simply adds clarification.

Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-69 Log #2412 NEC-P19 **Final Action: Accept**
(550.33(A) Exception)

TCC Action: It was the action of the Technical Correlating Committee that the proposal be reconsidered and that the panel consider correlating this proposal with the Code-Making Panel 5 action on Proposal 5-119 relative to an exception for existing installations. This action will be considered by the panel as a public comment.
Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Revise text to read:
550.33 Feeder.
(A) Feeder Conductors. Feeder conductors shall consist of either a listed cord, factory installed in accordance with 550.10(B), or a permanently installed feeder consisting of four insulated, color-coded conductors that shall be identified by the factory or field marking of the conductors in compliance with 310.12. Equipment grounding conductors shall not be identified by stripping the insulation.
~~Exception: Where a feeder is installed between service equipment and a disconnecting means as covered in 550.32(A), it shall be permitted to omit the equipment grounding conductor where the grounded circuit conductor is grounded at the disconnecting means as required in 250.32(B).~~
Substantiation: This is a companion proposal to my proposal to delete 250.32(B)(2). If 250.32(B)(2) is deleted as I am requesting, this section will need to be revised as well.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-70 Log #1083 NEC-P19 **Final Action: Accept**
(550.33(B))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Delete "at 120/240 volts".
Substantiation: Edit. Conductors are not rated at 120/240 volts. 310.11 requires the maximum rated voltage to be marked. Voltage rating has no direct bearing on ampacity.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-71 Log #1126 NEC-P19 **Final Action: Accept**
(550.33(B))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Delete "at 120/240 volts."
Substantiation: Edit. Conductors and cables are only to be marked for the maximum rated voltage per 310.11(A). Ampere rating is not directly rated to voltage.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 551 — RECREATIONAL VEHICLES AND RECREATIONAL VEHICLE PARKS

19-72 Log #544 NEC-P19 **Final Action: Reject**
(551)

TCC Action: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.
Submitter: Souheil Chehayeb, Chehayeb & Associates
Recommendation: Amend Article 551 to include Recreational Vehicle Storage Facilities. For each occurrence of recreational vehicle "site", add "or storage space".
Substantiation: Storage facilities equipped for RV storage are currently required to calculate electrical service and feeders without diversity causing excessively sized equipment to be installed. Unoccupied RVs in storage have similar demand loads to RV parks.
Panel Meeting Action: Reject
Panel Statement: The submitter did not provide sufficient documentation to warrant adding storage space to Article 551.
The assumption that a recreational vehicle storage facility has similar electrical demands as a recreational vehicle park is unsubstantiated.
The panel recognizes that RVs in storage areas are intended to be uninhabited.
In addition, the scope of the article is under the jurisdiction of the NEC Technical Correlating Committee.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-73 Log #2302 NEC-P19 **Final Action: Accept**
(551.1, FPN)

Submitter: Kent Perkins, Recreation Vehicle Industry Association / Rep. RVIA
Recommendation: Revise FPN to read:
FPN: For information on low-voltage systems, ~~see~~ refer to NFPA 1192-200 ~~2~~ 5 , *Standard ~~for~~ on Recreational Vehicles* , and ANSI/RVIA 12V- 2005, Standard for Low-Voltage Systems in Conversion and Recreational Vehicles, ~~*2002 edition.*~~
Substantiation: This change identifies the latest published editions of these two standards.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-74 Log #2598 NEC-P19 **Final Action: Accept in Principle**
(551.4, 551.20, 551.31, 551.40, 551.42, 551.44 and 551.46)

Submitter: Barry Bauman, Alliante Energy / Rep. American Society of Agricultural and Biological Engineers
Recommendation: Revise text to read:
551.4 General Requirements.
(A) Not Covered. A recreational vehicle not used for the purposes as defined in 551.2 shall not be required to meet the provisions of Part I pertaining to the number of capacity of circuits required. It shall, however, meet all other applicable requirements of this article if the recreational vehicle is provided with an electrical installation intended to be energized from a 120- , 120/208- or 120/240-volt, nominal, ac power-supply system.
(B) Systems. This article covers combination electrical systems, generator installations, and 120- , 120/208 or 120/240-volt, nominal, systems.
551.20 Combination Electrical Systems.
(F) Receptacles and Plug Caps. Where a recreational vehicle is equipped with a 120-volt or 120/ 208- 240-volt ac system, a low-voltage system, or both, receptacles and plug caps of the low-voltage system shall differ in configuration from those of the 120- or 120/ 208- 240-volt system. Where a vehicle equipped with a battery or other low-voltage system has an external connection for low-voltage power, the connector shall have a configuration that will not accept 120-volt power.
551.31 Multiple Supply Source.
(C) Alternate Power Sources Exceeding 30 Amperes. If an alternate power source exceeds 30 amperes, 120 volts, nominal, it shall be permissible to wire it as a 120-volt, nominal, system or a 120/ 208- 240-volt, nominal, system, provided an overcurrent-protective device of the proper rating is installed in the feeder.
IV. Nominal 120-Volt or 120/ 208- 240-Volt Systems.
551.40 120-Volt or 120/ 208- 240-Volt, Nominal, Systems.
(A) General Requirements. The electrical equipment and material of recreational vehicles indicated for connection to a wiring system rated 120 volts, nominal, 2-wire with ground, or a wiring system rated 120/ 208- 240 volts, nominal, 3-wire with ground, shall be listed and installed in accordance with the requirements of Parts I, II, III, IV, and V of this article. Electrical equipment connected line-to-line shall have a voltage rating of 208-230 volts.
551.42 Branch Circuits Required. Each recreational vehicle containing a 120-volt electrical system shall contain one of the following.
(D) More Than Five Circuits Without a Listed Energy Management System. A 50-ampere, 120/ 208- 240-volt power-supply assembly shall be used where six or more circuits are employed. The load distribution shall ensure a reasonable current balance between phases.
551.44 Power-Supply Assembly. Each recreational vehicle shall have only one of the following main power-supply assemblies.
(A) Fifteen-Ampere Main Power-Supply Assembly. Recreational vehicles wired in accordance with 551.42(A) shall use a listed 15-ampere or larger main power-supply assembly.
(B) Twenty-Ampere Main Power-Supply Assembly. Recreational vehicles wired in accordance with 551.42(B) shall use a listed 20-ampere or larger main power-supply assembly.
(C) Thirty-Ampere Main Power-Supply Assembly. Recreational vehicles wired in accordance with 551.42(C) shall use a listed 30-ampere or larger main power-supply assembly.
(D) Fifty-Ampere Power-Supply Assembly. Recreational vehicles wired in accordance with 551.42(D) shall use a listed 50-ampere, 120/ 208- 240-volt main power-supply assembly.
551.46 Means for Connecting to Power Supply.
(D) Labeling at Electrical Entrance. Each recreational vehicle shall have permanently affixed to the exterior skin, at or near the point of entrance of the power-supply cord(s), a label 75 mm × 45 mm (3 in. × 1 3/4 in.) minimum size, made of etched, metal-stamped, or embossed brass, stainless steel, or anodized or alclad aluminum not less than 0.51 mm (0.020 in.) thick, or other suitable material [e.g., 0.13 mm (0.005 in.) thick plastic laminate] that reads, as appropriate, either THIS CONNECTION IS FOR 110-125-VOLT AC, 60 HZ, ______ AMPERE SUPPLY. or THIS CONNECTION IS FOR 120/208- or 120/240-VOLT AC, 3-POLE, 4-WIRE, 60 HZ, _____ AMPERE SUPPLY.
Substantiation: Many recreational vehicle parks require a service larger than is available from a single-phase service or they require a 3-phase service for 3-phase loads. Due to the unavailability for 120/240-volt 3-phase service from the providing utilities, the park will be served with a 120/208-volt 3-phase service. Experience with serving parks with 120/208-volt 3-phase has resulted in no problems. The service voltage has been transparent to the park and recreational vehicle owners. The existing code language requires the recreational park owner to install a transformer to convert from 120/208-volt to 120/240-volt for line-to-line connected equipment. This is an unnecessary burden for the park owner. The proposed language reflects how parks are typically served at 120/208 volts.
Panel Meeting Action: Accept in Principle
Revise the proposed wording to read as follows:
551.4 General Requirements.
(A) Not Covered. A recreational vehicle not used for the purposes as defined in 551.2 shall not be required to meet the provisions of Part I pertaining to the number of capacity of circuits required. It shall, however, meet all other applicable requirements of this article if the recreational vehicle is provided with an electrical installation intended to be energized from a 120-volt , 208Y/120-volt or 120/240-volt, nominal, ac power-supply system.
(B) Systems. This article covers combination electrical systems, generator installations, and 120-volt , 208Y/120-volt or 120/240-volt, nominal, systems.
551.20 Combination Electrical Systems.
(F) Receptacles and Plug Caps. Where a recreational vehicle is equipped with a n ~~120-~~ ~~or 120/240-volt ac~~ AC system, a low-voltage system, or both, receptacles and plug caps of the low-voltage system shall differ in configuration from those of the ~~120- or 120/240-volt~~ AC system. Where a vehicle equipped with a battery or other low-voltage system has an external connection for low-voltage power, the connector shall have a configuration that will not accept ~~120-volt~~ AC power.
551.31 Multiple Supply Source.
(C) Alternate Power Sources Exceeding 30 Amperes. If an alternate power source exceeds 30 amperes, 120 volts, nominal, it shall be permissible to wire it as a 120-volt, nominal, system, a 208Y/120-volt, nominal, system, or a 120/240-volt, nominal, system, provided an overcurrent-protective device of the proper rating is installed in the feeder.
IV. Nominal 120-Volt or 120/240-Volt Systems.
551.40 120-Volt or 120/240-Volt, Nominal, Systems.
(A) General Requirements. The electrical equipment and material of recreational vehicles indicated for connection to a wiring system rated 120 volts, nominal, 2-wire with ground, or a wiring system rated 120/240 volts, nominal, 3-wire with ground, shall be listed and installed in accordance with the requirements of Parts I, II, III, IV, and V of this article. Electrical equipment connected line-to-line shall have a voltage rating of 208-230 volts.

551.42 Branch Circuits Required. Each recreational vehicle containing a n AC ~~120-volt~~ electrical system shall contain one of the following.

(D) More Than Five Circuits Without a Listed Energy Management System. A 50-ampere, 120/ 208- 240-volt power-supply assembly shall be used where six or more circuits are employed. The load distribution shall ensure a reasonable current balance between phases.

551.44 Power-Supply Assembly. Each recreational vehicle shall have only one of the following main power-supply assemblies.

(A) Fifteen-Ampere Main Power-Supply Assembly. Recreational vehicles wired in accordance with 551.42(A) shall use a listed 15-ampere or larger main power-supply assembly.

(B) Twenty-Ampere Main Power-Supply Assembly. Recreational vehicles wired in accordance with 551.42(B) shall use a listed 20-ampere or larger main power-supply assembly.

(C) Thirty-Ampere Main Power-Supply Assembly. Recreational vehicles wired in accordance with 551.42(C) shall use a listed 30-ampere or larger main power-supply assembly.

(D) Fifty-Ampere Power-Supply Assembly. Recreational vehicles wired in accordance with 551.42(D) shall use a listed 50-ampere, 120/ 208- 240-volt main power-supply assembly.

551.46 Means for Connecting to Power Supply.

(D) Labeling at Electrical Entrance. Each recreational vehicle shall have permanently affixed to the exterior skin, at or near the point of entrance of the power-supply cord(s), a label 75 mm × 45 mm (3 in. × 1 3/4 in.) minimum size, made of etched, metal-stamped, or embossed brass, stainless steel, or anodized or alclad aluminum not less than 0.51 mm (0.020 in.) thick, or other suitable material [e.g., 0.13 mm (0.005 in.) thick plastic laminate] that reads, as appropriate, either THIS CONNECTION IS FOR 110-125-VOLT AC, 60 HZ, ______ AMPERE SUPPLY. or THIS CONNECTION IS FOR 208Y/120-VOLT or 120/240-VOLT AC, 3-POLE, 4-WIRE, 60 HZ, _____ AMPERE SUPPLY.

Panel Statement: The revised wording is editorial in nature to correlate with the language used throughout the Code.

The term "AC systems" was used to differentiate between the low voltage DC systems and the AC systems.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

WEAKLEY, K.: Argument against changing from single phase 3 wire to single phase derived from 3 phase 4 wire.

When currents add, as in single phase circuits derived from a three phase supply, there is no canceling of currents by balancing the load. Therefore, voltage drop on a typical RV feeder poses a possible touch voltage condition, and the possibility of a 5 ma personnel fault, when the typical RV feeder is fully loaded, with additional differences in potential when momentarily overloaded (i.e., when a motor starts). To reduce the frequency of this condition occurring, the CMP should not accept the proposals that introduce 208-120v single phase systems, and should retain the requirement that all RV feeders are derived from single phase systems.

Problems related to two wire appliances that are bonded to the neutral, i.e., a toaster in proximity to grounded fixtures or appliances, would be frequent. This situation/condition, could, in fact, have enough potential to be a danger to those individuals that are sensitive to the voltage levels that may be present.

Three wire single phase system derived from a three phase four wire supply. When a momentary current of 250 amps at 208 volts is developed, a potential of 5.2875 volts is on the neutral conductor.

Calculations; 225 ft of 250 mcm AL conductor,.094 ohms per 1000 ft, 160 amp load, = 3.384 volts drop. A momentary load of 250 amps line to line would create a 5.2875 volt drop on one of the ungrounded conductors.

I see no reason to change from a rationale that has worked for years without the above problems surfacing.

Summary; using a single phase system derived from a three phase supply will have a greater propensity for tingle voltage situations. By allowing this into Article 551, we will increase problems with voltage differentials between sites and other services, i.e., the grounded sheath on CATV cabling.

ZIEMAN, M.: I change my vote to Negative. The concerns raised in the other Explanation of Negative Vote need to be addressed.

19-75 Log #2303 NEC-P19 **Final Action: Accept**
(551.4(B), FPN)

Submitter: Kent Perkins, Recreation Vehicle Industry Association / Rep. RVIA

Recommendation: Revise FPN to read:

FPN: For information on low-voltage systems, refer to NFPA 1192-200 ~~2~~ 5 , *Standard on Recreational Vehicles* , and ANSI/RVIA 12V-200 ~~2~~ 5 , *Standard for Low-Voltage Systems in Conversion and Recreational Vehicles.*

Substantiation: This change identifies the latest published editions of these two standards.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

19-76 Log #2304 NEC-P19 **Final Action: Reject**
(551.30(E))

Submitter: Kent Perkins, Recreation Vehicle Industry Association / Rep. RVIA

Recommendation: Revise language to read as follows:

(E) Supply Conductors. The supply conductors from the engine generator to the first termination on the vehicle shall be of the annealed stranded type and shall be installed in listed flexible conduit or...

Substantiation: Current language is intended to prohibit use of NM sheathed cable but falls short because 8 AWG or larger NM cable supply and neutral conductors are stranded. Adding the word annealed would ensure use of conductors capable of withstanding vibration.

Panel Meeting Action: Reject

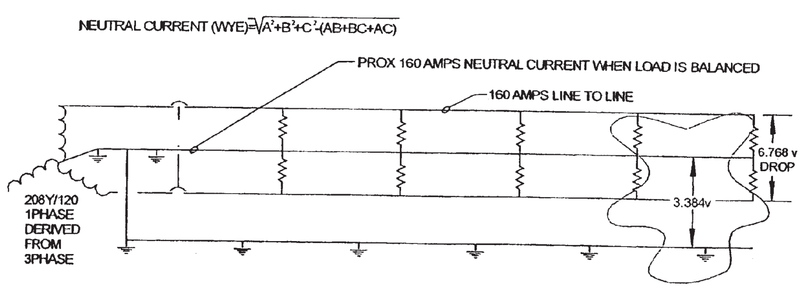
Panel Statement: The listing standards require that all stranded conductors be annealed.

Number Eligible to Vote: 12

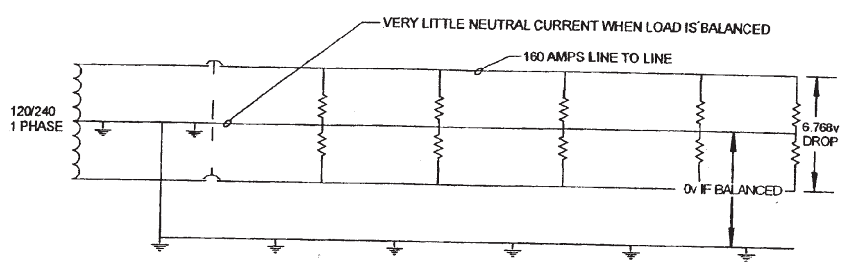
Ballot Results: Affirmative: 12

Comment on Affirmative:

BERNSON, J.: If the current language is intended to prohibit use of NM sheathed cable, more straightforward language should be included in this section to clarify this intent.



Three wire single phase system. When a momentary current of 250 amps line to line at 240 volts, is developed, a potential of 0 volts is on the neutral conductor.



19-77 Log #1014 NEC-P19 **Final Action: Reject**
(551.41(B)(4) (New))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Add new paragraph (4) to read:
(4) At least one receptacle shall be installed outdoors on the exterior of the unit.
Substantiation: Receptacle outlets required by this code are presumed to be for safety purposes. The exterior receptacle outlet required by 552.41(C)(4) for a park trailer is equally justified for recreation vehicles of this article.
Panel Meeting Action: Reject
Panel Statement: Section 552.41(C)(4) does not require a receptacle on the exterior of a park trailer as the submitter suggests. Section 552.41(C)(4) requires GFCI protection for receptacles on the exterior of the unit. The same requirement exists for recreational vehicles in 551.41(C)(4).
Every RV site with electrical supply within an RV park is already required to be equipped with at least one 20-ampere, 125-volt receptacle (See 551.71). This receptacle should alleviate the safety concerns of the submitter.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-78 Log #2305 NEC-P19 **Final Action: Accept in Principle**
(551.42(C))

Submitter: Kent Perkins, Recreation Vehicle Industry Association / Rep. RVIA
Recommendation: Add new sentence after current 2nd sentence: Distribution panelboards rated 120/240 volts shall be permitted if listed for either 30 amp or 50 amp applications.
Substantiation: Currently, panelboards listed for use with either 30 amp or 50 amp systems are available. Safety is not compromised since the listing would cover this application.
Panel Meeting Action: Accept in Principle
Insert the following text as a new second sentence in 551.42(C):
"Such recreational vehicles shall be permitted to be equipped with distribution panelboards rated 120/240 volts maximum listed for 30 amp or 50 amp applications supplied by the appropriate power supply assemblies."
Panel Statement: The revised wording provides clarity as to the panel's intent and addresses the issues raised by the Submitter.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
HOPKINS, B.: The Panel agreed with the intent of the proposal, but may have added confusion when revising the text in the Panel statement.
The permission of a panelboard rated at 120 volts with a 30 ampere rated power supply assembly is now in question as the revised panel text only permits a panelboard rated 120/240 volts maximum for the 30 ampere power supply assembly.
Some may argue that 120-volt is less than 120/240 volts, which is stated as a maximum, thus allowing a 120-volt rated panelboard, but that is not clearly defined by this new language. In addition, the current title of Part IV of Article 551 is "Nominal 120-volt or 120/240-volt Systems," which clearly indicates that there are two systems.
Therefore, to be consistent with the title of Part IV the proposal should be accepted because it is adding a new sentence to address 120/240 volt applications and retains the current second sentence to address 120 volt applications, thus eliminating any possibility for confusion.
MILLER, T.: The Panel agreed with the intent of the proposal, but may have added confusion when revising the text in the panel statement.
The permission of a panelboard rated at 120 volts with a 30 ampere rated power supply assembly is now in question as the revised panel text only permits a panelboard rated 120/240 volts maximum for the 30 ampere power supply assembly.
Some may argue that 120-volt is less than 120/240 volts, which is stated as a maximum, thus allowing a 120-volt rated panelboard, but that is not clearly defined by this new language. In addition, the current title of Part IV of Article 551 is "Nominal 120-volt or 120/240-volt systems," which clearly indicates that there are two systems.
Therefore, to be consistent with the title of Part IV the proposal should be accepted because it is adding a new sentence to address 120/240 volt applications and retains the current second sentence to address 120 volt applications, thus eliminating any possibility for confusion.

19-79 Log #1094 NEC-P19 **Final Action: Accept in Principle in Part**
(551.42(C) and (D))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise second sentence of (C):
Such recreational vehicles shall be equipped with a distribution panelboard rated at 120 volts, maximum and minimum 30 amperes , with a 30-ampere rated main power supply assembly.
(D) A 50-ampere 120/240 volt power supply assembly and a minimum 50-ampere rated distribution panelboard shall be used where six or more circuits are employed.
Substantiation: Edit. The definition of power supply assembly does not include the distribution panelboard, therefore, no ampere rating is specified for the panelboard.
Panel Meeting Action: Accept in Principle in Part
The panel Accepts in Principle the proposed wording in (C).
The panel Accepts the revised wording in (D) of the proposal.
Panel Statement: The panel notes that the action taken on Proposal 19-78 modifies the wording in (C) of this proposal.
The revised wording of (C) clarifies the intent of the panel and addresses the issues brought up in the submitter's proposal.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-80 Log #1110 NEC-P19 **Final Action: Reject**
(551.43(A))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:
Branch circuit overcurrent devices shall be ~~rated as follows~~ in accordance with the applicable provisions of 240.4.
Delete (1), (2), and (3).
Substantiation: Edit. 240.4 adequately covers conductor overcurrent protection and (G) of that section covers air conditioning equipment, motors, etc. (A)(1) is a limiting requirement and not mitigated by (2) or (3) which are ADDITIONAL requirements. If the 150 percent rating of (2) or the rating permitted by (3) is used, the ampacity of the branch circuit conductors has to be not less than the overcurrent device rating.
Panel Meeting Action: Reject
Panel Statement: The submitter's second sentence explains how the provisions are to be used, but does not substantiate a change. There are no documented instances of problems caused due to the current requirements in this section. This language parallels language used in mobile homes (550.11(B)).
Requirements in 551 are permitted to modify those in Chapter 4, which apply generally.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-81 Log #1111 NEC-P19 **Final Action: Reject**
(551.44(A), (B) an (C))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Delete the phrase "or larger."
Substantiation: The definition of Power-Supply Assembly in 555.2 includes attachment plug caps, which permits a plug cap rated higher than the conductors with the possibility of connection to a higher rated receptacle with overcurrent protection exceeding the cord ampacity. 551.46(C) specifies 15- 20- and 30 ampere attachment plugs respectively, for (A,)(B), an (C) of this section.
Panel Meeting Action: Reject
Panel Statement: Section 551.40(B) provides that the attachment plug caps and mating components of a power supply assembly be compatible according to their listing and intended use.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-82 Log #2306 NEC-P19 **Final Action: Accept in Part**
(551.45(A))

Submitter: Kent Perkins, Recreation Vehicle Industry Association / Rep. RVIA
Recommendation: Revise (A) title and 1st and last sentence as follows:
551.45 Distribution Panelboard.
(A) Listed and Appropriately Identified ~~Rated~~ . A listed enclosed and appropriately ~~rated~~ identified distribution panelboard or other equipment specifically listed for this purpose shall be used. The grounded conductor termination bar shall be insulated from the enclosure as provided in 551.54(C). An equipment grounding terminal bar shall be attached inside the ~~metal~~ enclosure of the panelboard.
Substantiation: This clarifies distribution panelboards must be of the enclosed type and are not required to be metal. Also the term "identified" is a defined term within the NEC Article 100.
Panel Meeting Action: Accept in Part
The panel Accepts the deletion of the word "metal" and Rejects the remainder of the proposal.
Panel Statement: The term "enclosed" type panelboard is not definined within the NEC. The word "identified" adds confusion when used in conjunction with the word "listed".
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-83 Log #2307 NEC-P19 **Final Action: Accept**
(551.45(B))

Submitter: Kent Perkins, Recreation Vehicle Industry Association / Rep. RVIA
Recommendation: Change first sentence as follows:...readily accessible location with the RV in the setup mode.
Change second sentence as follows:...for the panelboard with the RV in the setup mode shall be not less...
Substantiation: Access and working clearance for a distribution panelboard should only be required with the RV in the setup mode.
Panel Meeting Action: Accept
Panel Statement:
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-84 Log #2308 NEC-P19 **Final Action: Reject**
(551.45(D) (New))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be sent to Code-Making Panel 9 for comment relative to the question raised by Code-Making Panel 19 regarding the definition of "factory installed".
Submitter: Kent Perkins, Recreation Vehicle Industry Association / Rep. RVIA
Recommendation: Add a new section as follows:
(D) Back Fed-Devices. A backfed main circuit breaker shall not be required to be secured in place by a fastener that is in addition to its panelboard mounting means, providing the panelboard's front cover prevents all circuits breakers from being removed when the cover is in place.
Substantiation: Recreational vehicles unlike residential applications provide the option of complete disconnection of the power supply during service of the distribution panelboard. This allows service personal a safe option to perform panelboard service without the presence of live conductors. Therefore, the main breaker hold down requirement is unnecessary.
Panel Meeting Action: Reject
Panel Statement: If the panelboard is designed so that the front cover can be removed while the back fed main circuit breaker is energized, the breaker should be secured by the additional fastener required in 408.36(F).
This is a safety issue.
The panel requests that the Technical Correlating Committee refer this Proposal to Code-Making Panel 9 for Comment relative to a definition of "field installed" versus "factory installed" as shown in 408.36(F) and as it relates to recreational vehicles.
For example, where a distribution panelboard, with a plug-in-type back-fed main breaker, is installed in a recreational vehicle at a factory assembly production facility, is this type of installation considered to be "field-installed" as this term is used in 408.36(F)?
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-85 Log #923 NEC-P19 **Final Action: Reject**
(551.47(C))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Change "boxes" to "enclosures."
Substantiation: Edit. Boxes may be perceived as not including other enclosures such as cabinets. Conduit bodies, etc.
Panel Meeting Action: Reject
Panel Statement: Section 551.47(C) overrides the exceptions in 314.3 and does not pertain to the broader scope of all enclosures.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-86 Log #1546 NEC-P19 **Final Action: Accept in Principle**
(551.47(M))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be sent to the Technical Correlating Committee Grounding and Bonding Task Group for comment.
Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Delete the term "effectively" from the terms "effectively grounded" and "effectively bonded" from Articles 551 and revise text as shown for the affected NEC sections.
551.47(M): (M) Metal Faceplates ~~Effectively~~ Grounded. Where metal faceplates are used, they shall be ~~effectively~~ grounded by contact with the grounded mounting strap of the device ~~grounded~~ .
Substantiation: 551.47(M): The definition of "effectively grounded" is ambiguous and very subjective without any defined values or parameters for one to judge as either "effective" or "ineffective." This section has been revised to prescribe the connection of the faceplate to the equipment grounding conductor by contact with the device mounting strap connected to the equipment grounding conductor.
This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to delete the term "grounded, effectively" and its definition from Article 100 and other companion proposals throughout the NEC relative to this Task Group's recommendations. The substantiation of this proposal is as follows.
The term "Effectively Grounded" is used 29 times in the NEC. It appears as though in the majority of the locations where it is used, the word "grounded" or phrase "connected to an equipment grounding conductor" could be used. Other proposals are submitted to make those changes.
The 1996 NEC in Section 250.51 used the term "effective grounding path," and those concepts were incorporated in 250.2 (1999 NEC) and then expanded in 250.4(A) and (B) in the 2002 NEC. The performance criteria of grounding and bonding are currently provided in Section 250.4 and include the concepts contained in the vague definition of the term "effectively grounded."
The definition "Effectively Grounded" is very subjective and without any defined values or parameters for one to judge grounding as either "effective" or "ineffective." "Effective" is described in Section 250.4(A) and (B), but it relates to the effective ground-fault current path as a performance criteria. Deleting the term in the NEC and the definition is logical because there are no definitive parameters for Code users to make a determination on what constitutes "effectively grounded." Systems are solidly grounded, grounded through a resistor or impedance, or ungrounded. Equipment (normally noncurrent-carrying metal parts are grounded where connected to an equipment grounding conductor.
This proposal is to change the term "Effectively Bonded" to just "Bonded" in each of the section where it is used. The term "Effectively Bonded" is currently not defined in the NEC.
The term "effectively bonded" is also used a few times in the NEC and is undefined. The same situation exists. There are no defined parameters for Code users to judges what the difference between "Effectively Bonded" and "Bonded" really is. Where the term appears in the NEC, it is revised to just "bonded" and still has the same meaning in each rule.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Revise the proposed wording to read:
"551.47(M) Metal Faceplates Grounded. Where metal faceplates are used, they shall be grounded."
Panel Statement: This is identical to the language used in 406.5(B). There is no need to be more prescriptive as to the method of grounding.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-87 Log #2309 NEC-P19 **Final Action: Accept in Part**
(551.47(P)(2))

Submitter: Kent Perkins, Recreation Vehicle Industry Association / Rep. RVIA
Recommendation: Revise (P)(2) by adding to the end of the existing sentence :...551.47(P)(2)(a) through 551.47(P)(2)(d) or other wiring methods acceptable under this standard as applicable.
Change existing (P)(2)b. to read:
b. The flexible cord shall be permitted to be routed within ~~pass through~~ the interior of a wall or ~~through a~~ floor in lengths not to exceed 600 mm (24 in.) before terminating at an outlet.
Delete all of c. and d. and replace with new c. and d. below:
c. The flexible cord shall be protected by bushings or fittings where entering walls or floors.
d. The outer jacket of the flexible cord shall be continuous to the outlet box.
Substantiation: This new language is based on requirements from 400.14 that should apply. This application is also permitted under 400.7(A)9 for connection of moving parts. Also this new language under (P)(2) allows other wiring methods that are in compliance with the NEC.
Panel Meeting Action: Accept in Part
The panel Accepts the new language in 551.47(P)(2)(d) and Rejects the remainder of the proposal.
Panel Statement: The broad "or other wiring methods..." is unacceptable because of the installation techniques used in 551.47(P)(2) that are typically violations but, are permitted under this section because of issues with expandable units.
Allowing a flexible cord to be routed within a wall or floor is in clear violation of 400.8(5) which does not allow the cord to be concealed by walls or floors.
Section 400.8(2) does not permit flexible cords to be run through holes in walls or floors. The panel (in an earlier cycle) accepted 551.47(P)(2)(b) when the installation is in compliance with all the provisions in 551.47(P)(2)(a) through 551.47(P)(2)(d) because of the issues with expandable units.
The provisions in 551.47(P)(2)(c) should not be deleted. They are necessary if the cord is not allowed to be routed within interior walls and floors.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3

Explanation of Negative:

HOPKINS, B.: In the past several years, the industry has added expandable room sections at a rate that today, finds nearly 80 percent of all RV having expandable room sections. This includes all RV types including folding camping trailers, Class B motor homes (those built on van type chassis) and truck campers. Expandable room sections, room sections that move in and out of the main portion of the RV itself, often contain electrical systems, propane systems and plumbing systems.

The technology and approach to safely wiring these rooms have moved very quickly. With the conductors used for these rooms being equal to that of the power supply assembly (ref 551.47(P)(2)) allowing the cord to pass though walls and floors has been permitted by all AHJ, including state agencies. For a time, the cords were installed within walls and floors for short distances permitting flexible cord conductors to be connected with the minimum number of connections. This practice was proposed as an acceptable use in the 2005 NEC, but was rejected because of the prohibitions of Article 400. In an attempt to assist industry, the cord was permitted within the exterior wall, providing it was installed inside a conduit. It is industry's contention that no additional protection is provided beyond what is inherently provided by the wall or floor, particularly to a cord that is listed for hard usage and for wet locations.

The 2008 proposal to allow cord inside the wall without conduit was again rejected. In addition, other wiring methods acceptable under the NEC, such as following the permitted practice of running the cord through walls and floors as stated in 551.47(P)(2), was also rejected. Now, the NEC ONLY allows the use of the flex cord inside a conduit, inside the wall as the direct wiring method.

Article 551 exists to allow exceptions to the base requirements of Chapters 1 through 4. Addressing the general use of flexible cords addressed in Article 400 cannot take every possible usage into account, but general rules, nevertheless, have been established.

Wiring the expandable room is an area that needs exceptions permitted within Article 551.

We do not expect the panel to reverse its position during the letter ballot process. Instead, a new, revised proposal, in the form of a comment, will be submitted to address the direct wiring of expandable rooms. It is our hope that extensive consideration be given to this topic as there is a need to reduce the connections of the conductors while providing the protection of the conductors.

MIKEL, J.: The flexible cord described in P.551.47(P)(2) is equivalent to the power cords utilized in manufactured homes, recreational vehicles and park trailers. HUD, state and local authorities have for many years permitted these power cords to pass through floors and walls for connecting to the panel board. When done correctly, we are not aware of any incident attributable to this long standing practice.

We agree that the placement of this cord within the floor or wall cavity would not be in compliance with Section 400.8(2). With the two (2) feet limitation placed upon this practice, we believe that safety would not be sacrificed. As it has been previously stated, requirements in Article 551 can modify those in Chapters 1 through 4.

MILLER, T.: In the past several years, the industry has added expandable room sections at a rate that today, finds nearly 80% of all RV having expandable room sections. This includes all RV types including folding camping trailers, Class B motor homes (those built on van type chassis) and truck campers. Expandable room sections, room sections that move in and out of the main portion of the RV itself, often contain electrical systems, propane systems and plumbing systems.

The technology and approach to safely wiring these rooms have moved very quickly. With the conductors used for these rooms being equal to that of the power supply assembly, (ref 551.47(P)(2)) allowing the cord to pass through walls and floors has been permitted by all AHJ, including state agencies. For a time, the cords were installed within walls and floors for short distances permitting flexible cord conductors to be connected with the minimum number of connections. This practice was proposed as an acceptable use in the 2005 NEC, but was rejected because of the prohibitions of Article 400. In an attempt to assist industry, the cord was permitted within the exterior wall, providing it was installed inside a conduit. It is industry's intention that no additional protection is provided beyond what is inherently provided by the wall or floor particularly to a cord that is listed for hard usage and for wet locations.

The 2008 proposal to allow cord inside the wall without conduit was again rejected. In addition, other wiring methods acceptable under the NEC, such as following the permitted practice of running the cord through walls and floors as stated in 551.47(P)(2), was also rejected. Now, the NEC ONLY allows the use of the flex cord inside a conduit, inside the wall as the direct wiring method.

Article 551 exists to allow exceptions to the base requirements of Chapters 1 through 4. Addressing the general use of flexible cords addressed in Article 400 cannot take every possible usage into account, but general rules nevertheless have been established.

Wiring the expandable room is an area that needs exceptions permitted within Article 551.

We do not expect the panel to reverse its position during the letter ballot process. Instead, a new, revised proposal, in the form of a comment, will be submitted to address the direct wiring of expandable rooms. It is our hope that extensive consideration be given to this topic as there is a need to reduce the connections of the conductors while providing the protection of the conductors.

19-88 Log #2310 NEC-P19 **Final Action: Accept in Principle**
(551.47(R)(1))

TCC Action: The Technical Correlating Committee directs that the meeting action text be revised as follows to comply with the NEC Style Manual:

"Where the generator provides overcurrent protection for the conductors, additional overcurrent protection shall not be required."

Submitter: Kent Perkins, Recreation Vehicle Industry Association / Rep. RVIA

Recommendation: Revise text to read as follows:

(1) Circuit conductors shall be appropriately sized in relation to the anticipated load . ~~and shall be protected by an overcurrent device in accordance with their ampacities.~~

Substantiation: RV Generator Listing Standards ANSI/EGS-1 and UL 1484, require overcurrent protection to be on the generators for supply conductors. Installation of additional circuit breakers for generator preps is unnecessary because of this listing standard requirements.

Panel Meeting Action: Accept in Principle

In the existing Code, add a new sentence at the end of the existing requirement of 551.47(R)(1) to read as follows:

"Where the generator provides overcurrent protection for the conductors, additional overcurrent protection is not required."

Panel Statement: The panel agrees with the intent of the proposal, however, chooses to retain the requirement for overcurrent protection when the generator is installed.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

LICHTENSTEIN, T.: The RV generator Listing standards ANSI/RVIA EGS-1 2003, Engine Generator Sets for Recreational Vehicle Safety Requirements and UL 1248, the Standard for Safety for Engine Generator Assemblies for use in Recreational Vehicles require suitable overcurrent protection to protect the generator and conductors to the junction box for connection to the load. This overcurrent protection is intended to protect the generator and generator wiring only. These overcurrent devices when required are not intended to provide overcurrent protection to the wiring in the recreational vehicle and should not be relied upon to remove overcurrent protection requirements for circuit conductors in the recreational vehicle from the Code. See excerpt from the RV generator standards detailed below.

UL1248

14 Generator Protection

14.1 The generator and field conductors to the junction box for connection to the load shall be protected by an appropriately rated overcurrent protective device, except that this overcurrent protection need not be provided for generators having a collapsible field or other built-in overcurrent protection if field conductors are adequately sized for the maximum sustained current available. See Overload Test, Section 30.

ANSI/RVIA EGS-1

5.12 Overload or Short Circuit Protection.

5.12.1 The generator and feeder conductors to the junction box for connection to the load shall be protected by an appropriately rated overcurrent protective device, except that this overcurrent protection need not be provided for generators having a collapsible field or other built-in overcurrent protection if feeder conductors are sized for the maximum sustained current available.

ZIEMAN, M.: I change my vote to Negative. If I understand this matter correctly, I concur with the concerns raised in the other Explanation of Negative Vote.

A further concern: The code addresses "conductors appropriately sized in relation to the anticipated load." What if a generator larger than originally anticipated is installed? If no overcurrent protection is provided, would this not result in a potentially hazardous condition?

19-88a Log #CP1902 NEC-P19 **Final Action: Accept**
(551.47(R)(4))

Submitter: Code-Making Panel 19,

Recommendation: In the existing Code, 551.47(R)(4), revise the two labels as follows:

ONLY INSTALL A GENERATOR LISTED SPECIFICALLY FOR RV USE
GENERATOR CIRCUIT. THIS CONNECTION IS FOR GENERATORS RATED 110-125-VOLT AC, 60 HZ,________AMPERES MAXIMUM.

Or

ONLY INSTALL A GENERATOR LISTED SPECIFICALLY FOR RV USE
GENERATOR CIRCUIT. THIS CONNECTION IS FOR GENERATORS RATED 120/240-VOLT AC, 60 HZ,________AMPERES MAXIMUM.

Substantiation: Adding the suggested language provides added guidance to the installer of the generator in RVs where the RV manufacturer has pre-wired the RV for the future installation of a generator set.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-89 Log #2311 NEC-P19 **Final Action: Accept**
(551.47(S) (New))

Submitter: Kent Perkins, Recreation Vehicle Industry Association / Rep. RVIA
Recommendation: Add text to read as follows:
(S) Prewiring for Other Circuits
Prewiring installed for the purpose of installing other appliances or devices shall conform to the applicable portions of this article and the following:
(1) An overcurrent protection device with a rating compatible with the circuit conductors shall be installed in the distribution panelboard with wiring connections completed.
(2) The load end of the circuit shall terminate in a junction box with a blank cover or a device listed for the purpose. Where a junction box with blank cover is used, the free ends of the conductors shall be adequately capped or tapped.
(3) A label conforming to 551.46(D) shall be placed on or adjacent to the junction box or device listed for the purpose and shall read:
This connection is for ______ rated ______ Volt AC, 60Hz, amperes maximum. Do not exceed circuit rating.
An ampere rating compatible with the device shall be legibly marked in the blank space.
Substantiation: This requirement adds safety if additional circuits for future appliances are installed. Currently, these circuits are often not connected to circuit breakers or installed in a junction box at the load end.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
ZIEMAN, M.: The wording of the label proposed at new 551.47(S)(3) does not make sense. See 550.20(B) for a label for a similar application with wording which does make sense.

19-90 Log #1615 NEC-P19 **Final Action: Accept**
(551.54(C))

Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Make the following change in 551.54(C):
Change "neutral" to "grounded conductor." Delete "(neutral)"
The revised text would appear as follows:
(C) Insulated ~~Neutral~~ Grounded Conductor . The grounded circuit conductor ~~(neutral)~~ shall be insulated from the equipment grounding conductors and from equipment enclosures and other grounded parts. The grounded ~~(neutral)~~ circuit conductor terminals in the distribution panelboard and in ranges, clothes dryers, counter-mounted cooking units, and wall-mounted ovens shall be insulated from the equipment enclosure. Bonding screws, straps, or buses in the distribution panelboard or in appliances shall be removed and discarded. Connection of electric ranges and electric clothes dryers utilizing a grounded ~~(neutral)~~ conductor, if cord-connected, shall be made with 4-conductor cord and 3-pole, 4-wire grounding-type plug caps and receptacles.
Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).
The Task Group has proposed the following definitions to be added to Article 100:
● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.
● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.
This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals
● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.
● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.
Additional information is available in the Task Group report.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-91 Log #1043 NEC-P19 **Final Action: Reject**
(551.55(D) and (E))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:
(D) A connection between the one or more equipment grounding or bonding conductors brought into a nonmetallic ~~box~~ enclosure shall be so arranged that a connection can be made to any ~~fitting or device~~ equipment supported by or supplied from the enclosure that ~~requires grounding~~ is to be grounded or bonded .
(E) Where more than one equipment grounding or bonding conductor enters ~~a box~~ an enclosure all such conductors shall be in good electrical contact with each other, and the arrangement shall be that the disconnection or removal of ~~a receptacle, luminaire (fixture), or other device~~ any equipment supported by, or supplied from the enclosure will not interfere with or interrupt the grounding or bonding continuity.
Substantiation: Edit. Bonding conductors and enclosures other than boxes should be included. "Equipment" includes more than fittings or devices; proposal includes equipment supplied from the enclosure, but not in the enclosure. The rule should apply where grounding or bonding is done by choice, but not required. 250.1(1) indicates Article 250 applies to equipment "permitted" to be grounded.
Panel Meeting Action: Reject
Panel Statement: The definition in Article 100 for "Enclosure" does not pertain to boxes, cabinets or conduit bodies. A "box" pertains only to products described in Article 314. (See 19-85).
Adding the terms "and bonding" throughout 551.55 creates language that is not consistent with other Articles of the Code and does nothing to improve clarity of the section.
The requirement in 250.1(1) does apply here where grounding or bonding is done by choice.
No substantiation is given to include equipment other than fittings and devices.
In 551.55(D), "equipment supported by or supplied from the enclosure" is unnecessary language. The present language includes "any device or fitting in that box that requires grounding."
In 551.55(E), any device in the box is also fed from the box.
As for the submitter's last two sentences, it is unclear what part of 551.55(D)and(E) are being discussed.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-92 Log #2312 NEC-P19 **Final Action: Accept**
(551.60)

Submitter: Kent Perkins, Recreation Vehicle Industry Association / Rep. RVIA
Recommendation: Add text to the first sentence as follows:
Each recreational vehicle designed with a 120-volt or a 120/240-volt electrical system shall withstand the applied potential without electrical breakdown of a 1-minute, 900-volt AC or 1280 Volt DC dielectric strength test, or a 1-second, 1080 volt AC or 1530 volt DC dielectric strength test, with all switches closed between ungrounded and grounded conductors and the recreational vehicles ground.
Substantiation: DC dielectric test equipment is capable of testing AC circuits without disconnecting electric equipment before applying dielectric test voltage. This test equipment provides a safer test for workers in the area of a dielectric test because electrical equipment does not have to be disconnected and reconnected. This additional language provides a code reference allowing the use of this equipment.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-93 Log #2313 NEC-P19 **Final Action: Accept**
(551.60(4) (New))

Submitter: Kent Perkins, Recreation Vehicle Industry Association / Rep. RVIA
Recommendation: Add text to read as follows:
(4) GFCI test to demonstrate that the ground fault protection device(s) installed on the recreational vehicle are operating properly.
Substantiation: Currently, there is no requirement to assure that the GFCI protection device(s) is functioning properly.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-94 Log #1139 NEC-P19 **Final Action: Reject**
(Table 551.73)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:
DEMAND FACTORS FOR SITE FEEDERS AND SERVICE- ~~ENTRANCE~~ CONDUCTORS

Substantiation: Edit. The FPN for the definition of service-entrance conductors, underground system indicates there may be no service-entrance conductors.
Panel Meeting Action: Reject
Panel Statement: Based on definitions in Article 100, all service-entrance conductors are service conductors. Inclusion of the word "entrance" in the title is not incorrect and it does not create confusion. Removal of the word "entrance" does not to add clarity to applicability of the table.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-95 Log #1131 NEC-P19 **Final Action: Accept in Principle in Part (551.73(A) and (C))**

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:
Electrical services and feeders shall be calculated on the basis of not less than 9600 volt-amperes per site equipped with 50 ampere 120/208 volt or 120/240 volt supply facilities...(remainder unchanged).
The demand factors set forth in Table 551.73 shall be the minimum allowable demand factor that shall be permitted for calculating load for services and feeders. Where the electrical supply for a recreational vehicle site has more than one receptacle supplied by the same feeder the calculated load shall ~~only be calculated for~~ be permitted to be determined by the highest ampere rated receptacle.
Where the electrical is in a location that serves two recreational vehicles, the equipment for both sites ~~must~~ shall comply with 551.77 and the calculated load shall ~~only~~ be ~~computed for~~ permitted to be determined by the receptacle with the highest ampere rating.
Add to (C): Where the demand factors of Table 551.73 are applied the demand factors specified in 220.61(B) shall not be permitted.
Substantiation: Edit. Some recreational vehicle parks may have a 120/208 volt 3-phase service (see 551.40(A). Present wording prohibits a load calculation higher than the minimum required, which should be an option. "Highest rated" is not specific; is it volts, amperes, or volt-amperes? There is no apparent prohibition of use of demand factors in Table 551.73 and 220.6(B) which if applied could result in an undersized neutral.
Panel Meeting Action: Accept in Principle in Part
The panel Accepts in Principle"120/208 volt or", however, it revises it to read as follows:
"208Y/120-volt or".
The panel Accepts use of the word "shall" rather than the word "must."
The remainder of the Proposal is Rejected.
Panel Statement: The revision to "208/120-volt or" and "shall" is editorial in nature and correlates with language used elsewhere in the Code.
When the load is calculated for two RVs in the same location, the calculated load must include the two largest receptacles at that location.
The panel rejects additional language to 551.73(C) because 551.73(A) clarifies that the demand factors set forth in Table 551.73 shall be the minimum allowable demand factors permitted.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
WEAKLEY, K.: See my explanation of negative vote on Proposal 19-74.

19-96 Log #1187 NEC-P19 **Final Action: Accept in Principle in Part (551.73(A) and (C))**

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:
Electrical services and feeders shall be calculated on the basis of not less than 9600 volt-amperes per site equipped with 50 ampere 120/208 volt or 120/240 volt supply facilities...(remainder unchanged) The demand factors set forth in Table 551.73 shall be the minimum allowable demand factor that shall be permitted for calculating load for services and feeders. Where the electrical supply for a recreational vehicle site has more than one receptacle supplied by the same feeder the calculated load shall only ~~be calculated fo~~ r be permitted to be determined by the highest ampere rated receptacle.
Where the electrical is in a location that serves two recreational vehicles, the equipment for both sites shall comply with 551.77 and the calculated load shall ~~only~~ be ~~computed for~~ permitted to be determined by the receptacle with the highest ampere rating.
Add to (C): Where the demand factors of Table 551.73 are applied the demand factors specified in 220.61(B) shall not be permitted.
Substantiation: Edit. Some recreational vehicle parks may have a 120/208 volt 3-phase service (see 551.40(A)). Present wording prohibits a load calculation higher than the minimum required, which should be an option. "Highest rated" is not specific; is it volts, amperes, or volt-amperes? There is no apparent prohibition of use of demand factors in Table 551.73 and 220.6(B) which if applied could result in an undersized neutral.
Panel Meeting Action: Accept in Principle in Part
Panel Statement: See the panel action and statement on Proposal 19-95.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
WEAKLEY, K.: See my explanation of negative vote on Proposal 19-74.

19-97 Log #1104 NEC-P19 **Final Action: Accept in Principle in Part (551.73(D) and Exception (New))**

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:
Recreational vehicle site feeder conductors shall have ~~adequate~~ an ampacity ~~for~~ not less than the calculated loads supplied and shall be rated not less than 30 amperes. The ~~grounded~~ neutral conductors shall have ~~the same~~ an ampacity not less than the ungrounded conductors.
Exception: (no change).
Loads for other amenities such as, but not limited to, service buildings, recreational buildings, and swimming pools, shall be ~~sized~~ calculated separately, and then be added to the value calculated for the recreational vehicle sites where they are all supplied by ~~one~~ a common service.
Exception: A reduction in neutral ampacity shall be permitted in accordance with 220.22 for that portion of the calculated load permanently connected line-to-line to each ungrounded conductor, provided the demand factors in Table 551.73 have not been applied.
Substantiation: Edit. "Adequate" is to be avoided per Style Manual. Present wording does not permit a grounded conductor to have an ampacity greater than the ungrounded conductors. The phrase "not less than" is preferred terminology. "Calculated" is preferable to "sized" relating to ampacity. "One" service can be inferred as one (separate) service for each amenity listed. There doesn't seem to be a safety reason to not permit a reduction in neutral ampacity for permanently connected line-to-line loads (no neutral) associated with the "amenities".
Panel Meeting Action: Accept in Principle in Part
The panel accepts in principle the first and second sentence of the proposed wording to read as follows:
"Recreational vehicle site feeder-circuit conductors shall have an ampacity not less than the loads supplied and shall be rated not less than 30 amperes. The neutral conductors shall have an ampacity not less than the ungrounded conductors."
The panel accepts the changes submitted for the paragraph following Table 551.73, but rejects the proposed exception.
Panel Statement: The recommended language provides clearer sentence structure by removing "calculated" and "shall be rated."
The panel notes, there is no exception, only a fine print note.
Article 551 provides guidelines for load calculations in RV parks. Requirements in Article 551 modify those in Article 220. Article 220 is not applicable to 551.73. Any permitted reductions are given in Table 551.73.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-98 Log #1135 NEC-P19 **Final Action: Reject (551.75)**

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:
All ~~electrical equipment and installation for vehicle parks~~ exposed noncurrent-carrying metal parts shall be grounded as required by 250.10 ~~Article 250~~ .**Substantiation:** Edit. Electrical equipment includes such devices as fuses, circuit berakers, and other parts which are energized. 250.10 is more comprehensive and has exceptions which should be applicable.
Panel Meeting Action: Reject
Panel Statement: The recommended wording "All exposed noncurrent-carrying metal parts shall be grounded..." would indicate metal railings, fences, mail boxes and any other 'metal part' would need to be grounded. The submitter wants it grounded as in 250.10, but 250.10 is titled Protection of Ground Clamps and Fittings.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-99 Log #1621 NEC-P19 **Final Action: Reject (551.75 & 551.76, FPN)**

Submitter: John Powell, Independence, OR
Recommendation: Add new text as follows:
551.75 FPN: The use of a grounding electrode as provided in Article 250, Section 250.52, shall not be required for RV pedestals that are supplied by a common feeder.
Substantiation: The definition of structure in Article 100 and current requirement of 551.75, lead to the conclusion that RV pedestals that comply with 551.71, are to be treated as separate structures and therefore require grounding electrodes per 250.32. If this is truly the intent of the code making body, clarification of the requirement is needed. 551.76 seems to contradict 551.75.

Panel Meeting Action: Reject
Panel Statement: The panel agrees with the Submitter's conclusion that RV pedestals are to be treated as separate structures, and, therefore, require grounding electrodes per 250.32. 250.4(A)(1) provides the reasons for the use of a grounding electrode at each structure.
The addition of the FPN would conflict with the present requirements of the Article.
Section 551.76 restates some of the basic grounding requirements for clarification purposes. It also specifies that the exceptions in Article 250 for load side grounding or neutral connection to the equipment grounding conductor are not permitted in RV parks. This does not appear to be in conflict with 551.75.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-100 Log #1132 NEC-P19 **Final Action: Accept**
(551.76(A))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Delete "continuous" in the first sentence.
Substantiation: "Continuous" in many code context means unbroken; the last sentence permits splicing. Proposal removes ambiguity.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-101 Log #1084 NEC-P19 **Final Action: Accept**
(551.76(C) and (D))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Change "neutral" to "grounded" in the heading and text.
Substantiation: Edit. Sites equipped with only a 20 ampere 125-volt receptacle may be supplied by a 2-wire circuit without a "neutral". This section should also apply in that case.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-102 Log #2413 NEC-P19 **Final Action: Accept**
(551.76(D))

TCC Action: It was the action of the Technical Correlating Committee that the proposal be reconsidered and the panel consider correlating with the Code-Making Panel 5 action on Proposal 5-119 relative to an exception for existing installations. This action will be considered by the panel as a public comment.
Submitter: Mike Holt, Mike Holt Enterprises
Recommendation: Revise text to read:
551.76 Grounding – Recreational Vehicle Site Supply Equipment.
(A) Exposed Non-Current-Carrying Metal Parts. Exposed non-current-carrying metal parts of fixed equipment, metal boxes, cabinets, and fittings that are not electrically connected to grounded equipment shall be grounded by a continuous equipment grounding conductor run with the circuit conductors from the service equipment or from the transformer of a secondary distribution system. Equipment grounding conductors shall be sized in accordance with 250.122 and shall be permitted to be spliced by listed means.
The arrangement of equipment grounding connections shall be such that the disconnection or removal of a receptacle or other device will not interfere with, or interrupt, the grounding continuity.
(B) Secondary Distribution System. Each secondary distribution system shall be grounded at the transformer.
(C) Neutral Conductor Not to Be Used as an Equipment Ground. The neutral conductor shall not be used as an equipment ground for recreational vehicles or equipment within the recreational vehicle park.
(D) No Connection on the Load Side. No connection to a grounding electrode shall be made to the neutral conductor on the load side of the service disconnecting means except as covered in 250.30(A) for separately derived systems. ~~and 250.32(B)(2) for separate buildings.~~
Substantiation: This is a companion proposal to my proposal to delete 250.32(B)(2). If 250.32(B)(2) is deleted as I am requesting, this section will need to be revised as well.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-103 Log #943 NEC-P19 **Final Action: Accept in Part**
(551.78(A))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise text:
All switches, circuit breakers receptacles, ~~control~~ <u>electrical</u> equpment and metering devices located in wet locations ~~or outside of a building~~ shall be ~~rainproof~~ <u>weatherproof</u> ~~equipment~~ .
Substantiation: Edit. Equipment should not be limited to control type. "Weatherproof" is more encompassing. The FPN to the definition of weatherproof indicates rainproof is suitable where snow, ice, dust, or temperature extremes are NOT a problem. All locations outside of a building are not wet locations. Present wording doesn't include structures which are not "buildings."
Panel Meeting Action: Accept in Part
The panel Rejects replacing "control equipment" with "electrical equipment", and Accepts the remainder of proposal.
Panel Statement: The term "electrical equipment" would expand the requirement beyond that which is intended by this section.
The definition of "weatherproof" adequately addresses the deletion of the term "rainproof equipment" in accordance with the definition in Article 100.
The deletion of "outside of a building" is acceptable as the section title is evident to this location.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-104 Log #3435 NEC-P19 **Final Action: Reject**
(551.79)

Submitter: Aaron Richter, Saranac, MI
Recommendation: Revise text to read:
Clearance for Overhead Conductors. Open conductors of not over 600 volts, ~~nominal,~~ <u>measured from phase to ground</u> .
Substantiation: What is nominal? Nominal is mentioned all over the code and yet there is no definition for it. Therefore, I am suggesting that we change the wording so we know how the 600 volts is to be measured.
Panel Meeting Action: Reject
Panel Statement: The current language parallels language used in other sections of the code such as 230.24 for services and 215.18 and 215.19 for feeders.
"Voltage, nominal" is defined in Article 100.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-105 Log #1934 NEC-P19 **Final Action: Accept**
(551.80(B))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be sent to Code-Making Panel 8 for comment.
Submitter: William Wagner, Certification Solutions
Recommendation: Revise 551.80(B) as follows:
(B) Protection Against Physical Damage. Direct-buried conductors and cables entering or leaving a trench shall be protected by rigid metal conduit, intermediate metal conduit, electrical metallic tubing with supplementary corrosion protection, rigid nonmetallic conduit, liquid tight flexible nonmetallic conduit, liquid tight flexible metal conduit, or other approved raceways or enclosures. Where subject to physical damage, the conductors or cables shall be protected by rigid metal conduit, intermediate metal conduit, or Schedule 80 rigid ~~nonmetallic~~ <u>PVC</u> conduit. All such protection shall extend at least 450 mm (18 in.) into the trench from finished grade.
Substantiation: This is a companion proposal for the new definition of Rigid Nonmetallic Conduit in Article 100 and the revised Article 352 for Type PVC Conduit. It clarifies that rigid polyvinyl chloride conduit is designated as Type PVC, rather than the broader designation of rigid nonmetallic conduit (Type RNC) which includes PVC, HDPE and RTRC. It will also result in consistent terminology for this product throughout the code.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 552 — PARK TRAILERS

19-105a Log #CP1900 NEC-P19 **Final Action: Accept**
(552.44(D))

Submitter: Code-Making Panel 19,
Recommendation: Make the following revision to 552.44(D)
"THIS CONNECTION IS FOR <u>208Y/120-VOLT OR</u> 120/240-VOLT AC, 3-POLE, 4-WIRE, 60 HZ, ______ AMPERE SUPPLY.
The correct ampere rating shall be marked in the blank space."
Substantiation: The revision was made to correlate with the changes made in Proposal 19-74.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
WEAKLEY, K.: See my explanation of negative vote on Proposal 19-74.

19-106 Log #1508 NEC-P19 **Final Action: Accept in Principle**
(552.10(C)(4))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise last sentence:
In the event where the ~~power~~ unbonded lead from the battery exceeds 8 AWG the bonding conductor shall be of an equal or greater larger size.
Substantiation: Edit. All leads supply power. The bonding conductor should be permitted to be a larger size, not limited to equal.
Panel Meeting Action: Accept in Principle
Revise the proposed wording to read as follows:
"In the event the unbonded lead from the battery exceeds 8 AWG, the bonding conductor size shall be not less than that of the unbonded lead."
Panel Statement: The new language maintains the intent of the change while using the types of wording recommended in 3.2.2 of the NEC Style Manual.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-106a Log #CP1901 NEC-P19 **Final Action: Accept**
(552.47)

Submitter: Code-Making Panel 19,
Recommendation: Make the following revisions to 552.47 Calculations to read as follows:
"The following method shall be employed in computing the supply-cord and distribution-panelboard load for each feeder assembly for each park trailer in lieu of the procedure shown in Article 220 and shall be based on a 3-wire, 208Y/120-volt or 120/240-volt supply with 120-volt loads balanced between the two phases of the 3-wire system."

Substantiation: The revision was made to correlate with the changes made in Proposal 19-74.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
WEAKLEY, K.: See my explanation of negative vote on Proposal 19-74.

19-107 Log #1547 NEC-P19 **Final Action: Accept in Principle**
(552.48(L))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be sent to the Technical Correlating Committee Grounding and Bonding Task Group for comment.
Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Delete the term "effectively" from the terms "effectively grounded" and "effectively bonded" from Articles 552 and revise text as shown for the affected NEC sections.
552.48(L): (L) Metal Faceplates Effectively Grounded. Where metal faceplates are used, they shall be grounded by contact with the grounded mounting strap of the device ~~effectively grounded~~ .
Substantiation: 552.48(L): The definition of "effectively grounded" is ambiguous and very subjective without any defined values or parameters for one to judge as either "effective" or "ineffective." This section has been revised to prescribe the connection of the faceplate to the equipment grounding conductor by contact with the device mounting strap connected to the equipment grounding conductor.
This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to delete the term "grounded, effectively" and its definition from Article 100 and other companion proposals throughout the NEC relative to this Task Group's recommendations. The substantiation of this proposal is as follows.
The term "Effectively Grounded" is used 29 times in the NEC. It appears as though in the majority of the locations where it is used, the word "grounded" or phrase "connected to an equipment grounding conductor" could be used. Other proposals are submitted to make those changes.
The 1996 NEC in Section 250.51 used the term "effective grounding path," and those concepts were incorporated in 250.2 (1999 NEC) and then expanded in 250.4(A) and (B) in the 2002 NEC. The performance criteria of grounding and bonding are currently provided in Section 250.4 and include the concepts contained in the vague definition of the term "effectively grounded."
The definition "Effectively Grounded" is very subjective and without any defined values or parameters for one to judge grounding as either "effective" or "ineffective." "Effective" is described in Section 250.4(A) and (B), but it relates to the effective ground-fault current path as a performance criteria. Deleting the term in the NEC and the definition is logical because there are no definitive parameters for Code users to make a determination on what constitutes "effectively grounded." Systems are solidly grounded, grounded through a resistor or impedance, or ungrounded. Equipment (normally noncurrent-carrying metal parts are grounded where connected to an equipment grounding conductor.
This proposal is to change the term "Effectively Bonded" to just "Bonded" in each of the section where it is used. The term "Effectively Bonded" is currently not defined in the NEC.
The term "effectively bonded" is also used a few times in the NEC and is undefined. The same situation exists. There are no defined parameters for Code users to judges what the difference between "Effectively Bonded" and "Bonded" really is. Where the term appears in the NEC, it is revised to just "bonded" and still has the same meaning in each rule.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Revise the proposed wording to read:
"552.48(L) Metal Faceplates Grounded. Where metal faceplates are used, they shall be grounded."
Panel Statement: This is identical to the language used in 406.5(B). There is no need to be more prescriptive as to the method of grounding.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-108 Log #1045 NEC-P19 **Final Action: Accept**
(552.48(M))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Add "or Type MI cable" after "rigid nonmetallic conduit".
Substantiation: Type MI cable is a suitable wiring method and permitted by 552.48(A) and 551.47(A), and noted in 552.56(C). It is resistant to damage and corrosion, and not restricted to number of bends (which may require pull points), proposal clarifies that it is a cable identified for the application. It is permitted for mobile homes by the exception for 550.15(H).
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-109 Log #951 NEC-P19 **Final Action: Accept in Part**
(552.54(C))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:
Outdoor luminaires (fixtures) and other utilization equipment shall be listed for outdoor use or wet locations.
Substantiation: Edit. "Other equipment" is not specific and includes wiring methods covered in 552.48(M) which are not specifically listed for "outdoor" use. Outdoor fixtures are generally listed for wet locations.
Panel Meeting Action: Accept in Part
The panel Rejects changing "other equipment" to "other utilization equipment".
The panel Accepts in Principle adding "wet locations". The revised wording will now read as follows:
"Outdoor luminaires (fixtures) and other equipment shall be listed for outdoor use or wet locations."
Panel Statement: The deletion of the term utilization would expand the requirement beyond that which is intended by this section.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

19-110 Log #1616 NEC-P19 **Final Action: Accept**
(552.55(C))

Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Make the following change in 552.55(C):
Change "neutral" to "grounded conductor." Delete "(neutral)"
The revised text would appear as follows:
(C) Insulated ~~Neutral~~ Grounded Conductor . The grounded circuit conductor ~~(neutral)~~ shall be insulated from the equipment grounding conductors and from equipment enclosures and other grounded parts. The grounded ~~(neutral)~~ circuit conductor terminals in the distribution panelboard and in ranges, clothes dryers, counter-mounted cooking units, and wall-mounted ovens shall be insulated from the equipment enclosure. Bonding screws, straps, or buses in the distribution panelboard or in appliances shall be removed and discarded. Connection of electric ranges and electric clothes dryers utilizing a grounded ~~(neutral)~~ conductor, if cord-connected, shall be made with 4-conductor cord and 3-pole, 4-wire, grounding-type plug caps and receptacles.
Substantiation: This proposal was developed by the TCC Task Group on the definition of "Neutral Conductor." Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).
The Task Group has proposed the following definitions to be added to Article 100:
● **Neutral conductor.** A circuit conductor connected to the neutral point of a system.

● **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals

● The use of the word "neutral" as a noun should be avoided. The terms "neutral conductor" or "neutral point" should be used wherever grammatically possible.

● The phrase "grounded circuit conductor (neutral)" should be avoided. The phrases "grounded circuit conductor" or "grounded circuit conductor or neutral conductor" should be used as appropriate.

Additional information is available in the Task Group report.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

19-111 Log #1159 NEC-P19 **Final Action: Accept in Principle in Part**
(552.56(B), (C), (D), and (E))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Delete present text of (B) and substitute:

EQUIPMENT GROUNDING and BONDING CONDUCTORS. Equipment grounding and bonding conductors shall comply with 250.119 and other applicable provisions of this code.

Revise (C):

GROUNDING and BONDING ~~of ELECTRICAL EQUIPMENT~~ Where grounding or bonding ~~of electrical equipment~~ is done ~~specified~~ it shall be permitted as follows:

(1) Connection of metal raceway approved for grounding (~~conduit or electrical metallic tubing~~), the sheath of Type MI ~~MC~~ cable, and Type MC cable where the ~~sheath~~ covering is identified for grounding or the armor of Type AC cable, to metal enclosures.

(2) A connection between ~~the one or more~~ wire type grounding or bonding conductor s by means of a grounding screw which shall be used for no other purpose, or a listed grounding device. Sheet metal screws shall not be used for this purpose . The equipment grounding conductor ~~in nonmetallic sheathed cable~~ shall be permitted to be secured under a screw threaded into the luminaire (fixture) canopy, other than a mounting screw or cover screw, or shall be attached to a listed grounding means (plate) in a nonmetallic outlet box for luminaire (fixture) mounting... Sheet metal screws shall not be used for this purpose.

(3) The equipment grounding conductor in ~~nonmetallic sheathed cable~~ shall be permitted to be secured under a screw threaded into the luminaire (fixture) canopy, other than a mounting screw or cover screws, or shall be attached to a listed grounding means (plate) in a nonmetallic box for luminaire (fixture) mounting. Sheet metal screws shall not be used for this purpose . (~~grounding means shall also be permitted for luminaire (fixture) attachment screws.)~~

Revise (D):

GROUNDING CONNECTION in NONMETALLIC ENCLOSURE ~~BOX~~ A connection between the ~~one or more~~ grounding or bonding conductors brought into a nonmetallic enclosure ~~outlet box~~ shall be arranged so that a connection can be made to any ~~fitting or device~~ equipment ~~in~~ supported by, or supplied from the enclosure ~~required~~ that is to be grounded.

Revise (E):

GROUNDING and BONDING CONTINUITY. Where more than one equipment grounding or bonding conductor of a branch circuit enters ~~a box~~ an enclosure all such conductors shall be in good electrical contact with each other, and the arrangement shall be such that the disconnection or removal of ~~a receptacle, fixture, including a luminaire or other device~~ equipment supported by the enclosure or supplied from the enclosure ~~box~~ , will not interfere with, or disrupt the grounding or bonding continuity.

Substantiation: Edit. Bonding should also be covered and not limited to electrical equipment (see 552.47). The requirements should apply where grounding and bonding are done by choice and not required. 250.1 indicates Article 250 covers equipment permitted to be grounded. In (C)(3), wiring methods other than NMSC as permitted in 552.48(A) should be included. In (C)(1), metal raceways other than conduit and EMT are permitted for grounding. Sheet metal screws should be excluded for grounding. The proposal for (D) is more comprehensive. In (B), wires are only green when corroded, covering is usually what may be green.

Panel Meeting Action: Accept in Principle in Part

The Panel Accepts in Principle the wording in the proposal revised to read as follows:

"552.56(B) Equipment Grounding Conductors. Bare conductors or conductors with insulation or individual covering that is green or green with one or more yellow stripes shall be used for equipment grounding conductors only."

The panel Rejects the remainder of the proposed changes.

Panel Statement: The panel agrees with the submitter that the wires are not green or green wires with a yellow stripe(s) (552.56(B)), but prefers language parallel to similar Code sections as recommended by 3.3.5 in the NEC Style Manual.

Adding the terms "and bonding" throughout 552.56 creates language that is not consistent with other articles of the code and does nothing to improve clarity of the section. In addition, 552.47 in no way limits bonding to electrical equipment, as the submitter suggests.

The language referring to 250.119 and the language restricting use of sheet metal screws already applies unless modified in Article 552 as per 90.3.

Addition of the words "approved for grounding" in 552.56(C)(1) is redundant and does not improve clarity of the section.

The remainder of the changes in 552.56(C)(1) and those in 552.56(C)(2) and 552.56(E) are unsubstantiated.

"More comprehensive" language is not a technical substantiation to warrant the changes in 552.56(D).

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

19-112 Log #599 NEC-P19 **Final Action: Reject**
(552.60(B))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.

Submitter: Joel Creek, Skyline Corporation

Recommendation: Revise text to read as follows:

(B) Low-Voltage Circuits. ~~Low-voltage circuit conductors in each park trailer shall withstand the applied potential without electrical breakdown of a 1 minute, 500 volt or a 1 second, 600 volt dielectric strength test. The potential shall be applied between the ungrounded and grounded conductors.~~

~~The test shall be permitted on running light circuits before the lights are installed, provided the unit's outer covering and cabinetry have secured. The braking circuit shall be permitted to be tested before being connected to the brakes, provided the wiring has been completely secured.~~

An operational test of low-voltage circuits shall be conducted to demonstrate that all equipment is connected and in electrical working order. This test shall be performed in the final stages of production after all outer coverings and cabinetry have been secured.

Substantiation: The low-voltage testing requirement for recreational vehicles and park trailers are not consistent with each other. Recreational vehicles require an operational test of all low-voltage circuits per 8-1 of the ANSI/RVIA 12V 2005 edition and park trailers require a dielectric test of low-voltage circuit conductors per 552.60(B) of NFPA 70 2005 edition. The low-voltage dielectric test requirement for recreational vehicles was removed and replaced with an operational test in 551.60(B) in the 2002 edition of NFPA 70 but the low-voltage dielectric test was not removed and replaced with an operational test in 552.60(B).

Panel Meeting Action: Reject

Panel Statement: While the panel is sympathetic to the submitter's desire for consistent requirements, the proposal is too broad and does not represent the same prescriptive detail to ensure consistency and repeatability of the test method.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 7 Negative: 5

Explanation of Negative:

FINCH, J.: The proposal submitted by Joel Creek would make the testing procedure of low voltage systems for Park Trailer consistent with the testing procedure for recreational vehicles. The testing procedure for Recreational Vehicles was changed in the NEC 1999 to the wording that was used by Mr. Creek and that method was used through the NEC 2002 cycle (6 years).

Article 552 Park Trailers was added to the NEC in 1996. Until that time, Park Trailers fell under the jurisdiction of Article 551. Article 552 was modeled after Article 551 when it was written into the National Electrical Code. Why the wording for low voltage testing in Article 552 was not changed in 1999 to be consistent with Article 551, I do not know.

In the NEC 2005, 551.60(B) was removed from the National Electrical Code and it was deferred to the "ANSI/RVIA Standard for Low Voltage Systems in Conversion and Recreational Vehicles." The wording, in this document, for low voltage testing, 8-1 Operational Test, is as follows:

8-1 Operational Test. An operational test of all low voltage circuits shall be conducted to demonstrate that all equipment is connected and in electrical working order. This test shall be performed after all production activities that may damage conductors such as installation of fasteners or hole cutting, have been completed.

This is consistent with the wording of 551.60(B) in the NEC 1999 and NEC 2002 which is the wording used in Mr. Creek's proposal.

There are manufacturers who build both Recreational Vehicles and Park Trailers and to require these manufacturers to use different tests for similar products is inconsistent and confusing. I would ask members of Panel 19 to reconsider Proposal 19-112 and accept it.

HOPKINS, B.: This proposal should be accepted considering the proposed change is identical to the language approved by CMP-19 for recreational vehicles, 551.60(B) in the 1999 edition of the NEC. (Ref. 19-117-log #660, page 50 of the A98 ROP). The change was permitted on the bases that many of the low-voltage DC components must be removed from the system prior to testing to prevent component damage. Further, this test is not required by the automotive manufacturers, or in housing for the 120-volt systems. Additionally, the small number of faults that are detectable by high potential testing in reality cause no safety threat. High potential testing can only detect faults that may occur, but may never manifest themselves. If they do, there is the required over current protection in place for protection.

Additionally, the Panel statement indicates that this proposal is too broad and does not represent the same prescriptive detail to ensure consistency and repeatability of the test method. This requirement covers and “operational test” that means it is strictly a test to demonstrate if all equipment is in working order. In other words, the test is to determine if everything is operational, which should address the concern of “consistency and repeatability.” In addressing this change for RVs under the 1999 NEC, CMP-19 referenced the language of 550-12(b)(2) [now 550.17(B)(2)].

There are many recreational vehicle manufacturers who also build park trailers and they should not be required to conduct two different tests on 12 volts systems that are virtually the same.

MIKEL, J.: This proposal should be accepted. The exact wording for this proposal was contained within 551.60(B) of the 1999 and 2002 editions of NFPA 70. The high-voltage conductor insulation resistance test was removed from earlier editions of the standard because many of the components of the 12 volt system had to be removed prior to testing to prevent damage. The 2005 edition of the NEC removed the low-voltage requirements for recreational vehicles and replaced them by referencing ANSI/RVIA 12V-2005 which specifies an operational test rather than a dielectric test.

We cannot agree with the panel statement that “The proposal is too broad and does not represent the same prescriptive detail to ensure consistency and repeatability of the test method”. We believe that an “operational test” is very simple and should need no additional definition or explanation. It is as simple as turning it off or on and determining whether it performs as intended.

MILLER, T.: This proposal should be accepted considering the proposed change is identical to the language approved by CMP-19 for recreational vehicles, Section 551.60(B) in the 1999 edition of the NEC (Ref. 19-117-Log #660, page 50 of the A98 ROP). The change was permitted on the bases that many of the low-voltage DC components must be removed from the system prior to testing to prevent component damage. Further, this test is not required by the automotive manufacturers, or in housing for the 120-volt systems. Additionally, the small number of faults that are detectable by high potential testing in reality cause no safety threat. High potential testing can only detect faults that may occur, but may never manifest themselves. If they do, there is the required overcurrent protection in place for protection.

Additionally, the panel statement indicates that this proposal is too broad and does not represent the same prescriptive detail to ensure consistency and repeatability of the test method. This requirement covers an “operational test” that means it is strictly a test to demonstrate if all equipment is in working order. In other words, the test is to determine if everything is operational, which should address the concern of “consistency and repeatability.” In addressing this change for RVs under the 1999 NEC, CMP 19 referenced the language of 550-12(b)(2) [now 550.17(B)(2)].

There are many recreational vehicle manufacturers who also build park trailers and they should not be required to conduct two different tests on 12 volts systems that are virtually the same.

ZIEMAN, M.: I change my vote to negative. As stated in the other four Explanations of Negative Vote, the original proposal should be accepted.

ARTICLE 553 — FLOATING BUILDINGS

19-113 Log #1074 NEC-P19 **Final Action: Reject**
(553.6)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise text to read as follows:

Each floating building shall be supplied by not more than one set of feeder conductors from each of the services specified or permitted in 230.2 ~~its service equipment.~~

Substantiation: Edit “service equipment” is singular implying only one service. Large floating buildings such as casinos may have different classes of service.

Panel Meeting Action: Reject

Panel Statement: No technical substantiation has been provided to indicate a need for different classes of service in a floating building. The exception to 553.6 does allow for multiple services where the floating building has multiple occupancy. 553.6 intentionally modifies 230.2 providing a stricter requirement due to the nature of floating buildings.

Number Eligible to Vote: 7
Ballot Results: Affirmative: 7

19-114 Log #961 NEC-P19 **Final Action: Accept**
(553.9)

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal relative to its action on Proposal 19-115. This action will be considered by the Panel as a Public Comment.
Submitter: Daniel Leaf, Seneca, SC
Recommendation: In the last sentence change “circuit” to “conductor.”
Substantiation: Edit. Neutral circuit is not defined.
Panel Meeting Action: Accept
Number Eligible to Vote: 7
Ballot Results: Affirmative: 7

19-115 Log #1617 NEC-P19 **Final Action: Accept**
(553.9)

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal relative to its action on Proposal 19-114. This action will be considered by the Panel as a Public Comment.
Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Make the following change in 553.9:

Change “neutral” to “grounded conductor” in title. Delete “(neutral).” Replace “neutral” with “grounded” and add “conductor” in the last sentence.

The revised text would appear as follows:

553.9 Insulated ~~Neutral~~ Grounded Conductor . The grounded circuit conductor ~~(neutral)~~ shall be an insulated conductor identified in conformance with 200.6. The neutral conductor shall be connected to the equipment grounding terminal in the service equipment, and, except for that connection, it shall be insulated from the equipment grounding conductors, equipment enclosures, and all other grounded parts. The ~~neutral~~ grounded circuit conductor terminals in the panelboard and in ranges, clothes dryers, counter-mounted cooking units, and the like shall be insulated from the enclosures.

Substantiation: This proposal was developed by the TCC Task Group on the definition of “Neutral Conductor.” Task Group members were: Jeffrey Boksiner (Chair) (CMP 5, TCC), Paul Dobrowsky (CMP 5), Walter Skuggevig (CMP 5), Doug White (CMP 5), Michael Toman (CMP 2, TCC), Bob Wilkinson (CMP 2), Jim Daly (CMP 6, CMP 7, TCC), Bill Laidler (CMP 6), and Oran Post (CMP 6).

The Task Group has proposed the following definitions to be added to Article 100:

- **Neutral conductor.** A circuit conductor connected to the neutral point of a system.
- **Neutral point.** The common point of a wye-connection in a polyphase system or midpoint of a single-phase, 3-wire system or midpoint of a single-phase portion of a 3-phase delta system or midpoint of a 3-wire, direct-current system.

This is a correlating proposal to provide uniform usage of the terms in the NEC in accordance with the proposed definitions. The Task Group used the following guidelines to develop correlating change proposals

- The use of the word ”neutral” as a noun should be avoided. The terms “neutral conductor” or “neutral point” should be used wherever grammatically possible.
- The phrase “grounded circuit conductor (neutral)” should be avoided. The phrases “grounded circuit conductor” or “grounded circuit conductor or neutral conductor” should be used as appropriate.

Additional information is available in the Task Group report.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept
Number Eligible to Vote: 7
Ballot Results: Affirmative: 7

ARTICLE 555 — MARINAS AND BOATYARDS

19-116 Log #817 NEC-P19 **Final Action: Reject**
(555.1)

TCC Action: The Technical Correlating Committee directs the panel to reconsider the proposal at the public comment phase based on its technical merits. Although the Scope of NFPA 303 is limited to other than single family applications, there is no procedural reason why Code-Making Panel 19 cannot develop or apply electrical rules to single family applications if they desire to do so. This action will be considered by the panel as a public comment.
Submitter: Vincent Metallo, Sr., Baltimore County Government
Recommendation: Revise text to read as follows:

Private, noncommercial docking facilities constructed or occupied for the use of the owner or residents of the associated single family dwelling are (~~not~~) covered by (~~this article~~)

Private noncommercial docking facilities constructed or occupied for the use of the owners or residents of the associated single family dwelling are covered by (555.9, 555.13(A)(1), 555.15(A), (B), (C), (D), (E) and 555.19(B)(1)) .

Substantiation: There is a need for code requirements for single family dwellings at pier locations. These articles to be included in the proposal would add a needed level of safety for pier wiring and wiring methods. There are no height requirements for connections, receptacles, and wiring methods to ensure safety on piers. There have been several installations in our area that problems have occurred with corrosive connections and electrical problems. The level of safety exists out on piers whether the pier is for commercial or dwelling use. The change made to exclude these occupancies have created an enforcement problem.

Panel Meeting Action: Reject

Panel Statement: The scope of Article 555 is based on NFPA 303, which is written for other than single-family dwelling docks.

The panel recognizes that the Scope is established by the NEC Technical Correlating Committee.

The panel suggests that the Technical Correlating Committee refer this proposal to the NFPA 303 Technical Committee for comment.

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

19-117 Log #134 NEC-P19 **Final Action: Accept in Principle**
(555.9)

Submitter: David Fecitt, P.E., Anchor Engineering Consultants, Inc. / Rep. Bellingham Marine Industries, Inc.

Recommendation: Revise as follows:

555.9 Electrical connections. All electrical connections shall be located at least 305 mm (12 in.) above the deck of a floating pier. All electrical connections shall be located at least 305 mm (12 in.) above the deck of a fixed pier but not below the electrical datum plane. <u>Wire-to-wire splices utilizing sealed, waterproof connections and insulation shall be acceptable for use in pullboxes located above the waterline but below the electrical datum field for engineered, concrete floating docks and piers.</u>

Substantiation: The use of sealed, waterproof wire-to-wire splices in wet locations is common practice and allowable under the NFPA 70 110.14 (B). The exclusion of utilizing wire-to-wire splices for engineered concrete floating docks is impractical in many instances and places undue hardship on the owner and installing contractor with no additional safety benefit. Corrosion and insulation degradation is not an issue if the splice is designed and installed for marine environments. By limiting the use of wire-to-wire splices to engineered concrete floating piers and docks, substandard wood and other nonengineered type floating docks would be excluded. Engineered concrete floating docks and piers are designed to respond to wave action that limits or eliminates water splashing on the deck and junction boxes located in the dock sections, even in storm conditions. They are typically not located in areas that would have high surf as that would damage the connection system and dock/pier.

Panel Meeting Action: Accept in Principle

Revise the proposed wording to read as follows:

"555.9 Electrical Connections. Electrical connections shall be located at least 305 mm (12 in.) above the deck of a floating pier.

Conductor splices, within Type 6P junction boxes, utilizing sealed wire connector systems listed for this application shall be permitted where located above the waterline, but below the electrical datum field for floating piers.

All electrical connections shall be located at least 305 mm (12 in.) above the deck of a fixed pier, but not below the electrical datum plane."

Panel Statement: The revised wording addresses the submitter's recommendations and more fully addresses the system components.

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

19-118 Log #1100 NEC-P19 **Final Action: Reject**
(555.10(A) Exception (New))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Delete: "Independent of any conduit connecte to them."

Add:

Exception: Conduit bodies shall be permitted to be supported in accordance with 314.23(E), Exception.

Substantiation: Edit. "Substantially supported by structural members" makes the proposed to be deleted phrase superfluous. This section modifies 314.23(E) and since conduit bodies don't generally have external lugs or ears infers that holes must be drilled in them for internal screws.

Panel Meeting Action: Reject

Panel Statement: No technical substantiation has been provided to justify allowing conduit to support electrical equipment enclosures. A general installation as covered in 314.23(E) is not as likely to be subject to damage as are installations in marinas and boatyards. The Exception to 314.23(E) should not be allowed for these installations.

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

19-119 Log #931 NEC-P19 **Final Action: Reject**
(555.12)

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Add:

<u>Where demand factors are applied there shall be no reduction of neutral ampacity as permitted in 220.22</u> .

Revise Note 1:

Where shore power accommodations provide two or more receptacles for an individual boat slip and these receptacles have different <u>ratings</u> ~~voltages (for example one 30 ampere, 125 volt and one 50 ampere 125/250 volt)~~ <u>and supplied from a common feeder or service,</u> only the receptacle with the largest ~~kilowatt~~ <u>volt-ampere load capacity</u> shall be required to be calculated.

Substantiation: Edit. There is no prohibition against use of Table 555.12 demand factors in conjunction with 220.22, which in essence allows a demand factor applied to a demand factor (neutral reduced ampacity). The exemption from load calculation should be predicated on receptacles being supplied by the same source. Where supplied by two or more services, this provision should not apply. There is no feasible way for an AHJ to determine the larger kilowatt demand without evaluating the equipment, load and power factor of the boat to be connected, which may be a transient vessel.

Panel Meeting Action: Reject

Panel Statement: The panel recognizes that 220.22 is the incorrect section (See action on Proposal 19-120).

The general requirement in 555.12 already specifies "for each service and/or feeder" so this language does not need to be repeated in the Notes.

The AHJ does not need to evaluate the equipment, load and power factor of the boat to determine which of two receptacles allows the larger kilowatt demand if performing the calculations based on Article 220.

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

19-120 Log #1058 NEC-P19 **Final Action: Accept**
(555.12)

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Insert "Part III" ahead of "Article 220".

Add: Where demand factors of Table 555.12 are applied, the demand factor specified in 220.61(B) shall not be permitted.

Substantiation: Edit. Application of Table 555.12 and 220.61(B) essentially results in a double application of demand factors which could result in an undersized neutral.

Panel Meeting Action: Accept

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

19-121 Log #686 NEC-P19 **Final Action: Reject**
(555.13(A)(2)(1)(2))

Submitter: Vincent Metallo, Sr., Baltimore County Government

Recommendation: Delete the following:

~~(1) As permanent wiring on the undesired of piers (floating or fixed).~~

~~(2) Where flexibility is necessary an on piers compressed of floating sections.~~

Substantiation: Portable power cables are listed by Underwriters Laboratories to be used to "supply power to mobile equipment and machinery" and to be "used in accordance with Article 400 of the National electrical Code." I received product data sheets from several manufacturers that were providing portable power cables to contractors that were to be installed for permanent power to piers. These product data sheets state for application use: for portable power supply for various types of portable equipment. (See data sheets and listing information). The problem is that portable power cables are only intended to be used for portable power for various types of machinery and not as a permanent power feeder connected to a panelboard overcurrent device feeding a marina pedestal panelboard. Underwriters Laboratories has a cable listed specifically as flexible branch circuit and feeder wiring in marinas and boatyards in accordance with Article 555 of the National Electrical Code. I feel this change should be made for safety reasons and a reference to a specific type of cable should not be made as its use would be in accordance with listing and manufacturers' installation instructions and recommendations.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The substantiation provided by the submitter would seem to infer that he wants to delete all of the text in 555.13(A)(2) Portable Power Cables.

This is not, however, what is recommended by the submitter. The panel is, therefore, unclear as to the submitter's actual intent and does not support the elimination of this wiring method.

Ballot Results: Affirmative: 8

19-124 Log #152 NEC-P19 **Final Action: Reject**
(555.19(A)(4))

Submitter: Donald Spencer, Bainbridge, WA
Recommendation: Revise as follows:
Receptacles that provide shore power for boats shall be rated not less than 30 amps and shall be single outlet type <u>and shall be ground fault protected with a trip current rating of 100 mo.</u>
Substantiation: New circuit breakers suggested for marinas in salt water.
There is a significant problem in marinas with regard to corrosion. If a boat has been wired properly with no equipment malfunctions, there should be no inordinate corrosion of propellers, rudders, out drives, etc. In the past several years several of my fellow boaters have been victims of other peoples electrical grounding problems to the tune of $4000 plus each, in the form of dissolved propellers, shafts, underwater fittings, etc. After measuring the direction of voltage drops in the water, the source of the stray current was found. This is both time consuming and requires experienced people. In talking with other professionals who have encountered similar problems in other marinas, I found this problem is endemic and very expensive for the marinas, boat owners and the insurance companies. Divers who clean the boat bottoms and change zincs in marinas have all experienced the effect of fault currents in the water (not pleasant). I know of no fatalities so far.
The problem occurs in a boat when 120 volt power is drawn from shore power and returned to shore power via the salt water, which in turn gets back to the shore power grid via another boat or boats. When the electrical current leaves or enters a boat it does so via the boats metal parts in the water. Where this occurs the metal is eaten up at a rate proportional to the products of current and time. Hence a boat, which has no electrical faults and is properly, wired could fall victim to another boats ground currents. The nasty part of this occurs when the weather gets cold and boat owners install heaters, battery chargers etc. and don't visit their boat regularly. This results in sunken and extensively damaged boats. Further compounding the problem for people who locate the source of an offending heater (improperly wired by the owner), the thermostat will be off during the day because its warmer and less heat is required, therefore it emits no current in the water. Just as frustrating is the current cycling on and off while trying to locate it.
In an attempt to protect themselves from faults on neighboring boats, boat owners disconnect the green wire from the shore power entrance after verifying that they do not have any ground faults. Not only is this a very dangerous method, but it also does not totally solve the problem. When an electrical current flows in salt water there is a voltage drop in the direction the current is going. For an electrically isolated boat adjacent to the source boat, the current will enter one propeller and exit the other casing both propellers on that boat to be damaged because the water is at a different potential for each propeller causing a current to flow from propeller to propeller. The electrical resistance between the propellers via the boat's shafting and grounding system is considerably less than the salt water, causing the electrical current to flow from propeller to propeller within the boat. It also becomes obvious here, even a very expensive isolation transformer on the power input of the adjacent boat, will not protect it from this problem of propeller-to-propeller or propeller-to-rudder etc. corrosion. The best solution to this problem is to automatically turn off the power to the boat generating the fault current.
At first glance there is an obvious solution to this vexing problem. One that was tried years ago by a number of marinas without success; install a GFCI circuit breaker for each shore power receptacle. To understand the reason for the failure we must look at how they work and what they are designed to do. A GFI circuit breaker measures the current going to the load and subtracts the current returning from the load. If the difference is equal to or greater than 5 mllliamps the circuit breaker will trip. The tripping problem occurs on boats that have electric hot water tanks and electric stove surface units including ovens and some space heaters. This family of heating elements has a resistance wire core surrounded by a solid metal jacket with ceramic insulation between. The outer metal tube insulates the core and provides oxidation protection, but when the core gets red hot the ceramic insulation leaks a small amount of current to the outer metal tube. Normally this does not cause problems because the appliance it is installed in is grounded and the leakage current is returned via the green wire. Empirical measurements have shown this leakage current can be up to 25 milliamp per element. With that in mind it is easily seen why the early experiments failed when the hot water and/or the stovetop was turned on. The trip current should be in the neighborhood of 100 milliamp. This would allow the hot water heater and electric range and space heaters to operate normally, while tripping when miswired loads are applied.
The 30 amp circuit breakers for shore power receptacles are not the GFI protection kind because of the previously mentioned leakage problem on the boats and they could be chained to the ground fault protection kind provided the ground fault trip current is appropriate. The 100-milliamps fault current trip would drop the offender off line immediately, spare the innocent boater much expense, reduce marina personnel trouble shooting time and improve diver safety. The interesting point here is the offending boat owner would become aware there is a problem with the wiring immediately, because shore power would not stay on. This usually results in calling for help from knowledgeable people to correct the problem. Unless every boat in a marina is served by one of these breakers, innocent boats are still vulnerable because a fault current can enter the boat, via its through the hull equipment, and return to the power grid via the green wire, which does not go through the circuit breaker.
When I tried to purchase 30 amp circuit breakers with a 100 milliamp ground fault trip from two different manufacturers for my yacht club the reply was; This is a good idea and an easy task, how many thousand would you like? Without industry wide recognition of the problem and a set of standards accepted to solve it, no manufacturer will produce them given its commodity pricing and total market size. Please consider this as a marina ground fault standard for 30 amp shore power services. Manufacturers will then be willing to produce them.
Panel Meeting Action: Reject
Panel Statement: The panel does not believe that the proposed device will resolve the submitter's concern. Electrolysis caused from the flow of direct current causes the corrosion of the metal, not the flow of alternating current.

NOTE: The following proposal consists of Comment 19-52 on Proposal 19-143 in the 2004 May Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2004 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 19-143 was:
Revise existing Section 555.21 as follows:
555.21 Gasoline Dispensing Stations Ñ Hazardous (Classified) Locations.
<u>(A) General.</u> Electrical wiring and equipment located at or serving gasoline dispensing <u>equipment</u> ~~stations~~ <u>located on shore</u> shall comply with Article 514 ~~in addition to the requirements of this article~~ . <u>For other than the classification of Class I, Division 1 and 2 areas, electrical wiring and equipment for gasoline dispensing equipment located on fixed or floating portions of docks or piers shall comply with Article 514.</u>
<u>(B) Classification of Class I, Division 1 and 2 Areas.</u>
<u>(1) Closed Construction. Where the construction of floating docks or piers is closed, such as concrete enclosed expanded foam or similar construction, and having integral service boxes with supply chases, the following shall be used for the purpose of applying Table 514.3(B)(1).</u>
<u>Exception: Where space between dock sections does not permit gasoline liquid or vapor to dissipate, the entire length of the assembled dock sections shall be classified Class I, Division 2.</u>
<u>(a) The space above the surface of the deck shall be a Class I, Division 2 location.</u>
<u>(b) The space below the surface of the deck shall be a Class I, Division 1location that shall extend to the surface of the water.</u>
<u>(2) Open Construction. Where the construction of floating docks or piers is open, such as decks built on stringers supported by floats or pontoons or similar construction, the following shall be used for the purpose of applying Table 514.3(B)(1)</u>

(a) The space below the surface of the deck down to the water level shall be a Class I, Division 2 location.

Submitter: J. Philip Simmons, Simmons Electrical Services / Rep. National Armored Cable Manufacturers Association

Recommendation: Accept the Proposal in Principle with the changes indicated in the Panel Meeting Action.

Substantiation: The proposal brings improvements to the section that are sorely needed for making safe installations of motor fuel dispensing equipment at marinas and boatyards. The indication is that the proposal was accepted in principle but the language does not appear in the 2005 NEC ROP Draft.

Panel Meeting Action: Accept in Principle

Panel Statement: This proposal was Held during the previous code cycle, and resubmitted as a proposal this cycle. The original submitter also submitted Proposal19-127 which supersedes the original proposal. See action on Proposal 19-127.

19-127 Log #2950 NEC-P19 **Final Action: Accept**
(555.21)

Submitter: Philip Simmons, Simmons Electrical Services

Recommendation: Revise existing 555.21 as follows:

555.21 Motor Fuel Dispensing Stations — Hazardous (Classified) Locations.

(A) General. Electrical wiring and equipment located at or serving motor fuel dispensing equipment ~~stations~~ located on shore shall comply with Article 514 ~~in addition to the requirements of this article~~ . The determination of Class I, Division 1 and 2 areas for motor fuel dispensing on floating or fixed docks or piers shall comply with (B) . All electrical wiring for power and lighting shall be installed on the side of the wharf, pier, or dock opposite from the liquid piping system.

(B) Classification of Class I, Division 1 and 2 Areas.

(1) Closed Construction. Where the construction of floating docks or piers is closed, such as concrete enclosed expanded foam or similar construction, and having integral service boxes with supply chases, the following shall be used for the purpose of applying Tables 514.3(B)(1) and 514.3(B)(2).

Exception: Where space between dock sections does not permit flammable liquids or vapors to dissipate, the entire length of the assembled dock sections shall be classified Class I, Division 2.

(a) The space above the surface of the deck shall be a Class I, Division 2 location.

(b) The space below the surface of the deck having enclosures such as deck boxes where gasoline liquid or vapor can accumulate shall be a Class I, Division 1 location.

(2) Open Construction. Where the construction of floating docks or piers is open, such as decks built on stringers supported by floats or pontoons or similar construction, the following shall be used for the purpose of applying Table 514.3(B)(1)

(a) Enclosures such as flush deck boxes or tubs installed within 20 ft of the dispenser where flammable liquids or vapors can accumulate shall be a Class I, Division 1 location.

(b) The space below the surface of the deck down to the water level shall be a Class I, Division 2 location.

Retain the existing FPN.

Substantiation: CMP-19 stated in its Panel Statement for the 2005 NEC ROC that it recognized that the hazardous locations associated with motor fuel dispensing should be addressed in the Code but did not take action to do so due to the extensive work that would be required to address all the issues involved in motor fuel dispensing. This proposal is being submitted in case the Task Group recommended by the Panel in its Panel Statement did not take action for the 2008 NEC.

Changes made to this section for the 2005 NEC fail to address the hazards associated with the unique installation practices of gasoline dispensers at marinas or boatyards, This proposal intends to expand and clarify the requirements for installing electrical wiring to and in the vicinity of gasoline dispensing equipment installed at marinas and boatyards. It also intends to bring the requirements in this section up to date with actual construction practices.

Floating docks are commonly manufactured with expanded foam cores that are encapsulated in concrete. Flush-mounted deck boxes are cast in place. One or more 4 in. PVC chases are installed between deck boxes and from the deck boxes to the end of the dock sections. This is done to accommodate installation of gasoline pipes, diesel fuel lines, water and waste disposal piping as well as for installation of power, communications, television and other wiring.

Note that this construction provides boxes at deck level that can easily collect gasoline liquid and vapors that are heavier than air. Gasoline spills can occur at marinas for all the same reasons they do at land-based fuel dispensing facilities. The PVC chases then allow gasoline liquid and vapor to travel throughout the length of the dock sections. As a result, the surface of the deck should be designated equivalent to the surface of the earth with the Class I, Division 2 space above the deck and Class I, Division 1 below the surface of the deck where gasoline liquid or vapors can accumulate in enclosures or travel through the PVC chases. Gasoline dispensers are typically installed over a large deck box designed to allow conduits to enter the bottom of dispensers from the PVC chases.

Depending on assembly of the dock sections, there may be from 1 inch to no air space between sections. Where adequate ventilation to atmosphere cannot be assured by design and assembly of the float sections, the Class I, Division 1 area should extend the full length of the dock sections as the PVC chases easily transmit the gasoline liquid or vapor from one dock section to another.

Where docks are constructed in this manner, additional clarification of the extent of hazardous locations is required since Table 514.3(B)(1) and 514.8 clearly apply to land-based gasoline dispensing locations but not to dispensing equipment installed at marinas. Yet, 551.21 simply requires compliance with Article 514 except for separation of fuel and other services. Some of these requirements are difficult to apply to dock construction of the concrete encapsulated constructions.

For open dock construction, a framework of stringers or beams are installed on floats with a variety of flooring materials installed. This construction typically has fuel lines and electrical wiring installed under the decking. Like closed construction, gasoline dispensers are installed over fiberglass tubs. For this open type of construction, gasoline vapors can easily dissipate so the Class I, Division 2 area from the deck surface to the water surface seems appropriate. There would be no Class I, Division 1 area for this type of construction unless a tub or similar enclosure is installed below the dispenser.

The following is the Panel Statement from Comment 19-52 for the 2005 NEC ROC. I have inserted a number in brackets where a question is found that is addressed below the Statement.

"Hold Panel Statement: The panel notes that this hold action is on Comment 19-52 and Proposal 19-143. The panel agrees that the concept of the proposal (19-143) is valid and the submitter's concerns that current construction techniques for docks and piers need to be addressed in the Code have merit. However, upon reviewing the proposal, the panel concludes that extensive revisions would be necessary in order to adequately cover all requirements. The comment recommends that the proposal be accepted in principle with the changes indicated in the panel action which were to simply change the term "gasoline dispensing" to "Motor Fuel Dispensing". If this were to be done, the original substantiation, which speaks only to gasoline liquid and vapor, would have to be restudied and the text would possibly have to be changed to account for fuels other than gasoline. CNG for example is lighter than air and the language of proposed 555.21(B)(1) and (2) may have to be modified [1]. Additionally, the proposed language in (B)(1)(a) should be modified to set an upper limit. As written, the text reads, "The space above the surface of the deck shall be a Class I, Division 2 location". How far above the deck does the space extend? Five feet, ten feet, one hundred feet? [2]

Both proposed (B)(1) and (2) reference Table 514.3(B)(1) and since this section now applies to motor fuels not just gasoline, a reference to Table 514.3(B)(2) would need to be made. [3] The panel recommends to the TCC that a task group comprised of members from CMP 19, CMP 14 and the NFPA 303 technical committee be established to study this issue." [4]

Panel statement: "CNG for example is lighter than air and the language of proposed 555.21(B)(1) and (2) may have to be modified" [1].

Response: This proposal adds a reference to Table 514.3(B)(2) where motor vehicle fuels other than gasoline are addressed. Gasoline is the most frequent flammable motor fuel dispensed from marinas and boatyards. One has to wonder if delaying implementation of the protections offered by the previous proposal was justified. Diesel fuel is also frequently dispensed but due to the flash point being typically above 100 degrees F, these installations are often treated as dispensing of combustible liquids rather than flammable liquids.

For the vast majority of fuel dispensing, lighter than air fuel vapors will simply dissipate but it is recognized that there can be structures that could trap these vapors so the reference to Table 514.3(B)(2) is appropriate.

Panel statement: "Additionally, the proposed language in (B)(1)(a) should be modified to set an upper limit. As written, the text reads, "The space above the surface of the deck shall be a Class I, Division 2 location". How far above the deck does the space extend? Five feet, ten feet, one hundred feet?" [2]

Response: Perhaps the Panel missed the concept that the proposal was not to repeat all the information in Tables 514.3(B)(1) and (2) but to interface the area classifications for marinas and boatyards with the tables. The big issue here is Tables 514.3(B)(1) and (B)(2) specifically apply to land-based fuel dispensing.

For example, the proposed language for application of the information in 555.21(B)(1)(a) for the 2005 NEC proposal states, " the following shall be used for the purpose of applying Table 514.3(B)(1)." Table 514.3(B)(1) indicates the extension of the Class I, Division 2 area is 18 in. vertically and 20 ft horizontally. The language in the Proposal simply states the space above the deck near gasoline dispensing was a Class I, Division 2 area and relies on Table 514.3(B)(1) for the dimensions of the space. Without the statement in 555.21, it is not clear how to apply the area classifications from the tables in Article 514.

Panel statement: "Both proposed (B)(1) and (2) reference Table 514.3(B)(1) and since this section now applies to motor fuels not just gasoline, a reference to Table 514.3(B)(2) would need to be made." [3]

Response: Done.

Panel statement: "The panel recommends to the TCC that a task group comprised of members from CMP 19, CMP 14 and the NFPA 303 Technical Committee be established to study this issue." [4]

Response: Let's hope this was accomplished between the 2005 and 2008 NEC cycles.

Panel Meeting Action: Accept

Panel Statement: The chair of Code-Making Panel 19 will form a task group to address the technical merits of the proposal. Code-Making Panel14 and the NFPA 303 Technical Committee will be asked to participate in the task group.

The panel recognizes the need for requirements and that Code-Making Panel 19 does not have the collective expertise to verify if the Submitter's proposal is technically correct on all requirements.

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

19-128 Log #1028 NEC-P19 **Final Action: Reject**
(555.23)

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Delete "and be provided with an outer jacket of distinctive color for safety."

Substantiation: Edit. "Distinctive" is not defined. Orange, red, yellow, black, etc., are all distinctive. No one color is specified, therefore, a myriad of these colors could be used and indicate no special purpose. "Distinctive" is subjective and, therefore, meaningless. Other color requirements in this code are specific. There is no similar requirement in Article 610 for cranes and hoists.

Panel Meeting Action: Reject

Panel Statement: "Distinctive" is not meaningless as it indicates a clear differentiation for the portable power cable. A specific color is not necessary. The Submitter claims that other color requirements in the Code are specific, but conductor identification in 310.12(C) requires conductors to be clearly distinguishable or to have distinguishing markings.

Number Eligible to Vote: 8

Ballot Results: Affirmative: 8

20-1 Log #3497 NEC-P20 **Final Action: Accept in Principle in Part**
(585 and Annex H (New))

TCC Action: The Technical Correlating Committee advises that article scope statements and titles are the responsibilty of the Technical Correlating Committee and the Technical Correlating Committee accepts the panel action. The Technical Correlating Committee requests that those who wish to submit comments on this proposal do so by submitting separate comments for individual sections of the new Article.

Submitter: Alan Manche, Square D Co.

Recommendation: Add a new Article 585 and Annex H as follows:

Article 585 Critical Operations Power Systems

FPN: Rules that are followed by a reference in brackets contain text that has been extracted from NFPA 110, *Standard for Emergency and Standby Power Systems*, 2005 edition, NFPA 111, *Standard on Stored Electrical Energy Emergency and Standby Power Systems*, 2005 Edition and NFPA 1600, *Standard on*

Disaster/Emergency Management and Business Continuity Programs, 2004 edition. Only editorial changes were made to the extracted text to make it consistent with this Code.

I. General

585.1 Scope. The provisions of this article apply to the electrical installation, operation, supervision, and maintenance of critical operations power systems consisting of circuits and equipment intended to automatically supply, distribute and control electricity to designated operations in the event of disruption to elements of the normal system intended to supply, distribute, and control power essential for continuity of vital operations..

Critical operations power systems are those systems classed as critical by municipal, state, federal, other governmental agency having jurisdiction or by facility engineering documentation establishing the necessity for such a system.

FPN No. 1: Critical Operations Power systems are generally installed in vital infrastructure facilities that if destroyed or incapacitated would disrupt national security, the economy, public health or safety; and where enhanced electrical infrastructure for continuity of operation has been deemed necessary by governmental authority.

FPN No. 2: Types of facilities where mission critical power systems may be deemed necessary include:

Air traffic control centers

Central station service facilities (fire and security system monitoring)

Chemical, petrochemical, and hazardous material (including biohazard) handling facilities

Communications centers, telephone exchanges, cellular tower sites

Emergency evacuation centers

Financial, banking, business data processing facilities

Fuel supply pumping stations (i.e. natural gas distribution and delivery infrastructure)

Hospitals and associated support facilities

Municipal infrastructure – water and sewer treatment facilities

911 centers

Offices and facilities deemed critical to continuity of government

Police, fire, civil defense facilities including power for radio repeater operations

Radio and television stations

Transportation infrastructure – airports, rail stations, seaports

FPN No. 3: For further information regarding performance of emergency and standby power systems, see NFPA 110-2005, *Standard for Emergency and Standby Power Systems.*

FPN No. 4: For further information regarding performance and maintenance of emergency systems in health care facilities, see NFPA 99-2005, *Standard for Health Care Facilities.*

FPN No. 5: For specification of locations where emergency lighting is considered essential to life safety, see NFPA 101®-2006, *Life Safety Code®.*

FPN No. 6: Threats to facility that may require transfer of operation to the critical systems include, but not limited to:

Naturally occurring events:

Geological Hazards

Meteorological Hazards

Biological Hazards

Human caused events:

Accidental

Intentional

Electromagnetic Pulse

Explosion

Fire

Firearm discharge

Flood

Hurricanes & Tornados

Icing

Infectious agent (biohazard)

Ionizing (radiological)

Seismic

Software intrusion

Toxic gas or liquid

See also Section A.5.3.2, NFPA 1600-2004

585.2 Definitions.

Commissioning. The acceptance testing, integrated system testing, operational tune-up, and start-up testing, is the process by which baseline tests results verify the proper operation and sequence of operation of electrical equipment, in addition to developing baseline criteria by which future trend analysis can identify equipment deterioration.

Critical Operations Power System. Includes three different levels or sizes of facilities or parts of facilities that require uninterruptible operation for the reasons of public safety, emergency management, national security, and business continuity:

Critical Operations Power System, Small. A remote system may include a single service transformer, single standby transformer, local annunciation of alarms and control; up to 100kVA.

Critical Operations Power System, Medium. A main system may include multiple service transformers and standby generator with paralleling switchgear, SCADA with redundant distributed architecture systems, greater than 100kVA and up to 500kVA.

Critical Operations Power System, Large. A multi-system consisting of several installations with a central control networked used to distributed control within individual systems necessary to the reliability criteria of each system, greater than 1000kVA. A control network will typically be located at each central power plant that is required for such a system which can be accessed from other locations distributed along the network. Redundant and segregated pathways are required for the communication network.

The reliability, availability, and maintainability of the critical system shall be matched to the importance of the operation related its function.

Emergency Power Supply (EPS). The source of electric power of the required capacity and quality for an emergency power supply system (EPSS). **[NFPA 110, 3.3.4]**

Emergency Power Supply System (EPSS). A complete functioning EPS system coupled to a system of conductors, disconnecting means and overcurrent protective devices, transfer switches, and all control, supervisory, and support devices up to and including the load terminals of the transfer equipment needed for the system to operate as a safe and reliable source of electric power. **[NFPA 110, 3.3.5]**

Emergency Power Supply System, Level 1. Systems installed where failure of the equipment to perform could result in loss of human life or serious injuries. **[NFPA 110, 4.4.1]**

Emergency Power Supply System, Level 2. Systems installed where failure of the EPSS to perform is less critical to human life and safety and where the authority having jurisdiction permits a higher degree of flexibility than that provided by a Level 1 EPSS system. **[NFPA 110, 4.4.2]**

Supervisory Control and Data Acquisition (SCADA). An electronic system that provides monitoring and controls for the operation of the critical system. This includes the fire alarm system, security system, control of the HVAC, the start/stop/monitoring of the power supplies and electrical distribution system, annunciation and communication equipment to emergency personnel, facility occupants and remote operators.

585.3 Application of Other Articles. Except as modified by this article, all applicable articles of this Code shall apply.

585.4 Risk Assessment. Risk assessment for critical operations power systems shall be conducted in accordance with 585.4(A) through 585.4(D).

(A) Conducting Risk Assessment. In critical operations power systems, risk assessment shall be performed to identify hazards, the likelihood of their occurrence, and the vulnerability of the electrical system to those hazards.

(B) Identification of Hazards. Hazards to be considered at a minimum shall include, but shall not be limited to:

1) natural hazards (geological, meteorological, and biological)

2) human-caused events (accidental and intentional) [**NFPA 1600, 5.3.2]**

(C) Developing Mitigation Strategy. Based on the results of the risk assessment, a strategy shall be developed and implemented to mitigate the hazards that have not been sufficiently mitigated by the prescriptive requirements of the Code.

(D) Mitigation Strategy Components. The mitigation strategy shall consider, but not be limited to:

(1) The use of applicable building construction standards

(2) Hazard avoidance through appropriate land-use practices

(3) Relocation, retrofitting, or removal of structures at risk

(4) Removal or elimination of the hazard

(5) Reduction or limitation of the amount or size of the hazard

(6) Segregation of the hazard from that which is to be protected

(7) Modification of the basic characteristics of the hazard

(8) Control of the rate of release of the hazard

(9) Provision of protective systems or equipment for both cyber or physical risks

(10) Establishment of hazard warning and communication procedures

(11) Redundancy or duplication of essential personnel, critical systems, equipment, information, operations, or materials **[NFPA 1600, 5.4.3]**

FPN: Section 5.3 of NFPA 1600-2004, *Standard on Disaster/Emergency Management and Business Continuity Programs*, provides additional guidance concerning risk assessment and hazard analysis.

(E) Physical Security. Physical security shall be provided for critical operations in accordance with (E)(1) and (E)(2).

(1) Based on the results of the risk assessment, a strategy for providing physical security for a critical operation shall be developed and implement.

(2) Electrical circuits and equipment for critical operations shall be accessible to qualified personnel only.

585.6 Testing and Maintenance.

(A) Conduct or Witness Test. The authority having jurisdiction shall conduct or witness a test of the complete system upon installation and periodically afterward.

(B) Tested Periodically. Systems shall be tested periodically on a schedule acceptable to the authority having jurisdiction to ensure the systems are maintained in proper operating condition.

(C) Battery Systems Maintenance. Where battery systems or unit equipments are involved, including batteries used for starting, control, or ignition in auxiliary engines, the authority having jurisdiction shall require periodic maintenance.

(D) Written Record. A written record shall be kept of such tests and maintenance.

(E) Testing Under Load. Means for testing all critical power systems during maximum anticipated load conditions shall be provided.

FPN: For testing and maintenance procedures of emergency power supply systems (EPSSs), see NFPA 110-2005, *Standard for Emergency and Standby Power Systems.*

(F) Supervisory Control and Data Acquisition (SCADA) System. SCADA systems shall be maintained and tested in accordance with 585.6(F)(1) and 585.6(F)(2)

(1) Maintenance. The maintenance program for SCADA systems shall consist of the following components:

1. Shall have a documented Preventive Maintenance program.

2. Shall have concurrent maintenance capabilities, so that the testing, troubleshooting, repair, and/or replacement of a component or subsystem while redundant component(s) or subsystem(s) are serving the load.

3.Operational data shall be retained – the deleted material goes well beyond requirements to ensure proper maintenance and operation.

(2) Testing. SCADA systems shall be tested periodically under actual or simulated contingency conditions.

FPN: Periodic system testing procedures can duplicate or be derived from the recommended functional performance testing procedures of individual components, as provided by the manufacturers.

FPN: For more information on Maintenance and Testing of SCADA, see NFPA 70B-2002, *Recommended Practice for Electrical Equipment Maintenance.*

585.8 Commissioning.

(A) Commissioning Plan. A commissioning plan shall be developed and documented.

FPN: For further information on developing a commissioning program see NFPA 70B-2002, *Recommended Practice for Electrical Equipment Maintenance*

(B) Component and System Tests. The installation of the equipment shall undergo component and system tests to ensure that, when energized the system will function properly.

(C) Baseline Test Results. Develop a set of baseline test results for comparison in future maintenance testing to identify equipment deterioration.

FPN: This process or tests is usually performed by independent contractors, installation contractors, or the equipment manufacturer.

(D) Functional Performance Tests: A functional performance test program shall be established, documented and executed upon complete installation of the critical system in order to establish a baseline reference for future performance requirements.

FPN: See Annex X for more information on developing and implementing a functional performance test program.

II. Circuit Wiring

585.10 Feeder and Branch Circuit Wiring,

(A) Identification. All boxes and enclosures (including transfer switches, generators, and power panels) for critical circuits shall be permanently marked so they will be readily identified as a component of a critical circuit or system.

(B) Wiring. Wiring of two or more critical circuits supplied from the same source shall be permitted in the same raceway, cable, box, or cabinet. Wiring from a critical source or critical source distribution overcurrent protection to critical loads shall be kept entirely independent of all other wiring and equipment, unless otherwise permitted in (1) through (4):

(1) Wiring from the normal power source located in transfer equipment enclosures

(2) Wiring supplied from two sources in exit, emergency, or critical luminaires (lighting fixtures)

(3) Wiring from two sources in a common junction box, attached to luminaires designated for the critical power system (lighting fixtures)

(4) Wiring within a common junction box attached to unit equipment, containing only the branch circuit supplying the unit equipment and the critical circuit supplied by the unit equipment

(C) Wiring Design and Location. Critical system wiring circuits shall be designed and located such that the hazards of the system might experience are minimized.

(D) Fire Protection. Critical systems shall meet the additional requirements in 585.9(D)(1) and (D)(2).

(1) Feeder and Branch Circuit Wiring. Feeder-circuit wiring shall meet one of the following conditions:

(1) Be a listed electrical circuit protective system with a minimum 1-hour fire rating

(2) Be protected by a fire-rated assembly listed to achieve a minimum fire rating of 1 hour

(3) Be embedded in not less than 50 mm (2 in.) of concrete

(4) Be a cable listed to maintain circuit integrity for not less than 1 hour when installed in accordance with the listing requirement.

(2) Feeder Circuit Equipment. Equipment for feeder circuits in critical systems (including transfer equipment, transformers, and panelboards) shall meet all of the following conditions:

(1) Be located in spaces with a 1-hour fire resistance rating

(2) Be located above the 100 year flood level plane.

FPN: For information regarding occupancy classification, see Section 6.1 of NFPA 101-2006, *Life Safety Code*®.

585.12 Wiring of HVAC, Fire Alarm, Security, Emergency Communications and Signal Systems. The wiring of heating, ventilation, and air-conditioning remote-control and signaling circuits; fire alarm circuits; circuits for security; circuits for emergency communications; and signal systems shall comply with (1) through (9) as applicable.

(1) Signal and communication wires shall use shielded twisted pairs in continuous metallic conduit.

(2) Shields of signal and communication wiring should be continuous and follow manufacturer's installation requirements.

(3) Where a potential ground difference exists between two locations, fiber optic cables shall be used instead of copper wires.

(4) Properly installed TVSS shall be provided at the terminals of the communication circuits and shall have a direct low impedance path to ground.

(5) Communications, fire alarm, and signaling circuits shall be verified at rated full speed under worst case traffic level.

(6) Conductors for all control circuits rated above 50V shall be installed with wire rated not less than 600V.

(7) Communications, fire alarm, and signaling circuits shall use relays with contact ratings that exceed circuit voltage and current ratings in power circuits.

(8) Riser communication cables shall be 2-hour fire rated cable.

(9) Control, monitoring, and power wiring to HVAC systems shall be 2-hour fire rated cable.

III. Power Sources and Connection

585.20 Sources of Power.

(A) General Requirements. Current supply shall be such that, in the event of failure of the normal supply to the critical operation, emergency lighting, emergency power, critical power, or all shall be available within the time required for the application but not to exceed 10 seconds. The supply system for critical power purposes, in addition to the normal services to the building and meeting the general requirements of this section, shall be one or more of the types of systems described in 585.20(D) through 585.20(H)

In selecting a critical source of power, consideration shall be given to the occupancy and the type of service to be rendered, whether of minimum duration, as for evacuation of a theater, or longer duration, as for supplying critical power and lighting due to an indefinite period of current failure from trouble either inside or outside the building.

Equipment shall be designed and located so as to minimize the hazards that might cause complete failure due to flooding, fires, icing, vandalism or other identified means in a risk analysis.

Equipment for sources of power as described in 585.10(D) through 585.10(H) where located within assembly occupancies for greater than 1000 persons or in buildings above 23 m (75 ft) in height with any of the following occupancy classes — assembly, educational, residential, detention and correctional, business, and mercantile —shall be installed either in spaces fully protected by approved automatic fire suppression systems (sprinklers, carbon dioxide systems, and so forth) or in spaces with a 1-hour fire rating.

FPN No. 1: For the definition of occupancy classification, see Section 6.1 of NFPA *101*-2006, *Life Safety Code*®.

FPN No. 2: Assignment of degree of reliability of the recognized critical supply system depends on the careful evaluation of the variables at each particular installation.

(B) Grounding. All sources of power shall be grounded as a separately derived source in accordance with 250.30.

(C) Transient Voltage Surge Suppression. TVSS shall be proved at all facility distribution voltage levels.

(D) Storage Battery. Storage batteries used as a source of power for critical systems shall be of suitable rating and capacity to supply and maintain the total load for a minimum period of 1 1⁄2 hours, without the voltage applied to the load falling below 87 1⁄2 percent of normal. Storage batteries shall not be the sole critical system power source.

Batteries, whether of the acid or alkali type, shall be designed and constructed to meet the requirements of emergency service and shall be compatible with the charger for that particular installation.

For a sealed battery, the container shall not be required to be transparent. However, for the lead acid battery that requires water additions, transparent or translucent jars shall be furnished. Automotive-type batteries shall not be used.

An automatic battery charging means shall be provided.

(E) Generator Set.

(1) Prime Mover-Driven. For a generator set driven by a prime mover acceptable to the authority having jurisdiction and sized in accordance with 585.30, means shall be provided for automatically starting the prime mover on failure of the normal service and for automatic transfer and operation of all required critical system electrical circuits. A time-delay feature permitting a 15-minute setting shall be provided to avoid retransfer in case of short-time reestablishment of the normal source.

(2) Power for fuel transfer pumps. Where power is needed for the operation of the fuel transfer pumps to deliver fuel to a generator set day tank, this pump shall be connected to the critical power system.

(3) Dual Supplies. Prime movers shall not be solely dependent on a public utility gas system for their fuel supply or municipal water supply for their cooling systems. Means shall be provided for automatically transferring from one fuel supply to another where dual fuel supplies are used.

Exception: Where acceptable to the authority having jurisdiction, the use of other than on-site fuels shall be permitted where there is a low probability of a simultaneous failure of both the off-site fuel delivery system and power from the outside electrical utility company.

(4) Battery Power and Dampers. Where a storage battery is used for control or signal power or as the means of starting the prime mover, it shall be suitable for the purpose and shall be equipped with an automatic charging means independent of the generator set. Where the battery charger is required for the operation of the generator set, it shall be connected to the critical system. Where power is required for the operation of dampers used to ventilate the generator set, the dampers shall be connected to the critical system.

(5) Auxiliary Power Supply. Generator sets that require more than 10 seconds to develop power shall be permitted if an auxiliary power supply energizes the emergency system until the generator can pick up the load.

(6) Outdoor Generator Sets. Where an outdoor housed generator set is equipped with a readily accessible disconnecting means located within sight of the building or structure supplied, an additional disconnecting means shall not be required where ungrounded conductors serve or pass through the building or structure.

(F) Uninterruptible Power Supplies. Uninterruptible power supplies used to provide power for critical systems shall comply with the applicable provisions of 585.20(D) and 585.20(E).

(G) Separate Service. Where acceptable to the authority having jurisdiction as suitable for use as a critical source of power, an additional service shall be permitted. This service shall be in accordance with the applicable provisions of Article 230 and the following additional requirements:

(1) Separate service drop or service lateral

(2) Service conductors sufficiently remote electrically and physically from any other service conductors to minimize the possibility of simultaneous interruption of supply

(H) Fuel Cell System. Fuel cell systems used as a source of power for critical operation systems shall be of suitable rating and capacity to supply and maintain the total load for not less than 2 hours of full-demand operation or as deemed appropriate in the risk assessment and operation demand. Installation of a fuel cell system shall meet the requirements of Parts II through VIII of Article 692. Where a single fuel cell system serves as the normal supply for the building or group of buildings concerned, it shall not serve as the sole source of power for the emergency standby system.

585.22 Capacity of Power Sources.

(A) Capacity and Rating. A critical operations power system shall have adequate capacity and rating for all loads to be operated simultaneously for continuous operation with variable load for an unlimited number of hours, except for required maintenance of the power source. A portable, temporary or redundant alternate power source shall be available for use whenever the critical operations power source is out of service for maintenance or repair.

(B) Selective Load Pickup, Load Shedding, and Peak Load Sharing. The alternate power source shall be permitted to supply critical, emergency, legally required standby loads where the source has adequate capacity or where automatic selective load pickup and load shedding is provided as needed to ensure adequate power to (1) critical operations circuits (2) the emergency circuits, (3) the legally required standby circuits, and (4) the optional standby circuits, in that order of priority. The alternate power source shall be permitted to be used for peak load shaving, provided these conditions are met.

Peak load-shaving operation shall be permitted for satisfying the test requirement of 585.6(B), provided all other conditions of 585.6 are met.

(C) Fuel Supply. Where internal combustion engines are used as the prime mover, an on-site fuel supply shall be provided with on on-premise fuel supply sufficient for not less than 96 hours full demand operation of the system.

(D) Ventilation. Adequate ventilation shall be provided for the alternate power source for continued operation under maximum anticipated ambient temperatures.

FPN: NFPA 110-2005, *Standard for Emergency and Standby Power Systems* includes additional information on ventilation air for combustion and cooling.

585.24 Transfer Equipment.

(A) General. Transfer equipment, including automatic transfer switches, shall be automatic, identified for emergency use, and approved by the authority having jurisdiction. Transfer equipment shall be designed and installed to prevent the inadvertent interconnection of normal and critical operations sources of supply in any operation of the transfer equipment. Transfer equipment and electric power production systems installed to permit operation in parallel with the normal source shall meet the requirements of Article 705.

(B) Bypass Isolation Switches. Means shall be permitted to bypass and isolate the transfer equipment. Where bypass isolation switches are used, inadvertent parallel operation shall be avoided.

(C) Automatic Transfer Switches. Automatic transfer switches shall be electrically operated and mechanically held.

(D) Use. Transfer equipment shall supply only critical operations loads.

XXX. Critical System Circuits for Lighting and Power

585.30 Loads on Critical Branch Circuits. Critical operations branch circuits shall only supply equipment specified as required for critical operations use.

585.32 Critical Operations Illumination. Critical operations illumination shall be in addition to all required means of egress lighting, illuminated exit signs, and all other luminaires required.

Lighting systems shall be designed and installed so that the failure of any individual lighting element, such as the burning out of a lamp, cannot leave in total darkness any space that requires illumination.

Where high-intensity discharge lighting, such as high- and low-pressure sodium, mercury vapor, and metal halide, is used as the sole source of normal illumination, the critical operations lighting system shall be required to operate until normal illumination has been restored.

Exception: Alternative means that ensures the lighting illumination level is maintained shall be permitted.

585.34 Circuits for Critical Operations Illumination Branch circuits that supply critical operations lighting shall be installed to provide supply from a source complying with 585.20 in addition to the normal supply for lighting. Unit equipment shall provide for tertiary egress illumination only.

585.36 Circuits for Critical Operations Power Feeder and branch circuits that supply critical operations equipment shall be installed to provide supply from a source complying with 585.20 in addition to the normal supply.

585.40 Egress Illumination Switch Location. All manual switches for controlling illumination circuits shall be in locations convenient to authorized persons responsible for their actuation.

Exception: Where multiple switches are provided, one such switch shall be permitted in such locations where arranged so that it can only energize the circuit, but cannot de-energize the circuit.

585.42 Exterior Lights. Those lights located outside that are not required for illumination when there is sufficient daylight shall be permitted to be controlled by an automatic light-actuated device that fails in a closed position.

IV. Overcurrent Protection

585.50 Accessibility. The feeder- and branch-circuit overcurrent devices shall be accessible to authorized persons only.

585.52 Ground-Fault Protection of Equipment.

(A) Applicability. The requirements of 585.52 shall apply to critical operations (including multiple occupancy buildings) with critical operation areas.

(B) Feeders. Where ground-fault protection is provided for operation of the service disconnecting means or feeder disconnecting means as specified by 230.95 or 215.10, an additional step of ground-fault protection shall be provided in all next level feeder disconnecting means downstream toward the load. Such protection shall consist of overcurrent devices and current transformers or other equivalent protective equipment that shall cause the feeder disconnecting means to open.

The additional levels of ground-fault protection shall not be installed on electrical systems that are not solidly grounded wye systems with greater than 150 volts to ground but not exceeding 600 volts phase-to-phase

(C) Testing. When equipment ground-fault protection is first installed, each level shall be tested to ensure ground fault protection is operational.

FPN: Testing is intended to verify the ground fault function is operational. The performance test is not intended to verify selectivity in 585.52(D) as this is often coordinated similar to circuit breakers by reviewing tie and current curves and properly setting the equipment. (selectivity of fuses and circuit breakers are not performance tested for overload and short circuit)

(D) Selectivity. Ground-fault protection for operation of the service and feeder disconnecting means shall be fully selective such that the feeder device, but not the service device, shall open on ground faults on the load side of the feeder device. A six-cycle minimum separation between the service and feeder ground-fault tripping bands shall be provided. Operating time of the disconnecting devices shall be considered in selecting the time spread between these two bands to achieve 100 percent selectivity.

FPN: See 230.95, Fine Print Note No.4, for transfer of alternate source where ground-fault protection is applied.

V. System Performance and Analysis

585.60 Supervisory Control and Data Acquisition (SCADA).

(A) General. The general requirements in (A)(1) through (A)(11) shall apply to SCADA systems.

(1) The SCADA system for the mission critical loads shall be separate from the building management SCADA system.

(2) No single point failure shall be able to disable the SCADA system.

(3) The SCADA system shall provide control and monitor electrical and mechanical utility systems relate to mission critical loads, including:

a. Fire alarm system

b. Security system

c. Power distribution

d. Power generation

e. HVAC and Ventilation (damper position, air flow speed

and direction)

f. Load shedding

g. Fuel levels or hours of operation

(4) Before installing or employing a SCADA system, an O&M analysis and vulnerability assessment shall be performed to provide the maintenance parameter data

(5) Redundant system shall be provided in either warm or hot standby.

(6) The controller shall be a programmable logic controller (PLC).

(7) The SCADA system shall utilize open, not proprietary protocols.

(8) The SCADA system shall be able to assess the damage and determining system integrity after the "event"

(9) The monitor display shall provide graphical user interface for all major components monitored and controlled by the SCADA system, with color schemes readily recognized by typical user.

(10) The SCADA system shall have the capability to provide storage of critical system parameters at a 15 minute rate or more often when out-of-limit conditions exist.

(11) The SCADA system shall have a separate data storage facility not located in same vicinity.

(B) Power supply. The SCADA system power supply shall comply with (B)(1) through (B)(3).

(1) The power supply shall be provided with direct current station battery system, rated between 24 and 125V dc with a 96-hour capacity.

(2) The batteries of the SCADA system shall be separate from batteries for other electrical systems.

(3) The power supply shall be provided with properly installed TVSS at its terminals with direct low impedance path to ground. Protected and unprotected circuits shall be physically separated to prevent coupling.

(C) Security against hazards. Security against hazards shall be provided in accordance with (C)(1) through (C)(6).

(1) Controlled physical access by authorized personnel to only the system operational controls and software shall be provided.

(2) The SCADA system shall be protected against dust, dirt, water, and other contaminates by specifying enclosures appropriate for the environment.

(3) Conduit and tubing shall not violate the integrity of the SCADA system enclosure.

(4) The SCADA system shall be located in the same secure locations as the secured systems that they monitor and control.

(5) The SCADA system shall be provided with, dry agent fire protection systems or double interlocked pre-action sprinkler systems using cross-zoned detection, to minimize the threat of accidental water discharge into unprotected equipment. The fire protection systems shall be monitored by the fire alarm system in accordance with NFPA 72-2007, *National Fire Alarm Code®*.

(6) The SCADA system shall not be connected to other network communications outside the secure locations without encryption or use of fiber optics.

585.64 Disaster Recovery.

(A) Emergency Facilities Plan. A critical operations system shall have documented an emergency facilities plan. The plan shall consider emergency operations and response, recovery, and continuity of operations.

FPN: NFPA 1600-2004, *Standard on Disaster/Emergency Management and Business Continuity Programs* Section 5.7 provides guidance for the development and implementation of emergency plans.

(B) Fuel supply. Facilities shall establish a plan for securing the availability of fuel for critical operations power supplies in the event of a prolonged power outage.

(C) Power Recovery. A critical operations facility shall establish a procedure for restoring power in the event of an outage. The procedure shall include, but not be limited to: sequence of equipment restoration, prioritization of equipment restoration, safety procedures, notification, and verification of functionality of critical systems following power restoration.

(D) Training. Personnel shall be designated for power recovery procedures and shall be trained in the procedures.

(E) Restoration of Power. Following restoration of power, all critical operations power systems shall be restored to full operational readiness.

IV. Special Construction Requirements

585.70 Power Supply System Protective Techniques.

(A) General Considerations. When installing the EPSS equipment and related auxiliaries, environmental considerations shall be given, particularly with regard to the installation of the fuel tanks and exhaust lines, or the EPS building, or both.

FPN No. 1: The following are examples of external influences:

(1) Natural conditions:

(a) Storms

(b) Floods

(c) Earthquakes

(d) Tornadoes

(e) Hurricanes

(f) Lightning

(g) Ice storms

(h) Wind

(i) Fire

(2) Human-caused conditions:

(a) Vandalism

(b) Sabotage

(c) Other similar occurrences

(3) Material and equipment failures

FPN No. 2: For natural conditions, EPSS design should consider the "100-year storm" flooding level or the flooding level predicted by the Sea, Lake, and Overland Surges from Hurricanes (SLOSH) models for a Class 4 hurricane.

(B) Fire Protection. The room containing the EPSS equipment shall have a minimum 2-hour fire rating or be located in an adequate enclosure located outside the building capable of resisting the entrance of snow or rain at a maximum wind velocity required by local building codes. **[NFPA 110: 7.2.1.1]**

(C) Seismic Bracing. Seismic bracing shall be provided in accordance with (C)(1) through (C)(4).

(1) Operational Component Protection. In recognized seismic risk areas, EPS and EPSS components, such as electrical distribution lines, water distribution lines, fuel distribution lines, and other components that serve the EPS, shall be designed to minimize damage from earthquakes and to facilitate repairs if an earthquake occurs.**[NFPA 110: 7.11.5]**

(2) Electrical Component Protection. For systems in seismic risk areas, the EPS, transfer switches, distribution panels, circuit breakers, and associated controls shall be capable of performing their intended function during and after being subjected to the anticipated seismic shock. **[NFPA 110: 7.11.6]**

(3) Fuel Supply for Specific Seismic Design Categories. Seismic design category C, D, E, or F, as determined in accordance with ASCE 7, shall be provided with not less than 96 hours of fuel supply. **[NFPA 110: 5.1.2]**

(4) Batteries Installations. The installation of storage batteries for emergency and standby power shall comply with (1) and (2).

(1) In seismic design categories C, D, E, and F, as determined in accordance with ASCE 7, Minimum Design Loads for Buildings and Other Structures, the equipment shall be designed to reduce the risk of failure caused by the anticipated seismic ground motion. **[NFPA 111: 7.4.5.1]**

(2) The batteries shall be restrained in position, and the cables braced, to limit the chance of spillage or cable breakage due to the anticipated seismic ground movement. **[NFPA 111: 7.4.5.2]**

(D) Flood Protection. The rooms, shelters, or separate buildings housing Level 1 or Level 2 EPSS equipment shall be designed and located to minimize the damage from flooding, including that caused by the following:

(1) Flooding resulting from fire fighting

(2) Sewer water backup

(3) Causes identified in the documented risk analysis

(E) Lightning Protection. Power sources located outdoors shall be protected from lightning in accordance with recognized standards. **[NFPA 110: 7.11.4]**

FPN: This may include an listed lighting protection system or a documented protection system that can be provided upon request to the authority having jurisdiction for review.

(F) Freezing Protection. Protection against freezing shall be provided in accordance with (F)(1) through (F)(5).

(1) The prime mover for the power supply shall be heated as necessary to maintain the water jacket and battery temperature determined by the EPS manufacturer for cold start and load acceptance for the type of EPSS. **[NFPA 110: 5.3.1]**

(2) All prime mover heaters shall be automatically deactivated while the prime mover is running. Air-cooled prime movers shall be permitted to employ a heater to maintain lubricating oil temperature as recommended by the prime mover manufacturer. **[NFPA 110: 5.3.2]**

(3) Antifreeze protection shall be provided according to the manufacturer's recommendations. **[NFPA 110: 5.3.3]**

(4) Ether-type starting aids shall not be permitted. **[NFPA 110: 5.3.4]**

(5) The ambient air temperature in the power source equipment room or outdoor housing containing rotating equipment shall be not less than 4.5°C (40°F). **[NFPA 110: 7.7.6]**

(G) High Temperature Protection. The installed power source cooling system shall be designed to cool the prime mover at full rated load while operating in the particular installation circumstances of each power source. **[NFPA 110: 7.8.1]**

(H) Heating, Cooling, Ventilating, and Humidity Control for Storage Batteries. Environmental control for storage batteries shall be provided in accordance with (H)(1) through (H)(4).

(1) Storage batteries shall be located in an area provided with heating and cooling capable of ensuring, both during the time that normal power is available and during an emergency, that the equipment is operated within the manufacturer's ambient temperature specifications. **[NFPA 111: 7.3.1]**

(2) Provisions shall be made for sufficient diffusion and ventilation of the gases from the battery to limit the concentration of hydrogen. **[NFPA 111: 7.3.2]**

(3) For power source equipment using free electrolyte batteries with vents that allow the free evolution of gases, ventilation openings or airflow shall be situated to limit the possibility of the buildup of gas pockets. **[NFPA 111: 7.3.3.1]**

(4) Where needed, fans used to circulate and exhaust air shall use explosionproof motors designed for the application. **[NFPA 111: 7.3.3.2]**

585.71 Wind Protection. Where the critical operations system is subject to wind, provisions shall be documented in order to demonstrate design consideration are in place.

585.72 Illumination in Power Source Equipment Rooms. Illumination in power source equipment rooms while the critical operations system is in demand shall comply with 585.72(A) through 585.72(C).

(A) Installation of Battery-Powered Lighting. The power source equipment location(s) shall be provided with battery-powered lighting in addition to the normal lighting source. This requirement shall not apply to units located outdoors in enclosures that do not include walk-in access. **[NFPA 110: 7.3.1]**

(B) Supply Circuit for Charging Equipment. The lighting charging system and the normal service room lighting shall be supplied from the load side of the power transfer point. **[NFPA 110: 7.3.2]**

(C) Illumination Level. The intensity of illumination in the separate building or room housing the power source equipment shall be 32.3 lux (3.0 ft-candles), unless otherwise specified by a requirement recognized by the authority having jurisdiction.

Annex H: Availability and Reliability for Critical Operations Power Systems; and Development and Implementation of Functional Performance Tests (FPT's) for Critical Operations Power Systems

This annex is not a part of the requirements of this NFPA document but is included for informational purposes only.

I. Availability and Reliability for Critical Operations Power Systems. Critical operations power systems may support facilities with a variety of objectives that are vital to public safety. Often these objectives are of such critical importance that system downtime is costly in terms of economic losses, loss of security, or loss of mission. For those reasons the availability of the Critical Operations Power System, the percentage of time that the system is in service, is important to those facilities. Given a specified level of availability the reliability and maintainability requirements are then derived based on that availability requirement.

<u>Availability</u>

Availability is defined as the percentage of time that a system is available to perform its function(s). Availability is measured in a variety of ways, including:

MTBF/ (MTBF+MTTR)

Where, MTBF is mean time between failures
MTTF is mean time to failure
MTTR is mean time to repair

See table below for an example to establish required availability for critical operation power systems:

Availability	Hours of Down Time*
0.9	876
0.99	87.6
0.999	8.76
0.9999	0.876
0.99999	0.0876
0.999999	0.00876
0.9999999	0.000876

* Based on a year of 8760 hours.

Availability of a system in actual operations is determined by the following:

(1) The frequency of occurrence of failures. Failures may prevent the system from performing its function or cause a degraded effect on system operation. Frequency of failures is directly related to the system's level of reliability.

(2) The time required restoring operations following a system failure or the time required to perform maintenance to prevent a failure. These times are determined in part by the system's level of maintainability.

(3) The logistics provided to support maintenance of the system. The number and availability of spares, maintenance personnel, and other logistics resources (refueling, etc.) combined with the system's level of maintainability determine the total downtime following a system failure.

Reliability

Reliability is concerned with the probability and frequency of failures (or lack of failures). A commonly used measure of reliability for repairable systems is MTBF. The equivalent measure for non-repairable items is MTTF. Reliability is more accurately expressed as a probability over a given duration of time, cycles etc. For example, the reliability of a power plant might be stated as 95% probability of no failure over a 1000-hour operating period while generating a certain level of power. Reliability is usually defined in two ways (the electrical power industry has historically not used these definitions):

(1) The duration or probability of failure-free performance under stated conditions

(2) The probability that an item can perform its intended function for a specified interval under stated conditions. (For non-redundant items this is equivalent to the preceding definition (1). For redundant items this is equivalent to the definition of mission reliability).

Maintainability

Maintainability is a measure of how quickly and economically failures can be prevented through preventive maintenance, or system operation can be restored following failure through corrective maintenance. A commonly used measure of maintainability in terms of corrective maintenance is the mean time to repair (MTTR). Maintainability is not the same thing as maintenance. Maintainability is a design parameter, while maintenance consists of actions to correct or prevent a failure event.

Improving Availability

The appropriate methods to use for improving availability depend on whether the facility is being designed or is already in use. For both cases a reliability/availability analysis should be performed to determine the availability of the old system or proposed new system in order to ascertain the hours of downtime (see table above). The AHJ or government agency should dictate how much downtime is acceptable.

Existing facilities: For a facility that is being operated, two basic methods are available for improving availability when the current level of availability is unacceptable:

(1) Selectively adding redundant units (e.g., generators, chillers, fuel supply, etc) to eliminate sources of single-point failure, and

(2) Optimizing maintenance using a reliability-centered maintenance (RCM) approach to minimize downtime. [Refer to NFPA70B**]**

A combination of the previous two methods can also be implemented. A third very expensive method is to redesign subsystems or to replace components and subsystems with higher reliability items. [Refer to NFPA70B**]**

New facilities: The opportunity for high availability and reliability is greatest when designing a new facility. By applying an effective reliability strategy, designing for maintainability, and ensuring that manufacturing and commissioning do not negatively affect the inherent levels of reliability and maintainability, a highly available facility will result. The approach should be as follows:

(1) Develop and determine a reliability strategy (establish goals, develop system model, design for reliability, conduct reliability development testing, conduct reliability acceptance testing, system delivery, maintain design reliability, maintain design reliability in operation).

(2) Develop a reliability program. This is the application of the reliability strategy to a specific system, process or function. Each step in the strategy above requires the selection and use of specific methods and tools. For example, various tools can be used to develop requirements or evaluating potential failures. To derive requirements analytical models can be used like Quality Function Development (a technique for deriving more detailed, lower-level requirements from one level to another, beginning with mission requirements i.e. customer needs). This was developed as part of the Total Quality Management movement. Parametric models can also be used to derive design values of reliability from operational values and vice versa. Analytical methods include things like thermal analysis, durability analysis, predictions etc. Finally, one should evaluate possible failures. A Failure Modes and Effects Criticality Analysis (FMECA and Fault Tree Analysis (FTA) are two different methods for evaluating possible failures. The mission facility engineer should determine which method to use or whether to use both.

(3) The entire effort for designing for reliability begins with identifying the mission critical facility's reliability requirements. These requirements are stated in a variety of ways, depending on the customer and the specific system. For a mission critical facility it would be the Mission Success Probability.

II. Development and Implementation of Functional Performance Tests (FPT's) for Critical Operations Power Systems

Development of FPT:

(1) Submit functional performance tests (FPTs). System/component tests or FPTs shall be developed from submitted drawings, SODs and SOMMs, including large component testing (i.e. transformers, cable, generators, UPS), and how components operate as part of the total system. The commissioning authority shall develop the test and shall not be the installation contractor (or sub-contractor).
As the equipment/components/systems are installed quality assurance procedures shall be administered to verify components are installed in-accordance with minimum manufacturers recommendations, safety codes, and acceptable installation practices. Quality assurance discrepancies shall be identified and added to a "commissioning action list" that must be rectified as past of the commissioning program. These items would usually be discussed during commissioning meetings. Discrepancies are usually identified initially by visual inspection.

(2) Review FPTs. The tests shall be reviewed by the customer, electrical contractors, quality assurance personnel, maintenance personnel, etc (the commissioning team). Areas of concern include: 1) all functions of the system being tested, 2) all major components included, 3) do the tests reflect the system operating documents, 4) verify the tests make sense, etc.:

(3) Make changes to FPTs as required. The commissioning authority shall implement the corrections, questions answered, and additions.

(4) FPT's approval. After the changes are made to the FPTs, they shall be submitted to the commissioning team. When it is acceptable the customer or his/her designated approval authority shall approve the FPTs. It should be noted that even though the FPT is approved, problems that arise during the test (or areas not covered) shall be addressed.

Testing Implementation for FPT's. The final step in the successful commissioning plan is testing and proper execution of system-integrated tests.

(1) **Systems ready to operate.** The FPTs can be implemented as various systems become operative (i.e. test the generator system) or when the entire system is installed. However the final "pull the plug" test shall be performed after all systems are completely installed. If the electrical contractor (or sub-contractor) implements the FPTs then a witness shall initial each step of the test. The electrical contractor shall not employ the witness directly or indirectly.

(2) **Perform tests (FPT's)**: If the system fails the test then the problem shall be resolved and equipment or system re-tested or testing requirements shall be re-analyzed until successful tests are witnessed. Once the system or equipment passes test it shall be verified by designated commissioning official.

(3) **Customer receives system**. After all tests are completed (including the "pull the plug" test) the system shall be turned over to the customer.

Substantiation: This proposal is submitted on behalf of the NEC Task Group on Emergency and Standby Power Systems for Homeland Security. Members of this Task Group are:

Donald Bliss, Chair NI 2 Center for Infrastructure Expertise
Tarry Baker Broward County Board of Rules & Appeals
Lawrence Bey Cummins Power Generation
Richard Bingham Dranetz-BMI
Jeffrey Boksiner Telcordia Technologies, Inc.
James Carroll Square D Company
Palmer Hickman NJATC
Alan Manche Square D Company
Gil Moniz NEMA

Timothy Owens City of Santa Clara
Angie Stoyas US Army Corp of Engineers
Timothy P. Zgonena Underwriters Laboratories, Inc.

At their October 2005 meeting, the National Electrical Code Technical Correlating Committee voted to recommend to the NFPA Standard Council that a new Code-Making Panel 20 be created for the 2008 NEC revision cycle. This CMP will be responsible for proposals and comments related to critical operations power systems and the development of a new article covering this topic. At their October meeting, the NFPA Standards Council accepted the recommendation of the NEC TCC and CMP-20 was established. The members of the original task group will serve on this new CMP.

Recent terrorist events and natural disasters, including the World Trade Center attack 2005 hurricane season, most notably Hurricane Katrina have brought to light the need to assess the adequacy of current requirements in the National Electrical Code relating to electrical infrastructure protection and reliability. The mission of this task group from their first meeting in August 2005 was to review current requirements in the NEC and other pertinent NFPA codes and standards covering emergency and standby power systems and sources, and signaling systems for the purpose of identifying where the current minimum requirements do not adequately address the level of integrity and quality for power sources, power distribution, and signaling systems required due to threats and/or acts of terrorism, manmade disasters and natural disasters.

The result of the task group's work at their August 2005 meeting and subsequent conference call in October was to develop a new Article 585 entitled, Critical Operations Power Systems. Such systems may be installed throughout an entire facility or may be limited to specific areas depending upon the nature of the operations and where they are to be conducted within a specific facility. The task group reviewed the following considerations in developing the proposed new article.

Types of facilities where enhanced electrical infrastructure for continuity of operation may be deemed necessary:

Air traffic control centers
Chemical, petrochemical, and hazardous material (including biohazard) handling facilities
Communications centers, telephone exchanges, cellular tower sites
911 centers
Central station service facilities (fire and security system monitoring)
Financial, banking, business data processing facilities
Hospitals and associated support facilities
Police, fire, civil defense facilities including power for radio repeater operations
Emergency evacuation centers
Transportation infrastructure – airports, rail stations, seaports
Municipal infrastructure – water and sewer treatment facilities
Fuel supply pumping stations (i.e. natural gas distribution and delivery infrastructure
Offices and facilities deemed critical to continuity of government
Radio and television stations

Types of hazards that directly threaten electrical infrastructure or require continuity of operation:

Natural:
Earthquakes
Floods
Wind (hurricane, tornado)
Ice and freezing
Lightning
Accidental fire and explosion
Human initiated events:
Terrorist acts
Malicious mischief/vandalism

Electrical infrastructure exposures:

Utility power supply
On-site power supply including fuel for on-site EPS equipment
Power distribution system (feeders and branch circuits)
Signaling, fire alarm and communications systems

Reasons for continuity of electrical, signaling, fire alarm, and communications systems operation:

Evacuation
Relocation
Hazard mitigation
Critical operations continuity (communications, alarm and monitoring of alarm systems)
Business continuity

How should electrical infrastructure be protected/designed for reliability and survivability?

Hardening of wiring systems within buildings
Location – limiting access to critical equipment
Location – mitigating effects of natural disasters
Redundancy

Risk assessment considerations

Which facilities are most critical?
Which systems are most critical?
Development of risk assessment criteria.

The task group's work provides new minimum requirements for those electrical systems where continuity of power and operation of systems is paramount. These new requirements go beyond the scopes of the requirements of Articles 700 and 701 as those systems were developed primarily to allow for safe building egress for and to aid firefighters under emergency conditions. The requirements of Article 585 are designed to maintain power continuity and protect wiring systems against natural disasters and terrorist acts in those facilities where the continuity of operation is critical to public and occupant safety. These systems are not intended to get people out of buildings. The need for the types of enhanced electrical systems covered in the new Article 585 has been dramatically illustrated by recent manmade and natural disasters and the continuing threat of such events occurring in the future.

Panel Meeting Action: Accept in Principle in Part

Article 585 Critical Operations Power Systems (COPS)

FPN: Rules that are followed by a reference in brackets contain text that has been extracted from NFPA 110, *Standard for Emergency and Standby Power Systems*, 2005 edition, NFPA 111, *Standard on Stored Electrical Energy Emergency and Standby Power Systems*, 2005 Edition and NFPA 1600, *Standard on Disaster/Emergency Management and Business Continuity Programs*, 2004 edition. Only editorial changes were made to the extracted text to make it consistent with this Code.

I. General

585.1 Scope. The provisions of this article apply to the electrical installation, operation, monitoring, control, and maintenance of critical operations power systems consisting of circuits and equipment intended to supply, distribute and control electricity to designated vital operations in the event of disruption to elements of the normal system.

Critical operations power systems are those systems so classed by municipal, state, federal, or other codes, by any governmental agency having jurisdiction or by facility engineering documentation establishing the necessity for such a system.

FPN No. 1: Critical Operations Power Systems are generally installed in vital infrastructure facilities that, if destroyed or incapacitated, would disrupt national security, the economy, public health or safety; and where enhanced electrical infrastructure for continuity of operation has been deemed necessary by governmental authority.

FPN No. 2: For further information on disaster and emergency management see NFPA 1600-2004 edition, *Standard on Disaster/Emergency Management and Business Continuity Programs*.

FPN No. 3: For further information regarding performance of emergency and standby power systems, see NFPA 110-2005, *Standard for Emergency and Standby Power Systems.*

FPN No. 4: For further information regarding performance and maintenance of emergency systems in health care facilities, see NFPA 99-2005, *Standard for Health Care Facilities.*

FPN No. 5: For specification of locations where emergency lighting is considered essential to life safety, see NFPA 101®-2006, *Life Safety Code®.*

FPN No. 6: Threats to facilities that may require transfer of operation to the critical systems include both naturally occurring hazards and human caused events.

See also Section A.5.3.2, NFPA 1600-2004

585.2 Definitions.

Commissioning. The acceptance testing, integrated system testing, operational tune-up, and start-up testing, is the process by which baseline tests results verify the proper operation and sequence of operation of electrical equipment, in addition to developing baseline criteria by which future trend analysis can identify equipment deterioration.

Critical Operations Power Systems (COPS). Power systems for facilities or parts of facilities that require continuous operation for the reasons of public safety, emergency management, national security, or business continuity.

Designated Critical Operations Areas (DCOA). Areas within a facility or site designated as requiring critical operations power.

Supervisory Control and Data Acquisition (SCADA). An electronic system that provides monitoring and controls for the operation of the critical operations power system. This can include the fire alarm system, security system, control of the HVAC, the start/stop/monitoring of the power supplies and electrical distribution system, annunciation and communication equipment to emergency personnel, facility occupants and remote operators.

585.3 Application of Other Articles. Except as modified by this article, all applicable articles of this Code shall apply.

585.4 Risk Assessment. Risk assessment for critical operations power systems shall be documented and shall be conducted in accordance with 585.4(A) through 585.4(D).

FPN: Chapter 5 of NFPA 1600-2004, *Standard on Disaster/Emergency Management and Business Continuity Programs*, provides additional guidance concerning risk assessment and hazard analysis. **(A) Conducting Risk Assessment.** In critical operations power systems, risk assessment shall be performed to identify hazards, the likelihood of their occurrence, and the vulnerability of the electrical system to those hazards.

(B) Identification of Hazards. Hazards to be considered at a minimum shall include, but shall not be limited to:

1) naturally occurring hazards (geological, meteorological, and biological)

2) human-caused events (accidental and intentional) [**NFPA 1600, 5.3.2]**

(C) Developing Mitigation Strategy. Based on the results of the risk assessment, a strategy shall be developed and implemented to mitigate the hazards that have not been sufficiently mitigated by the prescriptive requirements of this Code.

585.5 Physical Security. Physical security shall be provided for critical operations power systems in accordance with (1) and (2).

(1) Based on the results of the risk assessment, a strategy for providing physical security for - critical operations power systems shall be developed and implemented.

(2) Electrical circuits and equipment for critical operations power systems shall be accessible to qualified personnel only.

585.6 Testing and Maintenance.

(A) Conduct or Witness Test. The authority having jurisdiction shall conduct or witness a test of the complete system upon installation and periodically afterward.

(B) Tested Periodically. Systems shall be tested periodically on a schedule acceptable to the authority having jurisdiction to ensure the systems are maintained in proper operating condition.

(C) Maintenance. The authority having jurisdiction shall require a documented preventive maintenance program for critical operations power systems. **FPN:** For testing and maintenance procedures, see NFPA 70B-2002 *Recommended Practice for Electrical Equipment Maintenance.*

(D) Written Record. A written record shall be kept of such tests and maintenance.

(E) Testing Under Load. Means for testing all critical power systems during maximum anticipated load conditions shall be provided.

FPN: For testing and maintenance procedures of emergency power supply systems (EPSSs) that are also applicable to COPS, see NFPA 110-2005, *Standard for Emergency and Standby Power Systems.*

585.8 Commissioning.

(A) Commissioning Plan. A commissioning plan shall be developed and documented.

FPN: For further information on developing a commissioning program see NFPA 70B-2002, *Recommended Practice for Electrical Equipment Maintenance*

(B) Component and System Tests. The installation of the equipment shall undergo component and system tests to ensure that, when energized the system will function properly.

(C) Baseline Test Results. Document a set of baseline test results for comparison in future periodic maintenance testing to identify equipment deterioration.

(D) Functional Performance Tests: A functional performance test program shall be established, documented and executed upon complete installation of the critical system in order to establish a baseline reference for future performance requirements.

FPN: See Annex X for more information on developing and implementing a functional performance test program.

II. Circuit Wiring and Equipment

585.10 Feeder and Branch Circuit Wiring.

(A) Identification.

(1)Boxes and Enclosures.All boxes and enclosures (including transfer switches, generators, and power panels) for critical operations power system circuits shall be permanently marked so they will be readily identified as a component of the system. (2) Receptacle Identification. The cover plates for the electrical receptacles or the electrical receptacles themselves supplied from the COPS shall have a distinctive color or marking so as to be readily identifiable.

(B) Wiring. Wiring of two or more COPS circuits supplied from the same source shall be permitted in the same raceway, cable, box, or cabinet. Wiring from a COPS source or COPS source distribution overcurrent protection to critical loads shall be kept entirely independent of all other wiring and equipment.

Exception: Where the COPS feeder is installed in transfer equipment enclosures.

(C) COPS Feeder Wiring Requirements. COPS feeders shall comply with 585.10(C)(1) through (C)(3).

(1) Protection Against Physical Damage. The wiring of the COPS system shall be protected against physical damage. The following wiring methods shall be permitted to be installed in accordance with the following:

(1) Rigid Metal Conduit, Intermediate Metal Conduit, Type MI cable, or Schedule 80 rigid nonmetallic conduit.

(2) Where encased in not less than 50 mm (2 in.) of concrete, Schedule 40 rigid nonmetallic conduit, flexible nonmetallic or jacketed metallic raceways, or jacketed metallic cable assemblies listed for installation in concrete.

(3) Where provisions must be made for flexibility at equipment connection, one or more of the following shall also be permitted:
(1) Flexible metal fittings
(2) Flexible metal conduit with listed fittings
(3) Liquidtight flexible metal conduit with listed fittings

(2) Fire Protection for Feeders. Feeders shall meet one of the following conditions:

(1) Be a listed electrical circuit protective system with a minimum 1-hour fire rating

(2) Be protected by a fire-rated assembly listed to achieve a minimum fire rating of 1 hour

(3) Be embedded in not less than 50 mm (2 in.) of concrete

(4) Be a cable listed to maintain circuit integrity for not less than 1 hour when installed in accordance with the listing requirement

(3) Floodplain Protection. Where COPS feeders are installed below the level of the 100-year floodplain, the wiring method and contained circuit conductors shall be listed for use in a wet location.

(D) **COPS Branch Circuit Wiring .** COPS branch circuits installed outside the DCOA shall comply with the physical and fire protection requirements of 585.10(C)(1) through (3).

585.11 Branch Circuit and Feeder Distribution Equipment.

(A) Branch Circuit Distribution Equipment. COPS branch circuit distribution equipment shall be located within the same DCOA as the branch circuits it supplies.

(B) Feeder Distribution Equipment. Equipment for COPS feeder circuits in (including transfer equipment, transformers, and panelboards) shall comply with (1) and (2).

(1) Be located in spaces with a 2-hour fire resistance rating

(2) Be located above the 100 year floodplain.

585.12 Feeders and Branch Circuits Supplied by COPS. Feeders and branch circuits supplied by the COPS shall only supply equipment specified as required for critical operations use.

585.14 Wiring of HVAC, Fire Alarm, Security, Emergency Communications, and Signaling Systems. The wiring of heating, ventilation, and air-conditioning remote-control and signaling circuits; fire alarm circuits; circuits for security; circuits for emergency communications; and signal systems shall comply with (1) through (9) as applicable.

(1) Signal and communication wires shall use shielded twisted pairs in any of the metal conduits installed in accordance with 585.10(C).

(2) Shields of signal and communication wiring shall be continuous. (3)Fiber optic cables shall be used for connections between two or more buildings on the property and under single management. (4) Listed secondary protectors shall be provided at the terminals of the communication circuits.

(5) Conductors for all control circuits rated above 50V shall be installed with wire rated not less than 600V.

(6) Communications, fire alarm, and signaling circuits shall use relays with contact ratings that exceed circuit voltage and current ratings in the controlled circuit.

(7) Riser communication cables shall be 2-hour fire rated cable or a listed 2-hour electrical circuit protective system.

(8) Control, monitoring, and power wiring to HVAC systems shall be 2-hour fire rated cable or a listed 2-hour electrical circuit protective system.

III. Power Sources and Connection

585.20 Sources of Power.

(A) General Requirements. Current supply shall be such that, in the event of failure of the normal supply to the DCOA,critical operations power shall be available within the time required for the application. . The supply system for critical operations power, in addition to the normal services to the building and meeting the general requirements of this section, shall be oneor more of the types of systems described in 585.20(D) through 585.20(H).**FPN:** Assignment of degree of reliability of the recognized critical operations power system depends on the careful evaluation in accordance with the risk assessment.

(B) Fire Protection. Where located within a building,equipment for sources of power as described in 585.10(D) through 585.10(H) shall be installed either in spaces fully protected by approved automatic fire suppression systems (sprinklers, carbon dioxide systems, and so forth) or in spaces with a 1-hour fire rating.

(C) Grounding. All sources of power shall be grounded as a separately derived source in accordance with 250.30.

Exception: Where the equipment containing the main bonding jumper or system bonding jumper for the normal source and the feeder wiring to the transfer equipment are installed in accordance with 585.10(C) and 585.11(B).

(D) Surge Protection Devices. Surge protection devices shall be provided at all facility distribution voltage levels.

(E) Storage Battery.

An automatic battery charging means shall be provided. Batteries shall be compatible with the charger for that particular installation. For a sealed battery, the container shall not be required to be transparent. However, for the lead acid battery that requires water additions, transparent or translucent jars shall be furnished. Automotive-type batteries shall not be used.

(F) Generator Set.

(1) Prime Mover-Driven. Generator sets driven by a prime mover shall be provided with means for automatically starting the prime mover on failure of the normal service. A time-delay feature permitting a minimum 15-minute setting shall be provided to avoid retransfer in case of short-time reestablishment of the normal source.

(2) Power for fuel transfer pumps. Where power is needed for the operation of the fuel transfer pumps to deliver fuel to a generator set day tank, this pump shall be connected to the COPS.

(3) Dual Supplies. Prime movers shall not be solely dependent on a public utility gas system for their fuel supply or municipal water supply for their cooling systems. Means shall be provided for automatically transferring from one fuel supply to another where dual fuel supplies are used.

(4) Battery Power and Dampers. Where a storage battery is used for control or signal power or as the means of starting the prime mover, it shall be suitable for the purpose and shall be equipped with an automatic charging means independent of the generator set. Where the battery charger is required for the operation of the generator set, it shall be connected to the COPS. Where power is required for the operation of dampers used to ventilate the generator set, the dampers shall be connected to the COPS.

(5) Outdoor Generator Sets. Where an outdoor housed generator set is equipped with a readily accessible disconnecting means located within sight of the building or structure supplied, an additional disconnecting means shall not be required where ungrounded conductors serve or pass through the building or structure.

(6) Mean for Connecting Portable or Vehicle-Mounted Generator. Where the COPS is supplied by a single generator, a means to connect a portable or vehicle-mounted generator shall be provided.

(7) On-Site Fuel Supply. Where internal combustion engines are used as the prime mover, a on-site fuel supply shall be provided. The on-site fuel supply shall be secured and protected in accordance with the risk assessment.

(G) Uninterruptible Power Supplies. Uninterruptible power supplies used as the sole source of power for COPS shall comply with the applicable provisions of 585.20(E) and 585.20(F).

(H) Fuel Cell System.. Installation of a fuel cell system shall meet the requirements of Parts II through VIII of Article 692.

585.22 Capacity of Power Sources.

(A) Capacity and Rating. A COPS shall have capacity and rating for all loads to be operated simultaneously for continuous operation with variable load for an unlimited number of hours, except for required maintenance of the power source. A portable, temporary or redundant alternate power source shall be available for use whenever the COPS power source is out of service for maintenance or repair.

(B) Selective Load Pickup, Load Shedding, and Peak Load Sharing. The alternate power source shall be permitted to supply COPS , emergency, legally required standby and optional loads where the source has adequate capacity or where automatic selective load pickup and load shedding is provided as needed to ensure adequate power to (1) the COPS and emergency circuits, (2) the legally required standby circuits, and (3) the optional standby circuits, in that order of priority. The alternate power source shall be permitted to be used for peak load shaving, provided these conditions are met.

Peak load-shaving operation shall be permitted for satisfying the test requirement of 585.6(B), provided all other conditions of 585.6 are met.

(C)Duration of COPS Operation. The alternate power source shall be capable of operating the COPS for a minimum of 72 hours at full load of DCOA with a steady state voltage within ± 10% of nominal utilization voltage.

(D) Ventilation. Adequate ventilation shall be provided for the alternate power source for continued operation under maximum anticipated ambient temperatures.

FPN: NFPA 110-2005, *Standard for Emergency and Standby Power Systems* and NFPA 111-2005, *Standard for Stored Energy Emergency and Standby Power Systems* include additional information on ventilation air for combustion and cooling.

585.24 Transfer Equipment.

(A) General. Transfer equipment including automatic transfer switches, shall be automatic and identified for emergency use. ,Transfer equipment shall be designed and installed to prevent the inadvertent interconnection of normal and critical operations sources of supply in any operation of the transfer equipment. Transfer equipment and electric power production systems installed to permit operation in parallel with the normal source shall meet the requirements of Article 705.**(B) Bypass Isolation Switches.** Means shall be permitted to bypass and isolate the transfer equipment. Where bypass isolation switches are used, inadvertent parallel operation shall be avoided.

(C) Automatic Transfer Switches. Automatic transfer switches shall comply with (C)(1) and (C)(2).

(1) Automatic transfer switches shall be listed for emergency use.

(2) Automatic transfer switches shall be electrically operated and mechanically held.

(D) Use. Transfer equipment shall supply only COPS loads.

585.30 Branch Circuits Supplied by COPS. Branch circuits supplied by the COPS shall only supply equipment specified as required for critical operations use.

III. Overcurrent Protection

585.50 Accessibility. The feeder- and branch-circuit overcurrent devices shall be accessible to authorized persons only.

585.52 Ground-Fault Protection of Equipment.

(A) Applicability. The requirements of 585.52 shall apply to critical operations (including multiple occupancy buildings) with critical operation areas.

(B) Feeders. Where ground-fault protection is provided for operation of the service disconnecting means or feeder disconnecting means as specified by 230.95 or 215.10, an additional step of ground-fault protection shall be provided in all next level feeder disconnecting means downstream toward the load. Such protection shall consist of overcurrent devices and current transformers or other equivalent protective equipment that shall cause the feeder disconnecting means to open.

The additional levels of ground-fault protection shall not be installed on electrical systems that are not solidly grounded wye systems with greater than 150 volts to ground but not exceeding 600 volts phase-to-phase

(C) Testing. When equipment ground-fault protection is first installed, each level shall be tested to ensure ground fault protection is operational.

FPN: Testing is intended to verify the ground fault function is operational. The performance test is not intended to verify selectivity in 585.52(D) as this is often coordinated similar to circuit breakers by reviewing tie and current curves and properly setting the equipment. (selectivity of fuses and circuit breakers are not performance tested for overload and short circuit)

(D) Selectivity. Ground-fault protection for operation of the service and feeder disconnecting means shall be fully selective such that the feeder device, but not the service device, shall open on ground faults on the load side of the feeder device. A six-cycle minimum separation between the service and feeder ground-fault tripping bands shall be provided. Operating time of the disconnecting devices shall be considered in selecting the time spread between these two bands to achieve 100 percent selectivity.

FPN: See 230.95, Fine Print Note No.4, for transfer of alternate source where ground-fault protection is applied.

585.54 Coordination. Critical operations power system(s) overcurrent devices shall be selectively coordinated with all supply side overcurrent protective devices.

IV. System Performance and Analysis

585.64 Emergency Operations Plan. A facilities with a COPS shall have documented an emergency operations plan. The plan shall consider emergency operations and response, recovery, and continuity of operations.

FPN: NFPA 1600-2004, *Standard on Disaster/Emergency Management and Business Continuity Programs* Section 5.7 provides guidance for the development and implementation of emergency plans.

Annex H: Availability and Reliability for Critical Operations Power Systems; and Development and Implementation of Functional Performance Tests (FPT's) for Critical Operations Power Systems

This annex is not a part of the requirements of this NFPA document but is included for informational purposes only.

I. Availability and Reliability for Critical Operations Power Systems. Critical operations power systems may support facilities with a variety of objectives that are vital to public safety. Often these objectives are of such critical importance that system downtime is costly in terms of economic losses, loss of security, or loss of mission. For those reasons the availability of the Critical Operations Power System, the percentage of time that the system is in service, is important to those facilities. Given a specified level of availability the reliability and maintainability requirements are then derived based on that availability requirement.

Availability

Availability is defined as the percentage of time that a system is available to perform its function(s). Availability is measured in a variety of ways, including:

MTBF/ (MTBF+MTTR)

Where, MTBF is mean time between failures
MTTF is mean time to failure
MTTR is mean time to repair

See table below for an example to establish required availability for critical operation power systems:

Availability	Hours of Down Time*
0.9	876
0.99	87.6
0.999	8.76
0.9999	0.876
0.99999	0.0876
0.999999	0.00876
0.9999999	0.000876

* Based on a year of 8760 hours.

Availability of a system in actual operations is determined by the following:

(1) The frequency of occurrence of failures. Failures may prevent the system from performing its function or cause a degraded effect on system operation. Frequency of failures is directly related to the system's level of reliability.

(2) The time required restoring operations following a system failure or the time required to perform maintenance to prevent a failure. These times are determined in part by the system's level of maintainability.

(3) The logistics provided to support maintenance of the system. The number and availability of spares, maintenance personnel, and other logistics resources (refueling, etc.) combined with the system's level of maintainability determine the total downtime following a system failure.

Reliability

Reliability is concerned with the probability and frequency of failures (or lack of failures). A commonly used measure of reliability for repairable systems is MTBF. The equivalent measure for non-repairable items is MTTF. Reliability is more accurately expressed as a probability over a given duration of time, cycles etc. For example, the reliability of a power plant might be stated as 95% probability of no failure over a 1000-hour operating period while generating a certain level of power. Reliability is usually defined in two ways (the electrical power industry has historically not used these definitions):

(1) The duration or probability of failure-free performance under stated conditions

(2) The probability that an item can perform its intended function for a specified interval under stated conditions. (For non-redundant items this is equivalent to the preceding definition (1). For redundant items this is equivalent to the definition of mission reliability).

Maintainability

Maintainability is a measure of how quickly and economically failures can be prevented through preventive maintenance, or system operation can be restored following failure through corrective maintenance. A commonly used measure of maintainability in terms of corrective maintenance is the mean time to repair (MTTR). Maintainability is not the same thing as maintenance. Maintainability is a design parameter, while maintenance consists of actions to correct or prevent a failure event.

Improving Availability

The appropriate methods to use for improving availability depend on whether the facility is being designed or is already in use. For both cases a reliability/availability analysis should be performed to determine the availability of the old system or proposed new system in order to ascertain the hours of downtime (see table above). The AHJ or government agency should dictate how much downtime is acceptable.

Existing facilities: For a facility that is being operated, two basic methods are available for improving availability when the current level of availability is unacceptable:

(1) Selectively adding redundant units (e.g., generators, chillers, fuel supply, etc) to eliminate sources of single-point failure, and

(2) Optimizing maintenance using a reliability-centered maintenance (RCM) approach to minimize downtime. [Refer to NFPA70B**]**

A combination of the previous two methods can also be implemented. A third very expensive method is to redesign subsystems or to replace components and subsystems with higher reliability items. [Refer to NFPA70B**]**

New facilities: The opportunity for high availability and reliability is greatest when designing a new facility. By applying an effective reliability strategy, designing for maintainability, and ensuring that manufacturing and commissioning do not negatively affect the inherent levels of reliability and maintainability, a highly available facility will result. The approach should be as follows:

(1) Develop and determine a reliability strategy (establish goals, develop system model, design for reliability, conduct reliability development testing, conduct reliability acceptance testing, system delivery, maintain design reliability, maintain design reliability in operation).

(2) Develop a reliability program. This is the application of the reliability strategy to a specific system, process or function. Each step in the strategy above requires the selection and use of specific methods and tools. For example, various tools can be used to develop requirements or evaluating potential failures. To derive requirements analytical models can be used like Quality Function Development (a technique for deriving more detailed, lower-level requirements from one level to another, beginning with mission requirements i.e. customer needs). This was developed as part of the Total Quality Management movement. Parametric models can also be used to derive design values of reliability from operational values and vice versa. Analytical methods include things like thermal analysis, durability analysis, predictions etc. Finally, one should evaluate possible failures. A Failure Modes and Effects Criticality Analysis (FMECA and Fault Tree Analysis (FTA) are two different methods for evaluating possible failures. The mission facility engineer should determine which method to use or whether to use both.

(3) The entire effort for designing for reliability begins with identifying the mission critical facility's reliability requirements. These requirements are stated in a variety of ways, depending on the customer and the specific system. For a mission critical facility it would be the Mission Success Probability.

II. Development and Implementation of Functional Performance Tests (FPT's) for Critical Operations Power Systems

Development of FPT:

(1) Submit functional performance tests (FPTs). System/component tests or FPTs shall be developed from submitted drawings, SODs and SOMMs, including large component testing (i.e. transformers, cable, generators, UPS), and how components operate as part of the total system. The commissioning authority shall develop the test and shall not be the installation contractor (or sub-contractor).
As the equipment/components/systems are installed quality assurance procedures shall be administered to verify components are installed in-accordance with minimum manufacturers recommendations, safety codes, and acceptable installation practices. Quality assurance discrepancies shall be identified and added to a "commissioning action list" that must be rectified as past of the commissioning program. These items would usually be discussed during commissioning meetings. Discrepancies are usually identified initially by visual inspection.

(2) Review FPTs. The tests shall be reviewed by the customer, electrical contractors, quality assurance personnel, maintenance personnel, etc (the commissioning team). Areas of concern include: 1) all functions of the system being tested, 2) all major components included, 3) do the tests reflect the system operating documents, 4) verify the tests make sense, etc.:

(3) Make changes to FPTs as required. The commissioning authority shall implement the corrections, questions answered, and additions.

(4) FPT's approval. After the changes are made to the FPTs, they shall be submitted to the commissioning team. When it is acceptable the customer or his/her designated approval authority shall approve the FPTs. It should be noted that even though the FPT is approved, problems that arise during the test (or areas not covered) shall be addressed.

Testing Implementation for FPT's. The final step in the successful commissioning plan is testing and proper execution of system-integrated tests.

(1) **Systems ready to operate.** The FPTs can be implemented as various systems become operative (i.e. test the generator system) or when the entire system is installed. However the final "pull the plug" test shall be performed after all systems are completely installed. If the electrical contractor (or sub-contractor) implements the FPTs then a witness shall initial each step of the test. The electrical contractor shall not employ the witness directly or indirectly.

(2) **Perform tests (FPT's)**: If the system fails the test then the problem shall be resolved and equipment or system re-tested or testing requirements shall be re-analyzed until successful tests are witnessed. Once the system or equipment passes test it shall be verified by designated commissioning official.

(3) Customer receives system. After all tests are completed (including the "pull the plug" test) the system shall be turned over to the customer.

Annex I

585.60 Supervisory Control and Data Acquisition (SCADA).

(A) General. Where provided, the general requirements in (A)(1) through (A)(11) shall apply to SCADA systems.

(1) The SCADA system for the COPS loads shall be separate from the building management SCADA system.

(2) No single point failure shall be able to disable the SCADA system.

(3) The SCADA system shall be permitted to provide control and monitor electrical and mechanical utility systems relate to mission critical loads, including, but not limited to:

a. Fire alarm system

b. Security system

c. Power distribution

d. Power generation

e. HVAC and Ventilation (damper position, air flow speed and direction)

f. Load shedding

g. Fuel levels or hours of operation

(4) Before installing or employing a SCADA system, an operations and maintenance analysis and risk assessment shall be performed to provide the maintenance parameter data

(5) Redundant system shall be provided in either warm or hot standby.

(6) The controller shall be a programmable logic controller (PLC).

(7) The SCADA system shall utilize open, not proprietary protocols.

(8) The SCADA system shall be able to assess the damage and determining system integrity after the "event"

(9) The monitor display shall provide graphical user interface for all major components monitored and controlled by the SCADA system, with color schemes readily recognized by typical user.

(10) The SCADA system shall have the capability to provide storage of critical system parameters at a 15 minute rate or more often when out-of-limit conditions exist.

(11) The SCADA system shall have a separate data storage facility not located in same vicinity.

(B) Power supply. The SCADA system power supply shall comply with (B)(1) through (B)(3).

(1) The power supply shall be provided with direct current station battery system, rated between 24 and 125V dc with a 72-hour capacity.

(2) The batteries of the SCADA system shall be separate from batteries for other electrical systems.

(3) The power supply shall be provided with properly installed surge protective device (TVSS) at its terminals with direct low impedance path to ground. Protected and unprotected circuits shall be physically separated to prevent coupling.

(C) Security against hazards. Security against hazards shall be provided in accordance with (C)(1) through (C)(6).

(1) Controlled physical access by authorized personnel to only the system operational controls and software shall be provided.

(2) The SCADA system shall be protected against dust, dirt, water, and other contaminates by specifying enclosures appropriate for the environment.

(3) Conduit and tubing shall not violate the integrity of the SCADA system enclosure.

(4) The SCADA system shall be located in the same secure locations as the secured systems that they monitor and control.

(5) The SCADA system shall be provided with, dry agent fire protection systems or double interlocked pre-action sprinkler systems using cross-zoned detection, to minimize the threat of accidental water discharge into unprotected equipment. The fire protection systems shall be monitored by the fire alarm system in accordance with NFPA 72-2002, *National Fire Alarm Code*®.

(6) The SCADA system shall not be connected to other network communications outside the secure locations without encryption or use of fiber optics.

Panel Statement: In addition to editorial changes, for clarity and style manual compliance, the panel has made technical revisions to the recommended text for the purposes of providing enforcable, prescriptive requirements for the installation and operation of a highly reliable power system for the operation of a mission critical facility. Additionally, there are two proposed annexes intended to provide useful design information. The following specific rationale is provided for technical changes made by the panel:
1) 585.1-the scope has been revised to include text that is similar to 700.1 in regard to who is responsible for classifying those facilities requiring mission critical power systems. The panel does not intend that the AHJ enforcing this Code be responsible for determining what facilities must have a critical operations power system. The panel understands that the scope, title and location of this article are under the purview of the TCC and recommend that

they accept the revised scope and title.

2) 585.1-Recommended Fine Print Note No.2 has been deleted because of concern that it could be misapplied in making the determination on which facilities fall within the scope of this article.

3) 585.1-A new fine print note has been added to reference NFPA 1600 for more information regarding disaster and emergency management.

4) 585.2-the definition of critical operations power systems has been revised to indicate that the system is to provide for continuous, rather than uninterruptable operation. The panel concludes that uninterruptable, operation is a matter of design and should not be the minimum requirement.

5) Definitions were deleted, modified, or added in keeping with the NEC Style Manual. A definition was developed for Designated Critical Operations Area to give clarity about the area covered by Article 585. The definitions for "small'',"medium", and "large" critical operations power systems have been deleted because they are not used in Article 585.

6)Section 585.4 is modified to provide guidance for clarity and in keeping with the NEC Style Manual.

7)Wiring methods was revised to enhance the requirements for physical protection and fire protection.

8)Sections were relocated and reordered to provide greater usability.

9)The duration of operation time of 72 hours was a compromise between the NFPA 110 duration of 96 hours and the current duration of emergency systems of 1½ hours. The 72 hour is the generally accepted minimum time frame recommended by the Army Corp of Engineers that allows for replenishment of fuel.

10)The Panel accepted an alternative to the separately derived power source requirement based on providing enhanced physical and fire protection of the normal supply grounded conductor wiring.

11) The proposed SCADA requirements were moved to an annex as the existing language is more informational than enforceable. Also, the SCADA system is optional and not mandatory.

12) The Panel agreed that a utility supplied second service to the building or facility does not meet the expectations for continuity of operations during the events Article 585 is designed to handle.

13) The panel provided language to differentiate the physical and fire protection requirements between branch circuits and feeders.

14) The panel agreed that the Critical Operations Power System (COPS) is separate and distinct from the Emergency System illumination covered in Article 700 and therefore deleted the proposed language concerning egress system illumination

15) The panel added language concerning the selective coordination of overcurrent devices in the critical operations power system for added reliability and to isolate faults to the lowest possible level and to parallel with similar requirements in Articles 700 and 701.

Number Eligible to Vote: 15

Ballot Results: Affirmative: 14 Negative: 1

Explanation of Negative:

SABIN-MERCADO, L.: We recognize the work of the technical committee however, we must vote against the Accept in Principle in Part for the following technical reasons.

1. **Material Outside the NEC Committee Scope** : The scope of Article 585 appears to cover material that is outside the Committee Scope of the National Electrical Code because it contains provisions for "operation, monitoring, control, and maintenance of critical operations power systems."

The Committee Scope of the National Electrical Code is printed on Page 22 of the 2005 NEC. The NEC Committee Scope (as a reference for discussion) is as follows:

Committee Scope: This Committee shall have primary responsibility for documents on minimizing the risk of electricity as a source of electric shock and as a potential ignition source of fires and explosions. It shall also be responsible for text to minimize the propagation of fire and explosions due to electrical installations.

In the past, the NEC Committee Scope has been interpreted to apply to only the **installation** portion of the electrical system and not the operation, monitoring, control and maintenance of such systems. Broadening the NEC Committee Scope or the proposed Scope of Article 585 will have unwanted applications and may make these provisions un-enforceable.

2. **Mandatory Requirements or Optional System:** The wording of the second paragraph of the Article Scope seems to indicate that Critical Operations Power Systems (COPS) are classed by either a government agency having jurisdiction or by facility engineering documentation establishing the necessity for such a system. The text of the paragraph is included for discussion purposes below:

Critical operations power systems are those systems so classed by municipal, state, federal, or other codes, by any governmental agency having jurisdiction or by facility engineering documentation establishing the necessity for such a system.

The issue is the identification of which governmental agency will actually class such systems. Also, can any engineer class their electrical system or facility as a Critical Operations Power System?

Typically, the term "authority having jurisdiction" is widely accepted in the NFPA documentation and used standards. In our opinion, this term should be the chosen term as the one to class such systems. The wording of this paragraph (paragraph 2 of the Scope) as currently written eliminates some authorities such as the non-governmental ones with statutory authority such as the investor owned electric utility companies.

Also, any engineering documentation for a facility can class the facility, or portion of such, as a critical operations power system. This action would further support the requirements of an optional system for those who choose to implement these requirements for their own use.

Article 585 is intended and written as a set of mandatory regulations. However in our opinion, the document may be best served as information in a Recommended Practice or an optional system. For example, section 585.4 Risk Assessment outlines a requirement for conducting a risk assessment for critical power operations power systems including identifying the hazards, their likelihood of occurrence and the vulnerability of the electrical system to those hazards. Hazards are to be identified as naturally occurring and human-caused events.

Once the hazards are known by completing the Risk Assessment, a mitigation strategy addressing the results of the risk assessment is to be developed. Much of the language that currently appears in Article 585 is not easily enforceable and is highly subjective for the engineer or individual conducting the Risk Assessment. Also, the section on mitigation strategy would be at best performance requirements of a standard.

We encourage the work of the technical committee and offer the following solution. We would support the document if the following changes were made to the Scope of Article 585 and editorial change to 585.20(F)(6) to add an s after Mean in the title.

Proposed Scope of 585

Critical Operations Power Systems (COPS)

585.1 Scope. The provisions of this article apply to the electrical installation ~~, operation, monitoring, control, and maintenance~~ of critical operations power systems consisting of circuits and equipment intended to supply, distribute and control electricity to designated vital operations in the event of disruption to elements of the normal system.

Critical operations power systems are those systems so classed by municipal, state, federal, or other codes, by ~~any governmental agency~~ <u>the authority</u> having jurisdiction or <u>as an optional system where</u> ~~by~~ facility engineering documentation establish <u>es</u> ~~ing~~ the necessity for such a system.

FPN No. 1: Critical Operations Power Systems are generally installed in vital infrastructure facilities that, if destroyed or incapacitated, would disrupt national security, the economy, public health or safety; and where enhanced electrical infrastructure for continuity of operation has been deemed necessary <u>.</u> ~~by governmental authority.~~

FPN No. 2: For further information on disaster and emergency management see NFPA 1600-2004 edition, *Standard on Disaster/Emergency Management and Business Continuity Programs* .

585.20(F)(6) revise to read: Mean <u>s</u> for Connecting Portable or Vehicle-Mounted Generator. Remainder unchanged.

3. Over Designing the Electrical System

Article 585 prescribes certain mandatory requirements for physical security, testing and maintenance, commissioning, protecting the power feeders and branch circuits, protecting the HVAC, Fire Alarm, Security, Emergency Communications and Signaling Systems, beefing up the sources of alternate power, providing uninterruptible power supplies, providing additional overcurrent protection and selective coordination, and completing an emergency operations plan. Many of these elements are costly and beyond the typically requirements for systems that are in current compliance with the Code.

Most of the requirements are subjective and difficult to enforce for a particular installation and may not be needed for all critical operations power systems. For example, the scope of the Article is to be able to operate in the event of disruption to elements of the normal "supply" system. There is no evidence that fire is a direct result of loss of the elements of the normal "supply" system. However, most of the feeders and branch circuits are beefed up for fire. The Risk Assessment should be used to determine the requirements necessary for each facility and/or operation. The electric utility industry supports reasonable additions for safety, however does not typically endorse additions in cost with minimal or no benefits in the performance of the system against the risks involved.

Comment on Affirmative:

BINGHAM, R.: Proposal 20-1 should also include new Annex I.

585.6 (F) SCADA (1) Maintenance and (2) Testing sections were deleted from the normative section, and I believe that the committee action should have been to add it to Annex I, the informative section, along with the other SCADA material, which was deemed "optional". Maintenance and testing isn't optional if it is installed.

585.8(D)FPN Editorial change: ~~Annex X~~ should be <u>Annex H, Section II</u> .

585.11(D)(A) Editorial change: ...as the branch circuit <u>that</u> it supplies.

585.14(3) no substantiation for the added restriction of "and under single management". This is a valid concern regardless of common ownership of the buildings.

Annex I SCADA - the definition of SCADA in 585.2 includes discussion of the HVAC, which is a critical component of many COPS. Where humans would be in the DCOA, there needs to be control of the ventilation system from within the DCOA to prevent degradation of the life-sustaining air quality as well as keeping the equipment operation within temperature range. This was covered when the SCADA section was in the normative portion of the Article. Now that is moved to the Annex, this concern is no longer addressed.

Unfortunately, I missed the opening discussion of the meeting (due to prior commitment) when this relocation was accepted by the committee, so I don't know if this concern was discussed and approved as is, or, overlooked.

BOKSINER, J.: The Panel made significant improvements to the scope. However, it seems that the scope does not reflect that the Panel intends critical operations power systems to be also survivable against various types of threats. Perhaps the scope can be modified as follows:

585.1 Scope. The provisions of this article apply to the electrical installation, operation, monitoring, control, and maintenance of critical operations power systems consisting of circuits and equipment intended to supply, distribute and control electricity to designated vital operations in the event of disruption to elements of the normal system. <u>Critical operations power systems are intended to be survivable against naturally-occurring and human-caused threats.</u>

Critical operations power systems are those systems so classed by municipal, state, federal, or other codes, by any governmental agency having jurisdiction or by facility engineering documentation establishing the necessity for such a system.

CARROLL, J.: I continue to support the addition of this article in the NEC with the following considerations:

1) I oppose the committee action which added a requirement for selective coordination. The addition of this requirement does not consider the overall impact of the system reliability. It is possible that selectivity will drive less reliability in specific system designs. Is centralizing an alternate power source on a campus more reliable than decentralization? That answer will differ depending upon the size of the facility and geographical challenges. Selectivity may drive your decision instead of making the appropriate decision based on load needs and impact. Selectivity also imposes unnecessary requirements in specific areas of the system that will impact electrical safety by unnecessarily increasing the arc-flash energy hazard. An example: Overcurrent protection arranged to protected the primary and secondary of a transformer would unnecessarily be required to be selectively coordinated, hereby increasing the size of the overcurrent devices without any additional isolation benefit. The engineering community must be left with the responsibility to ensure selectivity is optimized as one component of the design that will maximize the reliability of the system.

Propose 585.54 may be revised to read:

"585.54 Coordination. Selective Coordination of overcurrent protective devices shall be optimized."

2) The committee needs to consider adding a new 585.56 to address loss of a single phase on these systems:

"585.56 Phase Loss. All ungrounded conductors shall be automatically opened during an overcurrent condition."

System design can arrange the alternate power source as either centralized or distributed closest to each load. When a single phase is lost in the system, the alternate source may not identify that loss ahead of the transformer serving a particular transfer switch, therefore the transformer and other parts of the system and equipment are is subject to damage. Due to the critical nature of this system and the equipment connected to such as system, it is necessary to consider the loss of a single phase on the system and ensure such a condition does not place the reliability of the system at risk.

3) The committee accepted a requirement to list all transfer switches in 585.24(C)(1). There presently is no industry recognized standard to list a product over 600V. Revise the listing requirement to 600V and below transfer switches as proposed in article 700. "Automatic transfer switches, rated 600 VAC and below,shall be listed for emergency system use."

4) Specific items within text that need to be addressed: 585.8(D) FPN – Change "Annex X" to "Annex H"

585.20(B) The equipment is currently only required to be in a space with a 1-hr fire rating, however, 585.11(B)(1) requires the feeder to have a 2-hr fire rating. Propose the equipment be in a space with a fire suppression system or in a space with a "2hr" fire rating.

585.20(G) Uninterruptible Power Supplies – The text points to 585.20(E) and (F) which are extremely specific requirements for particular power sources and it does not appear that these requirement can all be applied to a UPS system. Do these references need to focus directly on specific requirements?

585.52(C) FPN- Change the word "tie" needs changed to "time".

DAUBERGER, G.: I concur with the work and the action taken by the panel, but I support Mr. Moniz's comments relative to 585.45 coordination.

HICKMAN, P.: We feel that the most robust protection available should be required. For example, we feel that a minimum 2-hour fire rating would have been more appropriate in 585.10(D)(1)(1), rather than a minimum 1-hour fire rating as accepted in the panel action.

MONIZ, G.: Acceptance of 585.54 raises a number of issues that must be addressed:

1) There is a material conflict between NFPA 110 and the NEC that creates a dilemma for the system designer. This design conflict within two NFPA documents is not acceptable.

2) A conflict between the text of 585.54 and the definition of selective coordination in Article 100.

3) Numerous industry standards that point to selectivity impacting reliability negatively or without benefit.

4) Unnecessary selective coordination increases overcurrent device size and can unnecessarily increase the arc-flash hazard on the electrical system.

NFPA 110 is a long-standing document, which recognizes the importance of selective coordination by requiring selective coordination of overcurrent devices to be "optimized". The International Building Code, adopted by many states, points to NFPA 110 for installing emergency system installations. The NFPA 110 Technical Committee recognizes selective coordination is prudent to enhance the performance of the electrical system, however, by adding the word "optimized" the committee permits the engineering community to provide the most reliable electrical system.

There is clearly a technical correlation issue between NFPA 110 and the NEC on selective coordination. Furthermore, the definition of selective coordination in Article 100 of the NEC requires the "localization of an overcurrent condition to restrict outages to the circuit or equipment affected". Proposed Section 585.54 will go well beyond the definition of localizing an overcurrent condition, by requiring "all" overcurrent devices to be selectively coordinated. No other industry document supports all overcurrent devices being selectively coordinated.

The proposed wording in Section 585.54 must be revised to align with NFPA 110, the definition of selective coordination, and IEEE standards, which recognize selective coordination as not being necessary for "all" overcurrent device as follows:

585.54 Coordination. Selective Coordination of critical Operations Power System(s) overcurrent protective devices shall be optimized.

ARTICLE 590 — TEMPORARY INSTALLATIONS

___

3-109 Log #2586 NEC-P03 **Final Action: Reject**
(590)

___

TCC Action: The Technical Correlating Committee advises that Article location is the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.

Submitter: Jebediah Novak, Cedar Rapids Electrical JATC

Recommendation: Relocate Article 590-Temporary Installations to Chapter 7-Special Conditions.

Substantiation: Temporary installations would be a special condition rather than occupancy, since this should just be a phase in a construction project, temporary lighting around the holidays, etc. When I think of a temp. occupancy, I think of something like a circus tent, as covered in Article 525.

Panel Meeting Action: Reject

Panel Statement: Relocating Article 590 is under the jurisdiction of the NEC Technical Correlating Committee (TCC), not Panel 3. The submitter should petition the NEC TCC for this proposed change.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

___

3-110 Log #1301 NEC-P03 **Final Action: Reject**
(590.2(C) (New))

___

Submitter: Ronald E. Maassen, Lemberg Electric Co., Inc. / Rep. National Electrical Contractors Association

Recommendation: Add new text to read:

590.xx Temporary electrical power and lighting installations shall be installed in a neat and workman-like manner.

FPN: Accepted industry practices are described in ANSI/NECA 200-2002, Recommended Practice for Installing and Maintaining Temporary Electrical Power at Construction Sites, and other ANSI-approved Installation standards.

Substantiation: The general workmanship requirement of 110.12 applies to electrical equipment and systems covered by Article 590. However, safety would be improved by offering more detailed installation guidance for temporary power systems.

Panel Meeting Action: Reject

Panel Statement: Section 110.12 already provides requirements for electrical equipment to be installed in a neat and workmanlike manner with an accompanying Fine Print Note for accepted industry practices. Inserting this same requirement in Article 590 is not necessary since Chapters 1 through 4 are general requirements but anyone installing temporary wiring in accordance with Article 590 must adhere to 110.12.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

Comment on Affirmative:

MAASSEN, R.: The Panel action to reject Recommended Practices for Installing and Maintaining Temporary Electrical Power at Construction Sites, and referring to 110-12 FPN, did not take into consideration the specifics of the document. The NECA 200-2002 is specific to temporary wiring and gives the contractor and AHJ a document to better understand the installation of temporary wiring on construction sites and holiday lighting. I believe this document should be included as a fine print note to Article 590.

3-111 Log #2273 NEC-P03 **Final Action: Reject**
(590.2(C))

Submitter: H. Brooke Stauffer, National Electrical Contractors Assn. (NECA)
Recommendation: Add new text to read:
590.xx Temporary electrical power and lighting installations shall be installed in a neat and workmanlike manner.
FPN: Accepted industry practices are described in ANSI/NECA 200-2002, Recommended Practice for Installing and Maintaining Temporary Electrical Power at Construction Sites, and other ANSI-approved installation standards.
Substantiation: The general workmanship requirement of 110.12 applies to electrical equipment and systems covered by Article 590. However, safety would be improved by offering more detailed installation guidance for temporary power systems.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 3-110.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13
Comment on Affirmative:
MAASSEN, R.: See my Comment on Affirmative for Proposal 3-110.

3-112 Log #945 NEC-P03 **Final Action: Accept in Principle in Part**
(590.4(A) and (D))

TCC Action: It is the understanding of the Technical Correlating Committee that the Panel Action only accepted the text in the first sentence, as modified, and did not accept any of the recommended changes to the second sentence.
Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise text:
(A) Services shall be installed in conformance with <u>Parts I through VIII of</u> Article 230.
Revise second sentence of (D):
Unless installed in a continuous <u>ly</u> grounded metal raceway <u>approved for grounding</u> or a metal covered cable <u>approved for grounding</u> all branch circuit... (remainder unchanged).
Substantiation: Edit. Raceways and cables should be specified as a type approved for grounding so this section is not inferred as amending other code requirements. Continuous may be inferred as unbroken and not permitting junction points.
Panel Meeting Action: Accept in Principle in Part
Revise (A) to read as follows:
(A) Services shall be installed in conformance with Parts I through VIII of Article 230, as applicable.
Panel Statement: The change to (A) is made to comply with the NEC Manual of Style.
In Part (D) the word "continuous" was not changed since this word is not describing "grounded." It is requiring the metal raceway and the metal covered cables to be continuous. These raceways are not "approved" for grounding as indicated in the recommended text but must comply with 250.118.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-113 Log #1769 NEC-P03 **Final Action: Reject**
(590.4(B))

Submitter: Margarito Aragon, Jr., Santa Fe, NM
Recommendation: Add new text to read as follows: Add new fourth sentence:
<u>Conductors supplying temporary lighting circuits on construction sites shall not be connected to the load side of a ground-fault circuit interrupter and shall be protected in accordance with 240.4(D).</u>
Substantiation: The proposed change is to clarify that on construction sites temporary lighting is not to be installed on GFCI circuits or be cord and plug connected.
Article 590 does not adequately address the installation branch circuits and overcurrrent protection requirements for temporary lighting circuits. The only requirements for temporary lighting branch circuits is located in 590.4(D) which prohibits the installation of receptacles on temporary lighting circuit on construction sites. Therefore on construction sites, temporary lighting stingers cannot be cord and plug connected, due to the requirement of 590.4(D).
240.4(D) does cover overcurrent protection of conductors sizes 14, 12 and 10 AWG, which provide protection to the already used conductors on temporary lighting circuits.
Panel Meeting Action: Reject
Panel Statement: Conductors supplying temporary lighting circuits are already required to be protected in accordance with Article 240 and the size of the overcurrent protective device is based upon the conductor size and the type of lighting installed on the circuit. Section 240.4(D) provides size limitation of overcurrent protective devices on small conductors and has nothing to do with temporary lighting units. There was no technical substantiation provided to not require lighting circuits to be GFCI protected. Damage of these circuit conductors may be particularly common on a jobsite so GFCI protection may be warranted on some of these circuits. Given the choice between loss of lighting on a jobsite and an injury or fatality from electrical shock, all personnel will choose loss of lighting so GFCI protection of personnel is more critical than loss of lighting on a jobsite.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-114 Log #2841 NEC-P03 **Final Action: Reject**
(590.4(B))

Submitter: Ricky Massicott, Fiore Electric
Recommendation: Revise text to read as follows:
590.4(B) Feeders. Overcurrent protection shall be provided in accordance with 240.4, 240.5, 240.100, and 240.101. <u>Feeder overcurrent protective devices rated at 200 amperes and larger shall be limited to new circuit breakers, circuit breakers tested within one year prior to use or fused disconnects.</u> They shall originate in an approved distribution center. Conductors shall be permitted within cable assemblies or within multiconductor cords or cables of a type identified in Table 400.4 for hard usage or extra-hard usage. For the purpose of this section, Type NM and Type NMC cables shall be permitted to be used in any dwelling, building, or structure without any height limitation or limitation by building construction type and without concealment within walls, floors, or ceilings.
Substantiation: This proposal is intended to ensure that temporary wiring is provided with adequate protection.
I have witnessed multiple fires in temporary electrical equipment where older equipment was used for temporary and moved from jobsite to jobsite.
The problem occurs when a circuit breaker opens a ground fault or short circuit and is placed back in service and then sent to yet another job for temporary duty. The level of protection is unknown when used circuit breakers are installed as part of a temporary system. There is no rule allowing the inspector to refuse a circuit breaker, that has obviously been around on many jobs in temporary service from being used. I ask about the history of the device and the electricians have no idea.
Temporary wiring is subject to far more physical abuse than any other venue I inspect. Feeders and branch circuits are regularly damaged in the course of a construction project.
Several recent losses of power on jobsites and fires have been attributed to bad breakers not opening, starting a fire and then taking out the service. Circuit breakers in new condition work just fine but when they see physical abuse, are exposed to extreme environments or act on a ground fault or short circuit they need to be replaced or at the least tested. This is part of the UL standard.
UL says that when those faults occur the circuit breakers must be tested. Would UL take a truckload of circuit breakers in panelboards and switchboards that have seen use in temporary on five or six jobs and put new UL labels on them?
I picked the feeder devices because if a branch circuit device is bad at least the feeder device should open and clear the fault.
Panel Meeting Action: Reject
Panel Statement: The recommended text is almost impossible to enforce. Determining the age or condition of each and every feeder circuit breaker on a temporary installation would require testing and verification by a qualified factory technician. These fault currents may not be available at the temporary installation. Testing at elevated fault current should only be done with the safety procedures implemented in a certified test facility. The fault testing of a circuit breaker may often result in failure of the breaker, depending upon the fault current levels used in the testing. Field evaluation of a circuit breaker does not involve destructive testing since that would require replacement of the breaker. The age of the breaker is not necessarily a factor in its performance.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-115 Log #469 NEC-P03 **Final Action: Reject**
(590.4(C) Exception)

Submitter: David Shapiro, Safety First Electrical Contracting, Consulting, and Safety Education
Recommendation: Revise text to read as follows:
Exception: Where the wiring is installed in accordance with 590.3(B), the voltage to ground shall not exceed 150 volts, the wiring shall not be subject to ~~physical~~ damage, and the conductors shall be supported on insulators at intervals of not more than 3.0 m (10 ft); or, for festoon lighting, the conductors shall be arranged so that excessive strain is not transmitted to the lampholders...
Substantiation: Use of the word "physical" is superfluous–the intent is obvious given the context. (I leave it to the CMP whether you want to get more specific instead, naming some source of damage such as "blows or abrasion.")
Submitting proposals removing the adjective, "physical," may strike people as useful as hunting gnats with a cannon. However, doing so seems worthwhile for two reasons. First, if we eliminate every unnecessary instance, as I am attempting to do, we actually cut the NEC down by up to oh, maybe a quarter-page. Keeping it from growing too much fatter every cycle is a goal many of us can agree on.
Second, the unneeded use of "physical" not only is poor writing–look at William Zinsser's classic, On Writing Well–but is silly, and reflects a bit poorly on the Code process. When references were changed to "physical damage," in 1959, from "mechanical injury" (with no substantiation recorded), an excellent

opportunity was overlooked to eliminate the possibility of someone raising an eyebrow and saying fatuously, "Is anyone claiming electrical equipment needs protection from non-physical injury?" (Substitute the snide adjective of your choice.) Let's take care of that for good: for our purposes, "damage" means "physical damage."
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 3-177.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-115a Log #CP302 NEC-P03 **Final Action: Accept**
(590.4(D))

Submitter: Code-Making Panel 3,
Recommendation: Change the second sentence in existing 590.4(D) to read as follows:
Unless installed in a continuous ~~grounded~~ metal raceway that qualifies as an equipment grounding conductor in accordance with 250.118 or a continuous metal-covered cable that qualifies as an equipment grounding conductor in accordance with 250.118 , all branch circuits shall contain a separate equipment grounding conductor, and all receptacles shall be electrically connected to the equipment grounding conductors.
Substantiation: The word "grounded" was deleted for the metal raceway. The phrase "that qualifies as an equipment grounding conductor in accordance with 250.118" was added to both metal raceway and cable. This change should clarify that the metal cables or raceways must be continuous and qualify as an equipment grounding conductor. If the metal raceway or metal cable is not continuous or does not qualify as an equipment grounding conductor then a separate equipment grounding conductor must be installed.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-116 Log #2780 NEC-P03 **Final Action: Reject**
(590.4(D)(1))

Submitter: Ted Smith, Ludvik Electric Co. / Rep. International Electrical Instructors & Students Assoc.
Recommendation: Add new text to read as follows:
590.4(D)(1) Safeguarding of Termination Screws. Receptacle outlets shall be installed in a manner that protects the termination screws of the receptacle from accidental contact with persons and tools after installation.
Substantiation: Receptacle cover plates are often removed during the construction phase for the purpose of wall finishing. The receptacles are very often energized at this phase of construction. The receptacle cover plates are often left off of the devices inadvertently for a period of time, until they are discovered and replaced. This circumstance causes a potential safety problem and exposes workers to possible electrical shock or arc blast. Requiring an approved method of covering the termination screws on the receptacle after installation will reduce this potential hazard.
Receptacles are also often times removed from their mounting during maintenance while in the energized state. This is not a recommended practice and power should be turned off to the receptacle before it is removed. However, we must recognize that some individuals will not take these necessary safety measures and will expose themselves to the risk of electrical shock or arc blast. Requiring a covering over the receptacle termination screws will reduce the potential of electrical shock and arc blast in these circumstances.
The required covering can be any of numerous methods available and will be left up to the AHJ to determine its effectiveness. There is available in inexpensive UL listed plastic snap over cover that will meet these requirements completely in addition to other methods.
Panel Meeting Action: Reject
Panel Statement: With the exception of any special permission and any requirements of Article 590, all electrical installations must follow the requirements in the remainder of the NEC. Section 110.3(B) requires listed and labeled equipment to be installed and used in accordance with any instructions included in the listing and labeling instructions. Receptacles must have a cover plate of some type covering any otherwise exposed live parts. Section 406.4(D) requires receptacles, after installation, to be mounted flush with or project from faceplates with two exceptions.

(590.4(K))

Submitter: Margarito Aragon, Jr., Santa Fe, NM
Recommendation: Add new text to read as follows:
590.4 General.
(K) Construction Site Temporary Lighting Circuits. Temporary lighting circuits on construction sites shall not be connected to the load side of a ground-fault circuit interrupter. Temporary lighting circuit and conductors shall be protected in accordance with 240.4(D).
Substantiation: The proposed change is to clarify that on construction sites temporary lighting is not to be installed on GFCI circuits or be cord and plug connected.
Article 590 does not adequately address the installation and overcurrent protection requirements for temporary lighting circuits. The only requirements for temporary lighting is located in 590.4(D) which prohibits the installation of receptacles on temporary lighting circuit on construction sites. Therefore on construction sites, temporary lighting stingers cannot be cord and plug connected, due to the requirement of 590.4(D).
240.4(D) does cover overcurrent protection of conductors sizes 14, 12 and 10 AWG, which provide protection to the already used conductors on temporary lighting circuits.
Panel Meeting Action: Reject
Panel Statement: See the Panel Statement in Proposal 3-113.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-123 Log #864 NEC-P03 **Final Action: Reject**
(590.6)

Submitter: Grant Guymon, Comforce Technical Services
Recommendation: Revise as follows:
Temporary String Lighting shall not be connected to the load side of a ground-fault circuit interrupter.
This is a shorter version of a similar proposal I am submitting today.
Substantiation: Problem: Confusion and inconsistent enforcement. Make the language and intent clear and simple as in 620.22, 23 and 24.
Note: Please see my proposals for new definitions for "Temporary String Lighting" and "Task Lighting."
Panel Meeting Action: Reject
Panel Statement: There was no technical substantiation provided to not require lighting circuits to be GFCI protected. Damage of these circuit conductors may be particularly common on a jobsite so GFCI protection may be warranted on some of these circuits. Given the choice between loss of lighting on a jobsite and an injury or fatality from electrical shock, all personnel will choose loss of lighting so GFCI protection of personnel is more critical than loss of lighting on a jobsite.

Ballot Results: Affirmative: 13

3-125 Log #1717 NEC-P03 **Final Action: Accept**
(590.6)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 13 for information.
Submitter: Ray Stanko, Underwriters Laboratories, Inc.
Recommendation: Revise text to read as follows:
Ground-Fault Protection for Personnel.
Ground-fault protection for personnel for all temporary wiring installations shall be provided to comply with 590.6(A) and 590.6(B). This section shall apply only to temporary wiring installations used to supply temporary power to equipment used by personnel during construction, remodeling, maintenance, repair, or demolition of buildings, structures, equipment, or similar activities. This section shall apply to power derived from an electric utility company or from an onsite generated power source.
Substantiation: This new text provides clarification that the source of temporary power for branch circuits supplying 15-, 20-, and 30-ampere 125-volt receptacles on these various sites is not limited to just utility power but also includes any generator power used on the site since the same hazards would apply no matter the source. By deleting 305.6(A), Exception No. 1 for the 2002 NEC [renumbered as 527.6(A)], Panel 3 intended to require GFCI protection for personnel for all 125-volt 15-, 20-, and 30-amp receptacles. Some generator manufacturers are incorrectly assuming that by deleting this exception, GFCI protection is no longer required for generators supplying temporary power.
Requiring GFCI protection for personnel on temporary power during construction, remodeling, maintenance, repair, or demolition is intended to apply to all power sources, including generator power. Electrical equipment, such as table saws, pressure washers, and hand-held tools, should have adequate GFCI protection for personnel on construction sites. There are many hazards associated with temporary installations, such as cut and abraded wire, wet locations, and similar hazardous applications on job sites requiring GFCI protection no matter the power source.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13
Comment on Affirmative:
CASPARRO, P.: This proposal eliminates a possible misunderstanding of the current text of the NEC. The intent of the section is to make sure that all persons on a construction site are protected by a Ground Fault Circuit Interrupter regardless of the source of the power. This addition to the NEC adds clarity to this section.

3-126 Log #572 NEC-P03 **Final Action: Reject**
(590.6(A))

Submitter: David Barnhart, City of Portland
Recommendation: Delete the following:
~~For the purposes of this section, cord sets of devices incorporating listed ground-fault circuit-interrupter protection for personnel identified for portable use shall be permitted.~~
Substantiation: The deleted wording allowed a temporary power pole to be installed with receptacles not having GFCI protection. This code could not be enforced without involving OSHA or shutting down power. Also, it is difficult to enforce this section of the code when protection is up to the individual and can only be used at their discretion.
Most of the new temporary services are GFCI protected, in many cases the temporary services that are reused should not be in service anymore. Or, if they are in good shape, could have GFCI protection installed to accommodate the rule.
The main issue is that in residential, where OSHA is not as effective, the installers do not take as much care of their equipment and some don't even know what GFCI protection is, they just want power.
Panel Meeting Action: Reject
Panel Statement: There should be an option to use listed portable personal GFCI protection sets that someone can clip to their belts or to their belt loop. This places the GFCI device at the point of connection of the equipment and can be an effective way for someone to ensure personal protection. This option can be used very effectively on small or large jobsites where the owner or contractor has made this portable personal GFCI a requirement for all work at that jobsite.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-127 Log #2708 NEC-P03 **Final Action: Reject**
(590.6(A))

Submitter: Gary L. Siggins, Underwriters Laboratories Inc.
Recommendation: Revise as follows:

590.6 Ground-Fault Protection for Personnel. Ground-fault protection for personnel for all temporary wiring installations shall be provided to comply with 590.6(A) and 590.6(B). This section shall apply only to temporary wiring installations used to supply temporary power to equipment used by personnel during construction, remodeling, maintenance, repair, or demolition of buildings, structures, equipment, or similar activities .

(A) Performance. Portable power distribution equipment that provides ground-fault protection for personnel shall continue to provide protection with the supply cord to the equipment damaged or its attachment plug miswired.

FPN: The test conditions are described in UL 1640, Standard for Safety Portable Power Distribution Equipment.

(Subsequent text unchanged but references updated)

Substantiation: Construction sites can be harsh environments. The supply cords of portable power distribution equipment could be damaged. It is also possible an attachment plug could be miswired when a damaged one was replaced. The components and circuits provided for ground-fault protection for personnel in such equipment must continue to protect in the event of these abnormal situations. Standard listed receptacle type GFCIs will not provide adequate protection when assembled into equipment rated 120/240 single phase 3-wire. They will not function correctly with an open neutral.

Safety requirements for portable power distribution equipment designed for construction sites is detailed in the Standard for Portable Power Distribution Equipment, UL 1640. These requirements detail the test conditions that represent the anticipated damaged supply cords and miswired attachment plugs. These unique ground-fault protection requirements were originally developed in the 1970's after extensive input from industry. Present NEC text allows use of equipment certified to a lesser standard of safety.

Panel Meeting Action: Reject
Panel Statement: The submitter's recommendation is not clear. The appropriate portions of UL 1640 should be submitted to the Panel to provide explanation as to the intent of the requirements for GFCI protection of miswiring of the attachment plug and damage of the supply cord. The Panel does not agree that the NEC allows the use of equipment certified to a lesser standard of safety. The Panel notes that the term "Portable Power Distribution Unit" is defined in Article 520 and only applies to the requirements in Article 520.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 11 Negative: 2
Explanation of Negative:

CASPARRO, P.: I agree with Mr. Guida's explanation of negative vote on Proposal 3-127.

GUIDA, T.: This proposal should have been accepted in principle with the text inserted as a new second paragraph in (A), before the exception, and revised as follows:

"Portable ground-fault circuit-interrupter devices shall continue to provide protection in accordance with the applicable requirements for Class A ground-fault circuit-interrupters with the following incorrectly wired attachment plugs or damage to the supply cords to the electrical equipment:

(1) Where the ungrounded conductor(s) have been transposed with the grounded conductor ofthe branch circuit on the receptacle,

(2) Where each ungrounded conductor of the supply to the receptacle is in an open condition,

(3) Where each grounded conductor of the supply to the receptacle is in an open condition, or

(4) Where the equipment-grounding conductor of the supply to the receptacle is in an open condition."

The proposal recognizes a very real situation where GFCI devices, designed to be installed in a permanent installation, are being installed as portable devices without the added protection required by UL 1640, the Standard for Safety of Portable Power Distribution Equipment for these portable devices.

3-128 Log #3445 NEC-P03 **Final Action: Reject**
(590.6(A), FPN (New))

Submitter: Redwood Kardon, Code Check Institute
Recommendation: Add a FPN to read:

FPN: Utilizing GFCI devices at the end of an extension cord increases the risk of an electrical hazard. An "open neutral" condition resulting from cord damage with such installations can leave equipment unprotected from ground fault. Some specialized GFCI devices and all listed Portable GFCIs have open neutral protection but they too, require that they not be installed at the end of an extension cord. See 110.3(B).

Substantiation: It is not common knowledge that an open neutral ahead of a GFCI can disable its ability to clear an equipment fault. A FPN clarifying this hazard will increase job-site safety.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided sufficient substantiation for the proposed FPN. The FPN as proposed is not accurate. The first sentence is not universally true. Some units are intended for installation at the receptacle end of the cord set.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-129 Log #2825 NEC-P03 **Final Action: Reject**
(590.6(B) Exception)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 13 for information.
Submitter: Paul Schnackenberg, Gen/Tran Corp.
Recommendation: Add text to read as follows:

Exception: 30A - 125 V and 125/250V receptacles on portable generators, when used for home standby systems with approved transfer switches shall not be required to have GFCI protection on these specific receptacles.

Substantiation: 70 percent of portable generators are used primarily for home standby. The 30A - 125V and 125/250V receptacles on these generators are used for home standby systems. Whole generator GFCIs have been a major problem for years on these applications. Either the imbalance on the neutral on 125/250V house wiring or capacitive leakage because the whole house wiring is on the GFCI or the dual return of the neutral and ground causing an imbalance, has caused nuisance tripping of these GFCIs on this application.
Panel Meeting Action: Reject
Panel Statement: Section 590.6 only applies to temporary power to equipment used by personnel during construction, remodeling, maintenance, repair, or demolition of buildings, structures, equipment, or similar activities. This proposed text more appropriately belongs in Article 702 since the proposal is addressing portable generators used for optional standby power for a dwelling unit.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-130 Log #1735 NEC-P03 **Final Action: Reject**
(590.7)

Submitter: Craig Schumann, Yorkville, IL
Recommendation: Delete 590.7 in its entirety.
Substantiation: Consistent with 590.2(A), this paragraph 590.7 does not modify the requirements found in 110.30, 110.31, 110.32, 110.33 and 110.34. All the requirements found in Article 110 pertaining to over 600 volts should apply to Article 590 and by deletion of this paragraph, the Code would be clearer in its requirements for Temporary Installations.
Panel Meeting Action: Reject
Panel Statement: The submitter is correct that Section 590.2(A) requires compliance with Part III of Article 110 covering high voltage. However, an additional reminder of the guarding requirements for over 600 volt systems and the limited accessibility to only authorized and qualified personnel on a construction site should remain in 590.7. Too often, safety is compromised on a temporary installation because someone assumed it was just "temporary" and everyone "knows" that it is high voltage.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-131 Log #3195 NEC-P03 **Final Action: Reject**
(590.8 (New))

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 13 for information.
Submitter: Timothy M. Croushore, Allegheny Power
Recommendation: Please add a new section in Article 590 for temporary connection of portable generators. The section should read as follows:

590.8 Portable Generators. Temporary connection of a portable generator shall be permitted to supply permanent premises wiring where conditions of maintenance and supervision ensure that only qualified persons service the installation and where the normal supply is physically isolated by a lockable disconnecting means or by disconnection of the normal supply conductors.

Substantiation: The purpose of this change is to add portable generators as a means of supply to permanent premises wiring in Article 590 as permitted by the exception to 702.6, Transfer Equipment. Putting these requirements in Article 590 bring all of the other provisions such as time constraints and wiring methods of Article 590 for this application. This proposal has a companion proposal to 702.6 Transfer Equipment to properly correlate the two Code sections (New 590.8 and existing 702.6 Exception) within the scopes of their respective articles.

A companion proposal to add a new exception to 702.6 was submitted. The new exception is proposed to read as follows:

Exception: Connection of a portable generator without transfer equipment shall be permitted as provided in 590.8.

Panel Meeting Action: Reject
Panel Statement: This temporary connection is already permissible in the existing exception to 702.6 so this new section in Article 590 with similar wording is not needed.

Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
MENENDEZ, J.: This proposal should have been accepted. According to the scope of Article 702, the requirements of that Article are for optional standby systems that are <u>permanently</u> installed in their entirety and not for temporary installations. The specific requirements for temporary installations in 590.2; 590.3; and 590.4 should cover the temporary connection of portable generators.
The new section 590.8 as originally proposed properly deals with the "temporary connection of portable generators", and has additional requirements that are not covered under the provisions of Article 702.

ARTICLE 600 — ELECTRIC SIGNS AND OUTLINE LIGHTING

18-111 Log #526 NEC-P18 **Final Action: Accept in Principle**
(600.2)

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read:
Section Sign. A sign or outline lighting system, shipped <u>to the site</u> as subassemblies, <u>that requires either field-installed interconnections and wiring between subassemblies of a single sign unit or</u> field-installed wiring between the subassemblies of an overall sign that are remote from one another ~~but to complete the overall sign~~ .
Substantiation: Panel 18 took a real positive step by adding a definition of section sign to Article 600. The product standard UL 48 has specific details about listed section signs. This proposed revision to the definition accepted in the 2005 cycle is an effort to only improve the good work of the technical committee and provide more descriptive information that more accurately describes these types of signs. The two types of section signs that are manufactured and installed in the field should be included in the description. The NEC handbook (2005) included a good description and differentiation between the two types, but the definition accepted for the 2005 Code, was not complete. This proposed revision to this definition should help clarify what is meant by the term section sign. The handbook includes a picture of a section sign that is assembled at the site to form a single unit.
The subassemblies may be physically joined to form a single sign unit, or they may be installed as separate remote parts of an overall sign. The proposed revision to this definition of section sign clarifies that the multiple parts of a section sign are referred to as subassemblies and the only field wiring involved are the interconnections and wiring between subassemblies or field-installed wiring between the subassemblies remote from one another for overall sign and connection of the subassemblies to the power source. (Portions of this description taken from the NEC handbook)
Panel Meeting Action: Accept in Principle
Revised the definition in 600.2 to read:
Section Sign. A sign or outline lighting system, shipped as subassemblies, that requires field-installed wiring between the subassemblies to complete the overall sign. <u>The subassemblies are either physically joined to form a single sign unit or are installed as separate remote parts of an overall sign.</u>
Panel Statement: The panel agrees that additional information would improve the definition. This modified sentence from the 2005 NEC Handbook concisely accomplishes that task.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-112 Log #1191 NEC-P18 **Final Action: Reject**
(600.3)

Submitter: Stephen G. Kieffer, Kieffer & Co., Inc. / Rep. International Sign Association
Recommendation: Modify 600.3 LISTING by deleting the words "section sign" as follows:
"Electric signs, ~~section signs~~ , and outline lighting — fixed, mobile, or portable — shall be listed and installed in conformance with that listing, unless otherwise approved by special permission.
Substantiation: After CMP 18 completed their work processing comments for the 2005 Code, the Technical Correlating Committee took action on Comment 18-79 deleting the word "listed" from the definition of a section sign and inserting "section sign" in o 600.3 Listing.
The International Sign Association appealed this change to the Standards Council. The appeal stated "On behalf of the International Sign Association I'd like to appeal the action of the Technical Correlating Committee on Comment 18-79."
While the Technical Correlating Committee was correct in removing this word "listed" from the new definition for section sign, it is not correct to add the words "section sign" to 600.3 A section sign is a specific subtype of electric sign and as such is already covered by 600.3. Adding "section sign" to 600.3 does not change the requirements for this type of sign and might add confusion as a reader could wonder about the status of other subtypes of signs.
Therefore, it is recommended that the Standards Council delete the words "section sign" from 600.3.
After oral presentations at the Standards Council meeting this appeal was rejected as it had not first been taken to the NFPA membership. During those oral presentations, Mr. Mark Ode spoke on behalf of the Technical Correlating Committee and stated the following:
It is a new term or definition that's put in 600, and people may not equate it to the 600.3 listing requirements for those general types of signs that they've been used to.
And by putting it in there -- and it may just be necessary for the Code Panel to leave it in there for one code cycle until people get the idea that this is in fact a listing requirement, and then it could be removed for the 2008, if the panel decided that that was a problem with putting it in there. But sometimes you put those kinds of things in to introduce these new definitions and concepts. And that's one of the main reasons, I believe, that we as a Correlating Committee did the action that we did.
Including the words "section sign" in the listing requirements is redundant and could lead to confusion as people wonder whether or not other subtypes of signs are required to be listed. CMP 18 should take action to delete these words.
Panel Meeting Action: Reject
Panel Statement: Because of the unique nature of section signs, emphasis needs to be placed on the requirement that they be listed.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-113 Log #2861 NEC-P18 **Final Action: Accept in Principle**
(600.4)

Submitter: Randall K. Wright, RKW Consulting
Recommendation: Add new text as follows:
<u>(C) Section Signs Requiring Field-Wiring. Sections signs requiring field wiring shall be marked that field - wiring and installation instructions are required.</u>
Substantiation: UL, the primary listing agency has, clearly stated any field-wiring is the inspection requirement of the local (AHJ) and therefore marking for the local electrical inspection is required. The majority of the signs I investigate after a fire, are that of the section sign type. The concealed wiring is in areas where a large fire gets started before detection.
Panel Meeting Action: Accept in Principle
Add new text as follows:
<u>(C) Section Signs. Section signs shall be marked to indicate that field-wiring and installation instructions are required.</u>
Panel Statement: "Requiring Field-Wiring" was deleted, as this is a redundant repetition of a phrase included in the definition of Section Sign.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-114 Log #1170 NEC-P18 **Final Action: Accept in Principle**
(600.4(B))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise as follows:
Signs and outline lighting systems with ~~incandescent~~ lampholders <u>for incandescent lamps</u> ...(remainder unchanged).
Substantiation: Edit. Present wording infers the lampholders are incandescent.
Panel Meeting Action: Accept in Principle
Re-write 600.4(B) to read:
<u>Signs</u> with ~~Incandescent~~ Lampholders <u>for Incandescent Lamps</u> . Signs and outline lighting systems with ~~incandescent~~ lampholders <u>for incandescent lamps</u> shall be marked to indicate the maximum allowable <u>lamp</u> wattage ~~of lamps~~ <u>per lampholder</u> . The markings shall be permanently installed, in letters at least 6 mm (1/ 4 in.) high, and shall be located where visible during relamping.
Panel Statement: The submitter has correctly identified that this section is not worded correctly. The panel identified other wording in the section that required clarification.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-117 Log #2752 NEC-P18 **Final Action: Reject**
(600.5(A))

Submitter: Jonathan R. Althouse, Michigan State University
Recommendation: Add a new sentence that reads as follows:
<u>One circuit shall be permitted to supply an outlet at more than one pedestrian entrance</u> .
Substantiation: There is variability in interpretation as to whether the required outlet at each pedestrian entrance is permitted to be supplied by one 20-ampere branch circuit when the circuit is adequate to supply the load. In some jurisdictions a separate 20-ampere branch circuit is required for each entrance and others one 20-ampere branch circuit is permitted to supply all of these required outlets.

Panel Meeting Action: Reject
Panel Statement: The Code requires at least one outlet per pedestrian entrance. It does not restrict the number of outlets on the circuit. The Code requires each circuit to be 20 amperes or larger. The Code does not prohibit extending the circuit to multiple entrances.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-115 Log #520 NEC-P18 **Final Action: Accept**
(600.5(C)(3))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read:
(3) Metal or Nonmetallic Poles. Metal or Nonmetallic poles used to support signs shall be permitted to enclose supply conductors, provided the poles and conductors are installed in accordance with 410.15(B).
Substantiation: 410.15(B) was revised in the 2005 NEC to include references to nonmetallic poles in addition to metallic poles. 600.5(C)(3) provides a reference to 410.15(B). While it is recognized that nonmetallic poles are generally not used to support electric signs, there appears to be a restriction by not including the allowance in Article 600. Since 410.15(B) is referenced from this section in Article 600 it would seem logical to provide consistency between the two articles with the recognition of both metallic and nonmetallic poles as supports.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-116 Log #2042 NEC-P18 **Final Action: Accept in Principle**
(600.6(A))

Submitter: James T. Dollard, Jr., IBEW Local 98
Recommendation: Revise text to read as follows:
600.6(A) Location
(1) Within Sight of the Sign The disconnecting means shall be within sight of the sign or outline lighting system that it controls. Where the disconnecting means is out of the line of sight from any section that is able to be energized, the disconnecting means shall be capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed.
(2) Within Sight of the Controller The following shall apply for signs or outline lighting systems operated by electronic or electromechanical controllers located external to the sign or outline lighting system:
(1) The disconnecting means shall be permitted to be located within sight of the controller or in the same enclosure with the controller.
(2) The disconnecting means shall disconnect the sign or outline lighting system and the controller from all ungrounded supply conductors.
(3) The disconnecting means shall be designed such that no pole can be operated independently and shall be capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed.
Substantiation: The problem with the present wording of this section is that the disconnect in many sign applications is a circuit breaker in a panelboard or a switch that is not made with permanent provisions for locking the circuit breaker or switch in the open position.
This requirement for a disconnect is for the safety of the installer/maintainer of the equipment. Permanent provisions for making circuit breakers and switches capable of being locked in the open position are readily available from circuit breaker and switch manufacturers.
This proposal does not represent a large increase in the cost of an installation but will result in a dramatic increase in safety.
Where signs are involved we know that maintenance will take place, we must ensure that only a lock is needed by an installer/maintainer to work safely.
The practical safeguarding of persons from electrical hazards as detailed in the scope of the NEC must not be permitted to hinge on whether or not an installer just happens to have enough different types of devices and hopefully one that that happens to fit the circuit breaker or switch in an installation.
Note that this language was accepted by CMP-11 and is a present requirement, in the 2002 NEC, when a circuit breaker or switch is used as a disconnecting means not within sight of a motor. Also included in the 2005 NEC is the same language in 422.31 for appliances
The same level of safety is needed for these disconnecting means for signs.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposals 18-118 and 18-120.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-118 Log #355 NEC-P18 **Final Action: Accept**
(600.6(A)(1))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read as follows:
(A) Location.
(1) Within Sight of the Sign. The disconnecting means shall be within sight of the sign or outline lighting system that it controls. Where the disconnecting means is out of the line of sight from any section that may be energized, the disconnecting means shall be capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means must remain in place at the switch or circuit breaker whether the lock is installed or not. Portable means for adding a lock to the switch or circuit breaker shall not be permitted.
Substantiation: This proposed change in wording is to provide consistency between other similar rules in the NEC that also call for disconnecting means to be capable of being locked in the open position. The phrase "capable of being locked in the open position" is used over 25 times in the NEC and the purpose is the same in every instance. Electrical safety rules for the worker should be consistent and the wording and requirements should be consistent where this phrase is used. The last sentence is being proposed because there are claims that some of the portable units available for snapping on to circuit breakers do remain with the switch or circuit breaker after they are installed on the breakers when the lock is not installed, but they are portable. The actions by CMP 11 in the 2002 cycle in 430.102(B) Exception were fairly clear that the provisions for adding a lock should be more substantial and not portable units.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-119 Log #2139 NEC-P18 **Final Action: Reject**
(600.6(A)(1))

Submitter: David Pawlicki, Lansing, MI
Recommendation: Revise text to read:
600.6(A) Location.
(1) Within Sight of the Sign. The disconnecting means shall be within sight of the sign or outline lighting system that it controls. ~~Where the disconnecting means is out of the line of sight from any section that is able to be energized, the disconnecting means shall be capable of being locked in the open position.~~
Substantiation: The code requirement for a disconnecting means to be within sight of the sign is very important for safety. Servicing and inspections often occur when the business is not open and without a disconnecting means by the sign it puts the service or inspection personnel at risk of electrical shock.
Panel Meeting Action: Reject
Panel Statement: The proposal fails to recognize that many types of signs include portions that are not visible from a single location, either because of the physical size of the sign or because a portion of the sign is installed behind a surface on which the rest of the sign is located. The substantiation does not offer any injury data or incident reports indicating that the present wording is inadequate.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-120 Log #360 NEC-P18 **Final Action: Accept**
(600.6(A)(3))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read:
(2) Within Sight of the Controller. The following shall apply for signs or outline lighting systems operated by electronic or electromechanical controllers located external to the sign or outline lighting system:
(1) The disconnecting means shall be permitted to be located within sight of the controller or in the same enclosure with the controller.
(2) The disconnecting means shall disconnect the sign or outline lighting system and the controller from all ungrounded supply conductors.
(3) The disconnecting means shall be designed so that no pole can be operated independently and shall be capable of being locked in the open position. The provisions for locking or adding a lock to the disconnecting means must remain in place at the switch or circuit breaker whether the lock is installed or not. Portable means for adding a lock to the switch or circuit breaker shall not be permitted.
Substantiation: This proposed change in wording is to provide consistency between other similar rules in the NEC that also call for disconnecting means to be capable of being locked in the open position. The phrase "capable of being locked in the open position" is used over 25 times in the NEC and the purpose is the same in every instance. Electrical safety rules for workers should be consistent. This wording and requirement should be consistent where this phrase is used. The last sentence is being proposed because there are claims that some of the portable units available for snapping on to circuit breakers do remain with the switch or circuit breaker after they are installed on the breakers

when the lock is not installed, but they are portable. The actions by CMP 11 in the 2002 cycle in 430-102(B) Exception were fairly clear that the provisions for adding a lock should be more substantial and not portable units.

Panel Meeting Action: Accept

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

18-121 Log #659 NEC-P18 **Final Action: Reject**

(600.6(C))

Submitter: Leon Przybyla, Southern Arizona Chapter IAEI

Recommendation: Add new subsection as follows:

(C) Isolation. Conductors to the line of the disconnecting means as required in 600.6(A)(1) shall be isolated in a separate raceway, cable, or conduit within the sign or enclosure.

Substantiation: Conductors in a sign section, enclosure or raceway may be energized while sign switch is in the off position.

Panel Meeting Action: Reject

Panel Statement: The proposal fails to provide technical substantiation of a hazard or field reports of a problem. Safety concerns and construction requirements within a listed product are addressed by the ANSI standard for that product. The submitter is referred to the UL STP process which encourages public proposals.

There are many instances where the disconnect is not within the sign.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

18-123 Log #338 NEC-P18 **Final Action: Accept in Principle in Part**

(600.7)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to the Technical Correlating Committee Bonding and Grounding Task Group for information. The Technical Correlating Committee understands that this proposal modifies the action taken on Proposal 18-8.

Submitter: Michael J. Johnston, Plano, TX

Recommendation: Revise text to read as follows:

600.7 Grounding and Bonding.

(A) Grounding.

(1) Signs and metal equipment of outline lighting systems shall be grounded by connection to the equipment grounding conductor of the supply branch circuit or feeder using any of the types of equipment grounding conductors specified in 250.118.

(2) The equipment grounding conductor size shall be in accordance with 250.122 based on the rating of the overcurrent device protecting the branch circuit or feeder conductors supplying the sign or equipment.

(3) Connections. Equipment grounding conductor connections shall be made in accordance with 250.130 and in a method specified in 250.8.

(4) Supplementary Gounding Electrode. Supplementary grounding electrode(s) shall be permitted for electric signs and equipment covered by this article and shall meet the requirements of 250.54.

(5) Metal Building Parts. Metal parts of a building shall not be permitted as a secondary return conductor or an equipment grounding conductor.

(6) The earth shall not be used as an effective ground-fault current path.

(B) Bonding.

(1) Metal parts of electric signs and outline lighting systems shall be bonded together and to the associated transformer or power supply equipment grounding conductor of the supply branch circuit or feeder and shall meet the requirements of 250.90.

(2) Bonding connections shall be made in accordance with 250.8.

(3) Metal Building Parts. Metal parts of a building shall not be permitted to be used as a means for bonding metal parts of signs or outline lighting systems together or to the transformer or power supply equipment grounding conductor.

(4) Flexible Metal Conduit Length. Listed flexible metal conduit or listed liquidtight flexible metal conduit that encloses the secondary circuit conductor from a transformer or power supply for use with electric discharge tubing shall be permitted as a bonding means if the total accumulative length of the conduit in the secondary circuit does not exceed 30 m (100 ft).

(5) Small Metal Parts. Small metal parts not exceeding 50 mm (2 in.) in any dimension, not likely to be energized and spaced at least 19 mm (3/4 in.) from neon tubing shall not require bonding.

(6) Nonmetallic Conduit. Where listed nonmetallic conduit is used to enclose the secondary circuit conductor from a transformer or power supply and a bonding conductor is required, the bonding conductor shall be installed separate and remote from the nonmetallic conduit and be spaced at least 38 mm (1 1/2 in.) from the conduit when the circuit is operated at 100 Hz or less or 45 mm (1 3/4 in.) when the circuit is operated at over 100 Hz.

(7) Bonding Conductors. Bonding conductors shall be copper and not smaller than 14 AWG. Bonding conductors installed external shall be protected where subject to physical damage.

(8) Signs in Fountains. Signs or outline lighting installed inside a fountain shall have all metal parts and bonded to the equipment grounding conductor of the branch circuit for the fountain recirculating system. The bonding connection shall be as near as practicable to the fountain and shall be permitted to be made to metal piping systems that are bonded in accordance with 680.53.

FPN: Refer to 600.32(J) for restrictions in length of high-voltage secondary conductors.

Substantiation: The proposed wording is an effort to differentiate between the requirements for grounding and bonding of electric signs and outline lighting systems. The revision structures this section into a list format to meet the requirements of the NEC Style Manual. The proposed revision divides this section into two parts "Grounding" and "Bonding," and provides clear direction for users and enforcement as to what bonding is intended to accomplish and where the bonding conductors or jumpers are required to be connected. The Code currently does not provided any clear direction about where the bonding conductor path is required to originate or be connected to. This revision should provide additional needed clarification. I have provided two photos to help substantiate the need for this language in the NEC.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle in Part

Revise recommendation to read as follows:

600.7 Grounding and Bonding.

(A) Grounding.

(1) Signs and metal equipment of outline lighting systems shall be grounded by connection to the equipment grounding conductor of the supply branch circuit or feeder using any of the types of equipment grounding conductors specified in 250.118.

Exception: portable cord-connected signs shall not be required to be connected to the equipment grounding conductor where protected by a system of double insulation or its equivalent. Double insulated equipment shall be distinctively marked. (2) The equipment grounding conductor size shall be in accordance with 250.122 based on the rating of the overcurrent device protecting the branch circuit or feeder conductors supplying the sign or equipment.

(3) Connections. Equipment grounding conductor connections shall be made in accordance with 250.130 and in a method specified in 250.8.

(4) Supplementary Gounding Electrode. Supplementary grounding electrode(s) shall be permitted for electric signs and equipment covered by this article and shall meet the requirements of 250.54.

(5) Metal Building Parts. Metal parts of a building shall not be permitted as a secondary return conductor or an equipment grounding conductor.

(B) Bonding.

(1) Metal parts of electric signs and outline lighting systems shall be bonded together and to the associated transformer or power supply equipment grounding conductor of the supply branch circuit or feeder and shall meet the requirements of 250.90.

(2) Bonding connections shall be made in accordance with 250.8.

(3) Metal Building Parts. Metal parts of a building shall not be permitted to be used as a means for bonding metal parts of signs or outline lighting systems together or to the transformer or power supply equipment grounding conductor.

(4) Flexible Metal Conduit Length. Listed flexible metal conduit or listed liquidtight flexible metal conduit that encloses the secondary circuit conductor from a transformer or power supply for use with neon tubing shall be permitted as a bonding means if the total accumulative length of the conduit in the secondary circuit does not exceed 30 m (100 ft).

(5) Small Metal Parts. Small metal parts not exceeding 50 mm (2 in.) in any dimension, not likely to be energized and spaced at least 19 mm (3/4 in.) from neon tubing shall not require bonding.

(6) Nonmetallic Conduit. Where listed nonmetallic conduit is used to enclose the secondary circuit conductor from a transformer or power supply and a bonding conductor is required, the bonding conductor shall be installed separate and remote from the nonmetallic conduit and be spaced at least 38 mm (1 1/2 in.) from the conduit when the circuit is operated at 100 Hz or less or 45 mm (1 3/4 in.) when the circuit is operated at over 100 Hz.

(7) Bonding Conductors. Bonding conductors shall be copper and not smaller than 14 AWG. Bonding conductors installed external shall be protected where subject to physical damage.

(8) Signs in Fountains. Signs or outline lighting installed inside a fountain shall have all metal parts and bonded to the equipment grounding conductor of the branch circuit for the fountain recirculating system. The bonding connection shall be as near as practicable to the fountain and shall be permitted to be made to metal piping systems that are bonded in accordance with 680.53.

FPN: Refer to 600.32(J) for restrictions in length of high-voltage secondary conductors.

Panel Statement: The panel added an exception to Section 600.7(A)(1) to allow cord-connected double-insulated signs. In 600.7(B)(4); the panel did not accept 600.7(A)(6) because it is redundant. The panel changed 600.7(B)(4) the term from "electric discharge" to "neon".

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

Explanation of Negative:

KIEFFER, S.: These proposals should have been accepted in principle with Proposal 18-125 rather than 18-123 being the basis for the panel's action.

Both proposals, 18-123 and 18-124, as well as the panel action in Proposal 18-123 contain numerous violations of the 2003 NEC Style Manual, 4.1 Reference to Other NEC Rules, by referencing specific sections in Article 250 without modification. They are already covered by 90.3.

Of potential serious consequence, by only referencing a few of the sections in Article 250 applicable to signs and outline lighting, the panel action could lead users to the mistaken assumption that all other sections of Article 250 not referenced in Article 600 no longer apply to signs.

It is not appropriate to add references to Article 250 in Article 600 to improve the use of this article as a training tool for those who choose to ignore 90.1(C) or fail to enforce the code.

Proposal 18-125 should have been the basis for the panel's actions with the addition of the exception for cord-connected signs due to the Panel's action in Proposal 18-8, and the addition of the Proposal 18-129.

18-124 Log #632 NEC-P18 **Final Action: Accept in Principle**
(600.7)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to the Technical Correlating Committee Bonding and Grounding Task Group for information.

Submitter: Michael J. Johnston, Plano, TX

Recommendation: Revise text to read as follows:

600.7 Grounding and Bonding .

(A) Grounding. Signs and metal equipment of outline lighting systems shall be ~~grounded~~ connected to an equipment grounding conductor installed with the branch circuit or feeder supplying the sign or outline lighting system. Supplementary grounding electrode(s) shall be permitted for electric signs and equipment covered by this article and shall meet the requirements of 250.54.

(B) Bonding. Metal parts of electric signs and outline lighting systems shall be bonded together and to the associated transformer or power supply equipment grounding conductor of the supply branch circuit or feeder and shall meet the requirements of 250.90.

~~(A)~~ (1) Flexible Metal Conduit Length. Listed flexible metal conduit or listed liquidtight flexible metal conduit that encloses the secondary circuit conductor from a transformer or power supply for use with electric discharge tubing shall be permitted as a bonding means if the total accumulative length of the conduit in the secondary circuit does not exceed 30 m (100 ft).

~~(B)~~ (2) Small Metal Parts. Small metal parts not exceeding 50 mm (2 in.) in any dimension, not likely to be energized, and spaced at least 19 mm (3/4 in.) from neon tubing shall not require bonding.

~~(C)~~ (3) Nonmetallic Conduit. Where listed nonmetallic conduit is used to enclose the secondary circuit conductor from a transformer or power supply and a bonding conductor, is required, the bonding conductor shall be installed separate and remote from the nonmetallic conduit and be spaced at least 38 mm (1 1/2 in.) from the conduit when the circuit is operated at 100 Hz or less or 45 mm (1 3/4 in.) when the circuit is operated at over 100 Hz.

~~(D)~~ (4) Bonding Conductors. Bonding conductors shall be copper and not smaller than 14 AWG. Bonding conductors shall be protected where subject to physical damage.

~~(E)~~ (5) Metal Building Parts. Metal parts of a building shall not be permitted as a bonding means, a secondary return conductor, or an equipment grounding conductor.

~~(F)~~ (6) Signs in Fountains. Signs or outline lighting installed inside a fountain shall have all metal parts and equipment grounding conductors bonded to the equipment grounding conductors of the branch circuit supplying ~~for~~ the fountain recirculating system. The bonding connection shall be as near as practicable to the fountain and shall be permitted to be made to metal piping systems that are bonded in accordance with 680.53.

Substantiation: The proposed wording is an effort to differentiate between the requirements for grounding and bonding of electric signs and outline lighting systems. This section was previously titled "Grounding" yet there are more bonding rules in 600.7 than grounding rules, thus the proposed revision to the title of this section to include the word "Bonding". The revision restructures this section into a list format to meet the requirements of the NEC Style Manual. The proposed revision divides this section into two parts "Grounding" and "Bonding" and renumbers the balance of the section accordingly. Additional text has been added under bonding to provide clear direction for installers and enforcement as to what bonding is intended to accomplish and where the bonding conductors or jumpers are required to be connected. The Code currently does not provided any clear direction about where the bonding conductor path is required to originate or be connected to. This revision should provide additional needed clarification.

Since physical protection requirements are not currently provided in this section, it is proposed for the small 14 AWG copper conductors that would be installed for bonding. Obviously, where these bonding conductors are not installed in areas where physical damage is a concern (hollow spaces in walls and ceilings for example) additional protection would not be necessary.

The additional text concerning supplementary grounding electrodes is an effort to include a reference to the supplementary grounding electrode requirements in 250.54 to establish a clear distinction between the equipment grounding conductor which performs grounding and as an effective ground-fault path for ground fault currents and grounding by connection to a grounding electrode alone. Connecting a sign to a ground rod meets the definition of "grounded" as defined in Article 100. The additional text under new 600.7(A) is an effort to clarify what is required and will correlate with the equipment grounding requirements in 250.112(G). Similar revisions are being proposed for 250.112 and other sections of the Code that clarify how the terms and words used in grounding and bonding requirements are being used.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Proposal 18-123.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

Explanation of Negative:

KIEFFER, S.: These proposals should have been accepted in principle with Proposal 18-125 rather than 18-123 being the basis for the panel's action.

Both proposals, 18-123 and 18-124, as well as the panel action in Proposal 18-123 contain numerous violations of the 2003 NEC Style Manual, 4.1 Reference to Other NEC Rules, by referencing specific sections in Article 250 without modification. They are already covered by 90.3.

Of potential serious consequence, by only referencing a few of the sections in Article 250 applicable to signs and outline lighting, the panel action could lead users to the mistaken assumption that all other sections of Article 250 not referenced in Article 600 no longer apply to signs.

It is not appropriate to add references to Article 250 in Article 600 to improve the use of this article as a training tool for those who choose to ignore 90.1(C) or fail to enforce the code.

Proposal 18-125 should have been the basis for the panel's actions with the addition of the exception for cord-connected signs due to the Panel's action in Proposal 18-8, and the addition of the Proposal 18-129.

18-125 Log #1192 NEC-P18 **Final Action: Accept in Principle**
(600.7)

TCC Action: It was the action of the Technical Correlating Committee that this Proposal be referred to the Technical Correlating Committee Bonding and Grounding Task Group for information.

Submitter: Stephen G. Kieffer, Kieffer & Co., Inc. / Rep. International Sign Association

Recommendation: Reorganize and reword 600.7 to read as follows:

600.7 Grounding and Bonding:

A. Grounding .

(1) Signs and metal equipment of outline lighting systems shall be grounded.

(2) Metal parts of a building shall not be permitted as a secondary return conductor or an equpment grounding conductor.

B. Bonding of Secondary Neon Tubing Circuits over 1000 volts.

(1) Flexible Metal Conduit Length. Listed flexible metal conduit or listed liquidtight flexible metal conduti that encloses the secondary circuit conductor from a transformer or power supply for use with ~~electric discharge~~ neon tubing shall be permitted as a bonding means if the total accumulative length of the conduit in the secondary circuit does not exceed 30 m (100 ft).

(2) Small Metal parts. Small metal parts not exceeding 50 mm (2 in.) in any dimension, not likely to be energized, and spaced at least 19 mm (3/4 in.) from neon tubing shall not require bonding.

(3) Nonmetallic Conduit. Where listed nonmetallic conduit is used to enclose the secondary circuit conductor from a transformer or power supply f or use with neon tubing and a copper bonding conductor not smaller than 14 AWG is requried, the bonding conductor shall be installed separate and remote from the nonmetallic conduit and be spaced at least 38 mm (1 1/2 in.) from the conduit when the circuit is oprated at 100 Hz or less or 45 mm (1 3/4 in.) when the circuit is operted at over 100 Hz.

C. Signs in Fountains. Signs or outline lighting installed inside a fountain shall have all metal parts and equipment grounding conductors bonded to the equipment grounding conductor for the fountain recirculating system. The bonding connection shall be as near as practicable to the fountain and shall be permitted to be made to metal piping systems that are bonded in accordance with 680.53.

~~D. Bonding Conductors. Bonding conductors shall be copper and not smaller than 14 AWG.~~

~~FPN: Refer to 600.32(J) for restriction on length of high voltage secondary conductors.~~

Substantiation: In 1999, 600.7 was changed to improved readability. Unfortunately that change has caused some difficulites as those requirements which exist to modify Article 250 specifically as it relates to the bonding of secondary neoncircuits over 1000 volts have been intrpreted by some ndividuals to be general requirements for all signs.

This proposal retains the original intent as evidenced by the record beginnng with the 1996 code.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 18-123.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:

KIEFFER, S.: These proposals should have been accepted in principle with Proposal 18-125 rather than 18-123 being the basis for the panel's action.

Both proposals, 18-123 and 18-124, as well as the panel action in Proposal 18-123 contain numerous violations of the 2003 NEC Style Manual, 4.1 Reference to Other NEC Rules, by referencing specific sections in Article 250 without modification. They are already covered by 90.3.

Of potential serious consequence, by only referencing a few of the sections in Article 250 applicable to signs and outline lighting, the panel action could lead users to the mistaken assumption that all other sections of Article 250 not referenced in Article 600 no longer apply to signs.

It is not appropriate to add references to Article 250 in Article 600 to improve the use of this article as a training tool for those who choose to ignore 90.1(C) or fail to enforce the code.

Proposal 18-125 should have been the basis for the panel's actions with the addition of the exception for cord-connected signs due to the Panel's action in Proposal 18-8, and the addition of the Proposal 18-129.

18-126 Log #3263 NEC-P18 **Final Action: Reject**
(600.7)

Submitter: David Servine, Channelume/Let-R-Edge Co.
Recommendation: Revise text to read as follows:

Grounding. Signs and metal equipment of outline lighting systems shall be ~~grounded~~ . bonded to the supply system ground as permitted or required in 600.7(A) through 600.7(F) and 250.

Substantiation: There is confusion about what this section pertains to. Some illumination systems used in signs and outline lighting are correctly referred to as un-grounded systems. This section in its entirety describes bonding. Adding bonding clarifies that it is the metal parts of signs and outline lighting that must be connected together, "to insure electrical continuity and the capacity to conduct safely any current likely to be imposed" to ground for compliance with 600.7 and 250. There are other requirements than those itemized in 600.7 and referencing 250 puts the reader of this Article on notice that these also must be complied with.
Panel Meeting Action: Reject
Panel Statement: The proposal conflicts with the Section 4.1 of the 2003 NEC Style manual and the Code Arrangement in 90.3. No substantiation was provided to support the claim that "some illumination systems used in signs and outline lighting are correctly referred to as un-grounded systems".
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-127 Log #3264 NEC-P18 **Final Action: Reject**
(600.7 Exception No. 1)

Submitter: David Servine, Channelume/Let-R-Edge Co.
Recommendation: Exception No.1: Sign Bodies of non-metallic section letter signs.
Substantiation: 600.7 and 250.112 mandate signs are to be grounded. Some section letter sign systems utilize sign bodies that are thermo-formed or fabricated with other than metal components. Questions frequently arise about the Code compliance of these types of section signs. This clarifies that no bonding is required for these types of sign bodies in section signs.
Panel Meeting Action: Reject
Panel Statement: Bonding is defined a "the permanent joining of metallic parts to form an electrically conductive path that ensures electrical continuity and the capacity to conduct safely any current likely to be imposed." By definition bonding does not involve nonmetallic parts, therefore this proposal does not represent a change in the Code. Additionally, the panel notes that the NEC, as stated in 90.1 (C), is intended to be used by trained personnel. Repetition of requirements contained in Chapters 1 through 4 violates Section 4.1 of the NEC Style Manual.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-128 Log #3265 NEC-P18 **Final Action: Reject**
(600.7 Exception No. 2)

Submitter: David Servine, Channelume/Let-R-Edge Co.
Recommendation: Add text to read as follows:

Exception No.2: Sign Bodies of Section Signs with Class 2 Power Supplies and lighting systems operating at 30 volts or less where not installed within 3.0 m (10 Ft.) of pools, spas, fountains or similar locations.

Substantiation: Historically, Article 600 rules have mostly pertained to sign illumination operating at line voltages and electric discharge lighting operating at voltages in excess of line voltages requiring transformers, power supplies and ballasts to boost the secondary current. With the introduction of technology that requires just the opposite, reducing line voltage to very low voltages, Article 600 rules are non-respresentational and obscure for these systems. The Code does recognize thermostats, programmable controllers, security systems, sound systems, track and landscape lighting as operating with low voltage loads, but for signs, rules have to be abridged from other articles. The content of 600.7 is typical. Requiring bonding and grounding for signs with Class 2 circuits is not consistent with Code requirements for the low voltage installations described above or a supportable safety concern.

Class 2 circuits are considered safe from fire initiation because the Class 2 power supply limits the power to 100 VA for circuits 30V or less. Protection against electric shock is achieved by limiting the current to 5 mA for circuits over 30V (Chapter 9, Table 11) Bonding is not necessary for Class 2 sign circuits that operate at less than 50 volts because there is no need to create a low-impedance path for fault current. [*Understanding Low Voltage and Power-Limited Systems by Mike Holt]*

While 250.112 includes signs, regardless of voltage requiring grounding, by Code arrangement, this rule is amendable in Chapter 6 "for the particular conditions" of low voltage section sign installations. This is a start at fully recognizing a rapidly increasing sign lighting system that does not fit the historical mold of Article 600.

Panel Meeting Action: Reject
Panel Statement: The Code states that a Class 2 circuit is "the portion of the wiring system between the load side of a Class 2 power source and the connected equipment. Due to its power limitations, a Class 2 circuit considers safety from a fire initiation standpoint and provides acceptable protection from electric shock." This definition does not state that Class 2 circuits are inherently (always) safe from the risks of fire or shock. It is stating that the requirements of the Code are adequate to provide safety from fire and shock, even though these requirements are not as extensive as those for general wiring. According to 250.112 (I), the exceptions for grounding that may exist in Article 725 only apply to Class 2 or Class 3 circuits used for remote-control, signaling, or fire alarm circuits. This exception does not apply to a low-voltage lighting circuit of the type used in section signs. No technical substantiation has been provided to support an exception to the requirement for grounding of Class 2 circuits.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:

KEMPEL, K.: The Panel should accept proposal 18-128 based on the following rationale.

The Panel Statement implies that Class 2 circuits are not always safe from the risks of fire and shock and points to Section 250.112(I) for support. This appears to be a misapplication of this Code Section.

Section 250.112(I) applies only to remote control, signaling, and fire alarm circuits that are power limited but not to power limited circuits that power lighting or signs. This is based on the fact that there is NO comma between "power-limited "and "remote control" in the title of Section 250.112(I). Therefore, Section 250.112(I) does not apply to signs.

Further, the Code supports not grounding transformer isolated secondary circuits operating within Class 2 voltage limits. Section 411.5(A) states that secondary circuits of low voltage lighting systems are not to be grounded and is further emphasized by Section 250.22 (4).

The fact that Section 411.5(A) does not require the secondary circuits of a low voltage lighting system to be grounded and Article 725 does not require the grounding of a power limited Class 2 secondary circuit that the Code implies that the risk of shock in a transformer isolated secondary operating at 30 volts rms or less is within accepted limits without the added protection of grounding.

Therefore, it is reasonable to conclude that the risk of shock in a sign with a power limited Class 2 secondary circuit operating at 30 volts rms or less would also be within accepted levels of risk of shock defined by the Code without grounding the secondary.

18-129 Log #527 NEC-P18 **Final Action: Accept in Principle**
(600.7(D))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read:

(D) Bonding Conductors. Bonding conductors shall be copper and not smaller than 14 AWG. Bonding conductors shall be installed where not subject to physical damage unless protected by approved means.

Substantiation: 600.7(C) addresses spacing issues where separate bonding conductors are installed with nonmetallic raceways. This section specifies the minimum size of the conductor required to accomplish bonding purposes but stops short of providing rules on protecting it from physical damage. This proposed text is an effort to provide a clear requirement for installers and inspectors for protection of such bonding conductors in these small sizes. There does not appear to be any provisions in Article 600 that address this concern. 250.120(C) only has protection rules for equipment grounding conductors in sizes smaller than 6 AWG where run in hollow spaces or walls or partitions. This proposal adds language addressing the bonding conductors installed to meet the rules in Article 600 that are generally installed exposed in hollow spaces and often in areas where they are subject to physical damage.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 18-123.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-130 Log #2862 NEC-P18 **Final Action: Reject**
(600.8(B))

Submitter: Randall K. Wright, RKW Consulting
Recommendation: Revise text to read as follows:
(B) Material. Sign and outline lighting system enclosures shall be constructed of metal or shall be rated for the voltage and listed for the purpose.
Substantiation: Electric sign components are special parts and require special conditions. The sign industry requires parts listed for the purpose, to maintain the safety. A number of similar parts are available with lower milliampere rating then the transformer output and the parts they are to protect.
Panel Meeting Action: Reject
Panel Statement: The applicable ANSI standard for these enclosures covers the detailed requirements, including any voltage rating, if necessary. Technical substantiation or reports of field problems of an inadequacy in the ANSI standard were not provided to support this proposal. Adding the words "for the purpose" doesn't not change the requirement. This is an unenforceable term in conflict with 3.2.1 of the NEC Style Manual.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-131 Log #532 NEC-P18 **Final Action: Accept**
(600.9(B))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read:
(B) Pedestrians. Neon tubing, other than dry-location portable signs, readily accessible to pedestrians shall be protected from physical damage.
FPN: See 600.41(D) for additional requirements.
Substantiation: This is a companion proposal to work cooperatively with the revisions proposed in 600.41. The word readily was added for consistency in how accessible is defined in Article 100. The tubing could be installed at an elevated height and still be accessible, by definition, to pedestrians. By adding the word "readily" to this section, it brings more specifics to application of this section. The FPN was added to correlate with the proposed revision to 600.41 which includes the specific rules for field-installed skeleton tubing.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-132 Log #2573 NEC-P18 **Final Action: Reject**
(600.10(C)(a))

Submitter: Bud Swathwood, Bud Swathwood Consulting
Recommendation: Add new paragraph (a) to read:
(a) Receptacles for cord connected signs shall comply with 406.8(B)(1) and 406.8(1)(2)(a).
Substantiation: This addition to 600.10(c)(b) will make it clear that the outside receptacles need to be installed, the same as any other outside receptacle.
Panel Meeting Action: Reject
Panel Statement: This proposal is rejected, as it is not within the scope of Article 600. Article 600 does not address the installation requirements for receptacles.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-133 Log #856 NEC-P18 **Final Action: Accept**
(600.12)

TCC Action: It was the action of the Technical Correlating Committee that this proposal be sent to Code-Making Panel 3 for comment regarding the use of Class 2 wiring methods without there being a Class 2 power supply. This action will be considered by the panel as a public comment.
Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read as follows:
600.12 Field-Installed Secondary Wiring.
Field-installed secondary circuit wiring for electric signs and outline lighting systems shall be in accordance with (A), (B), or (C). ~~section signs shall comply with 600.31 if 1000 volts or less, or with 600.32 if over 1000 volts.~~
(A) 1000 Volts or Less. Secondary circuit wiring of 1000 volts or less shall comply with 600.31.
(B) Over 1000 Volts. Secondary circuit of over 1000 volts shall comply with 600.32.
(C) Less Than 50 Volts. Secondary circuit wiring less than 50 volts shall be installed in accordance with any of the following:
(1) Any wiring method included in Chapter 3 suitable for the conditions.
(2) Class 2 wiring methods as provided in 725.52(B)
Substantiation: Panel 18 made a positive step in the 2005 cycle by inserting this new section to provide users with direction on the rules that apply to secondary circuit wiring, but it was limited to only section signs. This proposal retains the original content and reorganizes it in a fashion to include coverage of secondary circuit wiring for low voltage (class 2) secondary circuit wiring. The installation requirements for wiring on the secondary side of a Class 2 power source are already provided in 725.54 and 725.61. The requirements for insulation on these conductors are provided in 725.82, which is also referenced from 725.52(B). It is logical to provide a reference to the requirements for these low voltage secondary circuits associated with electric signs and outline lighting installations. The revision also removes the limitation of coverage of secondary circuit wiring for only section signs. Companion proposals have been submitted to editorially adjust the titles of 600.31 and 600.32 from addressing just circuit conductors to circuit wiring (which includes the conductors). A companion proposal has also been submitted that creates a correlation to the requirements for the low voltage power supply requirements in 600.24.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-134 Log #2863 NEC-P18 **Final Action: Reject**
(600.12)

Submitter: Randall K. Wright, RKW Consulting
Recommendation: Revise text as follows:
The field-installed secondary circuit wiring of section signs shall comply with Part II. Field-Installed secondary wiring and skeleton tubing ~~600.31 if 1000 volts or less, or with 600.32 if over 1000 volts.~~
Substantiation: Since UL has presented in writing their position that all field wiring in Listed signs will be the inspection responsibility of the local authority having jurisdiction, Part II of the article is needed in its entirety for the inspection of electric signs requiring any field wiring.
Panel Meeting Action: Reject
Panel Statement: No technical substantiation is provided to support applying Sections 600.41 and 600.42 to section signs.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-135 Log #3266 NEC-P18 **Final Action: Reject**
(600.12)

Submitter: David Servine, Channelume/Let-R-Edge Co.
Recommendation: Revise text to read as follows:
600.12 Field-Installed Secondary Wiring. The field-installed secondary circuit wiring of skeleton neon and neon section signs shall comply with ~~600.31 if 100o volts or less, or with 600.32 if ever 1000 volts~~ Part II.
Field installed secondary circuit wiring for Class 2 section signs shall comply with 600 and 725. Field-installed wiring with other secondary voltages shall comply with the applicable article.
Substantiation: Present wording of this rule was inserted in the 2005 Code to provide the AHJ with a basis for inspection of field wiring in a particular type of listed neon sign. 600.12 covers only neon described in Part II. Part II was originally intended only for skeleton tube neon but revisions made during the 2005 Code cycle have moved away from that concept to facilitate inspection of secondary field-wiring of neon section signs and outline lighting for compliance with Code installation rules. This has resulted in the same rules for skeleton tubing becoming applicable to section signs. For consistency with the intent and title of the article, other field-installed secondary wiring systems regardless of voltage should be included. Part II of the 2005 NEC is applicable only to field wiring for neon installations. Including section signs and outline lighting with Class 2 lighting, and other possible voltages not covered in 600 Part II, provides the basis for Code compliance with Chapter 6. Article 725 is referenced in its entirety because there are multiple requirements in 725 for the safe installation of Class 2 secondary circuitry.
Panel Meeting Action: Reject
Panel Statement: Section 600.12 applies to all section signs regardless of illumination source. No technical substantiation was provided to support limiting 600.12 to neon illumination. The general reference to Articles 600 and 725 is a violation of 4.1.1 of the 2003 NEC Style Manual.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-136 Log #660 NEC-P18 **Final Action: Accept**
(600.21(E))

Submitter: Leon Przybyla, Southern Arizona Chapter IAEI
Recommendation: Add new text to section 600.21(E) as follows:
(E) Attic and Soffit Locations. Ballasts, transformers, and electronic power supplies shall be permitted to be located in attics and soffits, provided there is an access door at least 900 mm by 600 mm (3 ft by 2 ft) and a passageway of at least 900 mm (3 ft) high by 600 mm (2 ft) wide with a suitable permanent walkway at least 300 mm (12 in.) wide extending from the point of entry to each component. At least one lighting outlet containing a switch or controlled by a wall switch shall be installed in such spaces. At least one point of control shall be at the usual point of entry to these spaces. The lighting outlet shall be provided at or near the equipment requiring servicing.

Substantiation: To coordinate with 210.70(C).

(600.21(E))

Submitter: Rick Hollander, City of Tucson-Development Services
Recommendation: Add new text to section 600.21(E) as follows:
(E) Attic and Soffit Locations. Ballasts, transformers, and electronic power supplies shall be permitted to be located in attics and soffits, provided there is an access door at least 900 mm by 600 mm (3 ft by 2 ft) and a passageway of at least 900 mm (3 ft) high by 600 mm (2 ft) wide with a suitable permanent walkway at least 300 mm (12 in.) wide extending from the point of entry to each component. At least one lighting outlet containing a switch or controlled by a wall switch shall be installed in such spaces. At least one point of control shall be at the usual point of entry to these spaces. The lighting outlet shall be provided at or near the equipment requiring servicing.
Substantiation: To coordinate with 210.70(C).
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 18-136.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-138 Log #1622 NEC-P18 **Final Action: Accept in Part**
(600.21(E))

Submitter: Phil Yehl, City of Peoria, IL
Recommendation: Revise text to read as follows:
(E) Attic and Soffit Locations. Ballasts, transformers, and electronic power supplies shall be permitted to be located in attics and soffits, provided there is an access door at least 900 mm by ~~600 mm~~ 562.5 mm (36 in. by 22 1/2 in.) and a passageway of at least 900 mm ~~(3 ft)~~ (36 in.) high by ~~600 mm~~ 562.5 mm ~~(2 ft)~~ (22 1/2 in.) wide with a suitable permanent walkway at least 300 mm (12 in.) wide extending from the point of entry to each component.
Substantiation: This request for a proposed code change is driven by the construction and engineering practice of commonly spacing trusses 24 in. on center. This creates a net opening of 22 1/2 in. without modifying or reengineering the trusses.
Panel Meeting Action: Accept in Part
Revise text to read as follows:
(E) Attic and Soffit Locations. Ballasts, transformers, and electronic power supplies shall be permitted to be located in attics and soffits, provided there is an access door at least 900 mm by 562.5 mm (36 in. by 22 1/2 in.) and a passageway of at least 900 mm (3 ft) high by 600 mm (2 ft) wide with a suitable permanent walkway at least 300 mm (12 in.) wide extending from the point of entry to each component.
Panel Statement: The panel accepts the reduction in width of the access door and reject the reduction in the width of the passageway.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-139 Log #855 NEC-P18 **Final Action: Accept**
(600.24)

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read as follows:
600.24 Class 2 Power Sources.
~~In addition to the requirements of Article 600,~~ S igns and outline lighting systems supplied by Class 2 transformers, power supplies, and power sources shall comply with ~~725.41 and~~ the applicable requirements of Article 600 and all of the following:
(A) Listing. Class 2 Power supplies and power sources shall be listed for use with electric signs and outline lighting systems and shall comply with 725.41.
(B) Grounding. Systems shall be grounded where required by 250.20(A). Metal parts of signs and outline lighting systems shall be grounded in accordance with 600.7 and 250.112(G).
(C) Secondary Wiring. Secondary wiring from Class 2 power sources shall comply with 600.12(C).
Substantiation: This proposal is an effort to provide additional clarity in this new section added for the 2005 NEC. While the new requirement was needed for emerging technologies, it still lacked key provisions. The first proposed addition is a clear reference to 250.20(A) which provides the requirements as to when a low voltage system is required to be grounded or is permitted to be ungrounded. This is applicable to the system only. The grounding of metal parts of signs and outline lighting systems is referenced here again in addition to 600.7 to provide a clear direction for users about the grounding and bonding requirements for metal parts as differentiated from system grounding requirements. This is a companion proposal to the proposal to revise 600.12.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-140 Log #3267 NEC-P18 **Final Action: Reject**
(600 Part II)

Submitter: David Servine, Channelume/Let-R-Edge Co.
Recommendation: Revise text to read as follows:
II. Field-Installed ~~Skeleton Tubing~~ Neon Seconary Wiring .
Substantiation: 600.12 makes rules in Part II applicable to section letter signs. The rules no longer are exclusive to Skeleton Tubing. The change in the text is necessary to harmonize the description for Part II with 600.12. This categorizes rules in Part II as covering all secondary field wiring of neon.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 18-141.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-141 Log #531 NEC-P18 **Final Action: Accept in Principle in Part**
(600 Part II and 600.30)

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise the title of Part II of Article 600 as follows and 600.30 as follows:
II. Field-Installed Skeleton Neon Tubing and Wiring
600.30 Applicability. Part II of this article shall apply to field-installed skeleton neon tubing and wiring . These requirements are in addition to the requirements of Part I.
Substantiation: This proposed revision is intended to be an editorial revision to clarify and reflect what is actually covered by Part II of Article 600. Part II includes rules for more than just the tubing. The tubing requirements are covered in 600.41. This revision adds accuracy to what is actually covered which includes secondary circuit wiring, neon tubing, and electrode connections. The addition of the word neon is proposed to clarify that only neon tubing and associated secondary circuit wiring and electrode connections are covered by Part II. Cold Cathode installations are covered by Part XIV of Article 410.
Panel Meeting Action: Accept in Principle in Part
Revise the title of Part II of Article 600 as follows and 600.30 as follows:
II. Field-Installed Skeleton Tubing and Wiring
600.30 Applicability. Part II of this article shall apply to all of the following:
(1) Field-installed skeleton tubing
(2) Field-installed skeleton tubing wiring
These requirements are in addition to the requirements of Part I.
Panel Statement: The word "neon" was removed because neon is contained in the definition of skeleton tubing. The recommendation was reworded for usability.

18-142 Log #3059 NEC-P18 **Final Action: Accept in Principle**
(600.30)

Submitter: Randall K. Wright, RKW Consulting
Recommendation: Revise text to read as follows:
II. Field-Installed Secondary Wiring and Skeleton Tubing.
630.30 Applicability. Part II of this article shall apply to field-installed secondary wiring and skeleton tubing. These requirements are in addition to the requirements of Part I.
Substantiation: Since UL has presented in writing their position that all field wiring in Listed signs will be the inspection responsibility of the local authority having jurisdiction, Part II of the article is needed in its entirety for the inspection of electric signs requiring any field wiring.
Panel Meeting Action: Accept in Principle
Panel Statement: See the action and statement on Proposal 18-141. The panel concluded that the action on Proposals 18-133 and 18-141 enables installation and inspection of field wiring for both listed section signs and field installed skeleton tubing.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13
Comment on Affirmative:
WRIGHT, R.: I concur with the action and appreciate the panel comment to explain the panel's intent to have the field installed secondary wiring inspected by the (AHJ).

18-143 Log #3268 NEC-P18 **Final Action: Accept in Principle**
(600.30)

Submitter: David Servine, Channelume/Let-R-Edge Co.
Recommendation: Revise text to read as follows:
600.30 Applicability. Part II of this article shall apply to field installed wiring for skeleton tubing and neon section signs . These requirements are in addition to the requirements of Part I.

Substantiation: This change in text is necessary to harmonize Part II with 600.12. The rules in Part II are no longer exclusive to skeleton tubing but also include section signs with secondary neon wiring. The change also harmonizes with the proposed text revision for the title of Part II by this submitter.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposals 18-141 and 18-142.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-144 Log #854 NEC-P18 **Final Action: Accept**
(600.31)

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read as follows:
600.31 Neon Secondary-Circuit Wiring . ~~Conductors,~~ 1000 Volts or Less, Nominal.
(A) Wiring Method Conductors shall be installed using any wiring method included in Chapter 3 suitable for the conditions.
(B) Insulation and Size Conductors shall be listed, insulated, and not smaller than 18 AWG.
(C) Number of Conductors in Raceway. The number of conductors in a raceway shall be in accordance with Table 1 of Chapter 9.
(D) Installation Conductors shall be installed so they are not subject to physical damage.
(E) Protection of Leads. Bushings shall be used to protect wires passing through an opening in metal.
Substantiation: The revision is editorial in nature. The title of this section as it is currently worded should apply to only the conductors, however, the section addresses wiring methods and other items beyond just the conductors. Secondary circuit wiring includes rules applying to all of the items in (A) through (E).
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-145 Log #853 NEC-P18 **Final Action: Accept**
(600.32)

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read as follows:
600.32 Neon Secondary Circuit Wiring ~~Conductors~~ , Over 1000 Volts, Nominal
(A) Wiring Methods
(1) Installation Conductors shall be installed on insulators, in rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, liquidtight flexible nonmetallic conduit, flexible metal conduit, liquidtight flexible metal conduit, electrical metallic tubing, metal enclosures, or other equipment listed for the purpose and shall be installed in accordance with the requirements of Chapter 3.
(2) Number of Conductors. Conduit or tubing shall contain only one conductor.
(3) Size Conduit or tubing shall be a minimum of metric designator 16 (trade size 1/2).
Balance remains unchanged.
Substantiation: The revision is editorial in nature. The title of this section as it is currently worded should apply to only the conductors, however, the section addresses wiring methods and other items beyond just the conductors. Secondary circuit wiring includes rules applying to all the items in (A) through (J).
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-146 Log #1193 NEC-P18 **Final Action: Accept in Principle**
(600.32(A))

Submitter: Stephen G. Kieffer, Kieffer & Co., Inc. / Rep. International Sign Association
Recommendation: Modify 600.32 Neon Secondary Circuit Conductors, Over 1000 Volts, Nominal
(A) Wiring Methods to read:
(1) Installation. Conductors shall be installed ~~on insulators~~ , in rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, liquidtight flexible nonmetallic conduit, flexible metal conduit, liquidtight flexible metal conduit, electrical metallic tubing, metal enclosures, or other equipment listed for the purpose and shall be installed in accordance with the requirements of Chapter 3.
Substantiation: Article 398 Open Wiring on Insulators permits the use of this wiring method in industrial and agricultural applications. There are few instances where field installed skeleton tubing is installed in these locations. However, this wiring method had historically been permitted as equipment was not available to completely enclose the Type GTO cable beginning at the neon electrode. That situation has now changed.
As a result of changes in Article 600, Underwriters Laboratories has developed and issued UL 879, as the Electric Sign Component Standard. The effective date for this standard is June, 2007.
Within this standard, listed equipment complying with the requirements of 600.42 is required to include enclosure of the GTO cable from the electrode enclosure to a raceway. This listed product is also required to include a means for attachment of the GTO cable enclosure to the raceway. This listed product is also required to include a means for attachment of the GTO cable enclosure to the raceway. These assemblies are listed as a system.
The requirements for this equipment can be found in three sections under part 5, Sign Components for Field and Factory Installation, of the standard:
5.9 Neon electrode splice and GTO cable polymeric enclosure systems
5.10 Glass cup neon electrode receptacle and GTO cable splice enclosure systems
5.12 Neon electrode enclosure and GTO cable with integral sleeving enclosure system
As a result, the need no longer exists to allow the use of conductors on insulators, as it is no longer possible to comply with the provisions of 600.42 without enclosing the GTO cable.
Panel Meeting Action: Accept in Principle
Modify 600.32 Neon Secondary Circuit Conductors, Over 1000 Volts, Nominal
(A) Wiring Methods to read:
(1) Installation. Conductors shall be installed ~~on insulators~~ , in rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, liquidtight flexible nonmetallic conduit, flexible metal conduit, liquidtight flexible metal conduit, electrical metallic tubing, metal enclosures, on insulators in metal raceways , or other equipment listed for the purpose and shall be installed in accordance with the requirements of Chapter 3.
Panel Statement: The phrase “on insulators in metal raceways” was added to prevent elimination of the use of insulators within raceways.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-147 Log #1210 NEC-P18 **Final Action: Accept in Principle**
(600.32(A)(1))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise as follows:
600.32 Neon Secondary Circuit Wiring ~~Conductors~~ , Over 1000 Volts Nominal.
(A) Wiring Methods.
(1) Installation. Conductors shall be installed ~~on insulators,~~ in rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, liquidtight flexible nonmetallic conduit, flexible metal conduit, liquidtight flexible metal conduit, electrical metallic tubing, metal enclosures or other equipment listed for the purpose and shall be installed in accordance with the requirements of Chapter 3.
Substantiation: This method of installation for high voltage secondary conductors was used in the past, but is rare to be applied today. There are specific requirements for high voltage secondary conductors included in Part II of Article 600 as well as the product standard (UL 814) that call for these conductors to be protected from mechanical and physical damage. Neon secondary conductors are required to be installed so they are not subject to physical damage by 600.32(C). It’s not uncommon to see installers attempt to use glass neon tubing supports for GTO conductors to try to meet the requirements in 600.32(A)(1). Tubing supports are required to be listed by 600.41(B) and do not appear to be listed or evaluated for use as an insulator to install GTO cable exposed. Removing this method of installing GTO cable that was used years ago should remove the gray area in this section and provide installers and inspectors with more clear requirements for the acceptable wiring methods to use. Perhaps insulators are still used in listed signs.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 18-146.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-148 Log #3205 NEC-P18 **Final Action: Accept**
(600.32(A)(1))

Submitter: Donald Cook, Shelby County Development Services
Recommendation: 600.32(A)(1). Conductors shall be installed on insulators, in rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, liquidtight flexible nonmetallic conduit, flexible metal conduit, liquidtight flexible metal conduit, electrical metallic tubing, metal enclosures, or other equipment listed for ~~the purpose~~ use with circuits over 1000 volts and shall be installed in accordance with the requirements of Chapter 3.

Substantiation: During the 200? NEC cycle, the TCC provided direction where the NEC required items to be listed for the purpose, that the "purpose" be included in the requirement. Since the title of 600.32 relates to neon secondary circuit conductors over 1000 volts, I assumed that the specific purpose must relate to some or all that statement.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13
Comment on Affirmative:
KIEFFER, S.: Proposal 18-148 should have been accept in principle, see Proposal 18-149.

18-149 Log #3207 NEC-P18 **Final Action: Accept in Principle**
(600.32(A)(1))

Submitter: Donald Cook, Shelby County Development Services
Recommendation: 600.32(A)(1). Conductors shall be installed on insulators, in rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, liquidtight flexible nonmetallic conduit, flexible metal conduit, liquidtight flexible metal conduit, electrical metallic tubing, metal enclosures, or other equipment listed for ~~the purpose~~ <u>neon secondary circuit wiring methods over 1000 volts</u> and shall be installed in accordance with the requirements of Chapter 3.
Substantiation: During the 200? NEC cycle, the TCC provided direction where the NEC required items to be listed for the purpose, that the "purpose" be included in the requirement. Since the title of 600.32 relates to neon secondary circuit conductors over 1000 volts, I assumed that the specific purpose must relate to some or all that statement.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Proposal 18-148.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13
Comment on Affirmative:
KIEFFER, S.: Proposal 18-149 should have been accept. The correct wording should include the word "neon".

18-150 Log #2585 NEC-P18 **Final Action: Reject**
(600.32(B))

Submitter: Jebediah Novak, Cedar Rapids Electrical JATC
Recommendation: Add following text to the end of existing text:
<u>For the purposes of this section, the provisions of Section 310.6 shall not apply.</u>
Substantiation: The rules of Chapters 1-4 still apply in Chapters 5-7 unless specifically amended. I do not think that it is the intention to require shielded cable on a permanently wired neon sign, however. This will help to clarify that.
Panel Meeting Action: Reject
Panel Statement: Section 310.1 specifically excludes conductors specifically provided for elsewhere in this Code from the requirements of Article 310. Type GTO cable is only referenced in Article 600 and is therefore exempted from Article 310 requirements.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-151 Log #3204 NEC-P18 **Final Action: Accept**
(600.32(F))

TCC Action: The Technical Correlating Committee directs that the Panel reconsider and correlate their actions on this proposal with Proposal 18-152. This action will be considered by the Panel as a Public Comment.
Submitter: Donald Cook, Shelby County Development Services
Recommendation: Revise text to read:
Insulators and bushings for conductors shall be listed for ~~the purpose~~ <u>use with neon secondary circuits over 1000 volts.</u>
Substantiation: In a past NEC cycle, the TCC provided direction where the NEC required items to be listed for the purpose, that the "purpose" be included in the requirement. Since the title of 600.32 relates to neon secondary circuit conductors over 1000 volts, I assumed that the specific purpose must relate to some or all that statement.
Panel Meeting Action: Accept
Panel Statement: See panel action on Proposal 18-152.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13
Comment on Affirmative:
BER, M.: The Panel Action and statement were reported incorrectly as:
Panel Meeting Action: Accept
Panel Statement: See panel action on Proposal 18-152
The correct information should be:
Panel Meeting Action: Accept
Panel Statement: None
There was also an editorial change required because the proposal as submitted has the term "...for conductors..." twice. The final corrected wording should be: "600.32(F) INSULATORS AND BUSHINGS FOR CONDUCTORS SHALL BE LISTED FOR USE WITH NEON SECONDARY CIRCUITS OVER 1000 VOLTS.
CARPENTER, F.: NEMA believes the panel action is in error and should have been "Accept in Principle" to correct the wording to read as follows:
Insulators and bushings for conductors shall be listed for use with neon secondary circuits over 1000 volts.
COSTELLO, P.: The panel action and results were reported incorrectly and should read as follows:
Accept: Insulators and bushings for conductors shall be listed for use with neon secondary circuits over 1000 volts.
KEMPEL, K.: Panel action and results were reported incorrectly and should be:
Panel Meeting Action: Accept
With editorially corrected wording of: "600.32F INSULATORS AND BUSHINGS FOR CONDUTORS SHALL BE LISTED FOR USE WITH NEON SECONDARY CIRCUITS OVER 1000 VOLTS."
KIEFFER, S.: Proposal 18-151 was accepted and Proposal 18-151 should not be referenced in the panel statement.
OWENS, T.: There is an editorial change required with the accepted wording. The sentence as contained in the proposal has a duplication of the phrase "for conductors."
SMITH, M.: Panel action and results were reported incorrectly and should be:
Panel Meeting Action: Accept
600.32(F) insulators and bushings for conductors shall be listed for use with neon secondary circuits over 1000 volts.
WALL, C.: The panel action and results were reported incorrectly and should be:
Panel Meeting Action: Accept.
Panel Statement: To eliminate duplicate words the wording should be editorially corrected to read as follows: "600.32(F) Insulators and Bushings. Insulators and bushing for conductors shall be listed for use with neon secondary circuits over 1000 volts."
WELLS, J.: The panel action and results were reported incorrectly and should be: Panel Meeting Action: Accept with editorially corrected wording of: "600.32F INSULATORS AND BUSHINGS FOR CONDUCTORS SHALL BE LISTED FOR USE WITH NEON SECONDARY CIRCUITS OVER 1000 VOLTS".
WRIGHT, R.: My records reflect that we accepted this proposal in Principal (APR) and deleted the second... ~~for conductors~~ ...
The panel action does not reflect our action.

18-152 Log #3206 NEC-P18 **Final Action: Accept**
(600.32(F))

TCC Action: The Technical Correlating Committee directs that the Panel reconsider and correlate their actions on this proposal with Proposal 18-151. This action will be considered by the Panel as a Public Comment.
Submitter: Donald Cook, Shelby County Development Services
Recommendation: Insulators and bushings for conductors for conductors shall be listed for ~~the purpose~~ <u>use with circuits over 1000 volts</u> .
Substantiation: In a past NEC cycle, the TCC provided direction where the NEC required items to be listed for the purpose, that the "purpose" be included in the requirement. Since the title of 600.32 relates to neon secondary circuit conductors over 1000 volts, I assumed that the specific purpose must relate to some or all that statement.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
OWENS, T.: Accepting this proposal as written creates a conflict with Proposal 18-151 which was also accepted. This proposal should have been an "accept in principle" with a panel statement referring to Proposal 18-151.
Comment on Affirmative:
BER, M.: The Panel Action and statement were reported incorrectly as:
Panel Meeting Action: Accept
Panel Statement: None
The correct information should be:
Panel Meeting Action: Accept in Principle
Panel Statement: See Panel action on Proposal 18-151.
Please note that if the above corrections are not made to Proposals 18-151 and 18-152 the potential exists for two different "wordings" for the same section. The inclusion of the term "...neon secondary..." and the removal of the second "...for conductors..." is essential for total clarity in this section.
CARPENTER, F.: The correct panel action should have been "Accept in Principle". See NEMA comment on Proposal 18-151.
COSTELLO, P.: The panel action and statement were reportedly incorrectly and should read as follows:
Accept in Principle: See the panel action on Proposal 18-151.

KEMPEL, K.: Panel action and results were reported incorrectly and should be: Panel Meeting Action: Accept in Principle

Panel Statement: See panel action on Proposal 18-151.

KIEFFER, S.: Proposal 18-152 should have been accepted in principle, see Proposal 18-151. Proposal 18-151 contains the correct wording because it includes the word "neon".

SMITH, M.: Panel action and results were reported incorrectly and should be: Panel Meeting Action: Accept in Principle

Panel Statement: See panel action on proposal 18-151.

WALL, C.: The panel action and results were reported incorrectly and should be: Panel Meeting Action: Accept in principle.

Panel Statement: See panel action on Proposal 18-151.

WELLS, J.: The panel action and results were reported incorrectly and should be: Panel Meeting Action: Accept in Principle. Panel Statement: See panel action on Proposal 18-151.

WRIGHT, R.: My records indicate we accepted this proposal which would be incorrect. We should have accepted in principal in part and our panel action should reflect the deletion of the redundant... ~~for conductors~~ ... but would not remove the wording...neon secondary... from proposal 151.

In my opinion, the section should read as follows:

600.32(F) Insulators and Bushings. Insulators and bushings for conductors shall be listed for ~~the purpose~~ <u>use with neon secondary circuits over 1000 volts</u> .

18-153 Log #1194 NEC-P18 **Final Action: Reject**
(600.32(G)(1) and (2))

Submitter: Stephen G. Kieffer, Kieffer & Co., Inc. / Rep. International Sign Association

Recommendation: Revise 600.32 Neon Secondary Circuit Conductors, Over 1000 Volts, Nominal, (G) conductors in Raceways as follows:

(G) Conductors in Raceways

~~(1) Damp or Wet Locations in damp or wet locations, the insulation on all conductors shall extend not less than 100 mm (4 in.) beyond the metal conduit or tubing.~~

~~(2) Dry Locations. In dry locations~~ , ~~t~~ <u>T</u> he insulation on all conductors shall extend not less than 65 mm (2 1/2 in.) beyond the metal conduit or tubing.

Substantiation: This proposal was submitted and accepted by CMP 18 during the 2005 Code cycle. Comments were submitted in opposition to this change and those comments were rejected by CMP 18.

At the Annual NFPA meeting an amendment was presented and approved to accept Comment 18-110. This had the affect of rejecting the panel's acceptance of this change. CMP 18 and the Technical Correlating Committee voted on and rejected the amendment. The panel's vote was appealed to the Standards Council. NFPA rules are such that regardless of the merits of the panel's vote the section reverts to the 2002 wording.

This change has great merit and is properly substantiated. The opposition to this proposal rests on claims that the high-voltage GTO cable is not tested for arc-tracking and, therefore, the opposition assumes there would be some undocumented problem in wet and damp locations.

Arc-tracking tests are conducted on sheet materials. Arc-tracking tests do not exist for wire. Therefore, the claims of a failure to perform a nonexistent test are not valid substantiation for objection to this change.

Significant substantiation in support of the change was submitted during the 2005 code cycle by the International Sign Association and Underwriters Laboratories. Those documents are provided as part of this substantiation.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The panel concludes that retaining this requirement maintains the current level of protection that has not been shown to be a safety hazard.

The panel suggests that a fact-finding study or other technical data be provided to the panel during the comment stage to provide the appropriate information for the panel on which to base a more informed decision on this issue.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

Explanation of Negative:

KIEFFER, S.: The panel reversed its position on this issue, ignoring significant prior input during the 2005 code cycle.

The panel's action was based on nonscientific samples of claimed failures of listed GTO conductors handed out during the meeting. No evidence was provided that those samples relate to this proposal. No details were provided regarding the test procedures followed to produce those samples. It was implied that listed GTO cable had failed, yet no record was submitted of reports of these failures being made to the listing agency. I heard quiet comments by the submitter of these samples that they performed properly. They didn't burn. The insulation was self-extinguishing, even though they were subject to artificial conditions in an attempt to produce a failure.

In a rush to complete the panel's work late Wednesday afternoon, discussion was rapidly cut off. As a result the panel's attention was never directed to secondary-circuit fault-protection requirements of 600.23 which preclude the occurrence of the supposed failures. The panel never evaluated its actions in Proposals 18-146; 18-147; 18-148; 18-149; 18-154 and 18-158 which singularly and in total eliminate all conditions where GTO wire can exit a raceway into open air.

The panel should accept this proposal.

18-154 Log #407 NEC-P18 **Final Action: Accept in Principle**
(600.32(K))

Submitter: Michael J. Johnston, Plano, TX

Recommendation: Add text to read as follows:

<u>(K) Splices. Splices in high voltage secondary circuit conductors shall be made in a listed high voltage splice enclosure. Splice enclosures shall be accessible after installation and listed for the location where they are installed.</u>

Substantiation: Part II of Article 600 addresses field-installed skeleton tubing installations which often include splices in high voltage secondary circuit conductors. There are currently no requirements for high voltage splice enclosures within Article 600 and specifically Part II. Only electrode connections are covered in 600.42. This proposed revision should provide needed guidance for installers and provide enforcement with rules to apply to such equipment and locations of such devices. There are various manufacturers that currently produce listed devices for this purpose. Requirements to locate the splice device at an accessible location are consistent with low voltage splice rules requirements contained in Chapter 3 and including information about the location where the device is installed should provide guidance when high voltage splice enclosures are installed in dry, damp, or wet locations. They should be listed for those locations. Listed signs covered by Part I should already include this as part of being manufactured to meet the minimum requirements of the product standard.

Panel Meeting Action: Accept in Principle

Revise the wording in the proposal to read as follows:

"(K) Splices. Splices in high-voltage secondary circuit conductors shall be made in listed enclosures rated over 1000 volts. Splice enclosures shall be accessible after installation and listed for the location where they are installed."

Panel Statement: The revised wording clarifies that enclosures other than high-voltage splice enclosures are also acceptable to meet this requirement.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

18-156 Log #530 NEC-P18 **Final Action: Accept**
(600.41(B))

Submitter: Michael J. Johnston, Plano, TX

Recommendation: Revise text to read:

(B) Support tubing shall be supported by listed tube supports. <u>The neon tubing shall be supported within 150 mm (6 in.) from the electrode connection.</u>

Substantiation: This proposed revision improves clarity by relocating neon tubing support requirements currently located in 600.42(C) to 600.41(B) because that is the section that covers tubing supports. It is more appropriate to include the support location rules relative to the electrode connection in this section. This is a companion proposal to a similar revision to 600.42(C). No technical changes are proposed here, just revisions for clarity.

Panel Meeting Action: Accept

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

18-157 Log #529 NEC-P18 **Final Action: Accept**
(600.41(D) (New))

Submitter: Michael J. Johnston, Plano, TX

Recommendation: Add a new subdivision (D) to 600.41 as follows:

<u>(D) Protection. Field-installed skeleton tubing shall not be subject to physical damage. Where the tubing is readily accessible to other than qualified persons, field-installed skeleton tubing shall be provided with suitable guards or protected by other approved means.</u>

Substantiation: While it is understood that 600.9(B) also has general application in Part II, more specific language is needed in the section that specifically covers protection for field-installed skeleton tubing. 600.9(B) indicates that neon tubing shall be protected from physical damage, but stops short. The proposed revision places language in the Code that restricts the tubing from being installed where it would be subject to physical damage as a first requirement. The proposal also clarifies that where the tubing can be contacted (readily accessible) to other than qualified persons, the provision for suitable guards approved by the AHJ allows installers the ability to install the tubing in window frames or other locations where children or other unqualified persons can touch them. Many qualified neon installers already understand the hazards of such installations that are not protected and provide plexi-glass (clear) guards for physical damage protection and contact protection. The proposed revision uses "readily accessible" rather than "accessible" because of how the word "accessible" is defined in Article 100. The tubing, could be 12 ft above the floor and still be accessible by definition. See the companion proposal to 600.9.

Panel Meeting Action: Accept

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

18-158 Log #473 NEC-P18 **Final Action: Accept in Part**
(600.42(A) (New))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Add new text to read:
(A) Points of Transition. Where the high voltage secondary circuit conductors emerge from the wiring methods specified in 600.32(A), they shall be enclosed in a listed assembly or listed products for such transitions at electrode connections. The high voltage secondary conductors shall be protected and enclosed at transition points in sleeve material from the point of emergence to the electrode connection enclosure.
Substantiation: This part of field installed skeleton tubing installations is not adequately or clearly covered by rules presently provided in 600.32. This proposed revision adds a requirement that is clear and easy to follow. There is no clear language in the Code to address this part of the installation. The wiring method is covered in 600.32(A) and the electrode connection enclosure is covered in 600.42. Where high secondary wiring is installed for field installed skeleton tubing, the point of transition from the wiring method to the electrode connection at the tube is always the most challenging part of the installation for installers and inspectors. It also is the point where the most failures are occurring in these types of installations. There are listed products of the glass and nonmetallic types available to readily accomplish these transitions. One of the most critical points in any electrical installation is the connections. Generally, if something is going to fail in an electrical circuit, it usually starts at the connection points. I have submitted pictures of two listed assemblies suitable for use in this application and also two pictures of what is more commonly found in the field that does not comply with the minimum requirements of the Code and often leads to failure in these installations.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Part
Revise the proposed wording to read as follows:
"(A) Points of Transition. Where the high voltage secondary circuit conductors emerge from the wiring methods specified in 600.32(A), they shall be enclosed in a listed assembly."
Panel Statement: Transition assemblies are listed as a complete system, not as components. The deleted sections of the proposed wording addressed the components, not the assembly.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-159 Log #533 NEC-P18 **Final Action: Accept**
(600.42(C))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read:
(C) Support. ~~The neon tubing and~~ Neon secondary conductor (s) shall be supported not more than 150 mm (6 in.) from the electrode connection to the tubing .
Substantiation: This proposed revision improves clarity by relocating neon tubing support requirements currently located in 600.42(C) to 600.41(B) because that is the section that covers tubing supports. It is more appropriate to include the support location rules relative to the electrode connection in this section since 600.42 applies to the electrode connections. This is a companion proposal to a similar revision to 600.41(B). No technical changes are proposed here, just revisions for clarity.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

18-160 Log #361 NEC-P18 **Final Action: Accept**
(600.42(G))

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read:
(G) Electrode Enclosures. Electrode enclosures shall be listed.
(1) Dry Locations. Electrode enclosures that are listed for use in dry, damp, or wet locations shall be permitted to be installed and used in such locations.
(2) Damp and Wet Locations. Electrode enclosures installed in damp and wet locations shall be specifically listed and identified for use in such locations.
FPN: See Section 110.3(B) covering installation and use of electrical equipment.
Substantiation: In the 2005 Code cycle, each of the CMPs were charged with the task of addressing the term "listed for the purpose." The objective was intended to result in Code that was more specific as to the purpose if it was not already self-evident in the rule. This section was revised to only require that the electrode enclosure be listed, which resulted in reduced significance for users and enforcement to a degree. It is understood by those involved in the Code process that 110.3(B) applies here. The problem is that the specialized technicians installing signs and outline lighting systems generally have a minimal understanding of the NEC and how it is to be used and the general requirements in Article 110 that apply to electrical installations. Having the specific details about the requirements related to electrode enclosures and their locations addressed in this text will be more understandable and user friendly. There are far too many electrode enclosures (that are listed) being used in violation of that listing. There is no question about a need for specific language in this section for improvement in the Code for both installers and enforcement.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

ARTICLE 604 — MANUFACTURED WIRING SYSTEMS

19-129 Log #1709 NEC-P19 **Final Action: Accept in Principle in Part**
(604.2)

Submitter: Sherman Robbins, Joe Ross, Herman Miller Inc.
Recommendation: Add text to read as follows:
Manufacturing Wiring Systems. A listed system containing component parts that are assembled in the process of manufacturing and cannot be inspected at the building site without damage or destruction to the assembly and used for the connection of fixed or semi-fixed luminaries, utilization equipment, trolley-type busways and other devices .
Substantiation: The proposal expands the use and installation of listed manufactured wiring systems to include connection of equipment, other than luminaries, with strict accordance to the provisions of applicable articles (604.3 and 604.5). Trolley-type busway has proven to be a valuable wiring method to support reconfiguration in manufacturing environments that may be useful in other environments such as mall retail spaces, display spaces, and certain types of office spaces.
Panel Meeting Action: Accept in Principle in Part
Revise the proposed wording to read as follows:
"Manufacturing Wiring Systems. A ~~listed~~ system containing component parts that are assembled in the process of manufacturing and cannot be inspected at the building site without damage or destruction to the assembly and used for the connection of ~~fixed or semi-fixed~~ luminaries, utilization equipment, ~~trolley-type~~ **continuous plug-in type** busways and other devices."
Panel Statement: The panel accepts in principle the clarification of intended applications in the definition and addition of busways. The panel Rejects the addition of "Listed" as the NEC Style Manual prohibits the addition of requirements in a definition.
Number Eligible to Vote: 7
Ballot Results: Affirmative: 7

19-130 Log #3418 NEC-P19 **Final Action: Accept**
(604.6)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: I. In 604.6(A)(3) delete the phrase "other than luminaires (fixtures)."
II. Add an exception to 604.6(A)(3) as follows:
Exception: Listed electric-discharge luminaires (fixtures) that comply with 410.30(C) shall be permitted with conductors smaller than 12 AWG.
III. Delete 604.6(F).
Substantiation: Although the intent of the 2005 change was appropriate, to allow smaller cord connections, the literal text looks very much like a flat prohibition against flexible cord connections to luminaires, and some inspectors are taking exactly that approach. 604.6(A)(3) can now be read to remove luminaires from the flexible cord allowance. Remember that 410.30(C) covers more than just flexible cord connections, so the allowance in 604.6(F) does not necessarily conflict with this position. 604.6(F) is in effect an exception to 604.6(A)(3). This proposal is much more clear. Leave the generic rules in 604.6(A)(3) as they were in the 2002 NEC, and add a straightforward permissive exception for the desired usage.
Panel Meeting Action: Accept
Number Eligible to Vote: 7
Ballot Results: Affirmative: 7

19-131 Log #2507 NEC-P19 **Final Action: Accept**
(604.6(A))

TCC Action: It was the action of the Technical Correlating Committee that the panel reconsider the proposal and move the FPN reference to the product standard into Annex A. The NEC Style Manual requires that product standards references appear in Annex A. This action will be considered by the panel as a public comment.
Submitter: Tom Lichtenstein, Underwriters Laboratories Inc.
Recommendation: Revise text to read as follows:
604.6(A) Cable or Conduit Types. Manufactured wiring systems shall be listed as manufactured wiring systems assemblies or shall be constructed in accordance with (1), (2) or (3). FPN: One method of determining applicable requirements for listing of manufactured wiring systems is to refer to ANSI/UL 183-2004, the Standard for Manufactured Wiring Systems. Remainder of section unchanged.
Substantiation: For several years, some Listed manufactured wiring systems have been constructed with recognized component flexible metal conduit that was fully evaluated as part of the Listed manufactured wiring system, however, because it was not Listed flexible metal conduit, presented a conflict with the wording in 604.6(A)(2).

The Standard for Manufactured Wiring Systems, ANSI/UL 183 permits flexible metal conduit that may not be Listed, however, requires it to be fully evaluated as part of the Listing of the manufactured wiring system for compliance with all the requirements in UL 1, The standard for Flexible Metal Conduit, except for certain inner and outer diameter dimensions that permit for different shapes and trade sizes not permitted in UL 1. UL 183 permits these constructions provided the assemblies are provided with factory installed mating connectors and fittings and the conduit complies with factory follow up performance evaluation in accordance with UL 1.

The revised text would permit the other than Listed conduit, only when fully evaluated as part of a Listed assembly that was Listed for compliance with the Standard for Manufactured Wiring Systems, ANSI/UL 183. The FPN: would present guidance on the appropriate Listing standard.

Panel Meeting Action: Accept

Number Eligible to Vote: 7

Ballot Results: Affirmative: 5 Negative: 2

Explanation of Negative:

BERNSON, J.: Using flexible metal conduits (FMC) that are not listed not only presents a conflict with existing wording in 604.6(A)(2), it conflicts with 348.6 which requires FMC and associated fittings to be listed. Another concern is how these "different shape" conduits can be called flexible metal conduit when 348.2 defines flexible metal conduit as being "a raceway of circular cross section."

348.20 clearly states that FMC less than metric designator 16 (trade size 1/2) shall not be used unless permitted in 348.20(A)(1) for enclosing the leads of motors. Therefore, allowing smaller sizes in manufactured wiring systems would be in violation of 348.20.

The fact that manufactured wiring systems have been using flexible metal conduit in violation of the listing requirement in 604.6(A)(2) does not justify altering the Code to allow the use of a non-listed product. Making a change of this nature sets a precedent that is undesirable. If these other types of flexible conduits must be used, the products should obtain listing and meet current Code requirements, or the "different shapes and trade sizes" should be evaluated for inclusion in Article 348 by CMP 8.

MCNEIVE, T.: The principle substantiation used for this proposal is that Manufactured Wiring Systems have been listed "for several years" using unlisted flexible metal conduit which is contrary to NEC 604.6(A)(2). Past noncompliance with the NEC is not valid substantiation for a code change. NEMA is concerned that acceptance of this broad proposal will open the code to inconsistent interpretation and application of component standards by an increasing number of competing nationally recognized testing laboratories.

NEMA manufacturers liberally volunteer in the maintenance and updating of component product standards. Acceptance of this proposal would promote circumventing of this important process and introduction of component parts into listed assemblies that are not held to the same standards as those that are separately supplied for field installations.

19-132 Log #1710 NEC-P19 **Final Action: Accept in Principle in Part**
(604.6(A)(4) (New))

TCC Action: It was the action of the Technical Correlating Committee that this proposal be sent to Code-Making Panel 8 for comment relative to the requirements associated with busway.

Submitter: Sherman Robbins, Joe Ross, Herman Miller Inc.

Recommendation: Add inner subparagraph (4) to 604.6(A) as follows :

<u>(4) Trolley-Type Busway. Where used as a component of a listed manufactured wiring system, trolley-type busways shall be installed in accordance with 368.10 and 368.12.</u>

Substantiation: Trolley-type busway has proven to be a valuable wiring method to support reconfiguration in manufacturing environments that may be useful in other environments such as mall retail spaces, display spaces, and certain types of office spaces.

Panel Meeting Action: Accept in Principle in Part

Revise the proposed wording to read as follows:

"604.6(A) Wiring Methods

604.6(A)(4) Busways. Busways shall be Listed Continuous plug-in type containing factory mounted, bare or insulated conductors, which shall be copper or aluminum bars, rods or tubes. The busway shall be grounded and provided with an equipment ground busbar equivalent in size to the ungrounded busbar. The busway shall be rated nominal 600 volts 20, 30, or 40 amperes. Busways shall be installed in accordance with 368.12, 368.17(D) and 368.30."

Panel Statement: The panel accepts in principle the addition of busway as a wiring method and describing construction, ratings and use of the busways. The panel replaced "trolley type" busway with "continuous plug-in type" busway because trolley type may be provided with accessible uninsulated live parts and is not intended to be placed within reach of individuals. A continuous plug-in busway has no exposed bus bars, and is intended for general use, including installation within the reach of persons.

Busway is not sized in AWG so guidance on the acceptable ampacity of the branch circuit busway is required. 20 – 40 amps falls within the current 12 - 8 AWG wire range accepted in Article 604.

Number Eligible to Vote: 7

Ballot Results: Affirmative: 7

19-133 Log #3531 NEC-P19 **Final Action: Accept**
(604.6(A)(1))

Submitter: Richard Temblador, Southwire Company

Recommendation: Revise as follows:

(A) Cable or Conduit Types.

(1) Cables. Cable shall be ~~listed Type AC cable, or listed Type MC cable containing nominal 600 volt, 8 to 12 AWG insulated copper-conductors with a bare or insulated copper equipment grounding conductor equivalent in size to the ungrounded conductor~~ <u>one of the following:</u>

<u>a. Listed Type AC cable containing nominal 600-volt, 8 to 12 AWG insulated copper conductors with a bare or insulated copper equipment grounding conductor equivalent in size to the ungrounded conductor.</u>

<u>b. Listed Type MC cable containing nominal 600-volt, 8 to 12 AWG insulated copper conductors with a bare or insulated copper equipment grounding conductor equivalent in size to the ungrounded conductor.</u>

<u>c. Listed Type MC cable nominal 600 volts, 8 to 12 AWG insulated copper conductors with an aluminum grounding conductor and armor assembly identified as acceptable ground paths. The aluminum ground armor assembly shall have a current-carrying capacity equivalent to the ungrounded copper conductor.</u>

Other cables as listed in 725.61, 800.113, 820.113, and 830.179 shall be permitted in manufactured wiring systems for wiring of equipment within the scope of their respective articles.

The text of 604.6(A)(1) has been revised by a tentative interim amendment (TIA) see page 1.

Substantiation: Traditionally, a separate copper equipment grounding conductor has been required in Type MC or AC cables to insure that an effective ground fault current path is maintained when manufactured wiring components are subjected to frequent relocation. A listed MC cable product is available with an aluminum grounding conductor and an armor that provides redundant effective ground fault current paths and has current-carrying capacity equivalent to ungrounded circuit conductor in the cable.

The ground path effectiveness of this cable has been thoroughly evaluated by UL and found to provide an effective ground fault current path before and after physical performance testing.

Panel Meeting Action: Accept

Number Eligible to Vote: 7

Ballot Results: Affirmative: 6 Negative: 1

Explanation of Negative:

BERNSON, J.: 330.108 requires type MC cable to comply with 250.118(10) where it is used for equipment grounding. The new language in 604.6(A)(1)(b) and(c): "Listed Type MC cable," is not consistent with language in 250.118(10). Additionally, 250.118(10) requires the MC cable to be "listed and identified for grounding." The new language "grounding conductor and armor assembly identified as acceptable ground paths" in 604.6(A)(1)(c) does not meet the requirement in 250.118(10).

19-134 Log #1712 NEC-P19 **Final Action: Reject**
(604.6(G) (New))

Submitter: Timothy Edwards, Alcan Cable

Recommendation: Add text to read as follows:

604.6 Construction

(G) Mounting Brackets. The mounting brackets for supporting Metallic Outlet Boxes shall be listed for the purpose and shall have a thickness not less than 0.0625 in. (16 gauge) steel.

Substantiation: 314.40(B) Thickness of Metal defines the minimum thickness of metal boxes but the thickness for the bracket used to support and secure the boxes is not identified in the code. To ensure their suitability to support and secure boxes, it is essential that this requirement be specified in the code for the brackets. This change will ensure that the brackets, where used, will be capable of supporting the weight likely to be imposed on them from the boxes and other components of the system. Proposed thickness (16 gauge or 0.0625 in.) is consistent with the minimum dimensions used for the thickness of the steel used for boxes.

Panel Meeting Action: Reject

Panel Statement: Typically a manufactured wiring system is not constructed with metallic outlet boxes. The requirements for support of boxes and enclosures in 314.23 do not prescribe a minimum metal thickness. Listed box supports are subject to performance tests in lieu of prescriptive construction dimensions. See UL514A and C.

Number Eligible to Vote: 7

Ballot Results: Affirmative: 7

19-135 Log #3086 NEC-P19 **Final Action: Reject**
(604.6(G) (New))

Submitter: Timothy Edwards, Alcan Cable

Recommendation: Add text to read as follows:

604.6 Construction

(G) Mounting Brackets. The mounting brackets for supporting Metallic Outlet Boxes shall be listed for the purpose and shall have a thickness not less than 0.0625 in. (16 gauge) steel.

Substantiation: 314.40(B) Thickness of Metal defines the minimum thickness of metal boxes but the thickness for the bracket used to support and secure the boxes is not identified in the code. To ensure their suitability to support and secure boxes, it is essential that this requirement be specified in the code for the brackets. This change will ensure that the brackets, where used, will be capable of supporting the weight likely to be imposed on them from the boxes and other components of the system. Proposed thickness (16 gauge or 0.0625 in.) is consistent with the minimum dimensions used for the thickness of the steel used for boxes.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Proposal 19-134.
Number Eligible to Vote: 7
Ballot Results: Affirmative: 7

19-136 Log #510 NEC-P19 **Final Action: Accept in Principle in Part (604.7)**

Submitter: Robert L. Knapp, Byrne Electrical Specialists Inc. / Rep. UL-183 Working Group
Recommendation: Revise text to read:
604.7 ~~Unused~~ Outlets. All ~~unused~~ outlets shall be designed to prevent inadvertent contact with live parts. ~~capped to effectively close the connector opening~~ .
Substantiation: A standard NEMA outlet and a Manufactured Wiring System (MWS) connector currently could have similar size openings, be right next to each other and both pass a 1/4 in. probe test, but the MWS connector needs to have a cap and the NEMA receptacle doesn't. The UL 183 Standards Technical Panel proposes to add a 1/4 in. probe test to the UL 183 standard to evaluate the ability of a design to prevent inadvertent contact. This would be the same or similar to UL 498 Attachment Plugs and Receptacles 10.5 Contacts, UL 5 Surface Metal Raceways and Fittings 22.1(b), and CSA C22.2 No: 203.1-94 Manufactured Wiring Systems 4.3.4.
Panel Meeting Action: Accept in Principle in Part
Revise the existing Code with a following new second sentence to 604.6(C) to read as follows:
All connector openings shall be designed to prevent inadvertent contact with live parts or capped to effectively close the connector openings.
Delete 604.7
~~604.7 Unused Outlets. All unused outlets shall be capped to effectively close the connector openings.~~
Panel Statement: The panel a ccepts the proposed wording in principle in part as a second sentence to 604.6(C) to be consistent with the appropriate connector subsection and deleted 604.7. The panel retained the option for the use of caps to close openings as a means for complying with the requirements.
Number Eligible to Vote: 7
Ballot Results: Affirmative: 7

ARTICLE 605 — OFFICE FURNISHINGS (CONSISTING OF LIGHTING ACCESSORIES AND WIRED PARTITIONS)

18-161 Log #922 NEC-P18 **Final Action: Reject**
(605.8(A), (B), (C) and (E) (New))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Revise:
(A) Flexible Power-Supply Cord. The flexible power-supply cord shall be extra hard usage type with 12 AWG or larger conductors with an insulated equipment grounding conductor, a 20-ampere grounding type attachment plug, and not exceeding 600 mm (2 ft) in length.
(B) Receptacle Supplying Power. The receptacle supplying power shall be a grounding type rated 20-amperes 125 volts on a separate circuit serving only a panel ~~s and no other load~~ , and shall be located not more than 300 mm (12 in.) from the partition that ~~is connected to~~ it supplies.
(C) Individual partitions shall not contain more than 13 15- or 20 -ampere rated receptacle outlets.
Add:
(E) The branch circuit load shall be calculated in accordance with applicable requirements of 220.3 .
Substantiation: It appears the requirement for 12 AWG cord conductors and the (intended) limit of 13 receptacles correspond to 20-ampere circuit requirements, therefore a 20-ampere rated plug should be specified. If this is reasonable the 13 receptacles can be rated 15 or 20-amperes per 210.21(B)(3) and Tables 210.21(B)(3) and 210.24. Present limitation to 13 "outlets" is presumed to limit load (at 180 va each) to the ampacity of a 20-ampere circuit. However, only the number of outlets is limited; one outlet may contain more than one receptacle. Fixed type partitions (605.6) have no specific requirements re: number of receptacles or rating, nor does 605.7, therefore, 605.2(B) applies which involks other code sections for number, rating, and load calcualtion (220.3(B)(9)(11). The proposal would clarify load calculations and is more realistic than perhaps considering only the supply receptacle at 180 va as the load.
Panel Meeting Action: Reject
Panel Statement: Implementation of this restriction has not been substantiated. The use of a 12 AWG flexible cord does not necessarily dictate the requirement for a 20 amp plug cap.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 610 — CRANES AND HOISTS

12-1 Log #1523 NEC-P12 **Final Action: Accept in Principle (610, 620, 630, 640, 645, 650, and 665)**

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal by inserting the specific Sections or Parts of Article 250 that apply as required by 4.1.1 of the NEC Style Manual. This action will be considered by the Panel as a Public Comment.
The Technical Correlating Committee directs that this proposal be referred to the Technical Correlating Committee Task Group on Grounding and Bonding for comment.
Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Revise Articles 610, 620, 630, 640, 645, 650, and 665 as described in the following, relative to the terms bonding and grounding.
610.61: Revise 610.61 as follows:
610.61 Grounding All exposed non–current-carrying metal parts of cranes, monorail hoists, hoists, and accessories, including pendant controls, shall be ~~metallically joined together into a continuous electrical conductor so that the entire crane or hoist will be grounded in accordance with Article 250~~ connected to an equipment grounding conductor(s), to an equipment bonding jumper, or to the grounded conductor where permitted or required by 250.92(B)(1) or 250.142 .
Moving parts, other than removable accessories, or attachments that have metal-to-metal bearing surfaces, shall be considered to be electrically connected to each other through bearing surfaces for grounding purposes. The trolley frame and bridge frame shall not be considered as electrically grounded through the bridge and trolley wheels and its respective tracks. A separate equipment bonding ~~conductor~~ jumper shall be provided.
620.81: Revise 620.81 as follows:
620.81 Metal Raceways Attached to Cars. Metal raceways, Type MC cable, Type MI cable, or Type AC cable attached to elevator cars shall be connected ~~bonded~~ to ~~grounded~~ metal parts of the car that are connected to the equipment grounding conductor ~~they contact~~ .
620.82: Revise 620.82 as follows:
620.82 Electric Elevators. For electric elevators, the frames of all motors, elevator machines, controllers, and the metal enclosures for all electrical equipment in or on the car or in the hoistway shall be connected to the equipment grounding conductor ~~grounded~~ in accordance with Article 250.
620.83: Revise 620.83 as follows:
620.83 Nonelectric Elevators. For elevators other than electric having any electric conductors attached to the car, the metal frame of the car, where normally accessible to persons, shall be connected to the equipment grounding conductor ~~grounded~~ in accordance with Article 250.
630.15 FPN: Revise 630.15 FPN as follows:
FPN: Connecting welder secondary circuits to ~~grounded~~ objects that are connected to ground can create parallel paths and can cause objectionable current over equipment grounding conductors.
640.7(A): Revise 640.7(A) as follows:
(A) General. Wireways and auxiliary gutters shall be ~~grounded and bonded in accordance with the requirements of Article 250~~ . connected to an equipment grounding conductor(s), to an equipment bonding jumper, or to the grounded conductor where permitted or required by 250.92(B)(1) or 250.142 Where the wireway or auxiliary gutter does not contain power-supply wires, the equipment grounding conductor shall not be required to be larger than 14 AWG copper or its equivalent. Where the wireway or auxiliary gutter contains power-supply wires, the equipment grounding conductor shall not be smaller than specified in 250.122.
64515: Revise 645.15 as follows:
645.15 Grounding. All exposed non-current-carrying metal parts of an information technology system shall be connected to the equipment grounding conductor ~~grounded~~ in accordance with Article 250 or shall be double insulated. Power systems derived within listed information technology equipment that supply information technology systems through receptacles or cable assemblies supplied as part of this equipment shall not be considered separately derived for the purpose of applying 250.20(D). Where signal reference structures are installed, they shall be bonded to the equipment grounding conductor ~~system~~ provided for the information technology equipment.
FPN No. 1: The bonding ~~and grounding~~ requirements in the product standards governing this listed equipment ensure that it complies with Article 250.
FPN No. 2: Where isolated grounding-type receptacles are used, see 250.146(D) and 406.2(D).
650.5: Revise 650.5 as follows:
650.5 Grounding. The rectifier shall be connected to the equipment grounding conductor ~~grounded~~ according to the provisions in 250.11(B).

665.26: Revise 665.26 as follows:

665.26 Grounding and Bonding. Connecting to the equipment grounding conductor ~~Grounding~~ or inter-unit bonding, or both, shall be used wherever required for circuit operation, for limiting to a safe value radio frequency voltages between all exposed non-current-carrying parts of the equipment and earth ground, between all equipment parts and surrounding objects, and between such objects and earth ground. Such ~~grounding~~ connection to the equipment grounding conductor and bonding shall be installed in accordance with Article 250, Parts II and V.

FPN: Under certain conditions, contact between the object being heated and the applicator results in an unsafe condition, such as eruption of heated materials. This unsafe condition may be prevented by grounding of the object being heated and ground detection.

Substantiation: 610.61: The proposed changes are intended to make the requirements more prescriptive in nature and providing reference to where the requirements are found in Article 250.

620.81: The proposed changes are intended to make the requirements more prescriptive.

620.82: The proposed revision is intended to be more specific as to where the connection of the specified parts is to be made. The equipment grounding conductor, by definition establishes the connection to ground.

620.83: The proposed revision is intended to be more specific to where the connection of the specified parts is to be made. The equipment grounding conductor, by definition establishes the connection to ground.

630.15 FPN: The terminology has been revised to reflect the changes in Article 250.

640.7(A): The proposed changes are intended to make the requirements more prescriptive in nature and provide reference to where the requirements are found in Article 250.

645.15: The proposed revision is intended to be more specific as to where the connection of the specified parts is to be made. The equipment grounding conductor, by definition establishes the connection to ground.

645.15 FPN: The words “and grounding” are deleted from FPN No. 1 as the product standards for information technology equipment deal solely with bonding.

650.5: The proposed revision is intended to be more specific as to how the rectifier is to be grounded. The equipment grounding conductor, by definition establishes the connection to ground.

665.26: The terminology has been revised to reflect the changes in Article 250.

This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to the proposed revision to the terms “bonded”, “grounded”, and “equipment grounding conductor” in Article 100 relative to this Task Group’s recommendations. These changes clarify the present requirement in more prescriptive language.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle

Revise 610.61 as follows:

610.61 Grounding. All exposed non-current-carrying metal parts of cranes, monorail hoists, hoists, and accessories, including pendant controls, shall be bonded either by mechanical connections or bonding jumpers, where applicable so that the entire crane or hoist is a ground fault current path as required or permitted by Article 250, Parts V and VII.

Moving parts, other than removable accessories, or attachments that have metal-to-metal bearing surfaces, shall be considered to be electrically bonded to each other through bearing surfaces for grounding purposes. The trolley frame and bridge frame shall not be considered as electrically grounded through the bridge and trolley wheels and its respective tracks. A separate bonding conductor shall be provided.

620.81 Metal Raceways Attached to Cars. Metal raceways, Type MC cable, Type MI cable, or Type AC cable attached to elevator cars shall be bonded to metal parts of the car that are bonded to the equipment grounding conductor.

620.82 Electric Elevators. For electric elevators, the frames of all motors, elevator machines, controllers, and the metal enclosures for all electrical equipment in or on the car or in the hoistway shall be bonded in accordance with Article 250.

620.83 Nonelectric Elevators. For elevators other than electric having any electric conductors attached to the car, the metal frame of the car, where normally accessible to person, shall be bonded in accordance with Article 250.

630.15 FPN - Reject change in the TCC Subcommittee proposal.

640.7(A) Change “connected” to “bonded” in the TCC Subcommittee proposal.

645.15 Change “connected” to “bonded” in the TCC Subcommittee proposal.

650.5 Grounding. The rectifier shall be bonded to the equipment grounding conductor according to the provisions of Article 250, Parts V, VI, VII and VIII.

665.26 Change “connecting” to “bonding” in the TCC Subcommittee proposal.

Panel Statement: The proposed wording meets the intent of the TCC Task Group but changes the terminology to be technically correct for the equipment.

The existing FPN wording in 630.15 is clear and the submitter has provided no substantiation that there is a problem with existing text. Welding return current can appear on EGC and create noise or other objectionable currents.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

12-2 Log #2217 NEC-P12 **Final Action: Reject**
(610.11)

Submitter: Kyle Cope, Prysmian Cables and Systems

Recommendation: Revise as follows:

“Conductors shall be enclosed in raceways or be Type AC cable with insulated grounding conductor, Type PA , Type MC cable, or Type MI cable...”.

Substantiation: Statement of problem: Material technology advancements now allow for cable designs that provide improved mechanical damage protection. i.e., crush and impact, over standard Type MC cable without sacrificing flame performance properties. The characteristics achieved using traditional metallic components can now be realized using polymeric materials. The use of polymeric materials also provides the opportunity for lighter and smaller diameter cables.

Substantiation for Proposal: Type PA has been proposed as a new type (Article 3XX) and should be included in this list (610.11) as it offers enhanced mechanical benefits as an alternate to Type MC cable. See test data provided. A UL Fact-Finding study comparing the subject cable to type MC is ongoing at the time of proposal submittal. This data will be forwarded once the study is complete.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: Type PA cable has not been recognized by the NEC as suitable at this time. No substantiation has been provided that this product has been listed by a qualified testing laboratory. The proposed article relating to this product has not been accepted at this time. Without the requirements necessary for the use of this product being in force, the panel cannot accept its inclusion in Article 610.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

12-3 Log #1175 NEC-P12 **Final Action: Reject**
(610.12(A))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Change “exposed” to “open”.

Substantiation: Edit. This section appears related to open (individual) conductors. Exposed (wiring methods) as defined in Article 100 is on or attached to the surface or behind access panels which permits many wiring methods.

Panel Meeting Action: Reject

Panel Statement: There is no definition for the term “open”. The term exposed is defined and well understood. This term was revised in the 2005 cycle, and section works in conjunction with 610.11(B) “Exposed conductors.”

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

12-4 Log #950 NEC-P12 **Final Action: Reject**
(610.14(A))

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Add:

Neutral conduits shall not be required to be counted in determining allowable ampacities.

Substantiation: Edit. Neutral conductors are generally not required to be counted as current-carrying per 310.15(B)(4), Tables 310.15(B)(2)(a), 310.16, 310.18.

Panel Meeting Action: Reject

Panel Statement: The panel disagrees with the submitter’s substantiation that the proposal is editorial in nature. Furthermore, the substantiation deals with neutral conductors where the text of the proposal is requesting a change for neutral conduits. Section 310.15(B)(4) sets forth the requirements when common neutral conductors are counted as a current carrying conductor and when they are not. The statement in the substantiation,”generally not required”, is not correct in many installations where a neutral conductor is not a common conductor to all phase conductors.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

12-5 Log #3280 NEC-P12 **Final Action: Accept**
(Table 610.14(A))

TCC Action: The Technical Correlating Committee understands the accepted change to this Table occurs in the heading at the top of the Table and not to the notes at the bottom of the Table.

Submitter: Charles M. Trout, Maron Electric Co. Inc.

Recommendation: Revise text to read as follows:

Up to Four Simultaneously Energized Conductors in Raceway or Cable

Up to Three ac 2 or Four dc 1 Simultaneously Energized Conductors in Raceway or Cable.

Substantiation: The notes to Table 610.14(A) refer to simultaneously Energized conductors. The ampacities are based on simultaneously energized conductors as indicated by Notes 1 and 2. Present wording indicates neutrals are to be counted, where used. 310.15(B)(4) does not require a neutral conductor that carries only the unbalanced current from other conductors to be counted.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-6 Log #3281 NEC-P12 **Final Action: Accept in Principle**
(Table 610.14(D))

TCC Action: The Technical Correlating Committee directs the panel to reconsider this proposal and clarify if their revisions are to the recommendation or the existing code text. This action will be considered by the panel as a public comment.
Submitter: Charles M. Trout, Maron Electric Co. Inc.
Recommendation: Revise Table 610.14(D) to read:

Table 610.14(D) Contact Conductor Supports

Size of Wire (AWG)	**Maximum Distance Between End Strain Insulators or Clamp Type Intermediate Supports**
6	9.0 m (30 ft) or less
4	18 m (60 ft) or less
2	Over 18 m (60 ft)

Substantiation: Table 610.14(D) determines the maximum distance permitted between supports for contact conductors based on conductor size required for the installation.
Panel Meeting Action: Accept in Principle
Change the Table 610.14 (D) title to: “Minimum Contact Conductor Size Based on Distance Between Supports”.
Add the word “Minimum” in front of the column title “Size of Wire (AWG)”
Panel Statement: Table 610.14(D) provides mechanical strength in the wire depending on the distance between supports. The wire required for ampacity might only be 10 AWG (43 amp 30 min 75C) but must be 4 AWG because the distance between supports is 9 to 18 meters.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-7 Log #3282 NEC-P12 **Final Action: Accept in Principle**
(610.14(D))

Submitter: Charles M. Trout, Maron Electric Co. Inc.
Recommendation: Revise text to read as follows:
(D) Contact Conductors. The ampacity of contact conductors shall be based on Table 610.14(A) for 75°C (167°F) wire and shall be supported in accordance with Table 610.14(D).
Substantiation: Table 610.14(D) determines the maximum distance permitted between supports for contact conductors based on the contact conductor size required for the installation.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 12-6.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-8 Log #1548 NEC-P12 **Final Action: Accept in Principle**
(610.21(F)(4))

Submitter: Technical Correlating Committee on National Electrical Code®,
Recommendation: Delete the term “effectively” from the terms “effectively grounded” and “effectively bonded” from Articles 610 and revise text as shown for the affected NEC sections.
610.21(F)(4): (4) The rail serving as a conductor is ~~effectively grounded~~ connected to the equipment grounding conductor at the transformer and also shall be permitted to be grounded by the fittings used for the suspension or attachment of the rail to a building or structure.
Substantiation: 610.21(F)(4): The definition of “effectively grounded” is ambiguous and very subjective without any defined values or parameters for one to judge as either “effective” or “ineffective.” This section has been revised to prescribe the connection to the equipment grounding conductor.
This is the result of the TCC Task Group on Grounding and Bonding in resolve of the 2005 NEC cycle actions related to Proposal 5-1 and Comment 5-1 as directed by the Technical Correlating Committee. This is a companion proposal to delete the term “grounded, effectively” and its definition from Article 100 and other companion proposals throughout the NEC relative to this Task Group’s recommendations. The substantiation of this proposal is as follows.
The term “Effectively Grounded” is used 29 times in the NEC. It appears as though in the majority of the locations where it is used, the word “grounded” or phrase “connected to an equipment grounding conductor” could be used. Other proposals are submitted to make those changes.
The 1996 NEC in Section 250.51 used the term “effective grounding path,” and those concepts were incorporated in 250.2 (1999 NEC) and then expanded in 250.4(A) and (B) in the 2002 NEC. The performance criteria of grounding and bonding are currently provided in Section 250.4 and include the concepts contained in the vague definition of the term “effectively grounded.”
The definition “Effectively Grounded” is very subjective and without any defined values or parameters for one to judge grounding as either “effective” or “ineffective.” “Effective” is described in Section 250.4(A) and (B), but it relates to the effective ground-fault current path as a performance criteria. Deleting the term in the NEC and the definition is logical because there are no definitive parameters for Code users to make a determination on what constitutes “effectively grounded.” Systems are solidly grounded, grounded through a resistor or impedance, or ungrounded. Equipment (normally noncurrent-carrying metal parts are grounded where connected to an equipment grounding conductor.
This proposal is to change the term “Effectively Bonded” to just “Bonded” in each of the section where it is used. The term “Effectively Bonded” is currently not defined in the NEC.
The term “effectively bonded” is also used a few times in the NEC and is undefined. The same situation exists. There are no defined parameters for Code users to judges what the difference between “Effectively Bonded” and “Bonded” really is. Where the term appears in the NEC, it is revised to just “bonded” and still has the same meaning in each rule.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle
Revise 610.21(F)(4) to read:
The rail serving as a conductor shall be bonded to the equipment grounding conductor at the transformer and also shall be permitted to be grounded by the fittings used for the suspension or attachment of the rail to a building or structure.
Panel Statement: The text meets the intent of the submitter and changes the word “connected” to “bonded”.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-9 Log #359 NEC-P12 **Final Action: Accept in Principle**
(610.31)

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read:
610.31 Runway Conductor Disconnecting Means. A disconnecting means that has a continuous ampere rating not less than that computed in 610.14(E) and (F) shall be provided between the runway contact conductors and the power supply. Such disconnecting means shall consist of a motor-circuit switch, circuit breaker, or molded case switch. This disconnecting means shall be as follows:
(1) Readily accessible and operable from the ground or floor level
(2) Capable of being locked in the open position. The provisions for locking or adding a lock to the disconnecting means must remain in place at the switch or circuit breaker whether the lock is installed or not. Portable means for adding a lock to the switch or circuit breaker shall not be permitted.
Substantiation: This proposed change in wording is to provide consistency between other similar rules in the NEC that also call for disconnecting means to be capable of being locked in the open position. The phrase “capable of being locked in the open position” is used over 25 times in the NEC and the purpose is the same in every instance. Electrical safety rules for the worker should be consistent and the wording and requirements should be consistent where this phrase is used. The last sentence is being proposed because there are claims that some of the portable units available for snapping on to circuit breakers do remain with the switch or circuit breaker after they are installed on the breakers when the lock is not installed, but they are portable. The actions by CMP 11 in the 2002 cycle in 430.102(B) Exception were fairly clear that the provisions for adding a lock should be more substantial and not portable units.
Panel Meeting Action: Accept in Principle
Revise proposed text to read:
The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed. Portable means for adding a lock to the switch or circuit breaker shall not be permitted.
Panel Statement: The panel changed the wording of the first sentence to be consistent with 430.102(B), exception.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13
Comment on Affirmative:
QUAVE, D.: I agree with the submitter that it does provide consistency in the NEC and that it increases Safety for the installer/maintainer.
WHITE, K.: I would like to affirm with a comment, the last sentence that was added by the panel “Portable means for adding a lock to the switch or circuit breaker shall not be permitted.” Will prohibit the use of portable devices that provide for the attachment of multiple locks (i.e. Scissors) to the locking mechanism. The sentence should be removed.

12-10 Log #2043 NEC-P12 **Final Action: Accept in Principle**
(610.31)

Submitter: James T. Dollard, Jr., IBEW Local 98
Recommendation: Revise text to read as follows:
610.31 Runway Conductor Disconnecting Means
A disconnecting means that has a continuous ampere rating not less than that calculated in 610.14(E) and 610.14(F) shall be provided between the runway contact conductors and the power supply. Such disconnecting means shall consist of a motor-circuit switch, circuit breaker, or molded case switch. This disconnecting means shall be as follows:
(1) Readily accessible and operable from the ground or floor level
(2) Capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed.
(3) Open all ungrounded conductors simultaneously
(4) Placed within view of the runway contact conductors
Substantiation: The problem with the present wording of this section is that the disconnect in many crane/hoist applications is a circuit breaker in a panelboard/switchboard or a switch that is not made with permanent provisions for locking the circuit breaker or switch in the open position.
This requirement for a disconnect is for the safety of the installer/maintainer of the equipment. Permanent provisions for making circuit breakers and switches capable of being locked in the open position are readily available from circuit breaker and switch manufacturers.
This proposal does not represent a large increase in the cost of an installation but will result in a dramatic increase in safety.
Where cranes and hoists are involved we know that maintenance will take place, we must ensure that only a lock is needed by an installer/maintainer to work safely.
The practical safeguarding of persons from electrical hazards as detailed in the scope of the NEC must not be permitted to hinge on whether or not an installer just happens to have enough different types of devices and hopefully one that that happens to fit the circuit breaker or switch in an installation.
Note that this language was accepted by CMP-11 and is a present requirement, in the 2002 NEC, when a circuit breaker or switch is used as a disconnecting means not within sight of a motor. Also included in the 2005 NEC is the same language in 422.31 for appliances
The same level of safety is needed for these disconnecting means for cranes and hoists.
Panel Meeting Action: Accept in Principle
Revise proposed text to read:
The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed. Portable means for adding a lock to the switch or circuit breaker shall not be permitted.
Panel Statement: See panel action and statement on Proposal 12-9.

QUAVE, D.: Comment on Affirmative for Proposal 12-9.

12-12 Log #2044 NEC-P12 **Final Action: Accept in Principle**
(610.32)

Submitter: James T. Dollard, Jr., IBEW Local 98
Recommendation: Revise text to read as follows:
610.32 Disconnecting Means for Cranes and Monorail Hoists
A motor-circuit switch, molded-case switch, or circuit breaker shall be provided in the leads from the runway contact conductors or other power supply on all cranes and monorail hoists. The disconnecting means shall be capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed.
Where a monorail hoist or hand-propelled crane bridge installation meets all of the following, the disconnecting means shall be permitted to be omitted:
(1) The unit is controlled from the ground or floor level.
(2) The unit is within view of the power supply disconnecting means.
(3) No fixed work platform has been provided for servicing the unit.
Where the disconnecting means is not readily accessible from the crane or monorail hoist operating station, means shall be provided at the operating station to open the power circuit to all motors of the crane or monorail hoist.
Substantiation: The problem with the present wording of this section is that the disconnect in many crane/hoist applications is a circuit breaker in a panelboard/switchboard or a switch that is not made with permanent provisions for locking the circuit breaker or switch in the open position.
This requirement for a disconnect is for the safety of the installer/maintainer of the equipment. Permanent provisions for making circuit breakers and switches capable of being locked in the open position are readily available from circuit breaker and switch manufacturers.
This proposal does not represent a large increase in the cost of an installation but will result in a dramatic increase in safety.
Where cranes and hoists are involved we know that maintenance will take place, we must ensure that only a lock is needed by an installer/maintainer to work safely.
The practical safeguarding of persons from electrical hazards as detailed in the scope of the NEC must not be permitted to hinge on whether or not an installer just happens to have enough different types of devices and hopefully one that that happens to fit the circuit breaker or switch in an installation.

Number Eligible to Vote: 13
Ballot Results: Affirmative: 13
Comment on Affirmative:
QUAVE, D.: Comment on Affirmative for Proposal 12-9.

12-13 Log #1006 NEC-P12 **Final Action: Reject**
(610.43(A) Exception (New))

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Add:
Exception: Overload protection shall not be required where the interruption of the circuit would create a hazard.
Substantiation: This is permitted in 240.4(A) but not stated in this article, which may be perceived as modifying that section.
Panel Meeting Action: Reject

Panel Statement: The submitter has not provided any technical substantiation to identify a hazard or a safety problem with regard to the fuse or circuit breaker rating as required by 610.42 (A). The size of the fuse or circuit breaker rating in 610.42(A) and Table 430.52 is for short-circuit protection of the circuit and not overload protection. The permission in 240.4(A) does not identify a crane, hoist, or monorail hoist as a potential hazardous situation where an overcurrent protective device for short-circuit protection can be omitted because of an overload.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-14 Log #495 NEC-P12 **Final Action: Accept in Principle**
(610.61)

Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise as follows:
VII. Grounding and Bonding.
610.61 Grounding and Bonding. All exposed normally non-current-carrying metal parts of cranes, monorail hoists, hoists, and accessories, including pendant controls, shall be metallically joined together into a continuous electrical conductor so that the entire crane or hoist will be grounded in accordance with Article 250. Moving parts, other than removable accessories, or attachments that have metal-to-metal bearing surfaces, shall be considered to be electrically connected to each other (bonded) through bearing surfaces for grounding and bonding purposes. The trolley frame and bridge frame shall not be considered as electrically grounded or bonded through the bridge and trolley wheels and its respective tracks. A separate bonding conductor shall be provided.
Substantiation: A change was accepted in the 2005 NEC in this section to require a separate bonding conductor for bonding purposes. It appears that both bonding and grounding requirements are provided in this section. The proposed revision to the title of the part and the section is to reflect what is covered in the rule. The words “and bonding” have been added where appropriate to complete the requirements in this section.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Proposal 12-1.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-15 Log #1061 NEC-P12 **Final Action: Reject**
(610.61)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Delete “in accordance with the requirements of Article 250”.
Substantiation: Edit. To comply with the Style Manual. Article 250 already applies per 90.3.
Panel Meeting Action: Reject
Panel Statement: The panel disagrees with the submitter’s substantiation that this is mandated by the NEC Style Manual. The reference provides better clarity and helps the user and is allowed by 4.1.1 of the NEC Style Manual where additional conditions are specified.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-16 Log #1176 NEC-P12 **Final Action: Reject**
(610.61)

Submitter: Daniel Leaf, Seneca, SC
Recommendation: Delete “Article 250”.
Substantiation: Edit. To conform to the Style Manual. 90.3 states Article 250 applies generally unless amended.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 12-15.
Number Eligible to Vote: 13

ARTICLE 620 — ELEVATORS, DUMBWAITERS, ESCALTORS, MOVING WALKS, WHEELCHAIR LIFTS, AND STAIRWAY CHAIR LIFTS

12-16a Log #CP1201 NEC-P12 **Final Action: Accept**
(620)

Submitter: Code-Making Panel 12,
Recommendation: Add the following two new definitions to 620.2:
Remote Machine Room and Control Room (for Elevator, Dumbwaiter). A Machine Room or Control Room that is not attached to the outside perimeter or surface of the walls, ceiling or floor of the hoistway.
Remote Machinery Space and Control Space (for Elevator, Dumbwaiter). A Machinery Space or Control Space that is not within the hoistway, machine room or control room, and that is not attached to the outside perimeter or surface of the walls, ceiling or floor of the hoistway.
Substantiation: Remote Machine Rooms, Contro; Rooms, Machinery Spaces and Contro;l Spaces exist and are defined in A17.1-2004 , Safety Code for Elevators and Escalators.. The terms are also used in Article 620 and should be defined and coordinated with the Elevator Safety Code.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-17 Log #3539 NEC-P12 **Final Action: Accept in Principle**
(620)

TCC Action: The Technical Correlating Committee advises that Article titles and Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action on both with the request that “wheelchair lift” be changed to “platform lifts” and “stairway chair lifts” be changed to “stairway chairlifts” to agree with the title of the ASME A18.1 standard and to comply with 3.3.3 of the NEC Style Manual.
Submitter: Kevin L. Brinkman, David Balmer, Accessibility Equipment Manufacturers Association
Recommendation: Replace “wheelchair” lift with “platform” lift.
Substantiation: To provide consistent language with ASME A18.1 — Safety Standard for Platform Lifts and Stairway Chairlifts.
Panel Meeting Action: Accept in Principle
Replace the term “wheelchair lift(s)” with the term “platform lift(s)” throughout Article 620, Article 620 Title, 620.1 Scope, 620.4, 620.5(A)(1), 620.21, 620.21(C), 620.21(C)(1), 620.21(C)(2), 620.34, 620.38, 620.51(A) Exception, 620.51(C)(4), 620.61(B)(4), 620.71(B), 620.84.
Panel Statement: The submitter did not identify the exact sections, which should be changed, however, the panel agrees with the concerns of the submitter. The panel requests that the TCC review changing the term “wheelchair lift” to “platform lift” throughout the entire NEC. The panel also requests the TCC change both the title and scope of Article 620 to reflect the correct term “Platform Lift” as used in ASME A18.1.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-18 Log #3540 NEC-P12 **Final Action: Reject**
(620)

Submitter: Kevin L. Brinkman, David Balmer, Accessibility Equipment Manufacturers Association
Recommendation: Add a section with requirements for battery operated equipment.
Substantiation: Manual platform (wheelchair) lifts are battery powered and the current requirements do not adequately address this newer technology.
Panel Meeting Action: Reject
Panel Statement: The proposed changes fail to comply with Section 4-3.3 of NFPA Regulations Governing Committee Projects. A clear recommendation fails to exist.
Number Eligible to Vote: 11

12-20a Log #CP1200 NEC-P12 **Final Action: Accept**

(620.1, FPN 3)

TCC Action: The Technical Correlating Committee understands that the first sentence in the Recommendation is explanatory and the Panel Action on this Proposal does not incorporate the first sentence into the FPN.

Submitter: Code-Making Panel 12,

Recommendation: 1) Add a new fine print note 3 as follows:

FPN No. 3: The term "Wheelchair Lift" has been changed to "Platform Lift". For further information, see ASME A18.1–2005 *Safety Standard for Platform Lifts and Stairway Lifts.*

Substantiation: The user should be informed of the safety standard governing this equipment which is included in Article 620. ASME A18.1 Safety Standard for Platform Lifts and Stairway Chairlifts covers the design, construction, installation, operation, inspection, testing, maintenance, and repair of inclined stairway chairlifts and inclined and vertical platform lifts intended for transportation of a mobility impaired person only. These lifts are not intended for material handling purposes.

Panel Meeting Action: Accept

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

12-21 Log #1215 NEC-P12 **Final Action: Accept**

(620.3(A))

Submitter: Andy Juhasz, KONE Inc.

Recommendation: Revise text to read as follows:

620.3 Voltage Limitations. The supply voltage shall not exceed 300 volts between conductors unless otherwise permitted in 620.3(A) through 620.3(C).

(A) Power Circuits. Branch circuits to door operator controllers and door motors and branch circuits and feeders to motor controllers, driving machine motors, machine brakes, and motor-generator sets shall not have a circuit voltage in excess of 600 volts. Internal voltages of power conversion equipment and functionally associated equipment, and the operating voltages of wiring interconnecting the equipment ~~including the interconnecting wiring~~ , shall be permitted to ~~have~~ be higher ~~voltages~~ , provided that all such equipment and wiring shall be listed for the higher voltages. Where the voltage exceeds 600 volts, warning labels or signs that read "DANGER - HIGH VOLTAGE" shall be attached to the equipment and shall be plainly visible.

Substantiation: The wording "Internal voltages of power conversion and functionally associated equipment, including the interconnecting wiring, shall be permitted to have higher voltages, provided that all such equipment and wiring shall be listed for the higher voltages." is not clear. Is it interconnecting internal wiring or wiring that interconnects power conversion equipment with functionally associated equipment that is also permitted to have higher voltages? The use of the word "interconnecting", meaning connecting between, suggests the latter. For clarity, revise the wording as shown in this proposal.

12-23 Log #3532 NEC-P12 **Final Action: Reject**

(620.11(A))

Submitter: Kevin L. Brinkman, David Balmer, Accessibility Equipment Manufacturers Association

Recommendation: Revise as follows:

620.11(A) Hoistway Door Interlock Wiring. The conductors to the hoistway door interlocks from the hoistway riser shall be flame retardant and suitable for a temperature of not less than 200°C (392°F). Conductor shall be Type SF or equivalent. This requirement shall be waived for nonfire rated applications.

Substantiation: To clarify that this requirement does not apply to equipment that is not intended for use during fires.

Panel Meeting Action: Reject

Panel Statement: Elevators for which non-fire resistive construction is used and that travel more than 80 inches or that penetrate a floor are still required to operate on firefighters operation. The construction of this wiring is still necessary to provide for the protection of firefighters using the equipment. In addition, 620.11(C) states that all conductors in raceways shall have flame-retardant insulation.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

12-24 Log #935 NEC-P12 **Final Action: Reject**

(Table 620.14)

Submitter: Daniel Leaf, Seneca, SC

Recommendation: Revise text:

Feeder conductors of less ampacity than required by 620.13 shall be permitted ~~subject to the requirements of~~ a demand factor in accordance with Table 620.14. No other demand factors shall be permitted. Delete 1 in left column and 1.00 in right column.

Substantiation: Edit. Table 620.14 relates to permitted applications, not requirements per se which may infer demand factors must be used. A 100 percent demand factor for one elevator is not "permitted" to be 100 percent, but required.

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided any definitive technical substantiation that a problem exists with the present wording of Table 620.14. The intent of Table 620.14 is clearly expressed with the present wording, and the proposed wording would be of no value in explaining the intent.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

12-25 Log #3096 NEC-P12 **Final Action: Accept in Principle**

(620.21 Exception)

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal regarding the exact location of the Exception.

The Technical Correlating Committee understands that the last phrase in the first sentence should read "the pump shall be permitted to be cord connected."

This action will be considered by the Panel as a Public Comment.

Submitter: Joseph A. Hertel, Safety and Buildings

Recommendation: Revise as follows:

Wiring methods [620.21] This is an exception in addition to the requirements of 620.21(A)(1):

Exception: The hoistway storm water sump pump motor and the hoist oil recovery pump motor shall be permitted to be cord connected. The cord shall be a hard usage oil resistant type and shall be routed where not subject to physical damage.

Substantiation: Currently, there is no provision for the use of cord connected equipment in an elevator hoistway. An exception or the addition of appropriate language would allow installations that are commonly accepted.

Panel Meeting Action: Accept in Principle

Revise as follows:

Exception: Where a sump pump or oil recovery pump is located in the pit, shall be permitted to be cord connected. The cord shall be a hard usage oil-resistant type, of a length not to exceed 1.8 m (6 ft), and shall be located to be protected from physical damage.

Panel Statement: The panel's change meets the intent of the submitter and clarifiies that cord-connected sump pump and oil recovery pump equipment is permitted but sets the limit on the length of the cord.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-26 Log #1216 NEC-P12 **Final Action: Accept**
(620.21(A)(1)(d))

Submitter: Andy Juhasz, KONE Inc.
Recommendation: Revise text to read as follows:
620.21(A)(1)
~~(d) Flexible metal conduit, liquidtight flexible metal conduit, liquidtight flexible nonmetallic conduit or flexible cords and cables, or conductors grouped together and taped or corded that are part of listed equipment, a driving machine, or a driving machine brake shall be permitted in the hoistway, in lengths not to exceed 1.8 m (6 ft), without being installed in a raceway and where located to be protected from physical damage and are of a flame retardant type.~~
(d) The following wiring methods shall be permitted in the hoistway in lengths not to exceed 1.8 m (6 ft):
(1) flexible metal conduit
(2) liquidtight flexible metal conduit
(3) liquidtight flexible nonmetallic conduit
(4) flexible cords and cables, or conductors grouped together and taped or corded, shall be permitted to be installed without a raceway. They shall be located to be protected from physical damage and shall be of a flame-retardant type and shall be part of:
(a) listed equipment,
(b) a driving machine, or
(c) a driving machine brake
Substantiation: The current wording is not grammatically correct and leads to misinterpretation. It is only the flexible cords and cables or conductors grouped together and taped or corded that are not required to be installed in a raceway. The other methods listed are raceways themselves. For clarity revise the wording as shown in the proposal.

Ballot Results: Affirmative: 11

12-43 Log #3269 NEC-P12 **Final Action: Reject**
(620.25)

Submitter: Leonard F. Devine, Jr., Palm Beach County Plan Review
Recommendation: Relocate the following text:
620.25 Ground-Fault Circuit -Interrupter Protection for Personal. Each 125-volt, single-phase 15 and 20 ampere receptacle installed in pits, in hoist ways, on elevator car tops, and in escalator and moving walk well ways shall be of the ground-fault circuit-interrupter type.
All 125-volt, single-phase, 15-and 20-ampere receptacles installed in machine rooms and machinery spaces shall have ground-fault circuit-interrupter protection for personnel.
A single receptacle supplying a permanently installed sump pump shall not require ground-fault circuit-interrupter protection.
Substantiation: This is often overlooked during the installation by both the installer and the inspector because of its location in the code book at section IX, which is grounding. This was put in the code for the protection of individuals, and if not installed, it could be a hazard to individuals working on the elevator equipment.
Panel Meeting Action: Reject
Panel Statement: Installers and inspectors must adhere to the whole Code, not just the earlier parts. These requirements appear in all types of sections throughout NFPA 70. In addition, the submitter has not provided any technical substantiation for this change.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
JONES, R.: This proposal should have been accepted in principle. I agree with the submitter that the requirement for GFCI protection should not be located under Part IX Grounding. The more appropriate place for this requirement would be a new 620.26 or revise the wording of 620.23(C) to include the GFCI protection for the required receptacles. This would make the NEC more user friendly.

12-44 Log #3048 NEC-P12 **Final Action: Reject**
(620.26)

Submitter: Leonard F. Devine, Jr., Palm Beach County Plan Review
Recommendation: Create a new section 620.26 so that when article 620.85 is renamed 620.25, it is relocated by virtue that it is renamed.
Substantiation: You can't have two different articles with the same numbering. By changing the numbering, the sequence is in line with the rest of the article.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 12-43.
Number Eligible to Vote: 11

Recommendation: Relocate the following text:
620.26 Branch Circuits for Other Utilization Equipment.

Substantiation: You can't have two different articles with the same numbering. By charging the numbering the sequence is in line with the rest of the article.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 12-43.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-46 Log #591 NEC-P12 **Final Action: Reject**
(620.37(D))

Submitter: Thomas F. Norton, Norel Service Co. Inc.
Recommendation: Add text to read as follows:
"Wiring connecting The Fire Alarm Recall Outputs to The Elevator Control System shall be kept within The Elevator Machine Room, The Elevator Control Room or The Elevator Control Space."
Substantiation: This is a correlation issue between the NEC-NFPA-70, NFAC-NFPA-72, and ASME A17.1.
This proposal provides clarification of the wiring requirements of NFPA-70 and the supervision requirements of NFPA-72.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Proposal 12-47.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-47 Log #592 NEC-P12 **Final Action: Reject**
(620.37(D))

TCC Action: The Technical Correlating Committee directs that this Proposal be referred to the NFPA Technical Correlating Committee on Signaling Systems for the Protection of Life and Property for information.
The NEC Technical Correlating Committee is in basic agreement with the panel statement that Code-Making Panel 12 has written and that there is not a conflict between NFPA 72 and NFPA 70.
In addition, the NEC Technical Correlating Committee Chair will appoint a Task Group consisting of members from the NFPA 72 committee, NEC Code-Making Panels 3 and 12, and the NEC Technical Correlating Committee to address, in the future, the broader issue of what requirements, if any, from NFPA 72 should be included in the NEC.
Submitter: Wayne D. Moore, Hughes Assoc., Inc. / Rep. Technical Correlating Committee Signaling System for the Protection of Life and Property
Recommendation: Add text to read as follows:
"620.37(D) Interface With Fire Alarm System. Wiring connecting the Fire Alarm Recall Outputs to the Elevator Control System shall be kept within the Elevator Machine Room, the Elevator Control Room, or the Elevator Control Space."
Substantiation: The proposed language was submitted as Comment 12-18 to Proposal 12-26 during the May 2004 cycle and is being submitted as a public proposal for the Annual 2007 cycle. Panel 12 rejected Comment 12-18 (as well as Proposal 12-26) and indicated that the proposed requirement is already covered in the 2002 edition of NFPA 72, National Fire Alarm Code. The panel also indicted that "this is an issue of supervision and training." However, the panel failed to address the point made in the submitter's substantiation that while the NEC is adopted throughout the country, NFPA 72 is not as widely adopted.
It is the position of the TCC on Signaling Systems for the Protection of Life and Property that the proposed wiring requirement falls under the scope of the NEC and would provide a basis for more uniform installation of the fire alarm system wiring interface with the elevator controller. This proposed requirement would also enhance the correlation between the NEC, NFPA 72 and ASME A17.1 Safety Code for Elevators and Escalators.
The NFPA 72 TCC respectfully requests that NEC CMP 12 and the NEC TCC give this proposal full consideration both on its technical merits and on its correlation value.
Panel Meeting Action: Reject
Panel Statement: NFPA 70 is for the practical safeguarding of persons and property from hazards arising from the use of electricity, not one for the supervision of wiring or extending the adoption of NFPA 72. The submitter's proposal to require the outputs to be kept within the elevator machine room, elevator control room, or the elevator control space goes beyond what is required in NFPA 72, Article 6.15.2.2, which only requires the interface to be within 1 m (3 ft) of the controled circuit or appliance. This issue was the subject of an appeal to the Standards Council in the last cycle and was rejected.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-48 Log #1227 NEC-P12 **Final Action: Reject**
(620.44)

Submitter: Andy Juhasz, KONE Inc.
Recommendation: Revise text to read as follows:
620.44 Installation of Traveling Cables.
Traveling cable s that are suitably supported and protected from physical damage shall be permitted to be run without the use of a raceway in either or both of the following:
(A) When used inside the hoistway, on the elevator car, hoistway wall, counterweight, or controllers and machinery that are located inside the hoistway provided the cables are in the original sheath:
(B) from inside the hoistway, to elevator controller enclosures and to elevator car and machine room, control room, machinery space, and control space connections that are located outside the hoistway for a distance not exceeding 1.8 m (6 ft) in length as measured from the first point of support on the elevator car or hoistway wall, or counter weight where applicable, provided the conductors are grouped together and taped or corded, or in the original sheath. These t ~~T~~ raveling cables shall be permitted to be continued to this equipment ~~elevator controller enclosures and to elevator car and machine room, control room, machinery space, and control space connections, as fixed wiring provided they are suitably supported and protected from physical damage.~~
Substantiation: Fully sheathed elevator travel cables are robust and designed to survive in an elevator hoistway for great lengths, as much as 250 meters, in unsupported conditions. Cables are designed for little strain on the copper conductors by use of a steel support member typically used as a center member in a round cable and as integral support members in flat construction and must meet the requirements of NFPA 70. Fully sheathed travel cables that are attached to cars, counterweights, and other hoistway machinery and suitably protected from physical damage have no more risk of damage than cables provided in raceways in these locations
Panel Meeting Action: Reject
Panel Statement: No definitive technical substantiation has been provided to show that there is a problem with the current text.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10 Negative: 1
Explanation of Negative:
JUHASZ, A.: I disagree with the Panel action.
Fully sheathed traveling cables are designed for the conditions imposed on them in the elevator hoistway. To require elevator traveling cables located in the hoistway to be encased in a raceway once it is supported is not technically justified. The same cables hang for hundreds of feet in the hoistway from the points of suspension as flexible connections to the elevator car. As long as the traveling cable is suitably supported and protected from damage, e.g. located and tied off to prevent entanglement and abuse, there is no need for a raceway.

12-49 Log #2034 NEC-P12 **Final Action: Reject**
(620.44)

Submitter: Geraldine Burdeshaw, American Society of Mechanical Engineers / Rep. ASME A17 Standard Committee
Recommendation: Revise text to read as follows:
620.44 Installation of Traveling Cables.
Traveling cable s that are suitable supported and protected from physical damage shall be permitted to be run without the use of a raceway in either or both of the following:
a) when used inside the hoistway, of the elevator car, hoistway wall, counterweight, or controllers and machinery that are located inside the hoistway provided the cables are in the original sheath;
b) from inside the hoistway, to elevator controller enclosures and to elevator car and machine room, control room, machinery space, and control space connections that are located outside the hoistway for a distance not exceeding 1.8 m (6 ft) in length as measured from the first point of support on the elevator car or hoistway wall, or counterweight where applicable, provided the conductors are grouped together and taped or corded, or in the original sheath. These t ~~T~~ raveling cables shall be permitted to be continued to this equipment ~~elevator controller enclosures and to elevator car and machine room, control room, machinery space, and control space connections, as fixed wiring, provided they are suitable supported and protected from physical damage~~ .
Substantiation: Fully sheathed elevator travel cables are robust and designed to survive in an elevator hoistway for great lengths, as much as 250 meters, in unsupported conditions. Cables are designed for little strain on the copper conductors by use of a steel support member typically used as a center member in a round cable and as integral support members in flat construction and must meet the requirements of NFPA 70. JUHASZ, A.: See my Explanation of Negative for Proposal 12-48.

12-49a Log #417 NEC-P12 **Final Action: Reject**
(620.51)

Submitter: Peter VandeMotter, BLM Engineers Inc.
Recommendation: Add text to read as follows:
Disconnecting means shall be within 0.46 m (18 in.) of the door where possible.

Substantiation: Bring the NEC into conformance with elevator codes, which most electrical engineers or contractors are not familiar with.
Panel Meeting Action: Reject
Panel Statement: This is a local requirement in some jurisdictions that is not required by ASME A17.1. Section 620.51(C)(1) requires the disconnecting means be located within sight of the motor controller. The motor controller is not required to be within 18 inches of the door.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-50 Log #3536 NEC-P12 **Final Action: Reject**
(620.51 Exception (New))

Submitter: Kevin L. Brinkman, David Balmer, Accessibility Equipment Manufacturers Association
Recommendation: Add exception after first paragraph:
Exception: Where units receive power from more than one source (i.e., building power and standby or battery power) two disconnects may be provided in compliance with 620.52.
Substantiation: To clarify that two disconnects may be used when multiple power sources are provided.
Panel Meeting Action: Reject
Panel Statement: Where multiple power sources are used, they are normally connected on the line side of the disconnecting means required by this article. Personnel safety is assured when one disconnecting means is used to open all ungrounded main power supply conductors.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

12-51 Log #352 NEC-P12 **Final Action: Accept in Principle**
(620.51(A))

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal since the sentence requiring the disconnecting means to be listed is in two different locations in the accepted text in Proposals 12-51 and 12-52. This action will be considered by the Panel as a Public Comment.
Submitter: Michael J. Johnston, Plano, TX
Recommendation: Revise text to read as follows:
(A) Type. The disconnecting means shall be an enclosed externally operable fused motor circuit switch or circuit breaker capable of being locked in the open position. The disconnecting means shall be a listed device. <u>The provisions for locking or adding a lock to the disconnecting means must remain in place at the switch or circuit breaker whether the lock is installed or not. Portable means for adding a lock to the switch or circuit breaker shall not be permitted.</u>
Substantiation: This proposed change in wording is to provide consistency between other similar rules in the NEC that also call for disconnecting means to be capable of being locked in the open position. The phrase “capable of being locked in the open position” is used over 25 times in the NEC and the purpose is the same in every instance. Electrical safety rules for the worker should be consistent and the wording and requirements should be consistent where this phrase is used. The last sentence is being proposed because there are claims that some of the portable units available for snapping on to circuit breakers do remain with the switch or circuit breaker after they are installed on the breakers when the lock is not installed, but they are portable. The actions by CMP 11 in the 2002 cycle in 430.102(B) Exception were fairly clear that the provisions for adding a lock should be more substantial and not portable units.
Panel Meeting Action: Accept in Principle
Revise proposed text to read:
<u>The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed. Portable means for adding a lock to the switch or circuit breaker shall not be permitted.</u>
Panel Statement: See panel action and statement on Proposal 12-9.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11
Comment on Affirmative:
QUAVE, D.: Comment on Affirmative for Proposal 12-9.
WHITE, K.: I would like to affirm with a comment, the last sentence that was added by the panel “Portable means for adding a lock to the switch or circuit breaker shall not be permitted.” Will prohibit the use of portable devices that provide for the attachment of multiple locks (i.e. Scissors) to the locking mechanism. The sentence should be removed.

12-52 Log #2045 NEC-P12 **Final Action: Accept in Principle**
(620.51(A))

TCC Action: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal since the sentence requiring the disconnecting means to be listed is in two different locations in the accepted text in Proposals 12-51 and 12-52. This action will be considered by the Panel as a Public Comment.
Submitter: James T. Dollard, Jr., IBEW Local 98
Recommendation: Revise text to read as follows:
620.51(A) Type The disconnecting means shall be an enclosed externally operable fused motor circuit switch or circuit breaker capable of being locked in the open position. <u>The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed.</u>
The disconnecting means shall be a listed device.
Substantiation: The problem with the present wording of this section is that the disconnect in many elevator, dumbwaiter, escalators, moving walk, wheelchair and stairway lift equipment applications is a circuit breaker in a panelboard or a switch that is not made with permanent provisions for locking the circuit breaker or switch in the open position.
This requirement for a disconnect is for the safety of the installer/maintainer of the equipment. Permanent provisions for making circuit breakers and switches capable of being locked in the open position are readily available from circuit breaker and switch manufacturers.
This proposal does not represent a large increase in the cost of an installation but will result in a dramatic increase in safety.
Where elevator, dumbwaiter, escalator, moving walk, wheelchair and stairway lift equipment are involved we know that regular maintenance will take place, we must ensure that only a lock is needed by an installer/maintainer to work safely.
The practical safeguarding of persons from electrical hazards as detailed in the scope of the NEC must not be permitted to hinge on whether or not an installer just happens to have enough different types of devices and hopefully one that that happens to fit the circuit breaker or switch in an installation.
Note that this language was accepted by CMP-11 and is a present requirement, in the 2002 NEC, when a circuit breaker or switch is used as a disconnecting means not within sight of a motor. Also included in the 2005 NEC is the same language in 422.31 for appliances
The same level of safety is needed for these disconnecting means for elevator, dumbwaiter, escalators, moving walk, wheelchair and stairway lift equipment.
Panel Meeting Action: Accept in Principle
Revise proposed text to read:
<u>The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed. The disconnecting means shall be an enclosed externally operable fused motor circuit switch or circuit breaker capable of being locked in the open position and shall be located in the machine room or control room for that elevator car. <u>The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed.</u> Where there is no machine room or control room, the disconnecting means shall be located in the same space as the disconnecting means required by 620.51.

Where there is equipment for more than one elevator car in the machine room, the disconnecting means shall be numbered to correspond to the identifying number of the elevator car whose heating and air-conditioning source they control.

The disconnecting means shall be provided with a sign to identify the location of the supply side overcurrent protective device.

Substantiation: The problem with the present wording of this section is that the disconnect in many elevator, dumbwaiter, escalators, moving walk, wheelchair and stairway lift equipment applications is a circuit breaker in a panelboard or a switch that is not made with permanent provisions for locking the circuit breaker or switch in the open position.

This requirement for a disconnect is for the safety of the installer/maintainer of the equipment. Permanent provisions for making circuit breakers and switches capable of being locked in the open position are readily available from circuit breaker and switch manufacturers.

This proposal does not represent a large increase in the cost of an installation but will result in a dramatic increase in safety.

Where elevator, dumbwaiter, escalator, moving walk, wheelchair and stairway lift equipment are involved we know that regular maintenance will take place, we must ensure that only a lock is needed by an installer/maintainer to work safely.

The practical safeguarding of persons from electrical hazards as detailed in the scope of the NEC must not be permitted to hinge on whether or not an installer just happens to have enough different types of devices and hopefully one that that happens to fit the circuit breaker or switch in an installation.

Note that this language was accepted by CMP-11 and is a present requirement, in the 2002 NEC, when a circuit breaker or switch is used as a disconnecting means not within sight of a motor. Also included in the 2005 NEC is the same language in 422.31 for appliances

The same level of safety is needed for these disconnecting means for elevator, dumbwaiter, escalators, moving walk, wheelchair and stairway lift equipment.

Panel Meeting Action: Accept in Principle

Revise proposed text to read:

<u>The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed. Portable means for adding a lock to the switch or circuit breaker shall not be permitted.</u>

12-68 Log #3099 NEC-P12 **Final Action: Reject**
(620.55)

Submitter: Joseph A. Hertel, Safety and Buildings

Recommendation: Renumber 620.55 to become 620.25(C).

Substantiation: Placing the disconnect requirement with the other requirements for utilization equipment in one location will make the code more user friendly. It is confusing to users when requirements are located in remote places.

Panel Meeting Action: Reject

Panel Statement: Disconnecting means for utilization equipment should remain with all the other disconnecting means requirements in Part VI of Article 620.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

12-69 Log #2518 NEC-P12 **Final Action: Reject**
(620.62)

Submitter: Hugh O. Nash, Jr., Nash Lipsey Burch, LLC

Recommendation: Revise text to read as follows:

620.62 Selective Coordination. Where more than one driving machine disconnecting means is supplied by a single feeder, the overcurrent protective devices in each disconnecting means shall be selectively coordinated <u>in the long-time portion of the time-current curves</u> with any other supply side overcurrent protective devices. <u>Coordination shall not be required in the current-limiting or instantaneous portions of the time-current curves.</u>

Substantiation: (1) Molded case circuit breakers with instantaneous trips are unable to provide selectively in the instantaneous range of the breaker trip curve. Thus, fuses would be required for all emergency system circuits - including lighting branch circuits. (2) The substantiation provided for this change is insufficient to demonstrate that non-selective tripping of elevator circuits has been problematic.
Panel Meeting Action: Reject
Panel Statement: The panel does not agree with the relaxation of the selective coordination rules based upon the substantiation provided. There are options for all types of overcurrent protective devices that provide selective coordination.

12-71 Log #3416 NEC-P12 **Final Action: Reject**
(620.62)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Recommendation: Delete this section.
Substantiation: This rule first appeared in the 1993 NEC, without a single instance of loss experience presented to justify the change. Now that we have wide-scale awareness of the practical issues involved with perfect selective coordination because of the new rule in 700.27, it is time to revisit the technical merit of this rule as well. This section, if closely examined and literally applied, is tantamount to a mandate to use fused protection at all levels of a distribution that supplies multiple elevators.

The simple fact is there will always be systems that can't be fully coordinated. A system might fully coordinate under short circuit conditions, and fail to coordinate under ground-fault conditions, or vice-versa. One major NEC expert representing a leading circuit breaker manufacturer even noted in this regard that perhaps the only way this could be done with certainty would be with electronic trip CBs and zone selective interlocking (that is, where the upstream protective device response is restrained by the downstream device.) He was prophetic indeed. The conversation occurred in March, and the September/October issue of *IAEI News* , in an article written by the same fuse manufacturer, in fact by the very submitter of the NEC proposal in 700.27, mentioned this approach as the way to make circuit breakers coordinate for elevators, the very subject of this proposal.

There is a more interesting dimension to this problem, however. When you consider ground faults, even when the system is running on the generator it will frequently be impossible to coordinate the levels of protection. This is critical because ground faults are a far more likely source of failures than short circuits. Take a large, heavily loaded feeder, say, 1200A loaded to 1000A, with three 400A subfeeders and a 600A subfeeder originating at a distribution panel. If the 600A subfeeder sees a 800A ground fault, it will likely take out the 1200A main because the other loads that are making it heavily loaded will continue, and the ground fault will push it over the edge. All things being equal, a 600A circuit breaker loaded to 800A (+133%) during the ground fault event will take much longer to trip than a 1200A circuit breaker loaded to 1800A (+150%).

Remember that it is simply not possible to predict how much current will flow during a ground fault, although the worst case can be easily calculated. For many such coordination studies, the worst case for fault duty is the best case for coordination; the best case for fault duty is the worst case for coordination; and coordination for various fault conditions must therefore result in different protective devices under different fault scenarios on the same feeder.

Panel members should carefully review the substantiation and the comments in the voting on 2005 NEC Comment 13-88 (that created 700.27), where both NEMA and UL voted against the comment. They did not do so lightly. UL lists both fuses and circuit breakers and has no axe to grind, and correctly pointed out that the new language "would most likely exclude the application of circuit breakers in emergency systems." Do we seriously want to continue this burden on the design community? The rule in 620.62 has been under many radar screens for a long time, but it will likely become the focus of extensive attention as this code cycle moves forward.

In conclusion, this submitter would like to return to the points made in his Comment 12-44 in the 1993 cycle: Nowhere else in the Code [at that time] was this type of selective coordination required. Section 240.12 is permissive and Section 517.17(B) concerns GFPE. A precedent setting change like this should have been considered only if there were no other way to achieve the submitter's objectives. Solving the problem of the service personnel not knowing where to go if the upstream overcurrent device opened was insufficient substantiation for a change of this magnitude. As Mr. Trout pointed out in his comments in the voting at the time, an outage is an outage. If a fault in the supply feeder to the machine room opens the upstream device, then of what use is the coordination? The answer was, and is, simple and old fashioned: proper marking.

12-72 Log #3492 NEC-P12 **Final Action: Reject**
(620.62)

Submitter: Alan Manche, Square D Co.
Recommendation: Delete NEC **620.62 Selective Coordination.**
~~**620.62 Selective Coordination.** Where more than one driving machine disconnecting means is supplied by a single feeder, the overcurrent protective devices in each disconnecting means shall be selectively coordinated with any other supply side overcurrent protective devices.~~
Substantiation: The proposed deletion of this section is based on two foundational components under which this requirement exists and was accepted. I brief review of the historical information that supported the introduction of selective coordination of elevators will show that it was accepted based on maintenance practices by the electrician. The rational explains that if you are performing maintenance on one elevator and trip the overcurrent device, you would not want the other elevators to be impacted. The electrical equipment for an elevator should not be worked on while energized. The heightened awareness of electrical safety with the introduction of arc-flash protection and the requirements for developing an electrical safety program make this requirement obsolete. There are no provisions permitting the electrical system for an elevator to be worked on energized so the substantiation that supported this requirement is no longer valid.

The second component that would drive such a requirement is reliability of the electrical system for the elevator system. Unfortunately, selectivity is not an independent answer for ensuring reliability. Selectivity can actually drive a reduction in the electrical system's reliability.

The application of selective coordination is often misunderstood in that it is perceived as being independent of all other electrical design parameters. The seemingly simple misperception is that you just have to pick the correct fuses or circuit breakers to ensure this particular requirement is met. What has not been considered, at least in the NEC, is the impact placed upon the design and reliability of the entire electrical system. My discussion with engineers and our company involvement with coordination studies indicates they do a comprehensive coordination evaluation of electrical systems and maximize the selectivity, unfortunately the requirement in NEC for requiring full selectivity is driving system design parameters that can impact the reliability in a negative manner by possibly reducing that reliability. The requirement also places a requirement on the system that is unnecessary in various areas of the electrical system.

Other industry standards, such as NFPA 110 and IEEE Standard 242, recognize the need for this latitude in maximizing system reliability and permitting the engineer to selectively coordinate devices that support the isolation of the system as necessary. Electrical system designs and demands differ based on the size and occupancy needs. Ensuring the maximum reliability of the electrical system must be determined by the engineering professional for each facility.

A brief review of other technical committees guidance that have addressed this issue will support the need to delete this requirement. The NFPA 110 committee recognizes the limitations of selective coordination by requiring the selective coordination of the emergency system to be "optimized." They further provide an explanation in the annex of NFPA 110 regarding this subject:
A.6.5.1 It is important that the various overcurrent devices be coordinated, as far as
practicable, to isolate faulted circuits and to protect against cascading operation on short circuit faults. In many systems, however, full coordination is not practicable without using equipment that could be undesirable for other reasons or prohibitively costly. Primary consideration also should be given to prevent overloading of equipment by limiting the possibilities of large current inrushes due to instantaneous reestablishment of connections to heavy loads.

A review of IEEE Standard 242 also provides further explanation that selectivity of overcurrent devices may not provide any further enhancement to reliability, but this requirement in the NEC simply drives an unnecessary burden for these particular areas of the electrical system. An example is where primary and secondary protection is necessary for a transformer. Selectively coordinating the primary and secondary may or may not have any impact on isolating the fault.

The NEC places an unnecessary burden on the electrical system design without any benefit.

The only reason for requiring selective coordination in the NEC is to drive a performance parameter for enhanced reliability of power for the system. Based on this premise, that goal is not accomplished in many instances. Our company supports the design and installation of many critical electrical infrastructures and this requirement can drive a compromise in electrical reliability. The easiest system to recognize this issue is when an alternate power source is utilized. The system design must take into consideration of whether to have a generator located near the point of use or decide that a more reliable power source is paralleling a number of generators in the event one of the independent generators do not start. NFPA 70B does recognize that the reliability of the generator starting is an issue, likely based on poor maintenance practices, but that is the reality of our electrical infrastructure. If the power source does not exist then having a selectivity coordinated system serves no purpose. Selective coordination will drive large single generators and in effect prohibit the paralleling of small generators to establish a more reliable power source. Once again, an example that selective coordination is not independent from the rest of the electrical system design.

The present NEC requirement for selective coordination prohibits solid design considerations that would enhance the reliability of the system. I urge the committee to accept this proposal and delete the requirement for selective coordination on the electrical systems providing power to multiple elevators. Deleting this requirement will permit the electrical system design engineer to maximize the reliability of the system and remove a restriction placed on the designer that may reduce the reliability of the system.

Panel Meeting Action: Reject

Panel Statement: The panel does not agree that the requirements for selective coordination reduce the level of reliability based on the substantiation provided. The rule exists to require a certain level of performance that provides the level of reliability needed for elevator circuits. Sufficient technical substantiation is not provided for removal of this requirement.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10 Negative: 1

Explanation of Negative:

LOTTMANN, T.: NEMA believes that the proposal should be accepted and the text in 620.62 should be deleted. The issue of selective coordination is not a Code issue, but one of system design. To do the appropriate system design, there are a number of factors that impact the reliability of a system. In addition, that level of reliability can vary depending on the application and need of the user. The requirement to selectively coordinate the system can actually be at the detriment of other factors that can impact reliability. The level and need of selective coordination is one best handled by the design engineer in a manner that can accommodate the entire range of design parameters. The existing text places a design restriction on the engineer that is unnecessary and forces the engineer to create a design that may be code compliant, but not as reliable as it could be.

Finally, the requirement for selective coordination can also increase the arc flash hazard that the workers may be exposed to. The requirement to use larger overcurrent devices to simply achieve a selective coordination arrangement can result in larger currents and greater arc flash energy. This is another reason why the requirement for when to be selective and to what degree should be made by the engineer.

If the panel is not willing to delete the requirement completely, some concerns of the design community can be addressed by rewording 620.62 to read:

“Selective coordination of overcurrent devices in each elevator disconnecting means shall be optimized where more than one driving machine disconnecting means is supplied by a single feeder.”

This language will give the latitude to the designer to consider selective coordination in a manner that is consistent with the objectives of the system design.

ARTICLE 625 — ELECTRIC VEICLE CHARGING SYSTEM EQUPMENT

12-76 Log #404 NEC-P12 **Final Action: Accept**
(625.2)

Submitter: Sam Marcovici, NY City Buildings Dept.

Recommendation: Revise text to read as follows:

625.2 Definitions.

Electric Vehicle. An automotive-type vehicle for ~~highway~~ on-road use, such as passenger automobiles, buses, trucks, vans, neighborhood electric vehicles, and the like, primarily powered by an electric motor that draws current from a rechargeable storage battery, fuel cell, photovoltaic array, or other source of electric current. For the purpose of this article, electric motorcycles and similar type vehicles and off-road self-propelled electric vehicles, such as industrial trucks, hoists, lifts, transports, golf carts, airline ground support equipment, tractors, boats, and the like, are not included.

Substantiation: The term “highway use” does not apply to Neighborhood Electric Vehicles (NEVs). The National Highway Traffic Safety Administration (NHTSA) Rule 63 FR 33913 of June 17, 1998 defines NEVs as “low speed” vehicles, with a top speed of 25 miles/hour. These vehicles are approved for use on local roads only, and not on highways. Accordingly, the appropriate term for all the listed vehicles is “on-road use”.

Panel Meeting Action: Accept

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

12-77 Log #350 NEC-P12 **Final Action: Accept in Principle**
(625.23)

Submitter: Michael J. Johnston, Plano, TX

Recommendation: Revise text to read as follows:

625.23 Disconnecting Means. For electric vehicle supply equipment rated more than 60 amperes or more than 150 volts to ground, the disconnecting means shall be provided and installed in a readily accessible location. The disconnecting means shall be capable of being locked in the open position. The provisions for locking or adding a lock to the disconnecting means must remain in place at the switch or circuit breaker whether the lock is installed or not. Portable means for adding a lock to the switch or circuit breaker shall not be permitted.

Substantiation: This proposed change in wording is to provide consistency between other similar rules in the NEC that also call for disconnecting means to be capable of being locked in the open position. The phrase "capable of being locked in the open position" is used over 25 times in the NEC and the purpose is the same in every instance. Electrical safety rules for the worker should be consistent and the wording and requirements should be consistent where this phrase is used. The last sentence is being proposed because there are claims that some of the portable units available for snapping on to circuit breakers do remain with the switch or circuit breaker after they are installed on the breakers when the lock is not installed, but they are portable. The actions by CMP 11 in the 2002 cycle in 430.102(B) Exception were fairly clear that the provisions for adding a lock should be more substantial and not portable units.

Panel Meeting Action: Accept in Principle

Revise proposed text to read:

The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed. Portable means for adding a lock to the switch or circuit breaker shall not be permitted.

Panel Statement: See panel action and statement on Proposal 12-9.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

Comment on Affirmative:

QUAVE, D.: Comment on Affirmative for Proposal 12-9.

WHITE, K.: I would like to affirm with a comment, the last sentence that was added by the panel "Portable means for adding a lock to the switch or circuit breaker shall not be permitted." Will prohibit the use of portable devices that provide for the attachment of multiple locks (i.e. Scissors) to the locking mechanism. The sentence should be removed.

12-78 Log #2051 NEC-P12 **Final Action: Accept in Principle**
(625.23)

Submitter: James T. Dollard, Jr., IBEW Local 98

Recommendation: Revise text to read as follows:

625.23 Disconnecting Means

For electric vehicle supply equipment rated more than 60 amperes or more than 150 volts to ground, the disconnecting means shall be provided and installed in a readily accessible location. The disconnecting means shall be capable of being locked in the open position. The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed.

Substantiation: The problem with the present wording of this section is that the disconnect in many electric vehicle supply equipment applications is a circuit breaker in a panelboard or a switch that is not made with permanent provisions for locking the circuit breaker or switch in the open position.

This requirement for a disconnect is for the safety of the installer/maintainer of the equipment. Permanent provisions for making circuit breakers and switches capable of being locked in the open position are readily available from circuit breaker and switch manufacturers.

This proposal does not represent a large increase in the cost of an installation but will result in a dramatic increase in safety.

Where electric vehicle supply equipment is involved we know that maintenance will take place, we must ensure that only a lock is needed by an installer/maintainer to work safely.

The practical safeguarding of persons from electrical hazards as detailed in the scope of the NEC must not be permitted to hinge on whether or not an installer just happens to have enough different types of devices and hopefully one that that happens to fit the circuit breaker or switch in an installation.

Note that this language was accepted by CMP-11 and is a present requirement, in the 2002 NEC, when a circuit breaker or switch is used as a disconnecting means not within sight of a motor. Also included in the 2005 NEC is the same language in 422.31 for appliances

The same level of safety is needed for these disconnecting means for electric vehicle supply equipment.

Panel Meeting Action: Accept in Principle

Revise proposed text to read:
